34 11 552 OVERHAULING LEFT OR RIGHT FRONT BRAKE CALIPER (BRAKE CALIPER REMOVED)

Special tools required:

- 00 9 316

WARNING: In the following work step, large forces occur at the brake caliper piston (up to more than 2800 N).

Risk of injury!

Carefully force piston out through connection bore with compressed air.

To protect piston, place a protective plate (e.g. hard wood or hard felt) in caliper recess.

Do not grip piston with fingers - risk of trapping!

Fig. 31: Force Piston Out

Courtesy of BMW OF NORTH AMERICA, INC.

Check guide sleeves (5), fitting repair-kit guide sleeve if necessary.

Fig. 32: Guide Sleeves

Courtesy of BMW OF NORTH AMERICA, INC.

Press off dust sleeve (1).

Fig. 33: Dust Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully remove seal (1) with special tool 00 9 316 .

Clean cylinder bores and parts with alcohol and dry with compressed air.

Thoroughly inspect cylinder bore, piston and flange surfaces.

Machining of cylinders and pistons is not permitted.

Install new seal.

Installation:

Apply a light coat of Ate brake cylinder paste to cylinder bore, piston and seal.

Fig. 34: Seal With Special Tool (00 9 316)
Courtesy of BMW OF NORTH AMERICA, INC.

Fit dust sleeve (1) in annular groove of piston (2).

Press piston into cylinder bore.

IMPORTANT: Do not tilt piston.

Evenly press dust sleeve onto brake caliper housing as far as it will go.

Fig. 35: Annular Groove Of Piston And Dust Sleeve
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The area between the dust sleeve and the brake caliper housing must be kept dry. It must not come into contact with Ate brake cylinder paste or brake fluid so as to ensure that the dust sleeve is perfectly seated.

34 11 667 PRECISION-TURNING BOTH FRONT BRAKE DISCS ON BOTH SIDES

IMPORTANT: Always precision-turn both sides of both brake discs on one axle.

Observe Max. machining dimension per friction ring side, see 34 11 FRONT BRAKE E83 .

Minimum brake disc thickness (MIN TH)

Brake discs of M models (Compound brake discs) must not be machined!

Only one brake pad set may be used up on brake discs which have been lathe-turned to minimum thickness (MIN TH).

Stationary brake disc lathe:

In the case of stationary brake disc lathes, the brake disc must be removed, see 34 11 220 Removing and installing/replacing both front brake discs.

Please refer to the lathe manufacturer's instruction manual for the exact procedure.

IMPORTANT: Only BMW-approved brake disc lathes may be used!

Fig. 36: Stationary Brake Disc Lathe
Courtesy of BMW OF NORTH AMERICA, INC.

Mobile brake disc lathe:

In the case of mobile brake disc lathes, only the brake caliper must be removed, see 34 11 519 Removing and installing/replacing left or right front brake caliper.

The brake discs remain on the car.

Please refer to the lathe manufacturer's instruction manual for the exact procedure.

IMPORTANT: Only BMW-approved brake disc lathes may be used!

Fig. 37: Mobile Brake Disc Lathe
Courtesy of BMW OF NORTH AMERICA, INC.

After fine-grinding the brake discs, measure the thickness difference inside the braking surfaces at 8 points with an external micrometer, see **34 11 FRONT BRAKE E83** .

Fig. 38: Measuring Brake Discs Thickness
Courtesy of BMW OF NORTH AMERICA, INC.

21 REAR BRAKES

34 21 ... OVERVIEW OF REAR BRAKE

- | | | | |
|---|-------------------------------|---|--|
| 1 | Brake disk | 4 | Brake guard plate |
| 2 | Brake pad | 5 | Checking thickness of brake lining |
| 3 | Brake caliper | | |

Fig. 39: Rear Brakes Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 21 171 REMOVING AND INSTALLING/REPLACING A BRAKE CARRIER/BRAKE GUARD PLATE AT REAR

Necessary preliminary tasks:

- Remove expander lock, see **34 41 250 Removing and installing/replacing expander lock for handbrake shoes.**
- Remove wheel hub, see **33 41 153 REPLACING LEFT WHEEL BEARING ON REAR AXLE SHAFT .**
- After completing tasks, adjust handbrake, see **34 10 014 Adjusting handbrake.**

Release screws (1).

Release screws (2) and remove brake carrier (3).

Installation:

Tightening torque: 34 21 6AZ, see **34 21 REAR BRAKE** .

Fig. 40: Brake Carrier And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

34 21 173 REPLACING REAR LEFT (OR RIGHT) BRAKE CARRIER/BRAKE GUARD

Necessary preliminary tasks:

- Remove **expander lock**.
- Remove wheel hub. See **33 41 153 REPLACING LEFT WHEEL BEARING ON REAR AXLE SHAFT** .
- After completing tasks, **adjust handbrake**.

Release screws (1). Release screws (2) and remove brake carrier (3). Installation: Tightening torque, see 34 21 6AZ in **34 21 REAR BRAKE** .

Fig. 41: Release Screws (2) And Remove Brake Carrier (3)

Courtesy of BMW OF NORTH AMERICA, INC.

34 21 200 REMOVING AND INSTALLING/REPLACING BOTH REAR DISC BRAKES

Special tools required:

- 34 1 050

Necessary preliminary tasks:

- Remove wheels, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .

NOTE: After completing work:

- Fully depress brake pedal several times so that brake linings contact brake discs.
- When installing new brake linings at front and rear axles, brake fluid level must be brought up to "MAX" marking.
- Read and comply with notes on braking in new brake discs / brake pads, see **34 00 ... General information on braking in new brake discs / brake pads.**

Remove cover plug (1).

Right side:

Disconnect plug connection for brake lining wear sensor.

If necessary, replace brake lining wear sensor.

Fig. 42: Cover Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew guide screws (2).

Installation:

Only clean guide screws; do not grease.

Check threads.

Replace all guide screws which are not in perfect condition.

Tightening torque: 34 21 5AZ, see **34 21 REAR BRAKE** .

Fig. 43: Guide Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Lift out retaining spring (3).

Withdraw brake caliper backwards.

Fig. 44: Locating Retaining Spring

Courtesy of BMW OF NORTH AMERICA, INC.

Turn piston fully back with special tool 34 1 050 .

IMPORTANT: When turning back the piston, watch the brake-fluid level in the expansion tank, as overflowing brake fluid will destroy the paintwork.

Fig. 45: Turning Piston With Special Tool (34 1 050)
Courtesy of BMW OF NORTH AMERICA, INC.

Remove outer brake lining.

Inner brake lining is located with its spring in the piston.

IMPORTANT: Mark any worn brake linings.

In the event of one-sided brake lining wear, do not change brake linings round.

New brake linings may only be installed if the brake disc thickness is greater than or equal to the minimum brake disc thickness (MIN TH), see **34 21 REAR BRAKE DISCS E83** .

Observe minimum thickness of brake linings, see **34 21 REAR BRAKE DISCS E83** .

Clean brake linings.

Do not grease backs of brake linings sleeve.

Fig. 46: Removing Outer Brake Lining

Courtesy of BMW OF NORTH AMERICA, INC.

Check dust sleeve (1) for damage and replace if necessary.

Clean contact face (2) of brake piston and apply a thin coating of anti-squeak compound.

IMPORTANT: Dust sleeve must not come into contact with anti-squeak compound as this may cause the dust sleeve to swell.

Fig. 47: Contact Face And Dust Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

Clean contact faces (1...2) of brake lining hammer heads/brake caliper housing and coat with anti-squeak compound.

Fig. 48: Contact Face Of Brake Piston

Courtesy of BMW OF NORTH AMERICA, INC.

Clean contact face (3) of brake caliper and apply a thin coating of anti-squeak compound.

Fig. 49: Brake Caliper And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Clean brake caliper mounting bracket at hammer head guides and apply a thin coating of anti-squeak compound.

Fig. 50: Locating Brake Caliper Mounting Bracket
 Courtesy of BMW OF NORTH AMERICA, INC.

34 21 320 REMOVING AND INSTALLING/REPLACING BOTH BRAKE DISKS

Necessary preliminary tasks:

- Remove wheels, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .
- If necessary, remove and clean brake linings **34 21 200 Removing and installing/replacing both rear disc brakes**.

After completing tasks, adjust handbrake, see **34 10 014 Adjusting handbrake**.

IMPORTANT: The brake disks must be replaced if their thickness is below the minimum

thickness, see 34 21 REAR BRAKE DISCS E83 .

Always replace brake disks in pairs.

If the brake disks are replaced, you must also fit new brake linings.

Release bolts (1), pull off brake caliper towards rear and tie up.

IMPORTANT: Replace micro-encapsulated bolts.

If necessary, remove adhesive residue in nut thread with M10x1.5 tap. Then blow tapped hole out with compressed air.

Tightening torque: 34 21 3AZ, see 34 21 REAR BRAKE .

NOTE: Brake hose remains connected.

Fig. 51: Brake Caliper And Bolts

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolts and take off brake disk.

Installation:

Replace brake disk retaining screw.

Tightening torque: 34 21 1AZ, see 34 21 REAR BRAKE .

Fig. 52: Locating Brake Disk Retaining Screw
Courtesy of BMW OF NORTH AMERICA, INC.

34 21 745 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT REAR BRAKE CALIPER

Necessary preliminary tasks:

- Remove rear wheel .

After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC.**

Apply pedal prop and depress brake pedal slightly. This prevents brake fluid from emerging from the expansion tank and air from entering the brake system when the brake lines are opened.

Fig. 53: Locating Pedal Prop
Courtesy of BMW OF NORTH AMERICA, INC.

Slacken union nut (1); to do so, grip brake hose at square (2).

Installation:

Tightening torque: 34 32 1AZ, see **34 32 BRAKE LINES** .

Detach brake hose from brake caliper (3).

Installation:

Tightening torque: 34 32 2AZ, see **34 32 BRAKE LINES** .

Fig. 54: Brake Hose From Brake Caliper And Slacken Union Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Installation:

Tightening torque: 34 21 3AZ, see **34 21 REAR BRAKE** .

Right side:

Disconnect plug connection for brake lining wear sensor.

Pull off fist caliper towards rear of vehicle.

Fig. 55: Disconnecting Plug Connection For Brake Lining Wear Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Install brake hose without torsional stress.

First tighten the brake hose on the brake cover, then tighten connection on brake line.

Never twist brake hose when installing it and avoid all contact with parts attached rigidly to the body.

Check routing and securing of brake-pad-wear indicator cable. Check for correct securing with tab of dust cap. It is absolutely essential to prevent the cable on the rim from being scuffed.

34 21 812 OVERHAULING LEFT OR RIGHT REAR BRAKE CALIPER (BRAKE CALIPER REMOVED)

NOTE: Use repair kit.

Take off plastic caps (1).

Unscrew guide screws (2).

Installation:

Only clean guide screws; do not grease. Check guide bolts, replace if necessary.

Tightening torque: 34 21 5AZ, see **34 21 REAR BRAKE** .

Fig. 56: Guide Screws And Plastic Caps
Courtesy of BMW OF NORTH AMERICA, INC.

Dismantle brake caliper and remove brake linings.

Installation:

Press brake lining fully outwards and insert spring (4).

Fig. 57: Brake Lining Fully Outwards And Spring
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: In the following work step, large forces occur at the brake caliper piston (up to more than 2800 N!).

Danger of injury!

Carefully force piston out through connection bore with compressed air.

To protect piston, place a protective plate (e.g. hard wood or hard felt) in caliper recess.

Do not grip piston with fingers - risk of trapping!

Fig. 58: Locating Brake Caliper Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Check guide sleeves (5), fitting repair-kit guide sleeve if necessary.

Fig. 59: Guide Sleeves

Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealing ring carefully with a plastic needle.

Clean cylinder bores and parts with alcohol and dry with compressed air.

Thoroughly inspect cylinder bore, piston and flange surfaces.

Machining of cylinders and pistons is not permitted.

Fig. 60: Removing Sealing Ring With Plastic Needle

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Apply a light coat of Ate brake cylinder paste to cylinder bore, piston and sealing sleeve.

Install sealing cover in rear annular groove of cylinder bore.

Fig. 61: Sealing Cover In Rear Annular Groove Of Cylinder Bore
Courtesy of BMW OF NORTH AMERICA, INC.

Insert dust sleeve in front annular groove and press into annular groove over entire diameter.

Installation:

The area between the dust sleeve and the brake caliper housing must be kept dry. This area must not come into contact with Ate brake cylinder paste or brake fluid so as to ensure that the dust sleeve is perfectly seated.

Fig. 62: Area Between Dust Sleeve And Brake Caliper Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Take up brake piston with a commercially available extension and socket and gently press onto dust sleeve.

Blow up sleeve with compressed air (max. 3 bar). Sleeve jumps over brake piston.

Installation:

Coat dust sleeve and brake piston with brake fluid to facilitate installation of dust sleeve.

Fig. 63: Pressing Onto Dust Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

34 21 947 PRECISION-TURNING BOTH REAR BRAKE DISCS ON BOTH SIDES

IMPORTANT: Always precision-turn both sides of both brake discs on one axle.

Observe Max. machining dimension per friction ring side, see 34 21 REAR BRAKE DISCS E83 .

New brake linings may only be installed if the brake disc thickness is greater than or equal to the minimum brake disc thickness (MIN TH), see 34 21 REAR BRAKE DISCS E83 .

Brake discs of M models (Compound brake discs) must not be machined!

Only one brake pad set may be used up on brake discs which have been lathe-turned to minimum thickness (MIN TH), see 34 21 REAR BRAKE DISCS E83 .

Stationary brake disc lathe:

In the case of stationary brake disc lathes, the brake disc must be removed, see **34 11 220 Removing and installing/replacing both front brake discs.**

Please refer to the lathe manufacturer's instruction manual for the exact procedure.

IMPORTANT: Only BMW-approved brake disc lathes may be used!

Fig. 64: Stationary Brake Disc Lathe
Courtesy of BMW OF NORTH AMERICA, INC.

Mobile brake disc lathe:

In the case of mobile brake disc lathes, only the brake caliper has must be removed, see **34 21 745 Removing and installing/replacing left or right rear brake caliper.**

The brake discs remain on the car.

Please refer to the lathe manufacturer's instruction manual for the exact procedure.

IMPORTANT: Only BMW-approved brake disc lathes may be used!

Fig. 65: Mobile Brake Disc Lathe
Courtesy of BMW OF NORTH AMERICA, INC.

After fine-grinding the brake discs, measure the thickness difference, see **34 21 REAR BRAKE DISCS E83** inside the braking surfaces at 8 points with an external micrometer.

Fig. 66: Measuring Brake Discs Thickness

Courtesy of BMW OF NORTH AMERICA, INC.

31 MASTER BRAKE CYLINDER

34 31 ... OVERVIEW OF BRAKE MASTER CYLINDER / BRAKE BOOSTER

- | | | | |
|---|----------------------------------|---|---|
| 1 | Brake booster | 4 | Brake master cylinder |
| 2 | Non-return valve | 5 | Expansion tank |
| 3 | Vacuum hose | 6 | Bleeding braking system |

Fig. 67: Brake Master Cylinder / Brake Booster Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 31 181 REMOVING AND INSTALLING/REPLACING EXPANSION TANK FOR HYDRAULIC BRAKE ACTUATION

Necessary preliminary tasks:

- Follow general instructions, see **34 00 ... General Information**.
- Remove left partition wall for equipment compartment .
- Remove non-return valve, see **34 33 051 Removing and installing/replacing nonreturn valve for brake booster** from brake booster.
- After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

NOTE: Suck the brake fluid out of the expansion tank. Use a suction bottle used exclusively for drawing off brake fluid.

Do not reuse drawn out brake fluid.

Unfasten plug connection (1) and disconnect.

Pull off supply hose (2) of clutch hydraulic system if necessary.

Release retaining screw (3).

Installation:

Tightening torque: 34 31 3AZ, see **34 31 BRAKE MASTER CYLINDER** .

Pull expansion tank (4) vertically out of brake master cylinder.

Fig. 68: Pulling Expansion Tank And Supply Hose
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Check rubber plug in brake master cylinder for damage and replace if necessary.

Push the expansion tank vertically onto the master brake cylinder.

Fig. 69: Checking Rubber Plug In Brake Master Cylinder
Courtesy of BMW OF NORTH AMERICA, INC.

34 31 505 REMOVING AND INSTALLING/REPLACING MASTER BRAKE CYLINDER FOR DSC

Necessary preliminary tasks:

- Read and comply with General Information, see **34 00 ... General Information**.
- Remove expansion tank, see **34 31 181 Removing and installing/replacing expansion tank for hydraulic brake actuation**.
- After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

Unfasten brake lines (1).

Installation:

Note changed tightening torque.

Tightening torque: 34 32 6AZ, see **34 32 BRAKE LINES** .

Release nuts (2) and pull brake master cylinder (3) in direction of arrow straight out of brake booster.

Installation:

Replace self-locking nuts.

Tightening torque: 34 31 1AZ, see **34 31 BRAKE MASTER CYLINDER** .

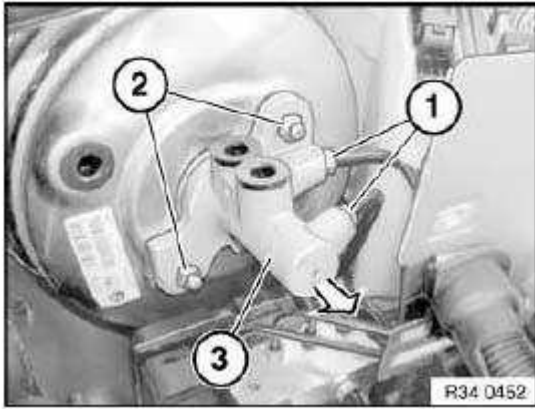

Fig. 70: Brake Master Cylinder, Brake Lines And Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace O-ring (1).

Fig. 71: O-ring
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

When inserting brake master cylinder (2) into brake booster (1), make sure that pressure rod of brake booster (1) and pressure rod of brake master cylinder (2) lie on a single plane.

Fig. 72: Brake Master Cylinder Into Brake Booster
Courtesy of BMW OF NORTH AMERICA, INC.

32 BRAKE LINES

34 32 ... OVERVIEW OF BRAKE LINES

1 [Brake hose, front](#)

2 [Brake tubes](#)

3 [Brake hose, rear](#)

Fig. 73: Brake Lines Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 32 861 REPLACING ALL BRAKE PIPES

Special tools required:

- **34 5 100 BENDING FIXTURE**

NOTE: The brake lines are only supplied in the straight version and correct length with connecting nipple.

Read and comply with General Information, see [34 00 ... General Information](#).

After completing tasks, bleed brake system, see [34 00 050 Bleeding brake system with DSC](#).

Observe safety instructions on raising the vehicle, see [00 LIFTING VEHICLE WITH A LIFTING PLATFORM](#) .

New brake lines are bent into shape with bending tool 34 5 100 .

Removed brake pipes can be used as templates for bending.

IMPORTANT:

- **Protective coating of brake line must not be damaged during bending.**
- **Do not kink or bend back brake lines.**
- **Watch distances to rigid and movable vehicle parts. Brake lines may not make contact or rub.**
- **Tighten down brake line couplings with torque wrench.**

Fig. 74: Special Tool (34 5 100)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tightening torque: 34 32 1AZ, see **34 32 BRAKE LINES** .

34 32 881 REPLACING FRONT LEFT OR RIGHT BRAKE HOSES

Necessary preliminary tasks:

- Remove wheel, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .
- After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

Apply pedal prop and depress brake pedal slightly. This prevents brake fluid from emerging from the expansion tank when the brake lines are opened.

Fig. 75: Locating Pedal Prop

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect brake hose from brake line (1).

Installation:

Tightening torque: 34 32 1AZ, see **34 32 BRAKE LINES** .

IMPORTANT: Grip brake hose at square drive to prevent connecting piece from turning in retaining bracket.

Remove retaining clip (2) and pull brake hose out of holder.

IMPORTANT: Make sure the retaining clip is correctly fitted.

Detach brake hose (3) from brake caliper.

Fig. 76: Brake Hose From Brake Line, Retaining Clip And Brake Hose

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tightening torque: 34 32 2AZ, see **34 32 BRAKE LINES** .

Installation:

First tighten brake hose on brake caliper.

Move wheels into straight-ahead position.

Insert brake hose in bracket and screw onto brake pipe.

Fit retaining clip.

IMPORTANT: Never twist brake hose when installing it and avoid all contact with parts attached rigidly to the body.

34 32 980 REPLACING REAR LEFT OR RIGHT BRAKE HOSES

Necessary preliminary tasks:

- Read and comply with General Information, see **34 00 ... General Information**.
- After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

Apply pedal prop and depress brake pedal slightly. This prevents brake fluid from emerging from the expansion tank and air from entering the system when the brake lines are opened.

Fig. 77: Locating Pedal Prop

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect brake hose (2) from brake line (1).

Installation:

Tightening torque: 34 32 1AZ, see **34 32 BRAKE LINES** .

IMPORTANT: Grip brake hose at square (3) to prevent connecting piece from turning in retaining bracket.

Fig. 78: Brake Hose From Brake Line
Courtesy of BMW OF NORTH AMERICA, INC.

Detach retaining plate (1) from metal bracket and feed out brake hose (2).

Disconnect brake hose (2) from brake caliper.

Installation:

Tightening torque: 34 32 2AZ, see **34 32 BRAKE LINES** .

Fig. 79: Retaining Plate And Brake Hose
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

First tighten brake hose on brake caliper.

Insert brake hose in bracket and screw onto brake pipe.

Fit retaining plate (1).

IMPORTANT: Never twist brake hose when installing it and avoid all contact with parts attached rigidly to the body.

33 BRAKE BOOSTER

34 33 051 REMOVING AND INSTALLING/REPLACING NONRETURN VALVE FOR BRAKE BOOSTER

Necessary preliminary tasks:

- Read and comply with General Information, see **34 00 ... General Information**.
- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD**.

IMPORTANT:

- If a rubber vacuum hose is fitted, it can be replaced individually.
- If a plastic vacuum line is fitted, it can only be replaced as a single unit together with the non-return valve.

NOTE: Before beginning work, fully press the brake pedal several times to reduce the vacuum pressure in the brake booster. This makes it easier to remove the non-return valve.

Release clip (1) and detach vacuum hose (2) from non-return valve (3).

Remove non-return valve (3) from brake booster.

Installation:

Replace hose clip.

Check sealing ring in brake booster and replace if necessary.

Fig. 80: Clip, Vacuum Hose And Non-Return Valve
Courtesy of BMW OF NORTH AMERICA, INC.

34 33 505 REMOVING AND INSTALLING/REPLACING BRAKE BOOSTER

Necessary preliminary tasks:

- Read and comply with General Information, see **34 00 ... General Information.**
- Remove brake master cylinder, see **34 31 505 Removing and installing/replacing master brake cylinder for DSC.**
- Remove left footwell trim, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY .**

Detach locking clip (1) from brake pedal, disengage and pull out locking pin.

Unscrew nuts (2).

Installation:

Replace self-locking nuts.

Fig. 81: Locking Clip And Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully pull brake booster (1) out of bulkhead and tilt out.

IMPORTANT: Do not use any force when removing and installing the brake unit; the brake unit can be damaged under certain circumstances.

Fig. 82: Pulling Brake Booster

Courtesy of BMW OF NORTH AMERICA, INC.

Tilt microfilter housing cover (2) upwards and lift out brake booster (1) in direction of arrow.

Fig. 83: Tilting Microfilter Housing Cover

Courtesy of BMW OF NORTH AMERICA, INC.

35 ELECTRICAL COMPONENTS

34 35 ... REPLACING A BRAKE PAD SENSOR (REAR)

IMPORTANT: If a brake pad sensor that has already been ground has to be replaced even though the minimum brake pad thickness has not yet been reached, you must

observe the following: The new sliding contact must be filed down with a file to the same length as the ground sliding contact.

Necessary preliminary tasks:

- Remove wheel, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .

Release screws (1). Release expander rivet (2) and remove cover (3).

Fig. 84: Release Expander Rivet (2) And Remove Cover (3)
Courtesy of BMW OF NORTH AMERICA, INC.

Open cover (1). Disconnect plug connection (2). Disengage cable from holders (3). Installation: Ensure proper locking of the plug connector and proper seating of the cable in the brackets.

Fig. 85: Disconnect Plug Connection (2) And Disengage Cable From Holders (3)
Courtesy of BMW OF NORTH AMERICA, INC.

Disengage cable from holders (1). Pull off brake pad wear sensor (2) in direction of arrow from brake caliper. Installation: Make sure cable and brake pad wear sensor are correctly seated in brake caliper.

Fig. 86: Disengage Cable From Holders (1)
Courtesy of BMW OF NORTH AMERICA, INC.

34 35 001 REPLACING A BRAKE LINING SENSOR (FRONT)

IMPORTANT: If a brake pad sensor that has already been ground has to be replaced even though the minimum brake pad thickness has not yet been reached, you must observe the following: The new sliding contact must be filed down with a file to the same length as the ground sliding contact.

Necessary preliminary tasks:

- Remove wheel, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .

Open plug housing (1).

Unclip lead of brake lining sensor (2) from plug housing (1).

Disconnect associated plug connection of lead from brake lining sensor (2).

Feed lead from brake lining sensor (2) out of fixtures.

Fig. 87: Brake Lining Sensor, Plug Housing And Brake Lining Sensor
 Courtesy of BMW OF NORTH AMERICA, INC.

Press clip (1) together and detach brake lining sensor (2) in direction of arrow from brake caliper (3).

Installation:

Make sure clip (1) and brake lining sensor (2) are correctly seated in brake caliper (3).

Fig. 88: Pressing Clip And Lining Sensor
 Courtesy of BMW OF NORTH AMERICA, INC.

41 PARKING BRAKE

34 41 ... OVERVIEW OF PARKING BRAKE

Fig. 89: Parking Brake Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 41 000 REMOVING AND INSTALLING/REPLACING HANDBRAKE LEVER

Special tools required:

- **32 1 030 LEVER**

Necessary preliminary tasks:

- Remove storage compartment, see **51 16 200 REMOVING AND INSTALLING STORAGE COMPARTMENT** .
- After completing tasks, adjust handbrake, see **34 10 014 Adjusting handbrake**.

Lock adjuster unit (ASZE).

Using special tool 32 1 030 , press stop (2) of adjusting spring back to such an extent that retaining hook (3) engages in stop (2).

Fig. 90: Special Tool (32 1 030) With Retaining Hook
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and remove carrier for center console (2).

Fig. 91: Carrier For Center Console And Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Release screws (2) and remove holder with DSC sensor.

IMPORTANT: Follow instructions on removing and installing DSC sensor .

Fig. 92: Plug Connection And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip mounting clip (1) upwards out of balance arm (2).

Fig. 93: Balance Arm And Mounting Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Guide handbrake Bowden cables (1) with a screwdriver inwards and pull out of balance bar (2).

Fig. 94: Guide Handbrake Bowden Cables And Balance Bar
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect cable (1) from handbrake check switch.

Release screw (2) and remove handbrake lever (3).

Installation:

Tightening torque: 34 41 1AZ, see **34 41 PARKING BRAKE** .

Handbrake lever and adjustment unit (ASZE) are only exchanged completely as a single unit.

Fig. 95: Handbrake Lever, Cable And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

34 41 120 REMOVING AND INSTALLING/REPLACING BOTH HANDBRAKE BOWDEN CABLES

Special tools required:

- **32 1 030 LEVER**

Necessary preliminary tasks:

Remove storage compartment, see **51 16 200 REMOVING AND INSTALLING STORAGE COMPARTMENT** .

Remove rear brake disks .

Remove exhaust system, see **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM (M54)** .

Remove heat shield.

NOTE: **After completing tasks, adjust handbrake, see 34 10 014 Adjusting handbrake.**

Lock adjuster unit (ASZE).

Using special tool 32 1 030 , press stop (1) of adjusting spring back to such an extent that retaining hook (2) engages in stop (1).

Fig. 96: Special Tool (32 1 030) With Retaining Hook
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip mounting clip (1) upwards out of balance arm (2).

Fig. 97: Balance Arm And Mounting Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Guide handbrake Bowden cables (1) with a screwdriver inwards and pull out of balance bar (2).

Fig. 98: Guide Handbrake Bowden Cables And Balance Bar
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect handbrake Bowden cables at expander locks.

Release screw (1) and remove holder.

Installation:

Tightening torque: 34 41 5AZ, see **34 41 PARKING BRAKE** .

Pull handbrake Bowden cables (2) out of wheel carrier.

Fig. 99: Handbrake Bowden Cables And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect handbrake Bowden cables (1) out of mountings (2).

Pull handbrake Bowden cables (1) out of guide (3).

Feed handbrake Bowden cables (1) out of guide of rear axle (4).

Fig. 100: Handbrake Bowden Cables, Guide And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

34 41 220 REMOVING AND INSTALLING/REPLACING ALL HANDBRAKE SHOES

Special tools required:

- **32 1 030 LEVER**
- **34 4 000 ALLEN KEY**

Necessary preliminary tasks:

- Remove rear brake disk

After completing work:

- Adjusting handbrake, see **34 10 014 Adjusting handbrake.**

Release handbrake lever.

Lock adjuster unit (ASZE).

Using special tool 32 1 030 , press stop (1) of adjusting spring back to such an extent that retaining hook (2) engages in stop (1).

Fig. 101: Special Tool (32 1 030) With Retaining Hook
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect return spring (1) with brake spring pliers.

Installation:

Check and if necessary replace return spring (1).

Pay attention to installation position of adjustment screw (2).

Apply a thin coat of grease to bush and screw threads.

Fig. 102: Return Spring And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect return spring (1) with brake spring pliers.

Installation:

Check and if necessary replace return spring (1).

Fig. 103: Return Spring
Courtesy of BMW OF NORTH AMERICA, INC.

Turn clamping pins (1) with special tool 34 4 000 through 90° and disconnect.

Remove brake shoes (2).

Fig. 104: Clamping Pins, Brake Shoes With Special Tool (34 4 000)
Courtesy of BMW OF NORTH AMERICA, INC.

34 41 250 REMOVING AND INSTALLING/REPLACING EXPANDER LOCK FOR HANDBRAKE SHOES

Special tools required:

- **32 1 030 LEVER**

Necessary preliminary tasks:

- Remove handbrake shoes, see **34 41 220 Removing and installing/replacing all handbrake shoes.**

After completing work:

- After completing tasks, adjust handbrake, see **34 10 014 Adjusting handbrake.**

Lock adjuster unit (ASZE).

Using special tool 32 1 030 , press stop (1) of adjusting spring back to such an extent that retaining hook (2) engages in stop (1).

Fig. 105: Special Tool (32 1 030) With Retaining Hook
 Courtesy of BMW OF NORTH AMERICA, INC.

Pull expander lock (1) forwards, disconnect handbrake Bowden cable (2) and remove expander lock.

Fig. 106: Pulling Expander Lock And Handbrake Bowden Cable
 Courtesy of BMW OF NORTH AMERICA, INC.

51 MECHANICAL/HYDRAULIC COMPONENTS

34 51 527 REMOVING AND INSTALLING/REPLACING DSC HYDRAULIC UNIT

Necessary preliminary tasks:

- Read and comply with General Information, see **34 00 ... General Information**.
- Remove brake master cylinder, see **34 31 505 Removing and installing/replacing master brake cylinder for DSC**.
- After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

When replacing control unit:

- Carry out programming/coding
- Adjustment of steering angle sensor
- Mix-up check of brake lines
- Function check, hydraulic unit

IMPORTANT: Do not mix up brake lines, mark prior to removal if necessary.

Seal off connection bores with plugs.

Disconnect plug connection (1) to control unit.

Release brake lines (2) and if necessary disconnect lines to brake master cylinder completely.

Installation:

Note changed tightening torque.

Tightening torque: 34 32 6AZ, see **34 32 BRAKE LINES** .

Release screw (3) and carefully feed out and remove hydraulic unit.

Fig. 107: Brake Lines, Plug Connection And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: If necessary, detach brake lines from mounting.

Brake lines must not be bent.

When replacing hydraulic unit:

Release screws (1) and convert holder (2).

Fig. 108: Convert Holder And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

52 ELECTRONIC COMPONENTS

34 52 ... OVERVIEW OF ELECTRONIC COMPONENTS

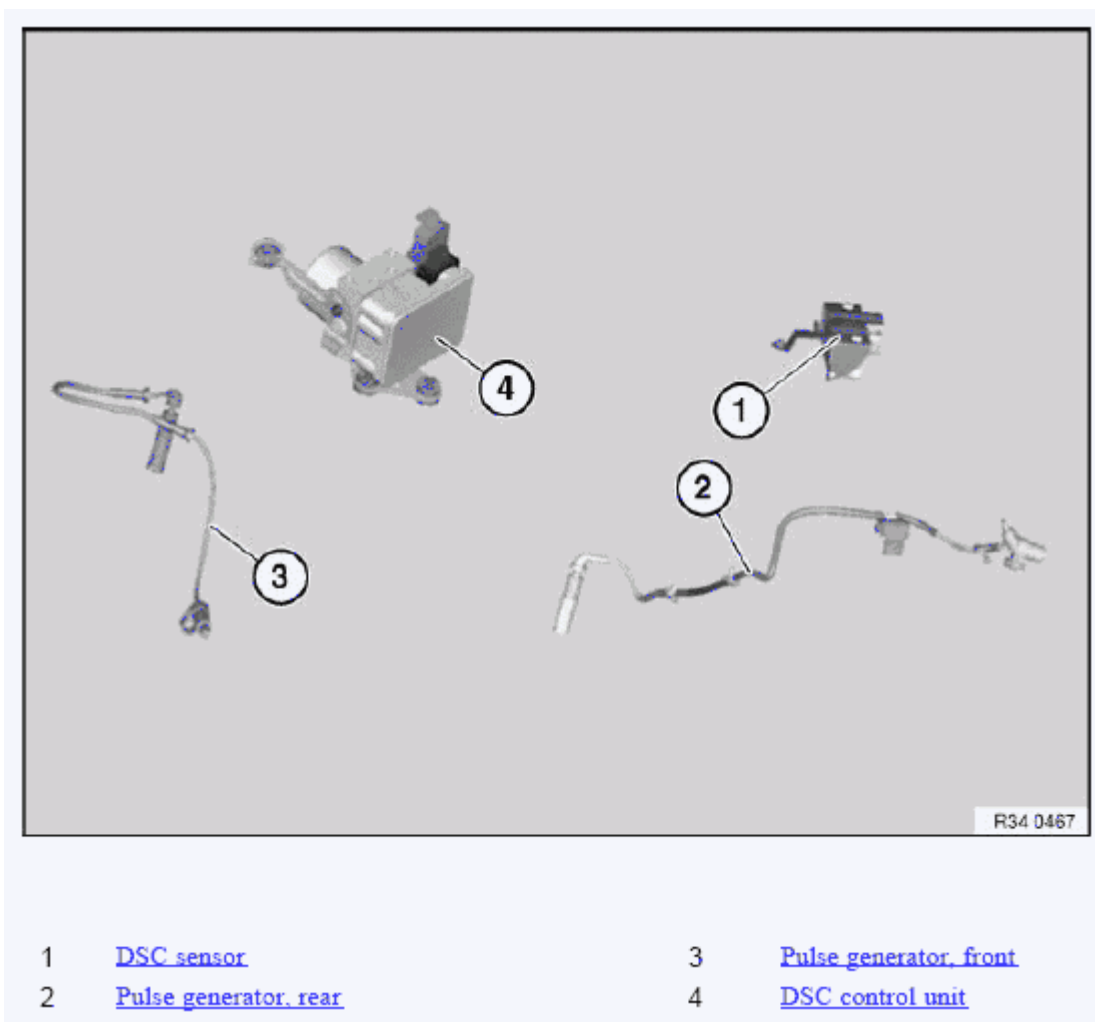

Fig. 109: Electronic Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 52 516 REMOVING AND INSTALLING/REPLACING DSC CONTROL UNIT

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove hydraulic unit, see 34 51 527 Removing and installing/replacing DSC hydraulic unit.

Replacement:

- Carry out programming/coding using appropriate BMW service tool.
- Adjustment of steering angle sensor
- Mix-up check of brake lines
- Function check, hydraulic unit

Release screws (1) and carefully detach control unit (2) towards front.

IMPORTANT: Risk of damage to the contacts when removing and installing the hydraulic unit.

Fig. 110: Control Unit And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Keep sealing faces clean.

Replace screws.

Observe tightening sequence (1-4).

Tightening torque: 34 51 1AZ, see [34 51 SLIP CONTROL SYSTEM \(ABS, ASC+T, DSC\)](#) .

Fig. 111: Hydraulic Unit Screw Sequence
Courtesy of BMW OF NORTH AMERICA, INC.

34 52 525 REPLACING ONE FRONT PULSE GENERATOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

Read and comply with General Information, see 34 00 ... General Information.

Open plug housing (1), pull plug connection (2) out of fixture and disconnect.

Pull cable with rubber grommet out of fixture on spring strut and on body.

Installation:

Ensure proper locking of plug connector and proper seating of rubber grommets.

Fig. 112: Pulling Plug Connection And Plug Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Release socket head cap screw (1).

Withdraw pulse generator (2) from bore.

Installation:

Tightening torque: 34 51 6AZ, see 34 51 SLIP CONTROL SYSTEM (ABS, ASC+T, DSC) .

Clean bore hole for pulse generator and grease with Staburags NBU 12/K lubricating grease.

Fig. 113: Socket Head Cap Screw And Pulse Generator
Courtesy of BMW OF NORTH AMERICA, INC.

34 52 535 REPLACING A REAR PULSE GENERATOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

Necessary preliminary tasks:

- Read and comply with General Information, see 34 00 ... General Information.
- Remove lip.

Open plug housing (1).

Pull plug connection for wheel speed sensor out of fixture and disconnect.

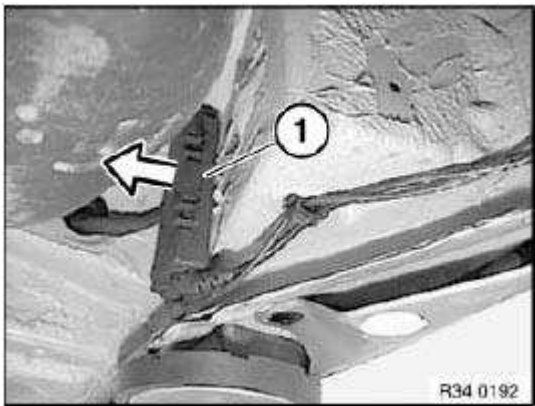

Fig. 114: Pulling Plug Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Release cable holder along trailing arm.

Release hexagon socket screw (1). Withdraw wheel speed sensor (2) from bore hole.

Installation:

Clean bore hole for pulse generator and grease with Staburags NBU 12/K lubricating grease.

Tightening torque: 34 51 6AZ, see **34 51 SLIP CONTROL SYSTEM (ABS, ASC+T, DSC)** .

Fig. 115: Hexagon Socket Screw And Wheel Speed Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

34 52 550 REMOVING AND INSTALLING/REPLACING DSC SENSOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove storage compartment, see **51 16 200 REMOVING AND INSTALLING STORAGE COMPARTMENT** .

NOTE: The DSC sensor contains the functions of the transversal acceleration sensor and the rotation rate sensor.

Unfasten plug connection (1).

Installation:

Make sure plug connection locks correctly.

Release screws (2) and remove rotation rate sensor.

Installation:

Tightening torque: 34 51 3AZ, see **34 51 SLIP CONTROL SYSTEM (ABS, ASC+T, DSC)** .

Fig. 116: Plug Connection And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

90 TROUBLESHOOTING

34 90 ... TROUBLESHOOTING BRAKE SYSTEM

TROUBLESHOOTING BRAKE SYSTEM CHART

Fault	Cause	Remedy
Brakes pull to one side	a) Tyre inflation pressure not in keeping with regulations b) Unevenly worn tire treads c) Oil on pads/liners d) Wrong type of pads/liners f) Guide bolts dirty or damaged g) Axle geometry not correct h) Corrosion in floating calipers	a) Correct tire inflation pressure b) <u>36 12 001 REPLACING A TYRE</u> c) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes</u> , Check for causes c) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes</u> , Check for causes f) Replace guide bolts, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes</u> . g) Check wheel alignment, see <u>32 00 ... CHASSIS/WHEEL ALIGNMENT CHECK PROCEDURE</u> . h) Remove and install, repair or

	<p>i) No shock absorber action</p> <p>k) Pad of one caliper worn</p>	<p>replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>i) Check shock absorber, replacing if necessary, see <u>31 31 031 REPLACING FRONT LEFT OR RIGHT SPRING STRUT SHOCK ABSORBER .</u></p> <p>c) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes,</u> Check floating caliper</p>
Brakes excessively hot while driving	<p>a) Compensating port in brake master cylinder blocked</p> <p>c) Swollen rubber parts due to use of wrong brake fluid</p> <p>d) Bleeder hole on expansion tank blocked</p> <p>e) Corroded floating calipers</p> <p>f) Handbrake lever not released fully</p>	<p>a) Replace master brake cylinder, see <u>34 31 505 Removing and installing/replacing master brake cylinder for DSC.</u></p> <p>c) Replace master brake cylinder, see <u>34 31 505 Removing and installing/replacing master brake cylinder for DSC.</u></p> <p>d) Clean expansion tank, see <u>34 31 181 Removing and installing/replacing expansion tank for hydraulic brake actuation.</u></p> <p>e) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>f) Check handbrake and handbrake Bowden cables, repair if necessary, see <u>34 41 120 Removing and installing/replacing both handbrake Bowden cables.</u></p>
Poor braking effect in spite of great force on pedal Travel at brake pedal normal	Brake pads oil-splattered or burnt; wrong type of brake pads	c) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u>
Poor braking effect in spite of great force on pedal Travel at brake pedal too short	Brake booster malfunctions - engine vacuum	Check brake booster
Poor braking effect in spite of great force on pedal Travel at brake pedal too long	One brake circuit failed due to leaks or damage	Leakage test of brake system

<p>Brake pedal can be pressed down softly and springily</p>	<p>a) Air in brake system</p> <p>b) Not enough brake fluid in expansion tank</p> <p>c) Overheated brake fluid - vapor lock due to excessive water content in brake fluid or excessive brake loads</p>	<p>a) Bleed brakes, see <u>34 00 050 Bleeding brake system with DSC.</u></p> <p>b) Top up or change brake fluid, Bleed brakes, see <u>34 00 050 Bleeding brake system with DSC.</u></p> <p>c) Change brake fluid, Bleed brakes, see <u>34 00 050 Bleeding brake system with DSC.</u></p>
<p>Brake is bled and readjusted, but brake pedal can be pressed down too far</p>	<p>a) Primary cup seal in brake master cylinder damaged</p> <p>b) Leaking separating cup seals on floating piston of brake master cylinder</p> <p>c) Leak in brake system</p>	<p>a) Replace master brake cylinder, see <u>34 31 505 Removing and installing/replacing master brake cylinder for DSC.</u></p> <p>b) Replace master brake cylinder, see <u>34 31 505 Removing and installing/replacing master brake cylinder for DSC.</u></p> <p>c) Leakage test of brake system</p>
<p>Uneven pad wear</p>	<p>a) Wrong type of pads/liners</p> <p>b) Dirty fist caliper recesses, damaged caps</p> <p>c) Corrosion in floating calipers</p> <p>d) Swollen rubber ring for piston control</p>	<p>a) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>b) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>c) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>d) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p>
<p>Brake pads worn at angle</p>	<p>a) Wheel-bearing play excessive</p> <p>b) Brake disk not aligned with fist caliper</p> <p>c) Corrosion in floating calipers</p> <p>d) Angular brake-disk wear</p>	<p>a) Replace wheel bearings</p> <p>b) Check floating caliper installation</p> <p>c) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>d) Grind or replace brake disks, see</p>

	<p>e) Minimum lining thickness undershot</p> <p>f) Spring force insufficient</p> <p>g) Guide bolts damaged</p>	<p><u>34 11 220 Removing and installing/replacing both front brake discs.</u></p> <p>e) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>f) Replace spring, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>g) Replace guide bolts, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p>
<p>Seized brake pads, pad does not move off brake disk</p>	<p>a) Dirty fist caliper recesses, damaged caps</p> <p>b) Corrosion in floating calipers</p> <p>c) Compensating port in brake master cylinder blocked</p>	<p>a) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>b) Remove and install, repair or replace floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>c) Replace master brake cylinder, see <u>34 31 505 Removing and installing/replacing master brake cylinder for DSC.</u></p>
<p>Brakes squeal or rattle</p>	<p>a) Wrong type of pads/liners</p> <p>b) Dirty floating caliper recesses</p> <p>c) Spring force insufficient</p> <p>d) Brake disk not aligned with fist caliper</p>	<p>a) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>b) Remove and install/clean floating calipers, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>c) Replace spring, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>d) Check floating caliper installation, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p>

	<p>e) Brake-disk runout</p> <p>f) Excessive thickness deviation within braking surface</p> <p>g) Liner wear excessive or one-sided</p> <p>h) Rust edges on brake disks</p> <p>i) Pad loose</p> <p>j) Wheel-bearing play excessive</p>	<p>e) Replace brake discs, see <u>34 11 220 Removing and installing/replacing both front brake discs.</u></p> <p>f) Measure brake disk thickness. Grind or replace disks, see <u>34 11 667 Precision-turning both front brake discs on both sides.</u></p> <p>g) Replace brake shoes, see <u>34 41 220 Removing and installing/replacing all handbrake shoes.</u></p> <p>h) Grind or replace brake disks, see <u>34 11 220 Removing and installing/replacing both front brake discs.</u></p> <p>i) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>j) Replace wheel bearings</p>
Brake-pedal dead travel excessive	<p>a) Wheel-bearing play excessive</p> <p>b) Brake disk not aligned with fist caliper</p> <p>c) Brake-disk runout</p> <p>d) Excessive thickness deviation within braking surface</p> <p>e) Brake system leaking</p> <p>f) Air in brake system</p> <p>g) Wrong type of pads/liners</p>	<p>a) Replace wheel bearings</p> <p>b) Check floating caliper installation</p> <p>c) Replace brake discs, see <u>34 11 220 Removing and installing/replacing both front brake discs.</u></p> <p>d) Measure brake disk thickness. Grind or replace disks, see <u>34 11 667 Precision-turning both front brake discs on both sides.</u></p> <p>e) Leakage test of brake system</p> <p>f) Bleed brakes, see <u>34 00 050 Bleeding brake system with DSC.</u></p> <p>g) Replace brake pads, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p>
Jammed piston in brake caliper	<p>a) Dirty fist caliper recesses, damaged caps</p> <p>b) Brake disk not aligned with fist caliper</p>	<p>a) Remove and install, repair or replace floating caliper, see <u>34 11 519 Removing and installing/replacing left or right front brake caliper.</u></p> <p>b) Check floating caliper installation, see <u>34 11 000</u></p>

	c) Pistons corroded in floating calipers	<p><u>Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>c) Remove and install, repair or replace floating caliper, see <u>34 11 519 Removing and installing/replacing left or right front brake caliper.</u></p>
Pulsating effect on brake pedal	<p>a) Wheel-bearing play excessive</p> <p>b) Brake disk not aligned with fist caliper</p> <p>c) Brake-disk runout</p> <p>d) Excessive thickness deviation within braking surface</p>	<p>a) Replace wheel bearings</p> <p>b) Check floating caliper installation, see <u>34 11 000 Removing and installing/replacing brake linings of both front disc brakes.</u></p> <p>c) Replace brake discs, see <u>34 11 220 Removing and installing/replacing both front brake discs.</u></p> <p>d) Measure brake disk thickness. Grind or replace disks, see <u>34 11 667 Precision-turning both front brake discs on both sides.</u></p>
Handbrake effect insufficient	<p>a) Brake shoes oil-splattered</p> <p>b) Excessive dead travel between brake shoes and brake drums</p> <p>c) Corroded transmitting elements</p>	<p>a) Replace brake shoes, see <u>34 41 220 Removing and installing/replacing all handbrake shoes,</u> determine cause</p> <p>b) Adjust handbrake, see <u>34 10 014 Adjusting handbrake.</u></p> <p>c) Remove and install handbrake and expander locks. Check Bowden cables, replacing if necessary, see <u>34 41 120 Removing and installing/replacing both handbrake Bowden cables.</u></p>

BRAKES

Pedal Assembly - Repair Instructions - X3

11 PEDAL MOUNTING BLOCK

35 11 000 REMOVING AND INSTALLING COMPLETE BEARING BLOCK FOR FOOT PEDAL

Necessary preliminary tasks:

- Remove brake pedal, see [35 21 000 Removing and installing/replacing brake pedal](#).
- Remove clutch pedal, see [35 31 000 Removing and installing/replacing clutch pedal](#).
- Remove clutch master cylinder from bearing block.

Unscrew nuts (1).

Release nut (2) and remove bearing block (3).

Installation:

Tighten nuts (1) in front of nut (2).

Tightening torque, see 1AZ in [PEDALS - TIGHTENING TORQUES -- X3](#).

Fig. 1: Nut And Bearing Block

Courtesy of BMW OF NORTH AMERICA, INC.

21 BRAKE PEDAL WITH LINKAGE

35 21 000 REMOVING AND INSTALLING/REPLACING BRAKE PEDAL

Necessary preliminary tasks:

- Remove pedal trim, see [51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR](#)

PEDAL ASSEMBLY .

Disconnect return spring (1).

Release screw (2) and remove holder (3).

Fig. 2: Spring, Screw And Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Remove locking clip (1), disconnect pin (2) and pull out.

Remove locking clip (3) and feed out brake pedal (4).

Installation:

Replace locking clip.

The locking clip must be seated with both legs in the pin groove.

Fig. 3: Locking Clip, Pin And Brake Pedal

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check bearing bushes (1) and replace if necessary.

Lightly grease bearing bushes (1).

Fig. 4: Bearing Bushes

Courtesy of BMW OF NORTH AMERICA, INC.

35 21 041 REPLACING SPRING FOR BRAKE PEDAL

- Remove pedal trim, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

Disconnect return spring (1). 2 = Clutch master cylinder 3 = Brake light switch Note: Check grommet for damage, replace if necessary.

Fig. 5: Disconnecting Return Spring

Courtesy of BMW OF NORTH AMERICA, INC.

35 21 041 REPLACING SPRING FOR CLUTCH PEDAL

Operation is described in: Removing and installing clutch pedal.

31 CLUTCH PEDAL WITH LINK

35 31 000 REMOVING AND INSTALLING/REPLACING CLUTCH PEDAL

Necessary preliminary tasks:

- Remove pedal trim, see 51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY .

Disconnect return spring (1).

Press pin ends (2) together and remove pin.

Detach locking clip (3) and pull clutch pedal off bearing block.

Installation:

Replace locking clip.

The locking clip must be seated with both legs in the pin groove.

Fig. 6: Spring, Pin Ends And Locking Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check bearing bushes (1) and replace if necessary.

Lightly grease bearing bushes (1),

Replace rubber grommet (2) if necessary.

Fig. 7: Bearing Bushes

Courtesy of BMW OF NORTH AMERICA, INC.

40 ACCELERATOR PEDAL ACTUATOR

35 40 001 REMOVING AND INSTALLING OR REPLACING ACCELERATOR PEDAL MODULE

Take off cap.

Release screw.

Pull accelerator pedal module upwards out of fixture.

Installation:

Tightening torque, see 1AZ in **35 40 PEDALS** .

Fig. 8: Pulling Accelerator Pedal

Courtesy of BMW OF NORTH AMERICA, INC.

Pull off plug (1).

Remove accelerator pedal module.

Fig. 9: Plug

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Accelerator pedal module can only be replaced completely with adapter plate.

BRAKES

Pedals - Operating Fluids

1.0 GENERAL INFORMATION

For lubricating friction points on the pedal assemblies, use Syntheso Glep 1 (BMW Part No. 83 23 9 407 778).

DRIVELINE/AXLES

Front Axle - Operating Fluids

1.0 GENERAL INFORMATION ON HIGH TEMPERATURE MULTI-PURPOSE GREASE

High temperature multi-purpose grease consists of a lithium complex soap in a mineral oil product with a selected combination of additives. Extremely fine soap is contained in the oil, and serves as the basic ingredient.

This lubricating grease possesses the following properties:

- Very good thermal resistance and penetration stability

The structure and consistency must be maintained over long service life with temperatures from -22°F to +302°F (-30°C to +150°C) in continuous operation and very high loads.

- Oxidation stability

A lubricating grease contains effective inhibitors (which limit or prevent chemical reactions) in order to stop oxidation at very high operating temperatures.

- Water resistance and corrosion inhibition

A high temperature multi-purpose grease is water resistant. At the same time lubricated parts are given maximum protection against rust by the corrosion inhibitors.

2.0 APPROVED HIGH TEMPERATURE MULTI-PURPOSE GREASE

High temperature multi-purpose grease is used for the lubrication of wheel bearings.

Ball Bearings (E24 from mid 1982, E28, E30, E31, E32 and all following)

Provided with lifetime lubrication.

No subsequent lubrication approved!

Tapered Roller Bearings (E23, E21)

50 grams grease packing in wheel hub and 20 grams in wheel hub grease cap per wheel.

Grease type: Retinax A

CRC Part No. SL 3131 (former BMW Part No. 81 22 9 407 710)

3.0 APPROVED FRONT AXLE FINAL DRIVE OILS

Approvals are the same as for rear axle final drive oils.

DRIVELINE/AXLES

Propeller Shaft - Operating Fluids

1.0 GENERAL INFORMATION

The locating tabs of the drive shaft to the transmission output flange may be lubricated with any high temperature resistant, long-term grease (available locally).

DRIVELINE/AXLES

Propeller Shaft - Repair Instructions - X3

00 PROPELLER SHAFT GENERAL

26 00 ... PROPELLER SHAFT DEFLECTION ANGLES

IMPORTANT: Specifications on propeller shaft deflection angles

For E53, E6x, E8x, E9x

Only possible on request with the vehicle identification number of the problem vehicle via PuMA.

26 20 001 REPLACING FRONT PROPELLER SHAFT

IMPORTANT: Do not move vehicle with engine power once propeller shaft has been removed. Replace propeller shaft only in conjunction with a new drive flange and radial shaft seal for front axle output.

IMPORTANT: Replacement only: according to installation with BMW diagnosis and information system under control unit function Perform functional check of transfer box (calibration)

Remove **front propeller shaft**. Replace output flange for front axle output. See **27 10 050 REPLACING OUTPUT FLANGE FOR FRONT AXLE OUTPUT (ATC 400/500 X-DRIVE)** . Replace radial shaft seal for output front axle. See **27 21 030 REPLACING RADIAL SHAFT SEAL FOR FRONT AXLE OUTPUT (ATC 400/500 X-DRIVE)** .

26 20 000 REMOVING AND INSTALLING FRONT PROPELLER SHAFT

IMPORTANT: Do not move vehicle with engine power once propeller shaft has been removed.

Necessary preliminary tasks: If necessary, remove underbody protection.

Unfasten screws. Tightening torque, see 26 11 9AZ in **26 11 PROPELLER SHAFT COMPLETE** .

Fig. 1: Unfastening Screws

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: M47T2 From 10/04, front propeller shaft with locking mass (1).

Unfasten screws. Tightening torque, see 26 11 9AZ in **26 11 PROPELLER SHAFT COMPLETE** . Remove propeller shaft with locking mass.

Fig. 2: Front Propeller Shaft With Locking Mass (1)

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws. Tightening torque, see 26 11 9AZ in **26 11 PROPELLER SHAFT COMPLETE** . Remove propeller shaft.

Fig. 3: Removing Propeller Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

11 PROPELLER SHAFT ASSEMBLY

26 11 000 REMOVING AND INSTALLING PROPELLER SHAFT (CARDAN UNIVERSAL JOINT) COMPLETELY

Special tools required:

See **26 1 040 SPANNER** .

- 26 1 040

Necessary preliminary tasks:

- Remove complete exhaust system, see **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM (M54)** .
- Remove heat shield.

Release threaded ring (1) several turns with special tool 26 1 040.

Installation:

Tighten threaded ring with special tool 26 1 040.

Tightening torque: 3AZ, See **26 11 PROPELLER SHAFT COMPLETE** .

Fig. 4: Threaded Ring And Special Tool (26 1 040)
Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws.

Tightening torque: 1AZ, see **26 11 PROPELLER SHAFT COMPLETE** .

Fig. 5: Driveshaft Screws
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: To avoid complaints of humming:

Before removing propeller shaft, mark cardan universal joint to drive flange of final drive.

Reinstall joint in this position.

Fig. 6: Mark On Universal Joint To Drive Flange Of Final Drive
Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws.

Tightening torque: 4AZ, see **26 11 PROPELLER SHAFT COMPLETE** .

Fig. 7: Driveshaft Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Push rear propeller shaft (1) forwards.

Fig. 8: Rear Propeller Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

Grip propeller shaft and release nuts.

Tightening torque: 6AZ, see **26 11 PROPELLER SHAFT COMPLETE** .

Bend propeller shaft downwards at center bearing (1).

Detach propeller shaft from transmission output flange and remove downwards.

Fig. 9: Driveshaft Retaining Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check centering; if necessary, replace damaged centering, see **26 11 090 Removing and installing /replacing centering mount for propeller shaft.**

Grease centering mount.

Fig. 10: Centering Mount

Courtesy of BMW OF NORTH AMERICA, INC.

26 11 020 REPLACING CENTRE MOUNT GAITER

Necessary preliminary tasks:

- Remove propeller shaft, see **26 11 000 Removing and installing propeller shaft (cardan universal joint) completely.**

NOTE: The propeller shaft is balanced. The front and rear propeller shafts must be reassembled in the same position.
Detach gaiter (1) from groove (2).

Mark front propeller shaft (3) and rear propeller shaft (4) in one plane.

Fig. 11: Gaiter, Groove, Front Propeller Shaft And Rear Propeller Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

Pull propeller shaft apart.

Fig. 12: Separating Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, insert new clamping ring (1) into front propeller shaft (2).

Fig. 13: Clamping Ring And Front Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Release gaiter (1) with screwdriver from groove (2) and pull off over longitudinal splines.

Installation:

Apply an even coating of grease to longitudinal splines on shaft.

Observe markings and force front propeller shaft onto longitudinal splines (markings must be flush).

Push gaiter (1) during installation into groove (2) and make sure it is firmly seated.

Fig. 14: Gaiter And Groove
 Courtesy of BMW OF NORTH AMERICA, INC.

26 11 051 REPLACING FLEXIBLE DISK FOR PROPELLER SHAFT

Necessary preliminary tasks:

- Remove propeller shaft, see 26 11 000 Removing and installing propeller shaft (cardan universal joint) completely.

NOTE: To protect universal joints, tie back propeller shaft in area of center bearing.

Release screws and remove flexible disk (1) from propeller shaft.

Installation:

- Arrows (3) on circumference of flexible disk must point to flange arms (2).
- Replace self-locking nuts.
- Tighten mounting screws of flexible disk on transmission flange by means of nuts only.

Tightening torque: 1AZ, see 26 11 PROPELLER SHAFT COMPLETE .

Fig. 15: Self-Locking Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check centering element, replace centering element if damaged, see **26 12 001 Replacing complete propeller shaft Centre mount**.

Grease centering mount.

Fig. 16: Centering Mount

Courtesy of BMW OF NORTH AMERICA, INC.

26 11 090 REMOVING AND INSTALLING /REPLACING CENTERING MOUNT FOR PROPELLER SHAFT

Special tools required:

- **00 5 500 HANDLE FOR DRIFTS**
- 11 1 310
- 11 2 030

Necessary preliminary tasks:

- Remove propeller shaft, see **26 11 000 Removing and installing propeller shaft (cardan universal joint) completely**.

Fill centering bore (1) completely with viscous grease.

Drive special tool 11 1 310 with a plastic hammer into centering bore.

The centering mount (1) is forced out of the propeller shaft by the pressure on the grease filling.

If necessary, top up grease repeatedly.

NOTE: To drive out the mount, you can also fill the centering bore with water instead of grease.

Fig. 17: Centering Bore And Special Tool (11 1 310)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Remove grease/water from mount bore.

Drive in centering (1) with special tools 11 2 030 and 00 5 500 into propeller shaft (observe protrusion).

Grease centering mount.

Fig. 18: Special Tools (11 2 030) (00 5 500)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Observe protrusion $A = 4^{+2}$ mm of centering (1).

Fig. 19: Protrusion Dimensions Of Centering Bore
 Courtesy of BMW OF NORTH AMERICA, INC.

12 CENTER CONSOLE ASSEMBLY

26 11 020 REPLACING CENTRE MOUNT GAITER

Necessary preliminary tasks:

- Remove propeller shaft, see **26 11 000 Removing and installing propeller shaft (cardan universal joint) completely.**

NOTE: The propeller shaft is balanced. The front and rear propeller shafts must be reassembled in the same position.
 Detach gaiter (1) from groove (2).

Mark front propeller shaft (3) and rear propeller shaft (4) in one plane.

Fig. 20: Gaiter, Groove, Front Propeller Shaft And Rear Propeller Shaft
 Courtesy of BMW OF NORTH AMERICA, INC.

Pull propeller shaft apart.

Fig. 21: Separating Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, insert new clamping ring (1) into front propeller shaft (2).

Fig. 22: Clamping Ring And Front Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Release gaiter (1) with screwdriver from groove (2) and pull off over longitudinal splines.

Installation:

Apply an even coating of grease to longitudinal splines on shaft.

Observe markings and force front propeller shaft onto longitudinal splines (markings must be flush).

Push gaiter (1) during installation into groove (2) and make sure it is firmly seated.

Fig. 23: Gaiter And Groove

Courtesy of BMW OF NORTH AMERICA, INC.

26 12 001 REPLACING COMPLETE PROPELLER SHAFT CENTRE MOUNT

Special tools required:

See

- **00 5 500 HANDLE FOR DRIFTS**
- 23 1 160
- **26 1 040 SPANNER**

Necessary preliminary tasks:

- Remove propeller shaft, see **26 11 000 Removing and installing propeller shaft (cardan universal joint) completely.**

NOTE: **The propeller shaft is balanced. The front and rear propeller shafts must be reassembled in the same position.**

Mark front propeller shaft (1) and rear propeller shaft (2) in one plane.

Fig. 24: Mark On Front Propeller Shaft And Rear Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Pull propeller shaft apart.

Fig. 25: Separating Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Remove snap ring (1).

Fig. 26: Snap Ring

Courtesy of BMW OF NORTH AMERICA, INC.

Install special tool 00 7 500 between center bearing (1) and universal joint (2).

Fig. 27: Special Tool (00 7 500), Center Bearing And Universal Joint

Courtesy of BMW OF NORTH AMERICA, INC.

Using a hydraulic press, force center bearing (1) off propeller shaft (2).

Fig. 28: Pressing Center Bearing Off Propeller Shaft Using Hydraulic Press

Courtesy of BMW OF NORTH AMERICA, INC.

Force new center bearing (1) onto propeller shaft. Collar (2) must point to universal joint (3). Drive Centre mount firmly home with special tool 23 1 160.

Fig. 29: Driving Centre Mount Firmly Home With Special Tool (23 1 160)
Courtesy of BMW OF NORTH AMERICA, INC.

Install new snap ring (1), with plate to bearing.

Fig. 30: Snap Ring
Courtesy of BMW OF NORTH AMERICA, INC.

Screw threaded ring (1) off propeller shaft. If necessary, use special tool 26 1 040 as an aid.

Fig. 31: Threaded Ring Of Propeller Shaft And Special Tool (26 1 040)
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, insert new clamping ring (1) in threaded ring (2).

Fig. 32: Clamping Ring And Threaded Ring
Courtesy of BMW OF NORTH AMERICA, INC.

Force threaded ring (1) onto shaft (2).

Grease longitudinal splines of shaft (2) uniformly.

Observe markings and force rear propeller shaft (3) onto shaft (2) (markings must be flush).

Screw down threaded ring (1) with propeller shaft (3) until hand - tight.

Fig. 33: Threaded Ring, Shaft And Rear Propeller Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

			Torque angle	45°

DRIVELINE/AXLE

Rear Axle - Operating Fluids

1.0 GENERAL INFORMATION ON FINAL DRIVE OIL

Final Drive oil or hypoid gear lubricant must conform with the following requirements because of the high loads which occur on the profiles of the hypoid gear teeth:

- Load carrying capacity.
- Sufficient protection against seizure.
- Good wear protection.
- Optimal friction and temperature behavior.
- Seal compatibility.
- Aging resistance.

These and other properties are already contained in brand-name hypoid gear lubricants because of the high content of EP additives (EP = extreme pressure).

OIL ADDITIVES

The factory has **not approved** oil additives for hypoid gear lubricants.

All final drives are designed in such a manner that they do not require any type of oil additives. Any type of additives is fundamentally rejected by the factory. BMW NA cannot accept any liability for follow-up damage resulting from the use of additives.

2.0 APPROVED FINAL DRIVE OILS FOR FRONT AND REAR AXLE FINAL DRIVES WITH AND WITHOUT LIMITED SLIP OR VISCOUS COUPLING

Mineral based final drive oils are no longer recommended due to the release of synthetic final drive oils for all vehicles with or without limited slip differentials.

Limited Slip Differentials

With the introduction of the Z3 roadster a new synthetic final drive oil for all vehicles with a multi-plate limited-slip differential has been released. The new BMW final drive oil SAF-XJ will replace the old final drive oil SAF-XLS.

The SAF-XLS final drive oil is not to be used in the final drive of the Z3 roadster.

Use only the SAF-XJ in the final drive of the Z3 roadster.

NOTE: If a non-limited slip differential oil is used in a limited slip differential a whining or chattering sound can be heard on very tight turns and will eventually result

in a failure of the differential.

BMW PARTS NUMBER SPECIFICATION

Description	Quantity	Part Number
BMW Synthetic Final Drive Oil (with multi-plate Limited Slip Differential)	55 liter drum (SAF-XJ)	83 22 1 470 080

Motorsport Vehicles:

All E46 M3, E60 M5, E63/E64 M6 and E85 M roadster and M coupe require SAF-XJ Fluid.

Non Limited Slip Differentials

BMW PARTS NUMBER SPECIFICATION

Description	Quantity	Part Number
BMW Synthetic Final Drive Oil (without multi-plate limited slip differential, or with viscous differential lock (325iX/iXA))	55 liter drum (SAF-XO)	83 22 9 407 768

3.0 FINAL DRIVE OIL FOR BMW M1 MOTORSPORT COUPE

The final drive of a BMW M1 is integrated in the manual transmission and oil supply is accomplished with a mutual oil filling.

Use reputable brand SAE 80 manual transmission oil conforming with specifications MIL-L-2105 A or API-GL 4.

4.0 OIL CHANGE INTERVALS

Maintenance requirements per the vehicle's Service Booklet or the respective Service Maintenance Checklist.

Replacement final drives: same as for new vehicles.

All models as of 9/97 production are factory-filled with synthetic rear axle oil having a lifetime service rating. No oil changes are required for the life of the vehicle.

5.0 CARS WITHOUT SERVICE INDICATOR (INCLUDING BMW M1)

First oil change at 600 miles

Further oil changes at 18,000 miles

Special rule for BMW 530i, 528i (E 12):

1st oil change at 600 miles after final drive replacement

2nd oil change at 4,500 miles after final drive replacement

Further oil changes at 9,000 miles intervals, beginning at 9,000 miles.

6.0 CARS WITH SERVICE INDICATOR

BREAK-IN PROCEDURES

Drive the car with changing engine speeds and road speeds during the first 1,200 miles/2,000 km, but never faster than 2/3rds of maximum speed in a selected gear. Avoid using full throttle and kick-down positions of the accelerator pedal during this period.

BMW PARTS NUMBER SPECIFICATION

BMW M3/M5/M6	Up to 1,200 miles max. engine speed 5500 RPM Generally avoid full-throttle position of the accelerator.
-----------------	---

These break-in procedures are, of course, also applicable to replacement final drives.

7.0 OUTPUT SHAFTS

The joints of output shafts have permanent grease lubrication and require no servicing. The amount of joint grease required after repairing is supplied in the "dust cover repair kit".

8.0 WHEEL BEARINGS

Ball Bearings E24 (Since 5/82), E28, E30, E31, E32 And All Following

Bearing unit is lubricated for its service life, cannot be disassembled and does not require subsequent lubrication.

Grooved Ball Bearings E12, E21, E23, E24 Before 5/82

Grease type: Retinax A (former BMW Part No. 81 22 9 407 710)

CRC Part No. SL 3131

9.0 DIFFERENTIAL HOUSING FINAL DRIVE COVERS AND HOUSING

On 735i/iL, 750iL, M6 and M5 (E28) models, the attaching bolts are to be installed with Hylogrip/Loctite 270 (green) thread sealant (former BMW Part No. 81 22 9 400 086).

BMW PARTS NUMBER SPECIFICATION

Wurth Loctite	Part No. 8932700

1. FOREWORD

1.1 Objectives

Wheel alignment has become an increasingly complex subject. The aim of this BMW Service Technology bulletin, therefore, is to achieve several objectives:

- Creation of guidelines for working with the BMW Kinematic Diagnosis System (KDS).
- Familiarization with wheel alignment technology for current vehicles and clarifying any questions which arise in this connection.
- Transparency and clarification of different terms.

- Clarification of the causes of errors in the past, such that they can be avoided after reading this document.
- Creation of conditions for dealing safely with the BMW KDS.

1.2 Further development of the BMW Kinematic Diagnosis System

- The BMW Kinematic Diagnosis System is an integrated part of automotive system concepts. It ensures that work is carried out in a particularly rational manner which is appropriate for BMW requirements, such that you can also be certain of being prepared for future technological developments. As far as precision and performance in wheel alignment and tuning is concerned, BMW, together with leading manufacturers, has made the best of what is technically feasible: the BMW Kinematic Diagnosis System.
- The BMW Kinematic Diagnosis System manufactured by Beissbarth is more than just the further development of conventional wheel alignment equipment. It sets new standards in precision, performance, speed and handling. It is a guarantor for the perfection which BMW service customers rely on.
- Ride comfort, road safety and tyre wear depend to a large extent on the perfect interplay of the vehicle's kinematic functions. BMW is constantly launching new generations of chassis which are even better than their predecessors. This is why there are fewer kinematics system adjusting points and narrower tolerances when measuring and tuning the chassis.
- With the use of the multi-link rear suspension and the E36, the electronic wheel alignment devices are no longer suitable for BMW wheel alignment purposes. This applies to both the measuring procedure and measuring precision. The generation of equipment which was approved with the E36 series still fulfils all the requirements placed on a modern wheel alignment device, including the use of the latest computer technology.
- Only BMW Kinematic Diagnosis Systems manufactured by Beissarath and Bosch may be used for wheel alignment.

1.3 Technical Data

Fig. 2: Display Kinematic Diagnosis System Technical Data
 Courtesy of BMW OF NORTH AMERICA, INC.

KINEMATIC DIAGNOSIS SYSTEM TECHNICAL DATA

1. Display	○ 17" graphic screen with high-resolution graphics (640x480 pixels with 256 colours)
2. On-screen text	○ in the appropriate national language
3. Wheel dimensions	○ 12"...20"
4. Vehicle memory locations	○ unlimited
5. Rotating plates	○ Loadbearing capacity 1000 kg, angle of rotation $\pm 360^\circ$, 450 x 450 x 50 mm (L x W x H), sliding range ± 50 mm, weight 18 kg
6. Sliding plates	○ Loadbearing capacity 1000 kg, angle of rotation $\pm 10^\circ$, 450 x 450 x 50mm (L x W x H), sliding range ± 65 mm, weight 17 kg
7. Electrical connection	○ 100...115 V/ 220...240 V 50/60 Hz, 0.5 kW (other connections on request)

1.4 Scope of delivery

- 1 PC display device with graphic screen, graphical tablet, small or large equipment cabinet including automatic charging station, DIN A4 dot matrix printer
- 4 Measuring sensors with CCD camera technology and infrared data transmission with built-in power supply
- 1 Cable set (comprising 4 cables)
- 1 Brake clamping device

- 1 Steering lock device
- 2 Electronic precision rotating plates with integrated sensor without access ramps
- 2 Sliding plates without access ramps
- 4 BMW quick-clamping units, comprising a P8-68 locating bell and P267 01 quick-acting clamp including coated holding claws
- 1 Operating instructions for BMW KDS (8 languages)
- 1 BMW software and the BMW vehicle setpoint data with setting screens as well as text for the measurement preparations

1.5 Accessories required

- 2 Locating rods for positioning the vehicle
- 1 Set of sand bags for the prescribed loading

1.6 Accessories recommended

- 4 Quick-clamping units
- 2 Sets of access ramps
- 1 Remote control / display
- 1 Trolley (for ballast bags, rotating and sliding plates and 4 quick-acting clamps)

2. MEASURING OPTIONS USING THE BMW KINEMATIC DIAGNOSIS SYSTEM

2.1 Front axle

- Toe-in (single and total toe-in in relation to the geometrical drive axis)
- Camber (with steering wheel pointing straight ahead)
- Wheel displacement (in relation to the left-hand front wheel)
- Castor, kingpin inclination and toe-differential angle

2.2 Rear axle

- Toe-in (single and total toe-in in relation to the longitudinal center plane of the vehicle <-- previously called symmetrical axis)
- Geometrical drive axis
- Camber

2.3 Other measuring options

- Rear wheel displacement
- Wheelbase difference
- Lateral displacement on right
- Lateral displacement on left

- Track difference
- Axial displacement

3. SYSTEM DESCRIPTION

3.1 BMW Kinematic Diagnosis System 1, based on the Beissbarth ML4000

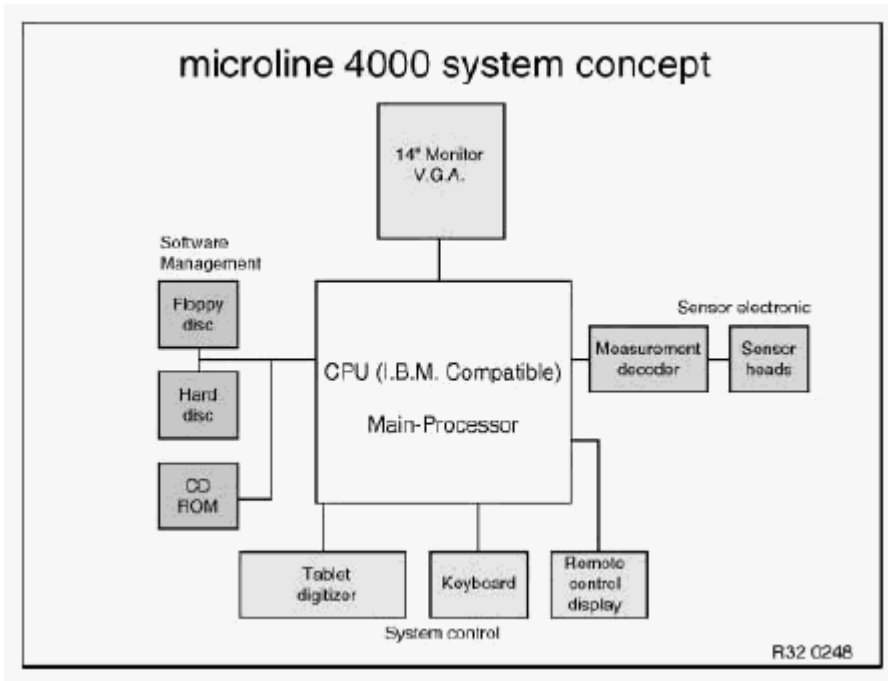

Fig. 3: BMW Kinematic Diagnosis System Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

The KDS 1 is available in two different designs at no extra charge:

1. Mobile workstation

Fig. 4: Mobile Workstation

Courtesy of BMW OF NORTH AMERICA, INC.

2. Mobile compact cabinet

Fig. 5: Mobile Compact Cabinet
Courtesy of BMW OF NORTH AMERICA, INC.

The larger workstation offers a small storage area for accessories, while the compact cabinet is mobile and ideal for restricted working areas. Both variants can be supplied as a cableless measuring system (infrared). From the point of view of measuring technology, there is only a difference in the handling and equipping of the system. For both designs, the four measuring sensors are stored in integrated inserts with rechargeable battery charging points. When automatically charged over night, the measuring sensor batteries provide enough power for 10 hours of continuous use.

3.2 Computer

- The KDS 1 system comprises tested and reliable industrial components. The computer is an IBM-compatible, 32-bit Intel processor with CD ROM drive to the industry standard.

Fig. 6: Computer
Courtesy of BMW OF NORTH AMERICA, INC.

3.3 Graphical tablet

- All functions are shown in graphical form on a "pictogram" panel. The panel is protected by a plexiglass cover. It can easily be replaced if more extensive design modifications are necessary. The operator interface has no membrane and is thus protected against damage. The main functions are activated by clicking the icon with the digital pen.

Fig. 7: Graphical Tablet
Courtesy of BMW OF NORTH AMERICA, INC.

3.4 Equipment cabinet

- The PC with graphic monitor and removable operating panel, supports for the measuring sensors, the remote control and the A4 printer are integrated into the workstation. The charging station is located in the cabinet and can also be connected to the measuring sensors and the remote control using the plug-in cables (operating while simultaneously charging the batteries).

Fig. 8: Equipment Cabinet
Courtesy of BMW OF NORTH AMERICA, INC.

3.5 Remote display

A cableless remote display can be supplied on request. The remote control keys are only active during measuring and adjustment (not for customer data input, or if selecting a vehicle or editing the setpoint data etc.). The following displays are supported by the remote control:

- Measured value with setpoint / actual comparison and tolerance bar
- Steering graphics for steering routines
- Live overview of the track / camber values with a setpoint / actual comparison
- Rim run-out compensation

Fig. 9: Remote Display
 Courtesy of BMW OF NORTH AMERICA, INC.

3.6 Measuring sensors with CCD camera

The measuring sensors are each equipped for automatic measurement with two CCD cameras and their own processor for the cableless infrared transmission of data with integrated batteries. Benefits:

- No temperature deviation
- Very high measuring resolution (the track could theoretically be measured in angular seconds)
- Single track range of more than ± 9 degrees for the constant display of toe-in when changing the tie-rod ends
- Exact system accuracy, i.e. when carrying out measurements at the vehicle following rim run-out compensation, the toe-in and camber measurements are accurate to 2 angular minutes

Fig. 10: Measuring Sensors With CCD Camera
Courtesy of BMW OF NORTH AMERICA, INC.

3.7 BMW Quick-acting clamp

- BMW quick-acting clamp for holding the measuring sensors precisely in position and measuring without rim run-out compensation.

NOTE: Any existing quick-acting clamps, e.g. from older F1600s or ML-3000s, must not be used on the BMW KDS.

Fig. 11: BMW Quick-Acting Clamp
Courtesy of BMW OF NORTH AMERICA, INC.

3.8 Rotating / sliding plates

- Electronic precision rotating plates for the front wheels with integrated sensor (360 degree measuring range)
- Stable sliding plates for the rear wheels with a swivelling / rotating top plate
- Accessories: Cover hood for aluminium rotating plates

Fig. 12: Rotating/Sliding Plates

Courtesy of BMW OF NORTH AMERICA, INC.

3.9 Sensor pins

- A new BMW light alloy wheel (styling no. 18) has been available as optional equipment from April 1993. When measurements are being made on vehicles with these wheels, new sensor pins are required for the quick-acting clamps of the recommended wheel alignment equipment.
- The new sensor pins are included in the scope of supply for new deliveries of KDS 1 (order number: BS 90 19 11).

Fig. 13: Sensor Pins

Courtesy of BMW OF NORTH AMERICA, INC.

3.10 Spoiler adapter

- In the case of vehicles with very low spoilers, the sensor beam may be broken by the spoiler between the measuring sensors. This primarily occurs in front of the front axle.
- The spoiler adapter is used here as a connecting element between the measuring equipment clamp and the measuring sensor. Thanks to the adapter, the sensors are placed 50 mm lower, thus allowing the sensor beam to move freely below the spoiler.

Fig. 14: Spoiler Adapter

Courtesy of BMW OF NORTH AMERICA, INC.

3.11 Quick-clamping units

- Quick-clamping units for wheel alignment on non-BMW vehicles with rim run-out compensation.
- Rims without sensors boreholes (rims for BMW vehicles from other manufacturers)

Fig. 15: Quick-Clamping Units

Courtesy of BMW OF NORTH AMERICA, INC.

3.12 Retainers

- The most varied clamping options for the measuring equipment are possible thanks to the versatile retainers and the rubber-coated thrust pieces, even on exotic light-alloy rims.

Fig. 16: Retainers

Courtesy of BMW OF NORTH AMERICA, INC.

4. WORKSTATION

4.1 Environment

DESCRIPTION AND REQUIREMENTS REFERENCE

Description:

All lifting platforms currently recommended by BMW (see) for wheel alignment meet the requirements for the BMW KDS.

No particular requirements have to be met in respect of the location at which the BMW KDS is used. The measuring device can be installed over working pits or on lifting platforms.

Requirements:

- Wheel alignment pits
- Pillar-type lifts with set-down device
- 2 plunger-type lifting platforms with set-down device
- One measuring area (approx. 4.5 m x 7.0 m).
- Repair stands with set-down device
- The rotating plates must be pinned to the platform

The support surfaces for the rotating and sliding plates may only display the following maximum height difference:

- from left to right ± 0.5 mm
- from front to back ± 1.0 mm
- diagonally ± 1.0 mm.

Fig. 17: Rotating And Sliding Plates Height Difference
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: A difference in the height of the rotary plates of ± 2 mm from left to right results in a measuring error of 4.8° in the camber.
As a comparison: The camber tolerance on the E36 is $\pm 10'$. The tyre tread difference or varying tyre pressure cause measuring errors of the same magnitude.

4.2 Preconditions for alignment

When carrying out the wheel alignment, the front and rear wheels must be centered on the rotating and sliding plates in order that all wheel suspensions remain free of tension during the steering routine and adjustment work. As a result, the rotating and sliding plates for the relevant wheel bases and track widths of the vehicle to be aligned must be moved.

4.3 Measuring tolerance

All measuring tolerances are system tolerances. This means that the sum of all individual tolerances gives the value shown in the example. Example of camber: Quick-acting clamp + measuring sensor + computer = 1' at a measuring range of $\pm 3^\circ$ (all BMW vehicles are within this measuring range).

4.4 Levelling the measuring station

The manufacturers of the BMW KDS (Beissbarth / Bosch) are able to measure the measuring area to the required accuracy using levelling devices. Any "normal" water level is not suitable for this. Lifting platforms must be levelled under load so that the uneven deflection in the travel rails is taken into account.

IMPORTANT: Adjustment work for the lifting platform concerned must be executed by a specialist (manufacturer's after-sales service).

5. CHASSIS-RELATED TERMS

5.1 Toe-differential angle

- The toe-differential angle (a) is the angular position of the internal wheel on the curve in relation to the external wheel on the curve when driving round bends. The steering is designed such that the angular position of the wheels in relation to each other changes as the steering angle increases.
- In ideal cases, the wheel axes meet at point D in any steering position (except for straight ahead).

Fig. 18: Toe-Differential Angle
Courtesy of BMW OF NORTH AMERICA, INC.

5.2 Camber

- The camber is the angle of inclination of the wheel in relation to the vertical.

Fig. 19: Camber Angle

Courtesy of BMW OF NORTH AMERICA, INC.

5.3 Toe-in

- The toe-in is the reduction in the distance between the front of the wheels and the rear. The toe-in prevents the wheels from moving apart while driving (wobbling and grinding).

Fig. 20: Toe-In

Courtesy of BMW OF NORTH AMERICA, INC.

5.4 Castor

- The castor is the kingpin angle seen from the side in the opposite direction of travel. The line through the center of the spring strut mount and control arm ball joint corresponds to the kingpin.

Fig. 21: Castor Angle
 Courtesy of BMW OF NORTH AMERICA, INC.

5.5 Geometrical drive axis / symmetrical axis

- (1) The geometrical drive axis is the line bisecting the angle of the overall rear wheel toe. The measurements of the front wheels relate to this axis.
- (2) The symmetrical axis represents the center line through the front and rear axes.

Fig. 22: Geometrical Drive Axis/Symmetrical Axis
 Courtesy of BMW OF NORTH AMERICA, INC.

5.6 Wheel displacement angle

- The wheel displacement angle is the angular deviation of the connecting line of the wheel contact points in relation to a line running at 90° to the geometrical drive axis. The wheel displacement angle is positive if the right-hand wheel is displaced to the front, and is negative if it is displaced to the rear.

Fig. 23: Wheel Displacement Angle
 Courtesy of BMW OF NORTH AMERICA, INC.

5.7 Kingpin offset

- The kingpin offset is the distance from the center of the wheel contact point to the contact point of the kingpin extrapolation.

Fig. 24: Kingpin Offset
 Courtesy of BMW OF NORTH AMERICA, INC.

6. WHEEL SUSPENSION

Those parts which connect the wheel to the mostly load-bearing floor elements of the bodywork and guide it in the required direction belong to the wheel suspension. They are connected by axles or other comparable structures and guided by the arms. The wheel suspension plays a decisive role in the handling characteristics of a vehicle. Two main groups have to be distinguished: 1. Rigid axle suspension and 2. Independent wheel suspension.

6.1 Rigid axle suspension

RIGID AXLE SUSPENSION ADVANTAGES AND DISADVANTAGES

Description	Advantages	Disadvantages
The rigid axle suspension has a rigid connection between both wheels or wheel pairs. Any change in one wheel is more or	In the event of deflection taking place, there are no changes to the camber or	Non-driven rear axles may also acquire negative camber

less transferred to the other. It is now only fitted as a rear axle, if at all. However it is frequently used for lorries or busses.	wheel toe. This means: less tyre wear and good track stability.	as well as increasing tyre lateral guidance, thus increasing tyre wear.
--	---	---

6.2 Independent wheel suspension

INDEPENDENT WHEEL SUSPENSION ADVANTAGES AND DISADVANTAGES

Description	Advantages	Disadvantages
State-of-the-art individual wheel suspension is available on BMW vehicles on the front and rear axles. This development has its cause in mass inertia, as a reduction in the non-suspended mass improves wheel and ground contact, and the wheel stays better on the road. Control arms and trailing arms, which have to absorb high longitudinal and lateral forces to some extent, are required for guiding independently suspended wheels.	Wheels suspended independently from each other have no mutual influence on each other.	Depending on the type, changes may occur in the camber, wheel toe, track width, castor and wheelbase.

7. WHEEL ALIGNMENT / PROCEDURE

7.1 Measuring options

An overview of all measuring options and values (VA = front axle, HA = rear axle) is shown below.

WHEEL ALIGNMENT SPECIFICATION

Measuring options	Measuring accuracy	In measuring range	Total measuring range
Total wheel toe (VA + HA)	± 2'	± 2°	± 18°
Single wheel toe (VA + HA)	± 2'	± 2°	± 9°
Camber (VA + HA)	± 1'	± 3°	± 10°
Wheel displacement (VA)	± 2'	± 2°	± 9°
Geometrical drive axis	± 2'	± 2°	± 9°
Castor	± 4'	± 18°	± 22°
Kingpin inclination	± 4'	± 18°	± 22°
Toe-differential angle	± 4'	± 20°	± 20°
Maximum steering angle (VA)	± 4'	± 60°	± 300°
Maximum steering angle (HA)	± 4'	± 9°	± 9°
Castor correction range	± 4'	± 7°	± 10°

NOTE: The measuring accuracy details only apply when using the precision rotating and sliding plates as well as the BMW quick-acting clamps.

7.2 Preparatory work

Before commencing the measurement, preparatory work must be carried out at the measuring area and on the vehicle. Preparatory work includes:

- Easy-running rotating and sliding plates
- Aligning the rotating and sliding plates in relation to the track width and wheelbase
- Centering the vehicle on the plates
- Applying the parking brake
- Removing the lock pins on the plates to prevent tension in the chassis under loading
- Checking the rim and tyre size, tread depth, tyre pressure, steering wheel play, wheel bearings and condition of suspension and shock absorbers
- Fastening the measuring equipment to the wheels
- Loading the vehicle according to BMW KDS specifications
- Rock the vehicle firmly with the brakes released to ensure a stable center position
- Lock the service brake using the brake clamping device

7.3 Initial / final measurement

This measurement can be carried out as a program-guided measurement in the same way as any subsequent adjusting work and the final measurement. The sequence of the chassis measuring points to be called up is specified and controlled by the system software. The individual steps comprise:

- Driving straight ahead to correctly record the wheel toe and camber values for the rear axle
- Steering routine for recording the castor, kingpin inclination and toe-differential angle
- Recording the wheel toe and camber of the front axle (adjust the steering center point in advance)
- Steering routine for measuring the maximum steering angle on the left/right
- Checking the overview of measured values with the setpoint and actual comparison of all measured values

7.4 Printing out the data

Fig. 25: Printing Layout Of Customer And Vehicle Identification Data
 Courtesy of BMW OF NORTH AMERICA, INC.

The report printout from the integrated DIN A4 printer is subdivided into three sections:

- Header lines with customer and vehicle identification data <-- the customer data entered before beginning the measurement as well as vehicle data are printed out here.
- Centre section with vehicle data <-- this includes the make, type, model and vehicle model year defined when the setpoint data record was selected. The values previously measured for height level, tyre pressure and tread depth are also printed in this section.
- The end section with all vehicle alignment values comprises the 3 columns initial measurement, setpoint values and output measurement. The measured values are recorded separately in these three columns.

8. SPECIAL FEATURES

8.1 Free wheel alignment

With free wheel alignment the selection and sequence of the measuring points is freely selectable. The following points must be observed for attaining the correct measurement results:

- Carry out all work in the same way as with the program-guided measurement.
- Before measuring the wheel toe and camber values for the rear axle, the steering must be in the "straight ahead" position to ensure that it is perfectly aligned in relation to the longitudinal center plane of the vehicle.
- Before measuring the single wheel toe values on the front axle, the center of steering must be established to ensure the correct position of the steering wheel.

8.2 System settings

The following settings must only be entered or set once: language, display format, date/time, advertising text, remote control with display, rotating plate selection and printer settings. They remain stored.

9. BMW KINEMATIC DIAGNOSIS SYSTEM COMPARISON (BOSCH - BEISSBARTH)

BMW KINEMATIC DIAGNOSIS SYSTEM COMPARISON (BOSCH - BEISSBARTH)

	Bosch	Beissbarth
Measured value recording	Infrared	CCD camera
Data transmission	Cable	Infrared / cable
Measuring sensor power supply	Cable	Battery / cable
Remote control	Infrared	Infrared
Remote control with measured value display	Cable	Infrared
Setpoint data memory	Floppy disk	Hard disk
Measured value memory	Always the last vehicle measured	Unlimited vehicle memory
Operating system	---	MS-DOS
Languages	English and one language on request	EN, DE, NI, SV, IT, FR, SP (further languages can be called up)
Update	3.5" floppy disk	3.5" floppy disk using TIS/DIS
Monitor	20"	17"
Computer	---	Pentium
Disk drives	2 x floppy disk	1 x floppy, 1 x CD ROM

10. CONTROL MODIFICATION (MENU)

10.1 Remote control with display

The following steps show how the remote control with display is activated:

1. Call up the "**Service**" menu in special functions ("S" key)
2. Call up the "**Remote control**" sub-menu in the "**Service**" menu.
3. Select the "**Remote control with display**" item in the "**Remote control**" sub-menu-this configuration is retained.

IMPORTANT: In the case of equipment without remote control, this must be configured to "No remote control" .

10.2 Brief operating instructions

1. Activate the remote control with the "**ON**" button (it may also be switched on during alignment). The title page will appear on the LCD.
2. Select "**Straight ahead**" of the "**Initial measurement**" , "**Adjustment work**" or "**Final**

measurement" at the measuring equipment cabinet. The steering graphics for **"Straight ahead"** will appear on the LCD.

3. Use the **"Forward arrow"** to change to the next measurement image. Display blocks will appear on the LCD with the designation of the measured value and tolerance bar with the measured value. If the measured value is within the tolerance range, it is shown in dark figures against a light background. If the measured value is outside the tolerance range, it will be shown in inverse video (light figures against a dark background).
4. By pressing the **"F"** key shortly, you can move alternately between the designation of the measured value and the setpoint value with the tolerance inside the display blocks.
5. You can scroll through the measured values using the **"Forward arrow"** , **"Backward arrow"** and **"Cancel" (red dot)** keys. The function of these keys is identical to that of the keys on the graphics panel.
6. Even with **"Free alignment"** , it is possible to scroll through the measured values in the same way as with **"Program-guided alignment"** .
7. During measurement, the report print-out can be initiated using the **"Printer"** key. The remote control keys are only active during measurement and adjustment (not during customer data input, vehicle selection etc.).

10.3 Display support

- Measured values with a setpoint/actual comparison and tolerance bar (setpoint figures can be displayed with the **"F"** key)
- Steering graphics for steering routines
- Overview of measured values with current setpoint/actual comparison
- Rim run-out compensation
- With all other functions (e.g. customer input), the title illustration appears on the LCD display

NOTE: **If the data transmission from the remote control to the computer is interrupted, the remote control icon in the bottom right-hand corner of the screen changes color from green to red and the illustration on the LCD display is shown inversely - black turns to white, white to black. This change does not take place in the title illustration. Once the line-of-sight connection has been re-established, the remote control continues to operate from the point of interruption in the program. A continuous visual connection during alignment is therefore not necessary.**

- The **"Hour glass"** icon in the LCD display means: **"Please wait"** .
- The **"Battery"** icon in the top right-hand corner of the LCD display means that the battery reserve has been reached.
- To switch off the remote control: press the **"F"** key for 5 seconds, then return it to its charging unit or connect it to a charge cable. The title illustration will again appear as a charging check.
- If, during the measurement, the remote control has been placed back in the charging unit, it must be switched on again using the **"ON"** button.

11. UPDATING THE SOFTWARE / SETPOINT DATA

Floppy disks will no longer be sent to BMW partners who have acquired a "**BMW KDS** (Beissbarth / Bosch)". For cost-related reasons, you can create these disks yourself on the "**Dis-tester**" or on the "**TIS/EPC server**". The data for this is regularly updated on the TIS CD.

11.1 Requirements

- BMW KDS (Beissbarth / Bosch)
- TIS CD program status (Beissbarth): from CD 12/95
- EPC program status: from 12/95
- TIS CD program status (Bosch): from CD 08/97
- DIS program status: from V6.0
- 3.5" diskettes, 1.44 MB (Beissbarth 5 diskettes / Bosch 1 diskette)

11.2 Procedure (Beissbarth)

1. Go to the "Administration" screen
2. Select the **KDS button**
3. Select **Beissbarth**
4. Insert "**Diskette 1**" on request and confirm with "**OK**" (program diskette 1 of 2 is created, label it)
5. Insert "**Diskette 2**" on request and confirm with "**OK**" (program diskette 2 of 2 is created, label it)
6. Insert "**Diskette 3**" on request and confirm with "**OK**" (setpoint data diskette 1 of 3 is created, label it)
7. Insert "**Diskette 4**" on request and confirm with "**OK**" (setpoint data diskette 2 of 3 is created, label it)
8. Insert "**Diskette 5**" on request and confirm with "**OK**" (setpoint data diskette 3 of 3 is created, label it)
9. Perform update and/or setpoint data on the KDS in the usual manner with the diskettes which have just been created.

11.3 Procedure (Bosch)

1. Go to the "Administration" screen
2. Select the **KDS button**
3. Select **Bosch**
4. Label "**Diskette 3.1**", insert it into the drive on request and confirm with "**OK**" (2x) <-- Setpoint data is copied to the diskettes.
5. Insert setpoint data diskette 3.1 into the 3.1 floppy disk drive, insert operating system diskette 3.0 into the 3.0 drive.
6. Switch on the machine in the usual manner.

IMPORTANT: When creating the KDS diskettes, all data on the diskettes used is overwritten.

NOTE: In the event of an error, a corresponding message is shown and the program is cancelled completely. The procedure must be run from the beginning again and all data on the diskette will be deleted. A new diskette may have to be used.

12. CREATING, COPYING AND EDITING SETPOINT DATA

12.1 Copying

- Press the "C" button and select the vehicle to be copied.
- Select the "**Edit setpoint data**" menu item from the special functions. Create a new vehicle in the usual manner. The setpoint values for the last vehicle selected will appear in the data input screen. Enter the data and save the data record.

12.2 Creating

- Press the "C" button and select the "**Edit setpoint data**" menu item from the special functions. Create a new vehicle in the usual manner. An empty data input screen will appear. Enter the data and save the data record.

12.3 Editing

- Factory-programmed setpoint data can neither be deleted nor modified. If this data does need to be modified, a new vehicle with modified setpoint data must be created. New vehicles created by the user are identified by a "+" in the selection menu. These vehicles can be deleted by the user using the "-" key or modified using the "<>" key. These keys only appear if vehicles have been entered by the user.

13. SPECIAL FUNCTIONS

13.1 Customer-specific printer report header

The sub-item "**Customer-specific text**" must be called up in the "**Special functions**" menu. An input screen will appear on the monitor. This input screen must be filled out with the name and address and stored with the "S" screen key. The text entered is inserted into the report header.

13.2 Adjusting options

- Call up the "**Service**" menu in the special functions ("S" key).
- Select the "**Wheel toe adjustment**" item or the "**Camber adjustment**" item from the "**Adjustment**" sub-menu. The toe and camber adjustment program will guide the user step by step through the adjustment using text and images. The measuring deviation for each measuring sensor will be shown on the screen when the adjustment has been completed.
- You can store the adjustment values in the measuring sensor using the "**Store**" key or you can quit the program with the "**Red dot key**" without saving them (check). The adjustment values can be printed out.

13.3 Rotating plate test

- Call up the "**Service**" menu in the special functions ("S" key).
- Call up the "**Rotating plate**" item in the "**Service**" menu. Turn the left-hand and right-hand rotating plate and check the display on the screen. Important: The measuring range is ± 306 degrees.

13.4 Viewing and deleting customer entries from database

- Call up the menu item "**Delete**" in the "**Database**" menu in the special functions. The data input screen will appear. Fill in the search fields with the data to be deleted.
- Use the "-" button to delete this data record. A new data record can then be highlighted and deleted with the digital pen.
- You can scroll through the entire database with the "**Arrow up**" and "**Arrow down**" keys.
- You can quit the delete function by pressing the cancel key (red dot).

14. MODIFICATIONS WITHIN PROGRAM

Further modifications were carried out within the program which only slightly change the program sequence but which optimize the alignment in respect of comfort and speed. This is described below:

- Optimization of the rim run-out compensation in respect of speed.
- Optimization of the steering routines: Highlighted values within the gate can still be corrected. The message "**Rotating plates not connected**" no longer causes the steering routine to be cancelled. Further measurements can be carried out after the rotating plates have been connected.
- Standardization of screen colors with the colors on the tablet.
- Addition of texts in several foreign languages.
- Elimination of program-related and cosmetic faults.
- Electronic water level.
- Omission of kingpin inclination measurement.

15. FAULTS

15.1 Tyre faults

TYRE FAULTS DESCRIPTION CHART

Fault	Effect
1 Wheel toe, camber, toe-differential angle and castor not correct	1 Severe tyre squeaking even at relatively low speeds
2 Excessive toe-in and excessive positive camber	2 Tyres are worn down on one outside edge in the longitudinal direction
3 Excessive negative camber	3 Tyre wear on inside edge
4 Worn front-axle suspension on front-wheel-drive vehicles	4 Increased noise / Vehicle pulls on one side when accelerating
5 Incorrect wheel alignment	5 Wheels scrubbing / Tyre surface shows feathering in the tread
6 Play in the suspension due to mechanical parts (suspension, steering)	6 Washout / Wobbling of front wheels
7 Tyre pressure too low	7 Outside tyre surface wear

15.2 Front axle faults

FRONT AXLE FAULTS DESCRIPTION CHART

Fault	Cause	Remedy
1. Toe deviation	<ul style="list-style-type: none"> a) Vehicle not in normal position b) Tie rod(s) bent c) Tie rod ball joints worn d) Rubber mount in control arm defective 	<ul style="list-style-type: none"> a) Correct height level b) Replace tie rod(s) c) Replace tie rod(s) d) Replace control arm
2. Camber deviation: The camber is fixed during the design stage and cannot be adjusted.	<ul style="list-style-type: none"> a) Rubber mount in control arm defective b) Control arm deformed c) Spring strut deformed d) Traction strut worn e) Spring deflection too great f) Front axle carrier deformed g) Spring strut mount deformed h) Distortion in the floor assembly (engine bracket) 	<ul style="list-style-type: none"> a) Replace control arm b) Replace control arm c) Replace spring strut d) Replace control arm e) Replace coil spring, height level f) Replace front axle carrier g) Repair forward structure h) Repair body
3. Castor deviation: The castor is fixed during the design stage and cannot be adjusted.	<ul style="list-style-type: none"> a) Rubber mount for tension / traction strut defective b) Tension / traction strut deformed c) Control arm deformed d) Spring strut deformed e) Wheelhouse deformed (spring strut mount) f) Distortion in the floor assembly (engine bracket) 	<ul style="list-style-type: none"> a) Replace rubber mount b) Replace tension / traction strut c) Replace control arm d) Replace spring strut e) Repair forward structure f) Repair body
4. Toe-differential angle deviation	<p>Requirement: camber and castor are correct</p> <ul style="list-style-type: none"> a) Tie rods unevenly adjusted 	<ul style="list-style-type: none"> a) Set wheel toe on left and right to identical values
5. Wheel displacement deviation	<p>Requirement: Front wheels have same single toe in relation to the geometrical axis</p> <ul style="list-style-type: none"> a) Front axle carrier deformed b) Engine bracket deformed c) Control arm deformed d) Tension / traction strut deformed 	<ul style="list-style-type: none"> a) Replace front axle carrier b) Repair body c) Replace control arm d) Replace tension / traction strut

15.3 Rear axle faults

REAR AXLE FAULTS DESCRIPTION CHART

Fault	Cause	Remedy
1. Camber deviation	a) Vehicle not in normal position: spring deflection too great b) Rubber mount on rear axle carrier defective c) Rear axle carrier deformed d) Control arm deformed e) Traction strut deformed f) Distortion in the floor assembly g) Swinging arm deformed	a) Correct height level b) Replace rubber mount c) Check rear axle carrier and replace, if necessary d) Check control arm and replace, if necessary e) Check traction strut and replace, if necessary f) Repair body g) Replace swinging arm
2. Rear wheel position is not correct	a) Rear axle carrier has been shifted laterally b) Distortion in the floor assembly	a) Check the rubber mounts on the rear axle carrier and replace, if necessary b) Repair body
3. Toe deviation	a) Vehicle not in normal position, i.e. spring deflection too great b) Rubber mount in rear axle carrier defective c) Control arm deformed d) Rubber mount and swinging arm defective e) Rear axle carrier deformed f) Traction strut deformed	a) Correct height level b) Replace rubber mount c) Replace control arm d) Replace swinging arm e) Check rear axle carrier and replace, if necessary f) Check traction strut and replace, if necessary
4. Deviation from the geometrical drive axis	Requirement: Total wheel toe is correct a) Distortion in the floor assembly	a) Repair body

Further details on the "Kinematic Diagnosis System" can be found in the operating instructions for the BMW KDS (Beissbarth / Bosch).

Functional and system descriptions are not subject to change. Parts availability and immediate ordering availability cannot be derived from this information. The specialist departments will be providing further details at the relevant time.

ACCESSORIES AND EQUIPMENT

Accessories Control System - Repair Instructions - X3

00 TROUBLESHOOTING

12 00 ... INSTRUCTIONS ON STARTING AID

Do not start the engine with help of starting sprays.

Preparation:

Conform with the following when starting engine with starting cable.

- Ensure that jump lead wires are to appropriate cross-section size.
- Only use fuse-protected jump leads.
- Check whether the current supplying battery has 12 V voltage.
- If engine is started from battery of another vehicle, ensure that there is no contact between the bodies of both vehicles.

CAUTION: Never touch ignition system components and current - dangerous high tension!

If the battery in the vehicle supplying power is weak, start the engine of this vehicle and let it run at idling speed.

Carrying out:

Always conform with the procedures to avoid injury to persons or damage to parts.

- On automatic transmission, select "P" setting, apply handbrake.
- Move the shift lever of vehicles with manual transmission into neutral and apply the parking brake.
- Ensure that the jump leads cannot get caught in rotating parts, e.g. fan.
- First connect positive terminals of both batteries with one jump lead (red).
- Use positive connection point in engine compartment for vehicles with one battery in trunk.
- Then attach second jump lead (black) to negative terminal of donor battery and to engine ground or body ground on vehicle to be started.

CAUTION: Never connect second jump lead (black) to negative terminal of battery in vehicle to be started. This would produce explosive gas which could be ignited by sparks.

Danger of explosion!

After engine of vehicle to be started has started up, first disconnect the jump lead on the negative terminal/ground connection. Then remove jump lead from positive terminals.

61 00 ... BATTERY

NOTE: Important notes and instructions for handling batteries in the dealership can be found in:

- Battery master document
- Disconnecting battery, see 12 00 ... Instructions for disconnecting and connecting battery
- Battery charging, see 61 20 ... Battery charging
- Welding work
- External jump-starting aid, see 12 00 ... Instructions on starting aid

Battery care and maintenance

In low-maintenance batteries, check the acid level at least once a year. If necessary, top up with distilled water up to the top marking.

The increasing number of electronic control units in the car reduces the self-discharging time of the battery (even in standby mode). To maintain the battery service life and to avoid exhaustive discharging, recharge laid-up vehicles every 6 weeks at the latest. The time for self-discharging depends on vehicle type and equipment specification.

Battery test

The battery acid density can be used to measure the charge state. However this test produces uncertainty caused by a design-related range of variation. The acid density e.g. for a charged battery is 1.28 kg/l (in the tropical version the acid density is 1.23 kg/l).

Another interference factor is the acid lamination immediately after filling with distilled water.

Battery wear with partially sulphated and/or heavily contaminated plates will also lead to incorrect acid density test results.

61 00 ... REPAIRING AIRBAG CABLES

IMPORTANT: Only repair those cables which show visible signs of damage. In the event of visible damage, make sure there is only one cable repair in effect after the repair work. If no visible damage can be identified, the entire cable must be replaced. When carrying out repairs to the airbag wiring harness, you must use the spare parts offered in the Electronic Parts Catalogue (EPC).

Safety regulations:

Safety regulations for handling components of airbag system, see 72 00 ... SAFETY REGULATIONS FOR

HANDLING COMPONENTS WITH GAS GENERATORS .

Instructions for disconnecting and connecting battery, see **12 00 ... Instructions for disconnecting and connecting battery**

Procedure for cable repair

In event of non-visible damage to wiring harness:

Disconnect plug connection on airbag module or on adapter plug. It is absolutely vital to disconnect the contacts in succession as there is a risk of them being mixed up! Cut through one cable after the other at an appropriate position, do not under any circumstances cut through both cables at the same time. Insulate cables remaining in wiring harness with insulating tape. Now disconnect plug connection on airbag control unit. Unpin contacts. Cut through one cable after the other at an appropriate position and insulate with insulating tape, do not under any circumstances cut through both cables at the same time. Pin contacts of repair cable for airbag control unit in control unit plug, assignment of repair cables is relevant. Lay repair cable in car parallel to existing airbag lead. Now pin in contacts for airbag control unit or contacts of adapter plug, assignment of repair cables is relevant. Cut off excess length of repair cable in proximity (visible area) of airbag module or of adapter plug. Twist open cables. With the connectors and shrink-fit hoses in the Electronic Parts Catalogue (EPC), reconnect the cables with the same cable colors. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

In event of visible damage:

Expose cable at damaged areas. Cut through one cable after the other at an appropriate position and insulate cables no longer required in wiring harness with insulating tape, do not under any circumstances cut through both cables at the same time. Now, depending on the scope of work, unpin contacts either on airbag control unit/airbag module or on adapter plug. Cut off unpinned cables. Insulate cables remaining in wiring harness with insulating tape. Now pin in contacts of repair cable, assignment of repair cables is relevant. Lay repair lead in car parallel to existing airbag lead up to cutting point. Cut off excess length of repair lead. Twist open cables. Connect cables with connectors and shrink-fit hoses in Electronic Parts Catalogue (EPC), assignment of repair cables is relevant. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

61 00 ... SAFETY INSTRUCTIONS FOR HANDLING VEHICLE BATTERY

Battery acid is highly corrosive:

Do not allow any battery acid to come into contact with the eyes, the skin or clothing. Therefore wear protective clothing, gloves and goggles.

Do not tilt the battery, acid may emerge from the vent opening.

In event of contact with acid:

If acid is splashed into the eyes, rinse them immediately for several minutes with clear water. You must then consult a doctor without delay.

If acid is splashed onto the skin or clothing, neutralize it immediately with a soapy solution and rinse with lots of water.

Seek medical attention immediately if battery acid is accidentally swallowed.

Explosion hazard:

Strictly no flames, sparks, naked light or smoking!

A highly explosive mixture of electrolytic gas is created when batteries are charged. The rooms where charging is carried out must therefore always be well ventilated.

Avoid the formation of sparks when handling cables, wiring and electrical devices.

Turn the ignition lock to the 0 position before disconnecting or connecting the battery.

Do not place tools or any similar object on the battery (danger of short-circuiting and explosion!).

61 13 OPENING PLUG HOUSINGS AND REMOVING CONTACTS OF DIFFERENT PLUG SYSTEMS

Special tools required:

- **61 0 300 RELEASING TOOL (COMPLETE KIT)**
- 61 0 400
- **61 1 150 RELEASING TOOL KIT**

Abbreviations and what they mean:

ABBREVIATIONS REFERENCE CHART

D 1.5 / 2.5	Round contacts of 1.5 mm or 2.5 mm diameter
MDK 3plus	Miniature double flat spring contact
JPT ELA	Junior Power Timer flat spring contacts with strand sealing
DFK ELA	Double flat spring contacts with strand sealing
Elo	Electronic contacts with and without strand sealing Manufacturer: Siemens
Elo Power	Electronic contacts for heavy loads with and without strand sealing Manufacturer: Siemens
MQS	Micro Quadlock System electronic contacts with and without strand sealing Manufacturer: AMP
MPQ	Micro Power Quadlock electronic contacts for heavy loads with and without strand sealing Manufacturer: AMP

Ultrasonic-welded connectors:

Ultrasonic-welded connectors (1) can be identified by the welds (2) on their longitudinal side.

The contacts of these connectors cannot be replaced. Replace plug completely.

Fig. 1: Identifying Ultrasonic-Welded Connectors
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Special tools referred to in the repair instructions below are contained in the following special tool kits:

61 20 908 PERFORMING BATTERY "POWER RESET" (FOR PROGRAMMING/CODING CONTROL UNIT(S))

IMPORTANT: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery.

The following steps must be carried out for a "power reset":

- Switch off and disconnect battery charger
- Switch off ignition

Cars with ignition key: Turn ignition key to 0 position

Cars with identification sensor: Remove identification sensor from slot

Cars with comfort access system: Make sure terminal is in 0 position

- Disconnect battery negative terminal
- Reconnect battery negative terminal (to ensure bus activity)
- Waiting time (5-10 seconds)
- Disconnect battery negative terminal
- Waiting time (1 minute)
- Connect battery negative terminal and tighten, tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .
- Connect and switch on battery charger
- Switch ignition on

12 AUXILIARY CABLES

61 12 004 REPLACING BATTERY POSITIVE LEAD (FROM BATTERY TO ENGINE COMPARTMENT PARTITION CONNECTOR)

WARNING: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

Necessary preliminary tasks:

- Remove right luggage compartment wheel arch trim, see **51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM**

- Remove instrument panel trim, see **51 45 030 REMOVING AND INSTALLING INSTRUMENT PANEL TRIM**
- Remove right front seat, see **52 13 015 REMOVING AND INSTALLING / REPLACING CONTROLS ON LEFT / RIGHT FRONT SEAT (NORMAL / MANUAL)**
- Remove central bass cover, see **65 12 050 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT CENTRAL BASS SPEAKER (UNDER FRONT SEAT)**
- Remove panel for door pillar on right, see **51 43 150 REMOVING AND INSTALLING OR REPLACING TRIM FOR LEFT OR RIGHT DOOR PILLAR (BOTTOM)**

Unfasten plug connection (2) and disconnect.

Disconnect battery negative lead (1), see **61 20 900 Disconnecting and connecting battery negative lead.**

Open positive terminal cover (3).

Fig. 11: Identifying Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Release nut (3), tightening torque: 61 12 1AZ, see **61 12 AUXILIARY CABLES/LEADS** .

Disconnect lead (4).

Release nut (1) of safety battery terminal (2), tightening torque: 61 21 1AZ, see **61 12 AUXILIARY CABLES/LEADS** .

IMPORTANT: Do not under any circumstances pull/lever safety battery terminal (2) off by force.

Detach safety battery terminal (2) towards top, lay to one side and secure.

Fig. 12: Identifying Battery Terminal And Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out covers (1) and remove.

Unfasten screws (2).

Lift out rail (3).

Fig. 13: Lifting Out Rail
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not kink floor panelling under any circumstances!

Cut and fold back floor panelling (1) in area (2).

Installation:

Cut into floor panelling (2) at marked points. Join cutting lines with cable straps (short).

Fig. 14: Folding Back Floor Panelling
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock cable lug mounting (1) and fold back.

Release screw (2), tightening torque: 61 12 2AZ, see **61 12 AUXILIARY CABLES/LEADS** .

Unclip cable lug mounting (1) from positive battery cable (3) and remove.

WARNING: Risk of short circuits!
When installing, ensure:

- Correct seating of cable lug mounting (1) on positive battery cable (3)
- Correct screw connection

Fig. 15: Identifying Cable Lug Mounting And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, the following illustrations show the front/rear floor panelling removed.

Raise front/rear floor panelling in area of battery positive lead.

Remove front insert (1).

Fig. 16: Identifying Front Insert

Courtesy of BMW OF NORTH AMERICA, INC.

Remove battery positive lead (1) from cable guides (2).

Fig. 17: Identifying Battery Lead And Cable Guides

Courtesy of BMW OF NORTH AMERICA, INC.

Detach battery positive lead (1) from cable guides (2) and remove.

 Courtesy of BMW OF NORTH AMERICA, INC.

61 12 013 REPLACING NEGATIVE BATTERY CABLE

WARNING: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

Necessary preliminary tasks:

- Remove roller cover from luggage compartment.
- Release cover on seat belt at top rear, see **72 11 100 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT SEAT BELTS**
- Remove both rest side sections on rear seat backrest, see **52 26 008 REMOVING AND INSTALLING/REPLACING LEFT/RIGHT SIDES OF BACKREST ON REAR SEAT BACKREST (THROUGH-LOADING)**
- Remove backrest for rear seat, see **52 26 015 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT REAR SEAT BACKREST (THROUGH-LOADING SYSTEM)**
- Remove rear luggage compartment floor trim, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Remove front trim for luggage compartment floor, see **51 47 131 REPLACING FRONT TRIM FOR LUGGAGE COMPARTMENT FLOOR**
- Remove trim for rear right roof pillar (C-pillar), see **51 43 251 REMOVING AND INSTALLING/REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (C - PILLAR)**
- Remove flap in luggage compartment panel, see **51 47 172 REMOVING AND INSTALLING/REPLACING FLAP IN LUGGAGE COMPARTMENT TRIM, LEFT OR RIGHT**
- Remove both trims for rear roof pillar (D-pillar), see **51 43 252 REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (D-PILLAR)**
- Remove trim on tail panel at top, see **51 46 050 REMOVING AND INSTALLING/REPLACING TOP TRIM ON REAR APRON**
- Remove inner window cavity cover strip on right, see **51 37 261 REMOVING AND**

INSTALLING/REPLACING WINDOW CAVITY COVER STRIP FOR DOOR WINDOW, REAR LEFT OR RIGHT

- Remove storage compartment in luggage compartment on right, see **51 47 ... REMOVING AND INSTALLING/REPLACING STORAGE COMPARTMENT IN LUGGAGE COMPARTMENT ON RIGHT**
- Remove right luggage compartment wheel arch trim, see **51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM** .
- Remove lashing rail in luggage compartment floor on right, see **51 47 135 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT LASHING RAIL IN LUGGAGE COMPARTMENT FLOOR**
- Remove right luggage compartment recess panel

Release nut (1) on battery negative terminal.

Tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

Detach battery negative cable (2) upwards.

Release nut (3) and battery negative cable (2).

Tightening torque: 61 21 2AZ, see **61 21 BATTERY WITH TERMINAL** .

Fig. 19: Identifying Battery Cable Nut
Courtesy of BMW OF NORTH AMERICA, INC.

61 12 137 REPLACING WIRING HARNESS FOR REAR LID ON RIGHT

Necessary preliminary tasks:

- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove trim for rear lid, see **51 49 008 REMOVING AND INSTALLING/REPLACING PANEL FOR REAR LID**
- Remove roofliner, see **51 44 002 REMOVING AND INSTALLING ROOFLINER (ON VERSION WITHOUT PANORAMA SUNROOF)**

Disconnect plug connection (1).

Feed wiring harness (2) out of rear lid.

Installation:

Correctly lay wiring harness (2).

Fig. 20: Identifying Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure rubber seal (1) is correctly installed in groove on frame.

Fig. 21: Identifying Rubber Seal

Courtesy of BMW OF NORTH AMERICA, INC.

Remove wiring harness sheathing in area (A).

Cut one cable after another at the appropriate point.

Connect cables of new wiring harness with butt connectors and heat-shrink sleeves.

Insulate wiring harness with insulating tape and secure in place.

Installation:

Correctly lay wiring harness (2).

Fig. 22: Identifying Wiring Harness Sheathing Area
Courtesy of BMW OF NORTH AMERICA, INC.

61 12 200 REPLACING WIRING HARNESS IN LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Close front side window completely
- Remove front door trim panel, see **51 41 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT DOOR TRIM PANEL**
- Remove front acoustic insulation, see **51 48 060 REMOVING AND INSTALLING/REPLACING SOUND INSULATION IN LEFT OR RIGHT FRONT DOOR**

Disconnect plug connection (1).

Unclip door wiring harness at points (2).

Installation:

Make sure door wiring harness is correctly laid.

Fig. 23: Identifying Plug Connection And Door Wiring Harness Points
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1), fold door wiring harness plug on A-pillar (2) downwards slightly and remove.

Unlock plug connection behind and disconnect.

Pull rubber grommet (3) out of front door.

Feed out door wiring harness towards front to A-pillar and remove.

Fig. 24: Pulling Rubber Grommet
 Courtesy of BMW OF NORTH AMERICA, INC.

61 12 210 REPLACING WIRING HARNESS IN LEFT OR RIGHT REAR DOOR

Necessary preliminary tasks:

- Close rear side window completely
- Remove cover on door handle, see **51 41 017 REMOVING AND INSTALLING/REPLACING COVER ON DOOR HANDLE, FRONT LEFT OR RIGHT**

- Remove rear door trim panel, see **51 42 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR TRIM PANEL**
- Remove rear acoustic insulation, see **51 48 070 REMOVING AND INSTALLING/REPLACING SOUND INSULATION ON LEFT OR RIGHT REAR DOOR**

Disconnect plug connection (1) on power window unit.

Unclip door wiring harness at points (2).

Installation:

Make sure door wiring harness is correctly laid.

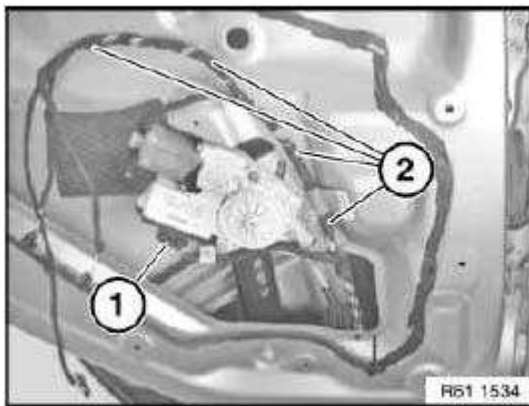

Fig. 25: Identifying Plug Connection And Door Wiring Harness Points
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1), fold door wiring harness plug on B-pillar (2) downwards slightly and remove.

Unlock plug connection behind and disconnect.

Pull rubber grommet (3) out of rear door.

Feed out door wiring harness towards front to B-pillar and remove.

Fig. 26: Pulling Rubber Grommet

Courtesy of BMW OF NORTH AMERICA, INC.

61 13 OPENING PLUG HOUSINGS AND REMOVING CONTACTS OF DIFFERENT PLUG SYSTEMS

13 CONNECTORS, TERMINALS, FUSE BOX

61 00 ... REPAIRING AIRBAG CABLES

IMPORTANT: Only repair those cables which show visible signs of damage. In the event of visible damage, make sure there is only one cable repair in effect after the repair work. If no visible damage can be identified, the entire cable must be replaced. When carrying out repairs to the airbag wiring harness, you must use the spare parts offered in the Electronic Parts Catalogue (EPC).

Safety regulations:

Safety regulations for handling components of airbag system, see **72 00 ... SAFETY REGULATIONS FOR HANDLING COMPONENTS WITH GAS GENERATORS** .

Instructions for disconnecting and connecting battery, see **12 00 ... Instructions for disconnecting and connecting battery**

Procedure for cable repair

In event of non-visible damage to wiring harness:

Disconnect plug connection on airbag module or on adapter plug. It is absolutely vital to disconnect the contacts in succession as there is a risk of them being mixed up! Cut through one cable after the other at an appropriate position, do not under any circumstances cut through both cables at the same time. Insulate cables remaining in wiring harness with insulating tape. Now disconnect plug connection on airbag control unit. Unpin contacts. Cut through one cable after the other at an appropriate position and insulate with insulating tape, do not under any circumstances cut through both cables at the same time. Pin contacts of repair cable for airbag control unit in control unit plug, assignment of repair cables is relevant. Lay repair cable in car parallel to existing airbag lead. Now pin in contacts for airbag control unit or contacts of adapter plug, assignment of repair cables is relevant.

Cut off excess length of repair cable in proximity (visible area) of airbag module or of adapter plug. Twist open cables. With the connectors and shrink-fit hoses in the Electronic Parts Catalogue (EPC), reconnect the cables with the same cable colors. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

In event of visible damage:

Expose cable at damaged areas. Cut through one cable after the other at an appropriate position and insulate cables no longer required in wiring harness with insulating tape, do not under any circumstances cut through both cables at the same time. Now, depending on the scope of work, unpin contacts either on airbag control unit/airbag module or on adapter plug. Cut off unpinned cables. Insulate cables remaining in wiring harness with insulating tape. Now pin in contacts of repair cable, assignment of repair cables is relevant. Lay repair lead in car parallel to existing airbag lead up to cutting point. Cut off excess length of repair lead. Twist open cables. Connect cables with connectors and shrink-fit hoses in Electronic Parts Catalogue (EPC), assignment of repair cables is relevant. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

61 13 BUTT CONNECTOR FOR REPAIRING A PLUG CONNECTION

Special tools required:

- **61 0 300 RELEASING TOOL (COMPLETE KIT)**
- **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**

- IMPORTANT:**
1. **Identify cause of damage (e.g. sharp-edged body parts, faulty electrical loads, jammed mechanisms, corrosion caused by ingress of water, etc.).**
 2. **Read out fault memory**
 3. **Eliminate cause of damage.**

4. Disconnect battery negative terminal
5. Make sure that no safety-related system according to connection scheme (e.g. anti-lock braking system, active rear-axe kinematics, airbags, etc.) are influenced. Otherwise replace faulty wiring harness or use repair cable (sourcing reference: BMW Parts Service)
6. Carry out function test and read out fault memories again
7. Eliminate new faults if applicable and clear fault memories

NOTE: The repair range IV for vehicle electrical system contained the required special tools and individual parts for retrofitting and repair work with the aid of fan connectors.

The case can no longer be ordered. Order individual parts for wiring harness repair through BMW Parts Service.

Special tools:

- Special tool 61 9 040

Choose repair kit.

Example: Repair kit, circular plug system D 2.5.

Fig. 37: Identifying Special Tool Kit
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 38: Identifying Circular Plug System D 2.5
Courtesy of BMW OF NORTH AMERICA, INC.

Remove following parts:

1. Prepackaged end of cable with requisite wire cross-section
2. Crimp connector for selected wire cross-section
3. Shrink-fit hose

Fig. 39: Identifying Crimp Connector And Shrink-Fit Hose
Courtesy of BMW OF NORTH AMERICA, INC.

Open secondary lock on housing.

Mark damaged contact (4) with socket number of housing and press it out of housing using relevant special tool contained in special tool kit 61 0 300 .

Refer to repair instructions:

Opening plug housings and removing contacts of different plug systems, see **61 13 Opening plug housings and removing contacts of different plug systems**

Fig. 40: Identifying Damaged Contact Mark With Socket Number
Courtesy of BMW OF NORTH AMERICA, INC.

- IMPORTANT:**
- Check maximum length of repair cable!
 - If more than one wire is to be repaired, the individual interfaces must be offset so that the wiring harness is not too thick at the repaired point.

Observe following procedure:

- Cut off wire with faulty contact at point which is easily accessible.
- Strip wiring-harness wire end (6).
- Cut preassembled wire end (7) to length and strip insulation.

Refer also to repair instruction:

Cutting to length and stripping insulation from cables, see **61 13 Cutting to length and stripping insulation from cables**

Fig. 41: Identifying Cutting Plier

Courtesy of BMW OF NORTH AMERICA, INC.

Crimp butt connector on preassembled wire end.

Refer to repair instructions:

Crimping on stop parts, see **61 13 Crimping stop parts**

Fig. 42: Identifying Crimp Butt Connector On Preassembled Wire End
Courtesy of BMW OF NORTH AMERICA, INC.

Push shrink-fit hose (8) onto free wire end.

Fig. 43: Identifying Shrink-Fit Hose
Courtesy of BMW OF NORTH AMERICA, INC.

Crimp unused wire end to butt connector.

Fig. 44: Crimping Unused Wire End To Butt Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Pull shrink-on sleeve over butt connector.

Fig. 45: Identifying Shrink-On Sleeve Over Butt Connector
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not burn shrink-on sleeve.

With hot air blower, shrink the shrink-on sleeve on both sides (9) of shrink-fit hose until glue emerges uniformly all round.

Insert contact in housing.

Close secondary lock on housing.

Fig. 46: Identifying Shrink-On Sleeve
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 CRIMPING STOP PARTS

Special tools required:

- 12 1 080
- 12 1 081
- 12 1 083

Spare parts for in-car electronics (housing and contacts):

1. **Crimping butt connectors and contact sleeves for fan connectors up to 2.5 mm²**
2. **Crimping butt connectors and contact sleeves for fan connectors from 2.5 mm²**
3. **Crimping contact sleeves for fan connectors 4 mm² and ignition cable contacts**

Special tool kit 12 1 080 is used to fit ignition cable contacts to crimp 4 mm² contact sleeves for fan connectors.

- 12 1 081 (hand crimping tool)
- 12 1 083 (matrix)

Special tools for wiring harness repairs, see **61 13 Special tools for wiring harness repairs**

Fig. 47: Identifying Special Tool (12 1 083) And (12 1 081)
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock special tool 12 1 081 :

Squeeze grips (1) lightly and push unlocking lever (2) in direction of arrow.

Or:

Compress handles as far as they will go, tool unlocks automatically.

Fig. 48: Identifying Grips And Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Insert contact sleeve 4 mm² in nest with lock (1) as far as it will go.

Fig. 49: Locating Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Preload contact by squeezing matrix in crimping tool. Grip contact (1) firmly only, do not crimp.

Fig. 50: Locating Grip Contact
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Follow procedure for cutting and stripping insulation from cables, see 61 13 Cutting to length and stripping insulation from cables

Insert stripped end of wire (7) in the contact. Ensure insulation and stripped wire end are correctly laid in contact.

Compress crimping tool as far as it will go.

Crimping tool unlocks automatically.

Take contact out of crimping tool.

Fig. 51: Identifying Wire And Crimping Tool
 Courtesy of BMW OF NORTH AMERICA, INC.

4. Checking crimping

Check insulation crimp (8) and wire crimp (9) against following illustrations to ensure crimps are correctly located.

NOTE: Illustration shows butt connectors and contact sleeves for fan connectors knocked on one side. The crimping procedure is identical here.

Fig. 52: Identifying Insulation Crimp And Wire Crimp
 Courtesy of BMW OF NORTH AMERICA, INC.

Correct crimping:

Visible conductor end (10).

Visible insulation end (11).

Fig. 53: Identifying Conductor End And Insulation End (Correct Crimping)
Courtesy of BMW OF NORTH AMERICA, INC.

Incorrect crimping:

Conductor end (10) inserted too far.

Insulation end (11) in wire crimp.

If necessary, repeat crimping with a new contact.

Fig. 54: Identifying Conductor End And Insulation End (Incorrect Crimping) (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Incorrect crimping:

Conductor end (10) not visible.

Insulation end (11) not visible.

If necessary, repeat crimping with a new contact.

Fig. 55: Identifying Conductor End And Insulation End (Incorrect Crimping) (2 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

61 13 CUTTING TO LENGTH AND STRIPPING INSULATION FROM CABLES

Stripped length:

STRIPPED LENGTH SPECIFICATION

Wire cross-section (mm ²)	Stripped length (mm)
0.35 ... 0.50	4.0
0.75 ... 1.00	4.5
1.00 ... 2.50	5.0

61 13 ... DME MASTER RELAY CONNECTOR

Unlock locking flap (1) of corresponding cable.

Fig. 56: Unlocking Locking Flap
 Courtesy of BMW OF NORTH AMERICA, INC.

With special tool 61 1 136 or 61 1 137 (ejector), press back arrester hook (2) of appropriate contact and pull out cable.

Fig. 57: Identifying Arrester Hook
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 INSTALLING FAN CONNECTOR FOR RETROFITTING/REPAIRS

Special tools required:

- **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**
- 61 9 041 **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**
- 61 9 042 **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**

NOTE: The repair range IV for vehicle electrical system contained the required special tools and individual parts for retrofitting and repair work with the aid of fan connectors.

Special tools:

- special tool 61 9 040

Fig. 58: Identifying Special Tool Kit
Courtesy of BMW OF NORTH AMERICA, INC.

Choose contact sleeve (up to 4 mm²) in accordance with wire cross-section.

Fig. 59: Identifying Contact Sleeve
Courtesy of BMW OF NORTH AMERICA, INC.

Alternatively:

Choose contact sleeves (up to 2.5 mm²) for fan connectors.

Fig. 60: Identifying Contact Sleeves
Courtesy of BMW OF NORTH AMERICA, INC.

Cut through wire loop in wiring harness at established point.

Strip insulation from both wire ends.

Refer to repair instructions:

Cutting to length and stripping insulation from cables, see **61 13 Cutting to length and stripping insulation from cables**

Fig. 61: Identifying Cutting Plier

Courtesy of BMW OF NORTH AMERICA, INC.

Crimp contact sleeves on both wire ends.

Refer to repair instructions:

Crimping on stop parts, see **61 13 Crimping stop parts**

NOTE: If using repair kit for contact sleeves, refer to repair instruction **Butt connector for repairing a plug connection**, see **61 13 Butt connector for repairing a plug connection**

Fig. 62: Identifying Crimp Contact Sleeves On Wire Ends

Courtesy of BMW OF NORTH AMERICA, INC.

Crimp connecting cable for retrofitting likewise with contact sleeve.

Fig. 63: Crimping Connecting Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Cut required number of poles to length for fan connectors.

Fig. 64: Identifying Fan Connectors Poles
Courtesy of BMW OF NORTH AMERICA, INC.

Special tool 61 9 041 (hand crimping tool) in conjunction with 61 9 042 (matrix) are used for pushing contact sleeves onto fan connectors.

Refer to repair instructions:

Special tools for wiring harness repairs, see **61 13 Special tools for wiring harness repairs**

Fig. 65: Identifying Special Tools
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock special tool 61 9 041 :

Squeeze grips (1) lightly and push unlocking lever (2) in direction of arrow.

Or:

Compress handles as far as they will go, tool unlocks automatically.

Fig. 66: Identifying Grips And Unlocking Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Insert prepared fan connector (3) in special tool 61 9 041 / 61 9 042 .

Fig. 67: Inserting Fan Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Attach wire with contact sleeve to fan connector.

Fig. 68: Attaching Wire With Contact Sleeve To Fan Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Press crimping tool together and slide contact sleeve firmly home.

Fig. 69: Identifying Slide Contact Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Once contact sleeves have been pushed on, they should not be detached again from the fan connector or reused.

Push on further contact sleeves for potential branching.

Fig. 70: Identifying Contact Sleeves

Courtesy of BMW OF NORTH AMERICA, INC.

Installation in wet area (engine compartment, wheel arch):

Apply sealing compound on both sides and press into contacts (1).

Fit shrink-fit hose and heat up with hot air blower (2) (approx. 250°C).

NOTE: Ensure that fan connector has sufficient contact surface on mounting point.

Do not heat shrink-fit hose on edges of fan connector too strongly, risk of cracking.

Fig. 71: Identifying Sealing Compound
Courtesy of BMW OF NORTH AMERICA, INC.

Allow shrink-fit hose to cool down until hand-warm. Then press sealing material again into contacts and onto edges of fan connector.

If necessary, carefully heat shrink-fit hose again.

Installation in dry area (interior, luggage compartment):

Slide assembled fan connector into insulation housing until it locks into place.

Fig. 72: Sliding Fan Connector Into Insulation Housing
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 OPENING PLUG HOUSINGS AND REMOVING CONTACTS OF DIFFERENT PLUG SYSTEMS

Special tools required:

- **61 0 300 RELEASING TOOL (COMPLETE KIT)**
- 61 0 400

- **61 1 150 RELEASING TOOL KIT**

Abbreviations and what they mean:

ABBREVIATIONS REFERENCE CHART

D 1.5 / 2.5	Round contacts of 1.5 mm or 2.5 mm diameter
MDK 3plus	Miniature double flat spring contact
JPT ELA	Junior Power Timer flat spring contacts with strand sealing
DFK ELA	Double flat spring contacts with strand sealing
Elo	Electronic contacts with and without strand sealing Manufacturer: Siemens
Elo Power	Electronic contacts for heavy loads with and without strand sealing Manufacturer: Siemens
MQS	Micro Quadlock System electronic contacts with and without strand sealing Manufacturer: AMP
MPQ	Micro Power Quadlock electronic contacts for heavy loads with and without strand sealing Manufacturer: AMP

Ultrasonic-welded connectors:

Ultrasonic-welded connectors (1) can be identified by the welds (2) on their longitudinal side.

The contacts of these connectors cannot be replaced. Replace plug completely.

Fig. 73: Identifying Ultrasonic-Welded Connectors
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Special tools referred to in the repair instructions below are contained in the following special tool kits:

Release and press-out tool 61 1 150

Replaced as from 09/2005 by: 61 0 300

61 0 400

61 13 SPECIAL TOOLS FOR WIRING HARNESS REPAIRS

Special tools required:

- 12 1 080
- **61 0 200 CRIMPING SET (BASIC TOOL)**
- **61 0 210 MATRIX LSK 8**
- **61 0 220 MATRIX FOR SLK 2.8**
- **61 0 230 STENCIL FOR CONTACTS "DFK 40" AND "MAK 8"**
- **61 0 300 RELEASING TOOL (COMPLETE KIT)**
- 61 0 400
- **61 1 190 PLIERS**
- **61 4 320 CRIMPING SET WITH PLIERS**
- 61 9 041 **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**
- 61 9 044 **61 9 040 SET OF TOOLS FOR REPAIR KIT IV**

Repair range, vehicle electrical system:

- Refer to Service Information:

SI 2 04 07 341

Release and press-out tool:

- Special tool 61 0 300
- Special tool 61 0 400 (MINI N12/N14)

Handling:

- Opening plug housings and removing contacts of different plug systems, see **61 13 Opening plug housings and removing contacts of different plug systems**

Fig. 74: Identifying Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

Cutting to length and stripping insulation from cables:

Handling:

- Cutting to length and stripping insulation from cables, see **61 13 Cutting to length and stripping insulation from cables**

Fig. 75: Identifying Cutting Plier

Courtesy of BMW OF NORTH AMERICA, INC.

Crimping stop parts (small contacts):

- Special tool 61 4 320
 1. Tool without crimping head
 2. Crimping head, see **61 13 ... Cutting off, stripping insulation and cutting optical fibres to length**
 3. Crimping head, see **61 13 ... Crimping optical fibres**

4. Crimping head **61 13 ... Crimping Micro Quadlock System contacts (MQS)**
5. Crimping head, see **61 13 ... Crimping Micro Power Quadlock contacts (MPQ)**
6. Replacement blade (face-cutting fibre-optic cables)
7. Replacement blade with tool (insulation stripping unit)
8. Universal crimping head

Fig. 76: Identifying Crimping Stop Parts (Small Contacts)
 Courtesy of BMW OF NORTH AMERICA, INC.

Crimping stop parts (large contacts):

- Special tool 61 0 200 (crimping set)
- Special tool 61 0 210 (matrix set LSK 8)
- Special tool 61 0 220 (matrix set SLK 2.8)
- Special tool 61 0 230 (matrix set MAK 8 / DFK4)

Fig. 77: Identifying Crimping Stop Parts (Large Contacts)
 Courtesy of BMW OF NORTH AMERICA, INC.

Crimping antenna elbow plugs:

- Special tool 61 9 041 (hand crimping tool)
- Special tool 61 9 044 (matrix)

Handling:

- Antenna elbow plug on radio receiver

Fig. 78: Identifying Special Tool (61 9 044) And (61 9 041)
Courtesy of BMW OF NORTH AMERICA, INC.

Repair kit for ignition cables and for crimping fan connector receptacles **4 mm²** :

- Special tool 12 1 080

Handling:

- Crimping stop parts (contacts), see **61 13 Crimping stop parts**

W12 1 080

Fig. 79: Identifying Special Tool Kit

Courtesy of BMW OF NORTH AMERICA, INC.

Repairing ribbon cables:

- Special tool 61 1 190

Handling:

- Repairing ribbon cables, see **61 13 ... Repairing ribbon cables**

Fig. 80: Identifying Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

61 13 .. UNLOCKING AND DISCONNECTING DIFFERENT PLUG CONNECTIONS

NOTE: Examples of unlocking and disconnecting different plug connections.

Press lock and open clip in direction of arrow.

Disconnect plug connection.

Fig. 81: Disconnecting Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and open clip in direction of arrow.

Disconnect plug connection.

Fig. 82: Pressing Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Open clip in direction of arrow and disconnect plug connection in direction of arrow.

Fig. 83: Disconnecting Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 84: Pressing Lock (1 Of 6)
Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 85: Pressing Lock (2 Of 6)

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 86: Pressing Lock (3 Of 6)

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 87: Pressing Lock (4 Of 6)

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 88: Pressing Lock (5 Of 6)

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock and disconnect plug connection in direction of arrow.

Fig. 89: Pressing Lock (6 Of 6)

Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... BASE OF TAB CONNECTOR HOUSINGS

Unlock hook (1) with special tool 61 1 360 and slide plug housing downwards out of base.

Fig. 90: Identifying Special Tool (61 1 360)

Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... CRIMPING MICRO POWER QUADLOCK CONTACTS (MPQ)

Special tools required:

- **61 4 320 CRIMPING SET WITH PLIERS**

To crimp MPQ contacts, use pliers 61 4 321 (1) in conjunction with crimping head 61 4 325 (2) from crimping set 61 4 320 .

NOTE: **Pliers (1) open automatically as far as they will go when handles are pressed**

together.

Fig. 91: Identifying Crimping Head And Crimping Set Plier
Courtesy of BMW OF NORTH AMERICA, INC.

Open pliers (1).

NOTE: Place contact (2) with utmost care in designated nest (observe cable cross-section) in crimping head (3). Make sure it is exactly positioned.

Place MPQ contact (2) in crimping head (3).

Close pliers (1) one notch.

Fig. 92: Identifying MPQ Contact In Crimping Head
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Follow procedure for cutting and stripping insulation from cables, see 61 13 Cutting to length and stripping insulation from cables

Insert stripped cable (2).

Close pliers (1) fully.

Open pliers (1) and remove cable (2).

NOTE: Check contact for correct crimping.

Fig. 93: Identifying Pliers And Stripped Cable
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... CRIMPING MICRO QUADLOCK SYSTEM CONTACTS (MQS)

Special tools required:

- **61 4 320 CRIMPING SET WITH PLIERS**

To crimp MQS contacts, use pliers 61 4 321 (1) in conjunction with crimping head 61 4 324 (2) from crimping set 61 4 320 .

NOTE: Pliers (1) open automatically as far as they will go when handles are pressed together.

Fig. 94: Identifying Crimping Head And Crimping Set Plier
Courtesy of BMW OF NORTH AMERICA, INC.

Open pliers (1).

Fold up contact carrier (2).

Insert MQS contact (3) in contact carrier (2).

Fold back contact carrier (2).

Fig. 95: Identifying MQS Contact
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Follow procedure for cutting and stripping insulation from cables, see 61 13 Cutting to length and stripping insulation from cables

Close pliers (1) one notch.

Insert stripped cable (2).

Close pliers (1) fully.

Fig. 96: Identifying Pliers And Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Open pliers (1).

Open contact carrier (2) gently and carefully remove MQS contact.

NOTE: Check contact for correct crimping.

Fig. 97: Opening Contact Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... CRIMPING ANNULAR CONTACTS

Special tools required:

- **61 4 320 CRIMPING SET WITH PLIERS**

Crimping annular contacts:

Special tool 61 4 320

61 13 ... CRIMPING OPTICAL FIBRES

Special tools required:

- **61 4 320 CRIMPING SET WITH PLIERS**

To crimp optical fibres, use pliers 61 4 321 (1) in conjunction with crimping head 61 4 323 (2) from crimping set 61 4 320 .

NOTE: **Pliers (1) open automatically as far as they will go when handles are pressed together.**

Fig. 98: Identifying Crimping Head Plier
Courtesy of BMW OF NORTH AMERICA, INC.

Move contact guide by means of stop lever (1) into corresponding position (pin contact or jack).

Fig. 99: Identifying Stop Lever

Courtesy of BMW OF NORTH AMERICA, INC.

Open pliers (2).

Place pin contact or jack (1) in crimping head and secure with locking lever (3).

Fig. 100: Identifying Pin Contact Or Jack

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Follow procedure for cutting and stripping insulation from cables, see 61 13 Cutting to length and stripping insulation from cables

Insert stripped optical fibre (1) as far as it will go into pin contact or jack (2).

Close pliers (3) fully.

Open pliers (3) and locking lever (4).

Remove optical fibre (1).

Fig. 101: Identifying Optical Fibre Plier
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Make sure optical fibre is correctly seated in jack.

Right (A)

End of optical fibre (1) must be flush with tip of pin contact (2).

Wrong (B)

End of optical fibre (1) is not flush with tip of pin contact (2).

Fig. 102: Identifying End Of Optical Fibre
 Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... CUTTING OFF, STRIPPING INSULATION AND CUTTING OPTICAL FIBRES TO LENGTH

Special tools required:

- **61 4 320 CRIMPING SET WITH PLIERS**

To cut off, strip insulation and cut optical fibres to length, use pliers 61 4 321 (1) in conjunction with crimping head 61 4 322 (2) from crimping set 61 4 320 .

NOTE: **Pliers (1) open automatically as far as they will go when handles are pressed together.**

Fig. 103: Identifying Crimping Head And Crimping Set
Courtesy of BMW OF NORTH AMERICA, INC.

Cutting optical fibre

Open pliers (1).

Place optical fibre (2) in cutting device (3).

Close pliers (1) and remove optical fibre (2).

Fig. 104: Identifying Optical Fibre Plier

Courtesy of BMW OF NORTH AMERICA, INC.

Stripping insulation from optical fibre

Open pliers (1).

Open lever (2) in direction of arrow.

Fig. 105: Opening Lever

Courtesy of BMW OF NORTH AMERICA, INC.

Slide optical fibre (1) into stripping device (2) until flush at point (3).

Close pliers (4) fully.

Close clamping lever (5) in direction of arrow.

Open pliers (4) by one tooth notch.

Open clamping lever (5) against direction of arrow again and remove optical fibre (1).

NOTE: A stripping replacement blade set is available under number 61 4 327.

Fig. 106: Identifying Pliers Clamping Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Cutting optical fibre to length

IMPORTANT: The cutting blade must be replaced prior to each cutting of the optical fibre.

Pull pin (1) in direction of arrow.

Fold up blade retaining link (2) in direction of arrow.

Fig. 107: Pulling Pin
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Risk of injury when changing the blade.

Remove blade (1) and replace.

Installation:

Make sure blade (1) is correctly seated on locating points (2).

Fig. 108: Identifying Blade
Courtesy of BMW OF NORTH AMERICA, INC.

Open pliers (3).

Slide optical fibre (1) into cutting device (2) until insulation of optical fibre (1) butts against clamping device.

Close pliers (3) fully and keep closed.

Remove optical fibre (1).

Fig. 109: Identifying Optical Fibre Plier
Courtesy of BMW OF NORTH AMERICA, INC.

Manufactured by AMP: The following contact types without strand sealing can be fitted in the plug housings:

- MQS (Micro Quadlock System)
- MPQ, width 2.8 mm (Micro Power Quadlock)
- MPQ, width 5.2 mm (Micro Power Quadlock)

Socket housing:

Raise lock (1) on housing (2).

Push contact carrier (3) from rear out of housing (2).

NOTE: Pushing out the contact carrier releases the secondary locks of the socket contacts.

Fig. 110: Pushing Contact Carrier From Rear Out Of Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Hold down retaining hook (1) of socket contact in opening of contact carrier with a small screwdriver.

Pull wire with socket contact in direction of arrow as far as secondary lock (2).

Fig. 111: Identifying Retaining Hook Of Socket
Courtesy of BMW OF NORTH AMERICA, INC.

Hold down retaining hook in secondary lock (1) again and pull cable with socket contact (2) completely out of contact carrier (3).

Fig. 112: Pulling Cable With Socket Contact
Courtesy of BMW OF NORTH AMERICA, INC.

Pin housing:

Contacts 1 ... 13 and 19 ... 27:

Raise locking slide (1) on both sides (2) of housing and detach.

NOTE: Detaching the locking slide releases the secondary locks of the pin contacts.

Fig. 113: Raising Locking Slide
 Courtesy of BMW OF NORTH AMERICA, INC.

Contacts 14 ... 18 and 28 ... 30:

Pull slide (1) outwards completely.

Raise lock (2) on housing.

Pull contact carrier (3) out of housing.

NOTE: Pulling out the contact carrier releases the secondary locks of the pin contacts.

Fig. 114: Pulling Slide And Contact Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

The pin contacts are pulled out of a contact carrier as described under "Socket housing".

61 13 ... PLUG HOUSING, LCC CONTACT (LOAD CURRENT CONTACT)

Special tools required:

- 61 0 317 **61 0 300** **RELEASING TOOL (COMPLETE KIT)**

Socket housing:

Press lock (1) with suitable tool (2) in direction of arrow out of socket housing (3).

Fig. 115: Pressing Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Pull lock (1) out of socket housing (2).

Fig. 116: Pulling Lock Out Of Socket Housing

Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 61 0 317 into socket housing (1) and pull out lead with LCC contact (2) in direction of arrow.

Fig. 117: Identifying Special Tool (61 0 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Pin housing:

Unlock locking slide (1) of pin housing (2) with suitable tool (3) in direction of arrow.

Fig. 118: Unlocking Locking Slide Of Pin Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 61 0 317 into pin housing (1) and pull out lead with LCC contact (2) in direction of arrow.

Fig. 119: Identifying Special Tool (61 0 317)
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... RELAY CARRIER

Place special tool 61 1 153 on relay carrier (1) and carefully pull in direction of arrow until retaining lugs (2) on relay carrier are raised.

Fig. 120: Identifying Relay Carrier And Retaining Lugs
Courtesy of BMW OF NORTH AMERICA, INC.

Pull relay carrier (2) in direction of arrow into first catch (3).

Fig. 121: Pulling Relay Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

Press down arrester hook (4) of appropriate contact and pull out cable with contact.

Press out double flat spring contact with special tool 61 1 136 or 61 1 137 (ejector).

Fig. 122: Identifying Arrester Hook
 Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... REPAIRING RIBBON CABLES

Special tools required:

- **61 1 190 PLIERS**

Place ribbon cables (1) in connector housing (2) and close cover (3).

Fig. 123: Identifying Ribbon Cables And Connector Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Place connector housing (1) in tool (2) 61 1 190 .

Close tool (2).

Fig. 124: Identifying Connector Housing
Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... Retaining bracket

Pull relevant fuse out of fuse block (1).

NOTE: Mark positions when removing fuses.

Pull locking slide (2) out of fuse block (1) as far as it will go.

Fig. 125: Identifying Fuse Block
 Courtesy of BMW OF NORTH AMERICA, INC.

With special tool 61 1 136 or 61 1 137 (ejector), press back arrester hook (3) of appropriate contact and pull out cable.

Fig. 126: Identifying Locking Slide And Fuse Block
 Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... SOCKET HOUSING (RADIO PLUG), HYBRID SYSTEM MQS/MPQ

Manufactured by AMP: The following contact types without strand sealing can be fitted in the plug housings:

- MQS (Micro Quadlock System)
- MPQ, width 2.8 mm (Micro Power Quadlock)
- MPQ, width 5.2 mm (Micro Power Quadlock)

Removing MPQ contacts from radio plug:

Press lock (1) in direction of arrow.

Detach secondary lock (2) from radio plug.

Fig. 127: Pressing Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Feed special tool 61 1 135 past side of contact.

Press special tool 61 1 135 in direction of arrow.

Pull wire (1) with socket contact out of radio plug (2).

Fig. 128: Pulling Wire With Socket Contact Out Of Radio Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Removing MQS contacts from contact carrier:

Press lock (1) in direction of arrow and pull housing (2) out of radio plug.

Fig. 129: Pressing Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock (1) in direction of arrow. Pull contact carrier (2) out of housing (3).

NOTE: When the contact carrier is pulled out, the secondary locks of the socket contacts are raised.

Fig. 130: Pressing Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Hold down retaining hook (1) of socket contact in opening of contact carrier with a small screwdriver.

Pull wire with socket contact in direction of arrow as far as secondary lock (2).

NOTE: The illustration shows an 8-pin socket housing where removal of the contacts is identical.

Fig. 131: Identifying Retaining Hook Of Socket
Courtesy of BMW OF NORTH AMERICA, INC.

Hold down arrester hook in secondary lock (1) again. Pull wire with socket contact (2) out of contact carrier (3).

Fig. 132: Pulling Cable With Socket Contact
Courtesy of BMW OF NORTH AMERICA, INC.

Removing MPQ contacts from contact carrier:

Remove contact carrier (1) with MQS contacts from radio plug.

Raise lock (2) on radio plug.

Pull contact carrier (3) out of radio plug.

Fig. 133: Pressing Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Press lock (1) in direction of arrow.

Pull secondary lock (2) in direction of arrow completely out of contact carrier (3).

Fig. 134: Pulling Secondary Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Press special tool 61 1 135 on inside of contact into contact carrier (2).

Pull wire with socket contact (1) out of contact carrier (2).

Fig. 135: Pulling Wire With Socket Contact
 Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... TREATING CABLES AND FIBRE-OPTIC CABLES

Special tools required:

- **61 1 190 PLIERS**
- **61 4 320 CRIMPING SET WITH PLIERS**

NOTE: Special tools referred to in the repair instructions below are contained in the following special tool kits:

REPAIR INSTRUCTIONS CHART

Repair range for vehicle electrical system	
Crimping set with tool for fibre-optic cables, Micro Power Quadlock (MPQ), Micro Quadlock System (MQS) contacts and universal crimping head	61 4 320
Insulation displacement tool for ribbon cable	61 1 190

Subject of repair instructions

- Special tools for wiring harness repairs, see **61 13 Special tools for wiring harness repairs**
- Cutting to length and stripping insulation from cables, see **61 13 Cutting to length and stripping insulation from cables**
- Crimping stop parts (contacts), see **61 13 Crimping stop parts**
- Butt connector for repairing a plug connection, see **61 13 Butt connector for repairing a plug connection**

20 BATTERY

12 00 ... INSTRUCTIONS FOR DISCONNECTING AND CONNECTING BATTERY

Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

Before disconnecting battery:

Turn off the ignition and other electrical loads/consumers to prevent sparking when reconnecting.

NOTE: If the ignition is not turned off when the battery is disconnected, fault memories may be set in some control units.

IMPORTANT:

- **There is a danger of mixing up battery leads: If the battery positive and negative leads are the same color and you are in doubt, follow the polarity to the battery, then mark and cover the leads.**
- **On vehicles with radio code: After disconnecting the battery, the radio code must be re-entered. Therefore obtain the radio code card from the customer beforehand. Note stored stations and restore them after connecting the battery.**
- **Stored settings of the on-board computer and clock will also be lost.**
- **All available central keys must be recoded for cars with first generation infrared transmitter locking systems.**

General notes on disconnecting battery:

- Do not disconnect battery leads and leads from alternator and starter motor while engine is running.
- Cars with IBS on battery negative terminal:

Do not under any circumstances pull/lever off pole shoes by force.

Do not under any circumstances release socket-head cap screw of IBS.

- Detach terminal of battery negative lead from car battery and second battery if fitted. Cover battery negative terminal(s) and secure.
- When work is carried out on the electrical system, faults may be caused in the fault memories of some control units when the battery is connected.
- When installing battery terminal: Tightening torque: 61 21 1AZ, see 61 21 BATTERY WITH TERMINAL .

After connecting battery:

IMPORTANT: After a power supply interruption some equipment is disabled and must be reactivated.

Likewise, individual settings are lost and must be activated.

Example:

- Vehicles with build date from 03/2007:

Teach-in mid-position for power steering, see 61 31 996 Carry out steering angle sensor adjustment

- If necessary, activate sliding sunroof
- If necessary, carry out adjustment of active front steering
- If necessary, activate power windows
- If necessary, activate mirror with compass, see 51 16 ... CALIBRATING COMPASS IN INTERIOR REARVIEW MIRROR

Please refer to the Progman user documentation for further information on vehicle-specific activation.

Vehicles with a two-battery system

Starter and equipment batteries

A two-battery system has a starter battery circuit and an equipment battery circuit. A secondary control unit monitors both battery circuits. Depending on the situation, the battery circuits are connected to or isolated from the secondary control unit via an isolating relay.

Two AGM batteries, whose design and properties are described in 61 20 ... AGM battery, are used as a storage battery.

IMPORTANT: These batteries must not under any circumstances be charged with a voltage in excess of 14.8 V. Rapid programs must not be used either.

Receiving/giving starting assistance via jump start terminal

The engine can be jump-started with an external voltage supply via the jump start terminal on the right side of the engine compartment.

NOTE: The starter battery is isolated from the alternators when the engine hood/bonnet is open.

Giving starting assistance via the jump start terminal is thus limited by the capacity of the starter battery when

the engine hood/bonnet is open.

Charging starter and equipment batteries via jump start terminal

The starter battery is charged as a matter of priority with a charger connected to the jump start terminal. The voltage at the starter battery is the decisive factor in determining whether the equipment battery is also included in the charging operation. The secondary control unit automatically detects a charging operation at a charging voltage at the starter battery of greater than 13.5 V. The isolating relay is closed and thus the equipment battery is connected in parallel. Both batteries are now charged.

Prerequisite:

- Terminal 61 inactive
- Terminal 15 inactive

If terminal 15 becomes "active" during the charging operation, the isolating relay is opened immediately and again only the starter battery is charged.

NOTE: When the engine hood is open, the isolating relay is also opened in normal operation when the engine is running.

A special mode can be set by means of diagnosis for workshop/garage operation. The isolating relay is closed from terminal R in this operating mode. This mode is automatically reset once a distance of 5 km has been driven.

Trickle charging

The increased closed-circuit current consumption can be compensated for via the jump-start connection point with the aid of the "Acctiva easy" battery trickle charger.

IMPORTANT: The cigarette lighter is isolated from the electrical system after terminal R "OFF" on a timed basis (60 mins.), thereby interrupting charging of the equipment battery via the cigarette lighter. This is prevented if the battery master switch (on the right side of the luggage compartment behind the panel) is turned on and off again twice within 2 seconds. (Cigarette light battery charging function).

12 00 ... INSTRUCTIONS ON STARTING AID

Do not start the engine with help of starting sprays.

Preparation:

Conform with the following when starting engine with starting cable.

- Ensure that jump lead wires are to appropriate cross-section size.

- Only use fuse-protected jump leads.
- Check whether the current supplying battery has 12 V voltage.
- If engine is started from battery of another vehicle, ensure that there is no contact between the bodies of both vehicles.

CAUTION: Never touch ignition system components and current - dangerous high tension!

If the battery in the vehicle supplying power is weak, start the engine of this vehicle and let it run at idling speed.

Carrying out:

Always conform with the procedures to avoid injury to persons or damage to parts.

- On automatic transmission, select "P" setting, apply handbrake.
- Move the shift lever of vehicles with manual transmission into neutral and apply the parking brake.
- Ensure that the jump leads cannot get caught in rotating parts, e.g. fan.
- First connect positive terminals of both batteries with one jump lead (red).
- Use positive connection point in engine compartment for vehicles with one battery in trunk.
- Then attach second jump lead (black) to negative terminal of donor battery and to engine ground or body ground on vehicle to be started.

CAUTION: Never connect second jump lead (black) to negative terminal of battery in vehicle to be started. This would produce explosive gas which could be ignited by sparks.

Danger of explosion!

After engine of vehicle to be started has started up, first disconnect the jump lead on the negative terminal/ground connection. Then remove jump lead from positive terminals.

61 00 ... BATTERY

NOTE: Important notes and instructions for handling batteries in the dealership can be found in:

- Battery master document
- Disconnecting battery, see **12 00 ... Instructions for disconnecting and connecting battery**
- Battery charging, see **61 20 ... Battery charging**
- Welding work
- External jump-starting aid, see **12 00 ... Instructions on starting aid**

Battery care and maintenance

In low-maintenance batteries, check the acid level at least once a year. If necessary, top up with distilled water up to the top marking.

The increasing number of electronic control units in the car reduces the self-discharging time of the battery (even in standby mode). To maintain the battery service life and to avoid exhaustive discharging, recharge laid-up vehicles every 6 weeks at the latest. The time for self-discharging depends on vehicle type and equipment specification.

Battery test

The battery acid density can be used to measure the charge state. However this test produces uncertainty caused by a design-related range of variation. The acid density e.g. for a charged battery is 1.28 kg/l (in the tropical version the acid density is 1.23 kg/l).

Another interference factor is the acid lamination immediately after filling with distilled water.

Battery wear with partially sulphated and/or heavily contaminated plates will also lead to incorrect acid density test results.

61 00 ... REPAIRING AIRBAG CABLES

IMPORTANT: Only repair those cables which show visible signs of damage. In the event of visible damage, make sure there is only one cable repair in effect after the repair work. If no visible damage can be identified, the entire cable must be replaced. When carrying out repairs to the airbag wiring harness, you must use the spare parts offered in the Electronic Parts Catalogue (EPC).

Safety regulations:

Safety regulations for handling components of airbag system, see **72 00 ... SAFETY REGULATIONS FOR HANDLING COMPONENTS WITH GAS GENERATORS** .

Instructions for disconnecting and connecting battery, see **12 00 ... Instructions for disconnecting and connecting battery**

Procedure for cable repair

In event of non-visible damage to wiring harness:

Disconnect plug connection on airbag module or on adapter plug. It is absolutely vital to disconnect the contacts in succession as there is a risk of them being mixed up! Cut through one cable after the other at an appropriate position, do not under any circumstances cut through both cables at the same time. Insulate cables remaining in wiring harness with insulating tape. Now disconnect plug connection on airbag control unit. Unpin contacts. Cut through one cable after the other at an appropriate position and insulate with insulating tape, do not under any circumstances cut through both cables at the same time. Pin contacts of repair cable for airbag control unit in

control unit plug, assignment of repair cables is relevant. Lay repair cable in car parallel to existing airbag lead. Now pin in contacts for airbag control unit or contacts of adapter plug, assignment of repair cables is relevant. Cut off excess length of repair cable in proximity (visible area) of airbag module or of adapter plug. Twist open cables. With the connectors and shrink-fit hoses in the Electronic Parts Catalogue (EPC), reconnect the cables with the same cable colors. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

In event of visible damage:

Expose cable at damaged areas. Cut through one cable after the other at an appropriate position and insulate cables no longer required in wiring harness with insulating tape, do not under any circumstances cut through both cables at the same time. Now, depending on the scope of work, unpin contacts either on airbag control unit/airbag module or on adapter plug. Cut off unpinned cables. Insulate cables remaining in wiring harness with insulating tape. Now pin in contacts of repair cable, assignment of repair cables is relevant. Lay repair lead in car parallel to existing airbag lead up to cutting point. Cut off excess length of repair lead. Twist open cables. Connect cables with connectors and shrink-fit hoses in Electronic Parts Catalogue (EPC), assignment of repair cables is relevant. Twist cables again, open length (twist) must not exceed 40 mm. Secure interface (shrink-fit hoses) with insulating tape to prevent cables from twisting open.

Instructions for cutting off, insulating, crimping cables, installing and removing contacts:

Cutting off and insulating cables, see **61 13 Cutting to length and stripping insulation from cables**

Repairing a plug connection using connectors, see **61 13 Butt connector for repairing a plug connection**

Installing and removing contacts, see **61 13 Opening plug housings and removing contacts of different plug systems**

61 00 ... SAFETY INSTRUCTIONS FOR HANDLING VEHICLE BATTERY

Battery acid is highly corrosive:

Do not allow any battery acid to come into contact with the eyes, the skin or clothing. Therefore wear protective clothing, gloves and goggles.

Do not tilt the battery, acid may emerge from the vent opening.

In event of contact with acid:

If acid is splashed into the eyes, rinse them immediately for several minutes with clear water. You must then consult a doctor without delay.

If acid is splashed onto the skin or clothing, neutralize it immediately with a soapy solution and rinse with lots of water.

Seek medical attention immediately if battery acid is accidentally swallowed.

Explosion hazard:

Strictly no flames, sparks, naked light or smoking!

A highly explosive mixture of electrolytic gas is created when batteries are charged. The rooms where charging is carried out must therefore always be well ventilated.

Avoid the formation of sparks when handling cables, wiring and electrical devices.

Turn the ignition lock to the 0 position before disconnecting or connecting the battery.

Do not place tools or any similar object on the battery (danger of short-circuiting and explosion!).

61 20 ... THRESHOLD VALUES FOR BATTERY INSPECTION OF ALL BATTERY (TELEPHONE EXCEPT FOR TELEPHONE BATTERY)

Observe safety instructions for handling vehicle battery, see **61 00 ... Safety instructions for handling vehicle battery**

Test step 1 - before charging the battery

BATTERY CHARGING REFERENCE CHART

Charge state ⁽¹⁾	Starting capability ⁽¹⁾	Test result
Not testable		Charge
less than 50 % ⁽¹⁾		Charge
more than 50 %	less than 75 %	Charge
more than 50 %	more than 75 % ⁽¹⁾	Charge
more than 80 %	more than 75 %	O.K.

Test step 2 - after charging the battery

BATTERY CHARGING REFERENCE CHART

Charge condition ⁽¹⁾	Starting capability ⁽²⁾	Test result
Not testable		Defective
less than 50 %	less than 75 %	Charge
more than 50 %	more than 75 %	Charge

- (1) Charge condition and starting power must always be evaluated together
- (2) When test charging for more than 5 hours, use charger Gossen CG 32 or Siemens / Gossen VB 801
- (3) Fully charge until charge state is more than 80 %.

NOTE: If battery was checked on the positive terminal in the engine compartment, repeat check directly on battery for sake of safety.

61 20 ... AGM BATTERY

7610891E

Fig. 136: Identifying AGM Battery
Courtesy of BMW OF NORTH AMERICA, INC.

Introduction

In September 2002 so-called VRLA batteries, better known as **AGM batteries**, were introduced.

(VRLA stands for **V**alve **R**egulated **L**ead **A**cid, i.e. lead acid battery with pressure relief valve; **AGM** stands for **A**bsorbent **G**lass Mat, i.e. absorbent glass fibre fleece)

AGM batteries are fitted in models with electrical loads/consumers which have a high energy demand.

With the option SA 146 (2nd battery), the AGM battery (70 Ah) is fitted as the 2nd battery.

The constantly increasing energy demand of modern vehicle electrical systems calls for ever more powerful

battery solutions. Today, up to 100 servomotors, which have to be electrically powered, operate in a modern luxury-class motor vehicle. Added to these are safety, environmental and comfort and convenience elements which are increasingly becoming standard features, such as e.g. Anti-lock Brake System (ABS), Dynamic Stability Control (DSC), electric steering effort assistance (EPS), heated catalytic converter, electronic chassis and suspension control, air conditioning and navigation system.

The power consumption is considerable even when the vehicle is parked.

The somewhat higher price compared with a battery of similar size is fully balanced by the following benefits:

- Significantly longer service life
- Increased starting reliability at low temperatures
- Safe starting of engines with high starting current demands, e.g. high-performance diesel engines
- 100 % freedom from maintenance
- Low risk in event of an accident (reduced risk to the environment)

Service life of AGM battery

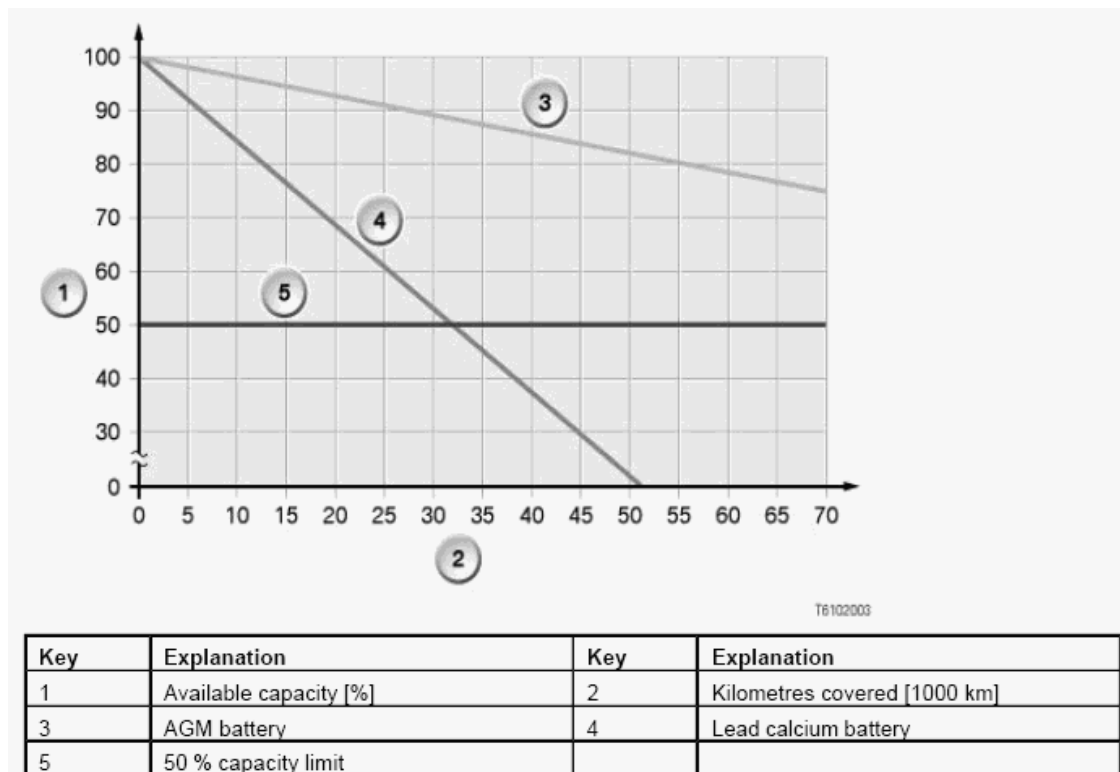

Fig. 137: AGM Battery Service Life Graph
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlike the previously used lead calcium batteries, the sulphuric acid contained in batteries with fleece technology is not self-contained in the battery housing.

Instead, the sulphuric acid is 100 % bound up in glass fibre fleece mats (separators). Thus, no acid can escape if the battery housing is damaged. In addition, the AGM battery is sealed gas-tight. This is possible because the gases are converted back into water as a result of the separator permeability.

Brief description of components

An AGM battery can be recognized by its black housing and the lack of a so-called "Magic Eye".

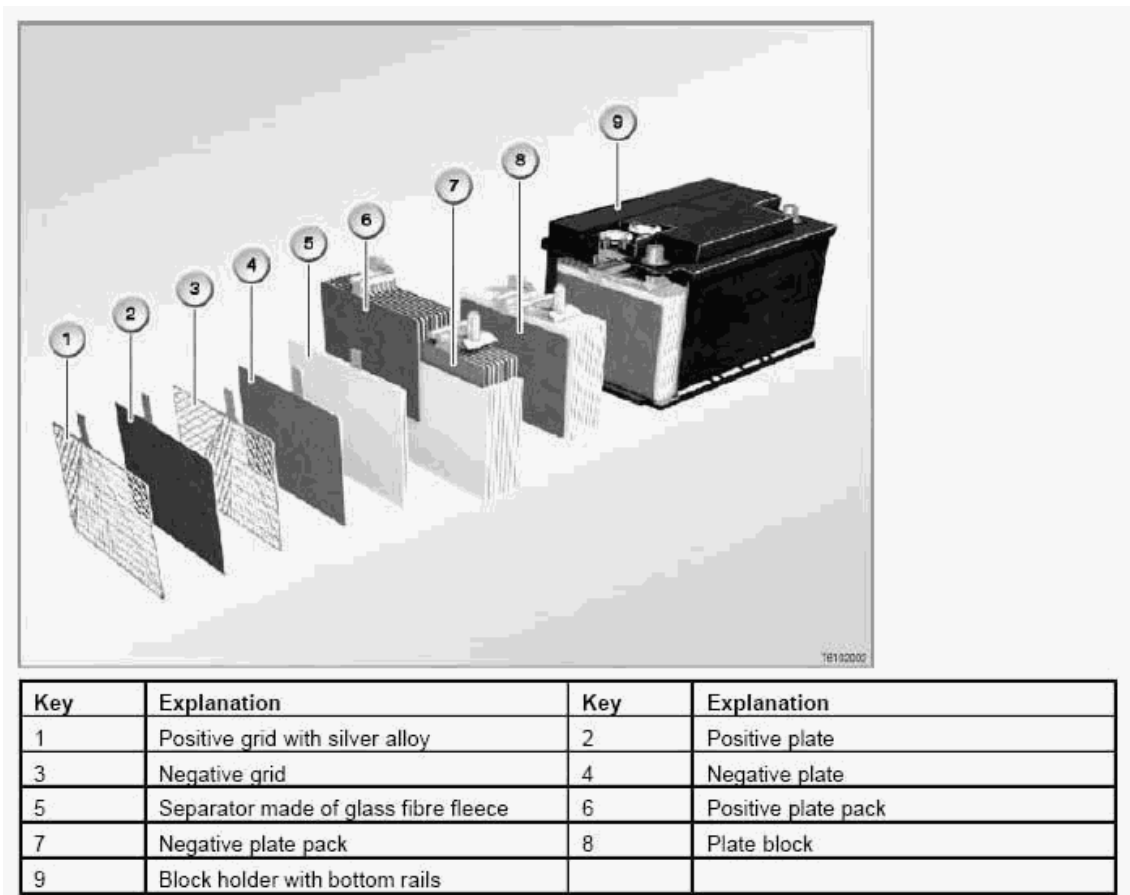

Fig. 138: Identifying AGM Battery Components
 Courtesy of BMW OF NORTH AMERICA, INC.

Design

The AGM battery differs from the conventional lead calcium battery as follows:

- Larger plates:
 - Larger plates provide for a 25 % higher power density.
- Separators made of glass fibre fleece:
 - These provide for up to 3 times higher cycle reliability.

This in turn improves cold starting performance, current consumption and service life.

- Gas-tight housing with pressure relief valve:

The cell plugs are welded and cannot be opened.

- Acid bound up in the glass fibre fleece:

The acid is not as previously self-contained in the housing, but 100 % bound up in the glass fibre fleece. This provides increased protection against acid leakage and thus represents a reduced risk to the environment.

Mode of operation

The AGM battery differs from conventional batteries in its non-polluting and substance-retaining behavior during charging.

When vehicle batteries are charged, the two gases oxygen and hydrogen are released by electrolysis.

- In a conventional wet lead calcium battery, the two gases hydrogen and oxygen are dissipated into the atmosphere.
- In an AGM battery, the two gases are converted back into water: The oxygen which is created at the positive electrode during charging passes through the permeable glass fibre fleece to the negative electrode. At the negative electrode the oxygen reacts with the arriving hydrogen ions in the electrolyte to form water (oxygen cycle).

In this way, the gas and thus also the electrolyte are not lost.

Only in the event of an excessively heavy buildup of gas, i.e. excessively high pressure buildup (20 to 200 mbar), does the pressure relief valve discharge the gas. In this process, the pressure relief valve does not allow any oxygen in the air to enter. Because a valve regulates the pressure in the battery, the AGM battery is also known as a VRLA battery (Valve Regulated Lead Acid).

Notes and instructions for service personnel

It is necessary when handling an AGM battery to observe some particular points pertaining to battery changing and installation location.

Charging

WARNING: Do not charge the AGM battery with greater than 15.2 V. No quick-charging routines!

When charging removed batteries (so-called stand-alone batteries), do not exceed the maximum charging voltage of 15.2 V at room temperature. Also when charging via the jump start terminal, do not exceed the maximum charging voltage of 15.2 V at room temperature.

The AGM battery will be damaged even when it is only briefly charged with a charging voltage of more than 15.2 V. A charging voltage of more than 15.2 V is usually used in quick-charging routines.

Installation location

WARNING: Do not install the AGM battery in the engine compartment.

The AGM battery must not be installed in the engine compartment on account of the high spatial temperature differences, otherwise its service life will be significantly shortened.

Housing

WARNING: Do not open the AGM battery.

The AGM battery must not be opened under any circumstances as the introduction of oxygen from the air will cause the battery to lose its chemical equilibrium and be rendered non-operational.

Battery changing

Any conventional lead calcium battery can always be replaced by an AGM battery.

Using an AGM battery does not require any alterations to be made to the vehicle electrical system.

NOTE: The AGM battery is recommended for "problem customers".

"Problem customers" encounter a high energy throughput through their batteries. This high energy throughput is caused by stationary loads/consumers (TV, independent heating, etc.) and a bad use profile for the battery ("chauffeur operation", short-distance driving, "stop-and-go"). The use of an AGM battery is recommended for these problem customers.

61 20 ... BATTERY CHARGING

If a normal or quick charger is used to charge the battery, the battery must be disconnected from the vehicle electrical system and removed. This prevents damage to paintwork and upholstery.

IMPORTANT: In order to prevent the intelligent battery sensor from malfunctioning, the charging terminals in the engine compartment must be used without fail in vehicles from E60 and should be used if possible in other vehicles.

IMPORTANT: Before charging the battery while it is installed, first carry out a closed-circuit current test, see 61 20 ... Battery open-circuit current test. If here the voltage is 10 V or less, one or more of the cells may be faulty or the entire battery may already be damaged. In this case, always remove the battery as escaping gases

during charging could damage the interior equipment and trim. Attempt to regenerate faulty cells with low charging current.

If necessary, open existing plugs on the individual cells.

61 20 ... BATTERY OPEN-CIRCUIT CURRENT TEST

NOTE: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery
Observe Service Information Adapter for open-circuit current measurement.

W05 95 001

Fig. 139: Identifying Battery Open-Circuit Current Testing Machine
Courtesy of BMW OF NORTH AMERICA, INC.

The open-circuit current test is performed using the Diagnosis and Information System (DIS).

61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD

WARNING: Observe safety instructions for handling vehicle battery.
Follow instructions for disconnecting and connecting battery!
Observe notes on power supply / on intelligent battery sensor (IBS).

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel with fitted mat, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**

Version with intelligent battery sensor (IBS):

Loosen nut (1).

Tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

**IMPORTANT: Do not under any circumstances use force to pull off pole shoe.
Do not under any circumstances release socket head cap screw of IBS (2).**

Detach battery negative lead (3) with IBS (2) in upward direction, lay to one side and secure.

Fig. 140: Identifying Head Cap Screw Of IBS
Courtesy of BMW OF NORTH AMERICA, INC.

Version without intelligent battery sensor (IBS):

Disconnect battery negative lead (1).

IMPORTANT: Cover battery negative terminal post and secure negative lead (1) at side.

Tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

Fig. 141: Identifying Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

61 20 908 PERFORMING BATTERY "POWER RESET" (FOR PROGRAMMING/CODING CONTROL UNIT(S))

IMPORTANT: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

The following steps must be carried out for a "power reset":

- Switch off and disconnect battery charger
- Switch off ignition

Cars with ignition key: Turn ignition key to 0 position

Cars with identification sensor: Remove identification sensor from slot

Cars with comfort access system: Make sure terminal is in 0 position

- Disconnect battery negative terminal
- Reconnect battery negative terminal (to ensure bus activity)
- Waiting time (5-10 seconds)
- Disconnect battery negative terminal
- Waiting time (1 minute)
- Connect battery negative terminal and tighten, tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .
- Connect and switch on battery charger
- Switch ignition on

21 BATTERY REMOVAL

61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD

**WARNING: Observe safety instructions for handling vehicle battery.
Follow instructions for disconnecting and connecting battery!
Observe notes on power supply / on intelligent battery sensor (IBS).**

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel with fitted mat, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**

Version with intelligent battery sensor (IBS):

Loosen nut (1).

Tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

**IMPORTANT: Do not under any circumstances use force to pull off pole shoe.
Do not under any circumstances release socket head cap screw of IBS (2).**

Detach battery negative lead (3) with IBS (2) in upward direction, lay to one side and secure.

Fig. 142: Identifying Head Cap Screw Of IBS
Courtesy of BMW OF NORTH AMERICA, INC.

Version without intelligent battery sensor (IBS):

Disconnect battery negative lead (1).

IMPORTANT: Cover battery negative terminal post and secure negative lead (1) at side.

Tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

Fig. 143: Identifying Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

61 20 908 PERFORMING BATTERY "POWER RESET" (FOR PROGRAMMING/CODING CONTROL UNIT(S))

IMPORTANT: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

The following steps must be carried out for a "power reset":

- Switch off and disconnect battery charger
- Switch off ignition

Cars with ignition key: Turn ignition key to 0 position

Cars with identification sensor: Remove identification sensor from slot

Cars with comfort access system: Make sure terminal is in 0 position

- Disconnect battery negative terminal
- Reconnect battery negative terminal (to ensure bus activity)
- Waiting time (5-10 seconds)
- Disconnect battery negative terminal
- Waiting time (1 minute)
- Connect battery negative terminal and tighten, tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .
- Connect and switch on battery charger
- Switch ignition on

61 21 010 REMOVING AND INSTALLING BATTERY

WARNING: Observe safety instructions for handling vehicle battery, see 61 00 ... Safety instructions for handling vehicle battery

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**

Unfasten plug connection (2) and disconnect.

Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**

Open positive terminal cover (3).

Fig. 144: Identifying Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

Release nut (1) of safety battery terminal (2), tightening torque: 61 21 1AZ, see **61 21 BATTERY WITH TERMINAL** .

IMPORTANT: Do not under any circumstances pull/lever safety battery terminal (2) off by force.

Detach safety battery terminal (2) towards top, lay to one side and secure.

Fig. 145: Identifying Battery Terminal And Nut
 Courtesy of BMW OF NORTH AMERICA, INC.

Release threaded pin (1).

Fold upper holder (3) up.

Take off holder (2).

Detach vent (6) in direction of arrow.

Fold both clips (4) open.

Lift out battery (5).

Installation:

Make sure battery (5) is correctly seated in associated mounts.

Fig. 146: Detaching Vent
 Courtesy of BMW OF NORTH AMERICA, INC.

31 SWITCH

61 31 .. OVERVIEW OF SWITCHES

- | | | | |
|---|--|----|---|
| 1 | Light operating unit | 6 | Switch for slide/tilt sunroof |
| 2 | Turn signal/headlight dipping stalk | 7 | Toggle switch for power window control |
| 3 | Fixture for steering column stalk | 8 | Switch unit on center console |
| 4 | Windscreen wiper switch | 9 | Switch for sport steering wheel |
| 5 | Switch for hazard warning system/central locking | 10 | Brake light switch / clutch switch module |

Fig. 147: Identifying Switches Components

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 005 REMOVING AND INSTALLING/REPLACING FIXTURE FOR STEERING COLUMN STALK

WARNING: Move wheels into straight-ahead position and do not alter this position during the repair work.
With steering wheel removed, do not under any circumstances turn/twist fixture for steering column stalk!

Necessary preliminary tasks:

- Remove steering wheel, see [32 33 000 REMOVING AND INSTALLING/REPLACING STEERING WHEEL \(FROM 09/2006\)](#)

- Remove lower section of steering column trim, see **32 31 020 REMOVING AND INSTALLING / REPLACING LOWER SECTION OF STEERING COLUMN TRIM**
- Remove top section of steering column casing, see **32 31 003 REPLACING UPPER SECTION OF STEERING COLUMN TRIM** .

Unlock and disconnect plug connections (1) on turn indicator/headlight dipping stalk and on windscreen wiper stalk.

Fig. 148: Identifying Plug Connections
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and disconnect plug connections (1) on fixture for steering column stalk.

If necessary, unlock and disconnect plug connection (2) on steering column adjustment stalk.

Fig. 149: Identifying Plug Connections
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Remove fixture for steering column stalk (2).

Fig. 150: Identifying Fixture And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: When removed, the cover (1) of the fixture for the steering column stalk (2) is secured against turning/twisting by the lock (3). Do not under any circumstances twist the cover (1) out of its centered position against the fixture for the steering column stalk (2).

Fig. 151: Identifying Cover Of Fixture For Steering Column Stalk
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock clips and pull out stalk for windscreen wipers (1).

NOTE: If necessary, remove steering column adjustment stalk (2).
Raise lock in direction of arrow and pull out stalk for steering column adjustment (2) in direction of arrow.

Unlock clips and pull out turn indicator/dimmer stalk (3) towards top.

Fig. 152: Pulling Out Stalk For Steering Column Adjustment
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 016 REMOVING AND INSTALLING/REPLACING TURN INDICATOR/HEADLIGHT DIPPING SWITCH

Necessary preliminary tasks:

- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove fixture for steering column stalks, see **61 31 005 Removing and installing/replacing fixture for steering column stalk**
- **E85, E86 only:** Remove cruise control switch

Press locks (1) and feed direction indicator/dipping stalk (2) in direction of arrow out of fixture for steering column stalk (3).

Fig. 153: Pressing Locks And Feed Direction Indicator/Dipping Stalk
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 020 REMOVING AND INSTALLING/REPLACING IGNITION STARTER SWITCH

Necessary preliminary tasks:

- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove lower section of steering column trim, see **32 31 020 REMOVING AND INSTALLING / REPLACING LOWER SECTION OF STEERING COLUMN TRIM**

Remove sealing varnish and release headless setscrews (1).

Detach ignition starter switch (2) in direction of arrow.

Installation:

Secure headless setscrews (1) with sealing varnish.

Open lock (3) in direction of arrow and disconnect plug (4) from ignition starter switch (2).

Fig. 154: Opening Lock

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 037 REMOVING AND INSTALLING/REPLACING LIGHT CONTROL UNIT

Special tools required:

- 00 9 341

Necessary preliminary tasks:

- Remove left fresh-air grill, see **64 22 135 REMOVING AND INSTALLING/REPLACING LEFT FRESH-AIR GRILL**

Fit special tool 00 9 341 at side as illustrated.

Lever out lighting control unit (1) all round.

Unlock and disconnect associated plug connection, remove lighting control unit (1) in direction of arrow.

Fig. 155: Identifying Special Tool (00 9 341)
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, remove felt strip (1) from instrument panel (2).

Installation:

Make sure lighting control unit is correctly seated in instrument panel (2).

Fig. 156: Identifying Felt Strip From Instrument Panel
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 040 REMOVING AND INSTALLING/REPLACING SWITCH FOR WINDSCREEN WIPERS

Necessary preliminary tasks:

- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove fixture for steering column stalks, see **61 31 005 Removing and installing/replacing fixture for steering column stalk**

Press locks (1) and windshield wiper stalk (2) in direction of arrow out of fixture for steering column stalk (3).

Fig. 157: Pressing Locks And Windshield Wiper Stalk
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 057 REMOVING AND INSTALLING/REPLACING SWITCH UNIT IN CENTER CONSOLE

Necessary preliminary tasks:

- Remove operator unit for heater/air conditioner, see **64 11 377 REMOVING AND INSTALLING CONTROL PANEL FOR HEATER - A/C SYSTEM (REPLACING, AUTOMATIC AIR CONDITIONING)**

Press out switch unit in storage tray (1) in direction of arrow.

Unlock and disconnect associated plug connection (2), remove switch unit in storage tray (1).

Fig. 158: Pressing Out Switch Unit In Storage Tray
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 069 REMOVING AND INSTALLING/REPLACING INDICATOR FOR FRONT PASSENGER AIRBAG DEACTIVATION

Necessary preliminary tasks:

- Remove front roofliner trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM**

Press locks (1) and unclip indicator for front passenger airbag deactivation (2) in direction of arrow from front roofliner trim (3).

Fig. 159: Pressing Locks And Unclip Indicator
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 079 REMOVING AND INSTALLING/REPLACING SWITCH FOR HAZARD WARNING FLASHERS/CENTRAL LOCKING

Special tools required:

- **64 1 020 RELEASE HOOK**

Lever out switch for hazard warning system/central locking (1) with special tool 64 1 020 and pull back.

Disconnect associated plug connection and remove switch for hazard warning system/central locking (1).

Fig. 160: Identifying Special Tool (64 1 020)

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 115 REPLACING ROCKER SWITCH FOR SIDE WINDOW OPERATION (FRONT)

Special tools required:

- 00 9 341

Carefully lever out rocker switch for side window operation (1) with special tool 00 9 341 at specified points.

Feed rocker switch for side window operation (1) out of front door trim panel (2).

Disconnect associated plug connection and remove rocker switch for side window operation (1).

Fig. 161: Identifying Special Tool (00 9 341)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of rocker switch for side window operation (2) must not be damaged.

Make sure rocker switch for side window operation (2) is correctly seated.

Fig. 162: Identifying Retaining Hooks Of Rocker Switch
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 116 REPLACING ROCKER SWITCH FOR SIDE WINDOW OPERATION (REAR)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

IMPORTANT: Comply with the following work steps in order to avoid damaging the door trim panel and rocker switch.
To avoid damaging leather armrests, wrap front end of special tool 00 9 317 in fabric adhesive tape.

Procedure:

- Slide special tool 00 9 317 under rocker switch for side window operation (1) (do not lift the switch in the process).
- Slide rocker switch (1) with special tool 00 9 317 towards rear and lever out.

Feed rocker switch (1) out of rear door trim panel (2) and disconnect plug connection.

Fig. 163: Identifying Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of rocker switch for side window operation (2) must not be damaged.

Make sure rocker switch for side window operation (2) is correctly seated.

Fig. 164: Identifying Retaining Hooks Of Rocker Switch
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 175 REMOVING AND INSTALLING/REPLACING SWITCH FOR SLIDE/TILT SUNROOF

Necessary preliminary tasks:

- Remove front roofliner trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM**

Press catches (1) and unclip switch for slide/tilt sunroof (2) in direction of arrow from front roofliner trim (3).

Fig. 165: Pressing Catches And Unclip Switch
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialise slide/tilt sunroof.

61 31 176 REMOVING AND INSTALLING/REPLACING EMERGENCY CALL BUTTON

Necessary preliminary tasks:

- Remove front roofliner trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM**

Press catches (1) and unclip emergency call button (2) in direction of arrow from front roofliner trim (3).

Fig. 166: Pressing Catches And Unclip Emergency Call Button
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 204 REPLACING SWITCH COMBINATION FOR SEAT ADJUSTMENT

This operation is described in:

"Removing outer cover on front seat", see **52 14 040 REMOVING AND INSTALLING/REPLACING OUTER COVER ON FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)** .

All models except Convertible:

Carry out programming/coding, see **Vehicle programming and coding**.

61 31 208 REMOVING AND INSTALLING/REPLACING SWITCH FOR FRONT LUMBAR SUPPORT

This operation is described in:

"Removing outer cover on front seat" see **52 13 040 REMOVING AND INSTALLING / REPLACING OUTER COVER ON LEFT OR RIGHT FRONT SEAT BACK-REST (NORMAL / MANUAL)** .

61 31 225 REPLACING SWITCH ON IMPACT CUSHION FOR LEFT AND RIGHT AIRBAGS

Necessary preliminary tasks:

- Remove airbag unit, see **32 34 020 REMOVING AND INSTALLING/REPLACING AIRBAG UNIT (FROM 09/2006)**

Disconnect plug connections (1).

Loosen screws (2).

Feed out switch on impact cushion for airbag (3) in each case in direction of arrow from airbag unit (4) and remove.

Fig. 167: Disconnecting Plug Connections

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 228 REPLACING SWITCH ON SPORTS STEERING WHEEL

Necessary preliminary tasks:

- Remove steering wheel, see **32 33 000 REMOVING AND INSTALLING/REPLACING STEERING WHEEL (FROM 09/2006)**

Release screws (1) on sports steering wheel (2).

Fig. 168: Identifying Sports Steering Wheel Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip complete trim (1) in direction of arrow from mountings (2) and remove from sports steering wheel (3).

Fig. 169: Unclipping Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Loosen screws (2).

Remove both switches on sports steering wheel (1) together from trim (5).

Installation:

Make sure wiring harness (4) is correctly laid in associated mountings (3).

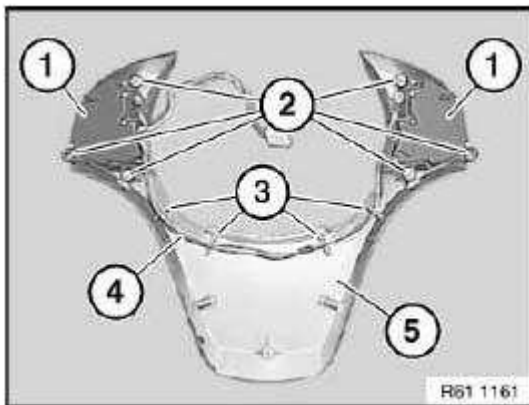

Fig. 170: Identifying Sports Steering Wheel Switches

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 241 REMOVING AND INSTALLING/REPLACING ENGINE HOOD CONTACT SWITCH

Unfasten plug connection (1) and disconnect.

Press catches (2) together and feed hood contact switch (4) in direction of arrow out of fixture (3).

Fig. 171: Unfastening Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 255 REPLACING SWITCH FOR OUTSIDE MIRROR

This operation is described in:

Replacing rocker switch for side window operation, see **61 31 115 Replacing rocker switch for side window operation (front)**.

61 31 270 REMOVING AND INSTALLING/REPLACING SWITCH FOR REVERSING LIGHT

Unfasten plug connection (1) and disconnect.

Unfasten switch for reversing light (2), tightening torque: 23 41 5AZ, see **23 41 EXTERNAL GEARSHIFT COMPONENTS** .

Fig. 172: Identifying Plug Connection And Reversing Light
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 299 REMOVING AND INSTALLING/REPLACING CLUTCH SWITCH MODULE

Necessary preliminary tasks:

- Remove trim panel for pedal assembly, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

NOTE: Clutch master cylinder (2) is removed for purposes of clarity.

Lever out clutch switch module (1) from clutch master cylinder (2) with screwdriver.

Unlock plug (4) and disconnect from housing (3).

Fig. 173: Identifying Clutch Master Cylinder And Clutch Switch Module
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clutch switch module is secured against incorrect installation.

Clutch switch module must snap audibly into place.

Fig. 174: Identifying Clutch Switch Module
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 310 REPLACING BRAKE-LIGHT SWITCH

Necessary preliminary tasks:

- Remove trim panel for pedal assembly, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

NOTE: Brake light switch (2) is situated above the brake pedal.

Disconnect plug connection (1).

Pull brake light switch (2) in direction of arrow out of brake light switch holder (3).

Press catches (4) together and unclip brake light switch holder (3) from brake pedal.

Installation:

Depress brake pedal.

Slide brake light switch (2) as far as it will go into brake light switch holder (3).

Grip brake light switch holder (3), slowly return brake pedal to starting position and pull back to stop.

Fig. 175: Identifying Brake Light Switch
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 382 REPLACING LEVEL SWITCH FOR COOLANT

WARNING: Danger of scalding!
Only perform this work after engine has cooled down.

Release screws (1).

Unlock plug connection for coolant level switch (4) and disconnect.

Pull coolant expansion tank (2) in direction of arrow out of grommet (3) underneath.

Installation:

Make sure coolant expansion tank (2) is correctly seated in grommet (3).

If necessary, replace grommet (3).

IMPORTANT: Do not damage connected water hoses.
Reposition coolant expansion tank (2) as far as possible until coolant level switch (4) forms the highest point. This will prevent coolant from escaping on opening.
If necessary, catch escaping coolant and feed back in later.

Fig. 176: Pulling Coolant Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, illustration shows coolant expansion tank (2) removed.

Turn coolant level switch (1) in direction of arrow, pull upwards out of coolant expansion tank (2) and remove.

Fig. 177: Turning Coolant Level Switch

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 440 REMOVING AND INSTALLING/REPLACING TEMPERATURE SWITCH FOR HEATED WINDSHIELD SPRAY JETS

Necessary preliminary tasks:

- **E52:** Detach front right wheel arch cover (front section)
- **E83:** Remove front underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION**

If necessary, unlock associated plug connection and disconnect.

Unclip temperature switch for heated windshield spray jets (1) in direction of arrow and remove.

Fig. 178: Identifying Heated Windshield Spray Jets

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 465 REMOVING AND INSTALLING/REPLACING RELAY/MODULE (IN DEVICE HOLDER ON LEFT)

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**

Release screws (1).

Remove electronics box cover (2).

Fig. 179: Identifying Electronics Box Cover Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Detach relay.

Fig. 180: Identifying Relay
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 470 REMOVING AND INSTALLING/REPLACING RELAY/MODULE (IN INSTRUMENT PANEL AT BOTTOM RIGHT)

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING**

Detach relay.

Fig. 181: Identifying Relay

Courtesy of BMW OF NORTH AMERICA, INC.

61 31 492 REPLACING LEVEL SWITCH FOR WINDSCREEN WASHER SYSTEM

This operation is described in:

"Replacing fluid reservoir for windscreen washer system", see **61 71 061 Replacing fluid reservoir for windshield washer system**

61 31 996 CARRY OUT STEERING ANGLE SENSOR ADJUSTMENT

IMPORTANT: In vehicles with active front steering, steering angle sensor adjustment is integrated in the service function "Initial operation/adjustment for active front steering" and must not be carried out separately!

NOTE: **Steering angle sensor adjustment must be carried out:**

- after adjustment work on the front axle/steering
- after all mechanical work on the steering system
- after replacement / coding / programming of the following components:
 - Fixture for switches of steering column / switch cluster / steering angle sensor
 - Dynamic Stability Control (DSC) control unit
 - Control unit active anti-roll stabilization (ARS)

Connect vehicle to BMW diagnosis system or Software Service Station.

Select and carry out steering angle sensor adjustment under Service functions.

33 HORN

61 33 040 REMOVING AND INSTALLING/REPLACING A FANFARE HORN (LEFT OR RIGHT)

Necessary preliminary tasks:

- Remove front underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION**

Unfasten plug connection (1) and disconnect.

Release nut (2) and remove fanfare horn (3).

Fig. 182: Identifying Plug Connection And Fanfare Horn
Courtesy of BMW OF NORTH AMERICA, INC.

35 ECUS, MODULES

61 35 .. OVERVIEW OF CONTROL UNITS

R61 1555

- | | | | |
|---|--|---|--|
| 1 | General module | 4 | Ring antenna of electronic immobilizer |
| 2 | Control unit, electronic immobilizer | 5 | Control unit, light module |
| 3 | Rain/light sensor | 6 | Control unit, slide/tilt sunroof |

Fig. 183: Identifying Control Units Components
 Courtesy of BMW OF NORTH AMERICA, INC.

61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE)

Special tools required:

- 12 7 060 ANTISTATIC MAT (ESD)

NOTE: Electrical components which are particularly sensitive to electrostatic discharge (electronic control units, sensors, etc.) are marked with the ESD warning symbol.

E -Electro

S -Static

D -Discharge

IMPORTANT: Read and comply without fail with the notes on this subject from Service Information 2 06 04 128 .

Statically charged persons can discharge by touching electrical components.

NOTE: Humans can only detect a discharge starting from a level of approx. 3000 V. The danger threshold for electrical components already starts from a level of approx. 100 V.

Fig. 184: Touching Electrical Components
Courtesy of BMW OF NORTH AMERICA, INC.

Example:

Mechatronic control unit.

Fig. 185: Identifying Mechatronic Control Unit
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 186: Precaution For - Do Not Touch Pins Or Multi-Pin Connectors Directly
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not touch pins or multi-pin connectors directly!

Touch electrical components by their housings only.

IMPORTANT: To prevent electrical components from being damaged or destroyed by electrostatic discharge, it is absolutely essential to comply with the following instructions:

- **When replacing electrical components, leave the replacement components in their original packaging until immediately before they are to be installed**
- **If necessary, always return a removed component in its original packaging (always pack the component away immediately)**
- **Read and comply with user information on using the associated special tool 12 7 060**

61 35 000 REMOVING AND INSTALLING/REPLACING MODULE (FOR TRAILER TWO HITCH)

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**

Remove clips (1) and fold up front luggage compartment floor trim panel (2) slightly.

Installation:

Make sure front luggage compartment floor trim panel (2) is correctly seated.

Fig. 187: Removing Clips

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Front luggage compartment floor trim panel shown removed for purposes of clarity.

Unfasten plug connection (1) and disconnect.

Unscrew nuts (2).

Remove module (3) in direction of arrow.

Fig. 188: Unfastening Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

61 35 122 REMOVING AND INSTALLING/REPLACING GENERAL MODULE

IMPORTANT: Read and comply with 61 35 ... Notes on ESD protection (Electro Static Discharge).

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Disconnect negative battery cable
- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING**

Release plastic nut (1).

Unclip device holder (2) from fixtures (3).

Unlock plug connections (4) and disconnect.

Press catch (6) and remove general module (5) towards rear.

Fig. 189: Pressing Catch And Remove General Module
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding, see **Vehicle programming and coding**.

61 35 177 REMOVING AND INSTALLING (REPLACING) RAIN/LIGHT SENSOR

Expand two-part mirror base cover (1) by pressing from below and detach.

Feed out two-part mirror base cover (1) and remove.

Fig. 190: Expanding Two-Part Mirror Base Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (3).

Press locks (1) in direction of arrow and remove rain/light sensor (2) towards bottom.

Installation:

Do not damage optical element covered by rain/light sensor (2).

If necessary, initialize rain/light sensor, see **61 35 679 Initializing rain/light sensor**.

Fig. 191: Pressing Locks
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding, see **Vehicle programming and coding**.

61 35 285 REMOVING AND INSTALLING (REPLACING) LIGHT MODULE

IMPORTANT: Read and comply with 61 35 ... Notes on ESD protection (Electro Static Discharge).

Necessary preliminary tasks:

- Remove trim panel for pedal assembly, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

Unlock plug connections (2) and (4) and disconnect.

Release screws (1), feed out light module (3) in direction of arrow and remove.

Fig. 192: Unlocking Plug Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure guides (1) of light module (2) are correctly seated in associated mountings.

Fig. 193: Identifying Guides Of Light Module

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding, see Vehicle programming and coding.

61 35 679 INITIALIZING RAIN/LIGHT SENSOR

NOTE: Initialization is necessary:

- After replacing windshield
- When installing a used rain/light sensor

NOTE:

- Connect BMW diagnosis system
- Initialize rain/light sensor.

61 35 714 REMOVING AND INSTALLING/REPLACING CONTROL UNIT FOR SLIDE/TILT SUNROOF

IMPORTANT: Read and comply with 61 35 ... Notes on ESD protection (Electro Static Discharge).

Necessary preliminary tasks:

- Remove front roofliner trim, see 51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM
- Remove complete ceiling light (front)

NOTE: Secure drive for slide/tilt sunroof (3) against falling out.

Release screws (2).

Lower control unit for slide/tilt sunroof (3).

Unlock and disconnect plug connections (1) and remove control unit for slide/tilt sunroof (3).

Fig. 194: Identifying Lower Control Unit For Slide/Tilt Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialise slide/tilt sunroof.

Replacement:

Carry out programming/coding, see **Vehicle programming and coding**.

IMPORTANT: There is a risk of permanent battery discharge if programming/coding is not carried out!

61 35 795 REMOVING AND INSTALLING (REPLACING) CONTROL UNIT FOR ADAPTIVE HEADLIGHT

IMPORTANT: Read and comply with 61 35 ... Notes on ESD protection (Electro Static Discharge).

Necessary preliminary tasks:

- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING**

Unlock catch (1) in direction of arrow.

Pull control unit for adaptive headlight (2) out of equipment carrier (3) slightly.

Unlock plug connection (4) and disconnect.

Remove control unit for adaptive headlight (2).

Fig. 195: Unlocking Catch

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding, see **Vehicle programming and coding**.

61 35 900 REMOVING AND INSTALLING/REPLACING RING ANTENNA OF ELECTRONIC IMMOBILIZER

Special tools required:

- 61 3 300

Necessary preliminary tasks:

- Remove top section of steering column casing, see **32 31 003 REPLACING UPPER SECTION OF STEERING COLUMN TRIM** .

Disconnect plug connection (1).

Position special tool 61 3 300 as illustrated with flattened side (A) to ring antenna of electronic immobilizer (2).

Lever out ring antenna of electronic immobilizer (2) in direction of arrow and remove.

Fig. 196: Identifying Special Tool (61 3 300)

Courtesy of BMW OF NORTH AMERICA, INC.

61 35 910 REMOVING AND INSTALLING/REPLACING CONTROL UNIT OF ELECTRONIC IMMOBILIZER

IMPORTANT: Read and comply with 61 35 ... Notes on ESD protection (Electro Static Discharge).

Necessary preliminary tasks:

- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove trim panel for pedal assembly, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

Unfasten plug connection (1) and disconnect.

NOTE: Secure control unit of electronic immobilizer (3) against falling out.

Release screws (2) and remove control unit of electronic immobilizer (3).

Fig. 197: Unfastening Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

IMPORTANT: Check hardware version of old control unit.

Part numbers of control units with hardware version HW03:

- 61 35 8 374 957
- 61 35 6 905 666
- 61 35 6 905 667
- 61 35 6 905 670

If hardware version HW03 was fitted, observe the following.

Disconnect cable from pin 3 of plug.

Replace double flat spring contact with a larger one.

Connect cable to pin 2 of plug.

Fig. 198: Identifying Plug Connector Pin

Courtesy of BMW OF NORTH AMERICA, INC.

Carry out programming/coding, see Vehicle programming and coding.

72 12 ... OVERVIEW OF AIRBAG MODULES, SEAT BELTS AND AIRBAG CONTROL UNITS

0 [Safety precautions and general information](#)

- | | | | |
|---|---|----|---|
| 1 | Airbag module, rear left/right | 8 | Lower strap (belt tensioner), front |
| 2 | AHPS head airbag, left/right | 9 | Sensor, B-pillar |
| 3 | Airbag module, front left/right | 10 | Seat belt, front left/right |
| 4 | Sensor, front door | 11 | Seat belts, rear middle |
| 5 | Airbag module, driver's side | 12 | Seat belt, rear left/right |
| 6 | Airbag module, front passenger side | 13 | Safety battery terminal |
| 7 | Airbag control unit | | |

Fig. 199: Identifying Airbag Modules, Seat Belts And Airbag Control Units Components
 Courtesy of BMW OF NORTH AMERICA, INC.

VEHICLE PROGRAMMING AND CODING

Select menu item (1).

Select corresponding procedure from selection list.

Example:

- Preparation and subsequent evaluation of vehicle programming
- Start a Progman session
- Sequence of BMW/MINI vehicle programming and coding

- BMW/MINI Car & Key Memory
- BMW/MINI initialization
- BMW/MINI service functions in Progman
- ...

NOTE: In order to avoid incorrect programming procedures and error messages, it is essential when working with the Progman programming system always to use the latest Progman version.

Fig. 200: Display Screen Of - Programming
 Courtesy of BMW OF NORTH AMERICA, INC.

36 RELAYS

61 13 ... DME MASTER RELAY CONNECTOR

Unlock locking flap (1) of corresponding cable.

Fig. 201: Unlocking Locking Flap

Courtesy of BMW OF NORTH AMERICA, INC.

With special tool 61 1 136 or 61 1 137 (ejector), press back arrester hook (2) of appropriate contact and pull out cable.

Fig. 202: Identifying Arrester Hook

Courtesy of BMW OF NORTH AMERICA, INC.

61 13 ... RELAY CARRIER

Place special tool 61 1 153 on relay carrier (1) and carefully pull in direction of arrow until retaining lugs (2) on relay carrier are raised.

Fig. 203: Identifying Relay Carrier And Retaining Lugs

Courtesy of BMW OF NORTH AMERICA, INC.

Pull relay carrier (2) in direction of arrow into first catch (3).

Fig. 204: Pulling Relay Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

Press down arrester hook (4) of appropriate contact and pull out cable with contact.

Press out double flat spring contact with special tool 61 1 136 or 61 1 137 (ejector).

Fig. 205: Identifying Arrester Hook
 Courtesy of BMW OF NORTH AMERICA, INC.

61 31 465 REMOVING AND INSTALLING/REPLACING RELAY/MODULE (IN DEVICE HOLDER ON LEFT)

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**

Release screws (1).

Remove electronics box cover (2).

Fig. 206: Identifying Electronics Box Cover Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Detach relay.

Fig. 207: Identifying Relay
Courtesy of BMW OF NORTH AMERICA, INC.

61 31 470 REMOVING AND INSTALLING/REPLACING RELAY/MODULE (IN INSTRUMENT PANEL AT BOTTOM RIGHT)

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL**
- Disconnect battery negative lead, see **61 20 900 Disconnecting and connecting battery negative lead**
- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING**

Detach relay.

Fig. 208: Identifying Relay

Courtesy of BMW OF NORTH AMERICA, INC.

61 WINDSCREEN WIPERS

61 61 .. OVERVIEW OF WINDSCREEN WIPER SYSTEM AND HEADLIGHT WASHER SYSTEM

R61 1554

- | | | | |
|---|--|---|---|
| 1 | <u>Spray nozzles of headlight washer system</u> | 5 | <u>Windscreen wiper arms</u> |
| 2 | <u>Washer pumps, fluid reservoir for washer system</u> | 6 | <u>Wiper blades</u> |
| 3 | <u>Wiper bracket</u> | 7 | <u>Rear window wiper motor</u> |
| 4 | <u>Spray nozzles of windscreen washer system</u> | 8 | <u>Window wiper arm, window wiper blade</u> |

Fig. 209: Identifying Windscreen Wiper System And Headlight Washer System Components

Courtesy of BMW OF NORTH AMERICA, INC.

61 61 01. ADJUSTING LEFT OR RIGHT WINDSCREEN WIPER

Special tools required:

- 61 6 100 ANGLE MEASURING INSTRUMENT

Correctly adjusting the contact angle of the wiper arms on the windscreen increases wiping quality. For adjustment, refer to the vehicle-specific repair instruction.

Fig. 210: Adjusting Contact Angle Of Wiper Arms On Windscreen
Courtesy of BMW OF NORTH AMERICA, INC.

A/B = Distance between windscreen wiper blade (2) and trim panel on cowl panel (1)

NOTE: Measurement is taken at the height of the locators (3) for the windscreen wiper arms

C= Contact angle between wiper blade center plane and windscreen

When adjusting with special tool 61 6 100 , set the scale value in accordance with the following table.

For RHD cars, change the preceding sign of the scale values.

- LHD cars, scale range 0 to-10
- RHD cars, scale range 0 to +10

WINDSCREEN WIPER ARM SPECIFICATIONS

Model	Contact angle (C) on windscreen wiper arm		Scale value (LHD) on special tool		Adjustment dimension (A, B) on windscreen wiper arm			
	Passenger side	Driver side	Passenger side	Driver side	Passenger side	Driver side	Rear end	
1'	E81	85.5° +1.5 to 1.0°	85.5° +1.5 to 1.0°	-5	-5	47 ± 3 mm	54 ± 3 mm

61 61 010 CHECKING/ADJUSTING CONTACT ANGLE OF WINDSCREEN WIPER ARMS ON WINDSCREEN

Special tools required:

- **00 9 220 BENDING LEVER (2 X)**
- **00 9 331 00 9 330 WINDSCREEN WIPER SETTING TOOL**
- **61 6 100 ANGLE MEASURING INSTRUMENT**

NOTE: Wipe quality is improved by precise adjustment of contact/approach angle of wiper arms, see **61 61 01. Adjusting left or right windscreen wiper**
Adjustment angle can be checked with special tool 00 9 331 or 61 6 100 .

Checking with setting gauge:

Before checking approach angle, briefly lift windscreen wiper arms off windscreen.

Place special tool 00 9 331 next to pivot point of wiper blade on windscreen.

Check light gap, adjust wiper arm if necessary.

Fig. 211: Identifying Special Tool (00 9 331)
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Tape off wiper arm with fabric adhesive tape to avoid damage.

Press special tools 00 9 220 in appropriate direction until correct contact/approach angle is obtained.

Fig. 212: Identifying Special Tool (00 9 220)
Courtesy of BMW OF NORTH AMERICA, INC.

Checking with angulometer:

Remove wiper blades.

Insert windscreen wiper arm (1) in angulometer 61 6 100 .

Using screw (2) and pressure plate (3), locate windscreen wiper arm (1) and position on windscreen.

Read off value in degrees, adjust wiper arm if necessary.

NOTE: Windscreen wiper arm (1) must rest correctly on lower and side contact surfaces (4) of angulometer 61 6 100 .

On right-hand-drive cars, screw (2) must be located on left side of special tool 61 6 100.

Fig. 213: Identifying Special Tool (61 6 100)
Courtesy of BMW OF NORTH AMERICA, INC.

Press special tools 00 9 220 in appropriate direction until correct contact/approach angle is obtained.

Fig. 214: Identifying Special Tool (00 6 100) And (00 6 100)
 Courtesy of BMW OF NORTH AMERICA, INC.

61 61 041 REPLACING BOTH WINDSCREEN WIPER BLADES

Move wipers into fold-back position:

- Switch on terminal "R".
- Actuate wiper control lever and bring wiper arms to a stop in vertical position (fold-back position) by switching off terminal "R".
- Remove ignition key from ignition switch.

Fold back wiper arm (3).

Press locking spring (1) in direction of arrow. Pull wiper blade (2) to wiper arm (3) and feed out.

Installation:

Install new wiper blade and snap into place.

Fold wiper arms to windscreen.

Fig. 215: Pressing Locking Spring

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Before switching on terminal "R" or the ignition or starting the engine, you must fold the wiper arms onto the windscreen otherwise damage will be caused.

Switch on terminal "R".

Set wiper system to rest position by flick-wiping.

61 61 100 REMOVING AND INSTALLING/REPLACING BOTH WINDSCREEN WIPER ARMS

Special tools required:

- **61 6 060 UNIVERSAL WIPER ARM PULLER**

Take off cap.

Fig. 216: Taking Off Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten nut.

Installation:

Observe tightening torque: 61 61 10AZ, see **61 61 WINDSHIELD WIPERS** .

Fig. 217: Locating Nut

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not bend windscreen wiper arm during removal (risk of breakage).

Detach windscreen wiper arm with special tool 61 6 060 .

Fig. 218: Identifying Special Tool (61 6 060)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check that sleeve (1) is firmly seated.

If sleeve (1) is loose, it must be replaced.

A sleeve (1) firmly seated in the windscreen wiper arm can be reused.

Fig. 219: Identifying Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

Windscreen wiper arm with firmly seated sleeve (1):

Return wiper system to rest position. Push wiper arm (2) with firmly seated sleeve (1) onto shaft and tighten down.

Observe tightening torque: 61 61 10AZ, see **61 61 WINDSHIELD WIPERS** .

Check setting of wiper arm (2).

To correct setting, replace sleeve (1).

Fig. 220: Identifying Wiper Arm Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

Windscreen wiper arm with new sleeve (2):

Return wiper system to rest position.

Push wiper arm (1) with sleeve (2) onto shaft and tighten until hand-tight.

Fig. 221: Identifying Wiper Arm With Sleeve
 Courtesy of BMW OF NORTH AMERICA, INC.

Adjust position of wiper arm in question in rest position (measured between wiper lip and top edge of cowl panel cover).

Then tighten down wiper arm and check position of relevant wiper arm again.

$66 \pm 1.5 \text{ mm}$

$61 \pm 1.5 \text{ mm}$

Observe tightening torque: 61 61 10AZ, see **61 61 WINDSHIELD WIPERS** .

Fig. 222: Measuring Dimension Between Wiper Lip And Top Edge Of Cowl Panel Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

61 61 270 REMOVING AND INSTALLING COMPLETE WIPER CONSOLE

Necessary preliminary tasks:

- Remove cowl panel cover, see **51 13 115 REMOVING AND INSTALLING/REPLACING COWL PANEL COVER**

- Remove heater bulkhead, see 51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD

Unfasten plug connection (1) and disconnect.

Unscrew bolt (2).

Installation:

Observe tightening torque: 61 61 6AZ, see 61 61 WINDSHIELD WIPERS .

Fig. 223: Unfastening Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit rubber grommet (1) of wiper console on pin (2).

Fig. 224: Identifying Rubber Grommet Of Wiper Console On Pin
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts and feed out complete wiper console through opening in heater bulkhead.

Installation:

Observe tightening torque: 61 61 5AZ, see **61 61 WINDSHIELD WIPERS** .

Fig. 225: Locating Wiper Console Nut
Courtesy of BMW OF NORTH AMERICA, INC.

62 REAR WINDOW WIPERS

61 61 .. OVERVIEW OF WINDSCREEN WIPER SYSTEM AND HEADLIGHT WASHER SYSTEM

R61 1554

- | | | | |
|---|--|---|---|
| 1 | <u>Spray nozzles of headlight washer system</u> | 5 | <u>Windscreen wiper arms</u> |
| 2 | <u>Washer pumps, fluid reservoir for washer system</u> | 6 | <u>Wiper blades</u> |
| 3 | <u>Wiper bracket</u> | 7 | <u>Rear window wiper motor</u> |
| 4 | <u>Spray nozzles of windscreen washer system</u> | 8 | <u>Window wiper arm, window wiper blade</u> |

Fig. 226: Identifying Windscreen Wiper System And Headlight Washer System Components
 Courtesy of BMW OF NORTH AMERICA, INC.

61 62 020 REMOVING AND INSTALLING/REPLACING REAR WINDOW WIPER BLADE

Fold wiper arm (1) away from rear window.

Unclip wiper blade (2) in direction of arrow.

Fig. 227: Unclipping Wiper Blade

Courtesy of BMW OF NORTH AMERICA, INC.

61 62 030 REPLACING WIPER ARM FOR REAR WINDOW WIPER

Pull internal locks (2) in direction of arrow and remove cover cap (1) as illustrated.

Fig. 228: Pulling Internal Locks

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Locks (1) and (2) of cover cap (3) must not be damaged.

Fig. 229: Identifying Locks And Of Cover Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Set wiper arm (1) upwards.

Release nut (2) and remove wiper arm (1) in direction of arrow.

Installation:

Observe tightening torque: 61 61 5AZ, see 61 61 WINDSHIELD WIPERS .

Fig. 230: Identifying Wiper Arm Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Rear window wiper motor must be in wiper rest position.

Adjust measurement (A) between wiper blade (1) and rear window edge (2).

Measurement (A): 29 mm.

Fig. 231: Identifying Measurement Between Wiper Blade And Rear Window Edge
Courtesy of BMW OF NORTH AMERICA, INC.

61 62 060 REMOVING AND INSTALLING/REPLACING REAR WINDOW WIPER MOTOR

Necessary preliminary tasks:

- Remove wiper arm for rear window, see 61 62 030 Replacing wiper arm for rear window wiper
- Remove panel for rear lid, see 51 49 008 REMOVING AND INSTALLING/REPLACING PANEL

FOR REAR LID .

Unfasten plug connections (1) and disconnect.

NOTE: **Secure rear window wiper motor (3) against falling out.**

Release screws (2).

Installation:

Tightening torque: 61 62 8AZ, see **61 62 TAILGATE WINDOW WIPER .**

Remove rear window wiper motor (3) in direction of arrow.

Installation:

Replace grommet (4) if necessary.

Fig. 232: Identifying Plug Connections And Rear Window Wiper Motor
Courtesy of BMW OF NORTH AMERICA, INC.

61 62 100 ADJUSTING JET NOZZLE FOR REAR WINDOW WASHER UNIT

NOTE: **The spray must meet the contact point (1).**

Fig. 233: Identifying Jet Nozzle For Rear Window Washer Unit Contact Point
 Courtesy of BMW OF NORTH AMERICA, INC.

Adjustment measurements:

MEASUREMENTS CHART

	Measurement A [mm]	Measurement B [mm]
E46 Touring	100	320
E53	100	450
E83	180	460

IMPORTANT: Do not insert any pointed objects in nozzle (risk of damage).

Mark contact point with crepe tape. Adjust jet nozzle with offset screwdriver (3.5 mm) in slot.

Fig. 234: Adjusting Jet Nozzle With Offset Screwdriver
Courtesy of BMW OF NORTH AMERICA, INC.

61 62 110 REMOVING AND INSTALLING/REPLACING SPRAY NOZZLE FOR REAR WINDOW WIPER

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Lever spray nozzle for rear window wiper (1) with special tool 00 9 317 out of spray nozzle holder (2).

Fig. 235: Identifying Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure turning lock (2) of spray nozzle for rear window wiper (1) is correctly seated in spray nozzle holder.

Adjust spray nozzle, see **61 62 100 Adjusting jet nozzle for rear window washer unit**

Fig. 236: Identifying Turning Lock Of Spray Nozzle
Courtesy of BMW OF NORTH AMERICA, INC.

61 62 150 REMOVING AND INSTALLING/REPLACING WINDOW WASHER PUMP FOR REAR WINDOW WASHER SYSTEM

NOTE: Drain washer fluid reservoir.

Unfasten plug connection (1) and disconnect.

Detach hose (2) in direction of arrow from windshield washer pump (3).

If necessary, turn window washer pump (3) and pull in direction of arrow out of washer fluid reservoir (4).

Fig. 237: Detaching Hose

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing ring of window washer pump.

Coat sealing ring of window washer pump with antiseize agent.

Ensure hose is laid without kinks.

Fill washer fluid reservoir.

61 62 170 REMOVING AND INSTALLING/REPLACING NONRETURN VALVE FOR REAR WINDOW WASHER SYSTEM

Necessary preliminary tasks:

- Remove rear spoiler, see **51 71 412 REMOVING AND INSTALLING REAR SPOILER** .

Detach hose (1) in direction of arrow from non-return valve (2).

Pull non-return valve (2) out of spray nozzle holder (3) and remove.

Installation:

Make sure hose (1) and non-return valve (2) are correctly seated.

Fig. 238: Detaching Hose

Courtesy of BMW OF NORTH AMERICA, INC.

67 HEADLIGHT WASHER SYSTEM

61 61 .. OVERVIEW OF WINDSCREEN WIPER SYSTEM AND HEADLIGHT WASHER SYSTEM

R61 1554

- | | | | |
|---|--|---|---|
| 1 | <u>Spray nozzles of headlight washer system</u> | 5 | <u>Windscreen wiper arms</u> |
| 2 | <u>Washer pumps, fluid reservoir for washer system</u> | 6 | <u>Wiper blades</u> |
| 3 | <u>Wiper bracket</u> | 7 | <u>Rear window wiper motor</u> |
| 4 | <u>Spray nozzles of windscreen washer system</u> | 8 | <u>Window wiper arm, window wiper blade</u> |

Fig. 239: Identifying Windscreen Wiper System And Headlight Washer System Components
 Courtesy of BMW OF NORTH AMERICA, INC.

61 67 010 REMOVING AND INSTALLING/REPLACING WASHER PUMP OF HEADLIGHT CLEANING SYSTEM

NOTE: Drain washer fluid tank.

Unfasten plug connection (1) and disconnect.

Press lock (2) and detach hose (3) from washer pump of headlight cleaning system (4).

Pull washer pump of headlight cleaning system (4) in direction of arrow out of washer fluid reservoir (5).

Fig. 240: Unfastening Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing ring/strainer of washer pump.

Coat sealing ring of washer pump with antiseize agent.

Ensure hose is laid without kinks.

Fill washer fluid reservoir.

61 67 040 ADJUSTING SPRAY NOZZLES FOR HEADLIGHT CLEANING SYSTEM

NOTE: The spray nozzles of the headlight cleaning system have been adjusted at the factory and normally this setting is not altered (except by an accident). The nozzles therefore do not have to be adjusted.

The spray nozzles do not have to be adjusted even in the event of replacement as the nozzles themselves and the telescopic nozzle form a single unit (high-pressure nozzle) and are already preset.

61 67 045 REMOVING AND INSTALLING/REPLACING SPRAY NOZZLES FOR LEFT OR RIGHT HEADLIGHT CLEANING SYSTEM (UP TO 9/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 REMOVING AND INSTALLING/REPLACING FRONT BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)** .

Press lock (1) and detach hose connection (2).

Pull out retainer (3) in direction of arrow.

Remove spray nozzle for headlight cleaning system (4) towards front.

Fig. 241: Pulling Out Retainer
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Unclip spray nozzle (2) from trim (3).

Installation:

If necessary, replace backing (1).

Guides (5) of backing (1) must be located in openings of spray nozzle (2).

Catches (4) of trim (3) must not be damaged or missing.

Fig. 242: Identifying Spray Nozzle From Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

61 67 045 REMOVING AND INSTALLING/REPLACING SPRAY NOZZLES OF HEADLIGHT WASHER SYSTEM ON LEFT OR RIGHT (FROM 09/2006)

- **13 3 010 HOSE CLIP**

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 REMOVING AND INSTALLING/REPLACING FRONT BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)** .
- Remove cover for headlight washer system, see **1 11 ... REMOVING AND INSTALLING/REPLACING FRONT COVER FOR HEADLIGHT WASHER SYSTEM ON LEFT OR RIGHT (M TECHNIC AERODYNAMIC KIT)**

To prevent excess escape of washer fluid, seal off end of high - pressure line with special tool 13 3 010 .

Catch any escaping washer fluid if necessary.

Fig. 243: Identifying Special Tool (13 3 010)

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug connection (1) and detach high-pressure line (2) from spray nozzle for headlight washer system (3). Release screws (5). Remove spray nozzle for headlight washer system (3) in direction of arrow from bumper trim (6).

Installation: Make sure guide (4) is correctly seated on bumper trim (6). Keep plug connection (1) of high-pressure line (2) and high-pressure nozzle (3) clean and free from grease.

Fig. 244: Make Sure Guide (4) Is Correctly Seated On Bumper Trim (6)
Courtesy of BMW OF NORTH AMERICA, INC.

Make sure high-pressure line (2) is correctly engaged on spray nozzle (3). If necessary, top up washer fluid.

61 67 083 REMOVING AND INSTALLING/REPLACING HIGH - PRESSURE NOZZLE OF LEFT OR RIGHT HEADLIGHT WASHER SYSTEM (M AERODYNAMIC KIT)

Special tools required:

- **13 3 010 HOSE CLIP**

Necessary preliminary tasks:

- Remove cover for headlight washer system, see **1 11 ... REMOVING AND INSTALLING/REPLACING FRONT COVER FOR HEADLIGHT WASHER SYSTEM ON LEFT OR RIGHT (M TECHNIC AERODYNAMIC KIT)**
- Remove front bumper trim, see **51 11 156 REMOVING AND INSTALLING/REPLACING FRONT BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)** .

To prevent excess escape of washer fluid, seal off end of high - pressure line with special tool 13 3 010 .

Fig. 245: Identifying Special Tool (13 3 010)
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlock H.P. line (3) and detach from H.P. nozzle (1).

Release screws (2).

Remove H.P. nozzle (1).

Installation:

New spray nozzles are already preset.

Check function.

Fig. 246: Unlocking H.P. Line
 Courtesy of BMW OF NORTH AMERICA, INC.

71 WINDOW WASHER SYSTEM

R61 1554

- | | | | |
|---|--|---|---|
| 1 | <u>Spray nozzles of headlight washer system</u> | 5 | <u>Windscreen wiper arms</u> |
| 2 | <u>Washer pumps, fluid reservoir for washer system</u> | 6 | <u>Wiper blades</u> |
| 3 | <u>Wiper bracket</u> | 7 | <u>Rear window wiper motor</u> |
| 4 | <u>Spray nozzles of windscreen washer system</u> | 8 | <u>Window wiper arm, window wiper blade</u> |

Fig. 247: Identifying Windscreen Wiper System And Headlight Washer System Components
 Courtesy of BMW OF NORTH AMERICA, INC.

61 62 150 REMOVING AND INSTALLING/REPLACING WINDOW WASHER PUMP FOR REAR WINDOW WASHER SYSTEM

NOTE: **Drain washer fluid reservoir.**

Unfasten plug connection (1) and disconnect.

Detach hose (2) in direction of arrow from windshield washer pump (3).

If necessary, turn window washer pump (3) and pull in direction of arrow out of washer fluid reservoir (4).

Fig. 248: Detaching Hose

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing ring of window washer pump.

Coat sealing ring of window washer pump with antiseize agent.

Ensure hose is laid without kinks.

Fill washer fluid reservoir.

61 71 015 REMOVING AND INSTALLING/REPLACING A JET NOZZLE IN WINDSHIELD WASHER SYSTEM

NOTE: The jet nozzles of the windshield washer system are preset at the factory and cannot be readjusted.

Lever out sealing plug (1) in direction of arrow.

Unclip, unlock and disconnect plug connection (2) behind.

Installation:

Make sure plug connection (2) is correctly seated in mounting (3).

Ensure correct installation position (mounting (3) at top) and correct seating of sealing plug (1).

Fig. 249: Removing Sealing Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Detach connector (1) in direction of arrow from nozzle of windshield washer system (2).

Unlock spray nozzle (2), press out through opening and remove.

Installation:

Make sure nozzle of windshield washer system (2) is correctly seated.

Ensure hose is laid without kinks.

Fig. 250: Detaching Connector

Courtesy of BMW OF NORTH AMERICA, INC.

61 71 061 REPLACING FLUID RESERVOIR FOR WINDSHIELD WASHER SYSTEM

NOTE: Drain fluid tank for windshield washer system.

Necessary preliminary tasks:

- Pull out windshield washer pump (unlock and disconnect plug connection), see **61 71 100 Removing and installing/replacing windshield washer pump**
- Pull out window washer pump for rear window cleaning system (unlock and disconnect plug connection), see **61 62 150 Removing and installing/replacing window washer pump for rear window washer system**
- If necessary, pull out washer pump of headlight cleaning system (unlock and disconnect plug connection). See **61 67 010 Removing and installing/replacing washer pump of headlight cleaning system**

Unscrew bolt (1).

Unlock and disconnect level switch plug connection on windshield washer system (2).

If necessary, unclip hose (3).

Remove fluid reservoir for windshield washer system (4) in direction of arrow.

Fig. 251: Removing Fluid Reservoir For Windshield Washer System
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Feed guide (1) of fluid reservoir for windshield washer system (2) in direction of arrow into mountings (3).

Fig. 252: Identifying Guide Of Fluid Reservoir
Courtesy of BMW OF NORTH AMERICA, INC.

Turn level switch for windshield washer system (1) in direction of arrow, remove downwards from water reservoir for windshield washer system (2) and place to one side.

Remove cover and strainer from water reservoir for windshield washer system.

Fig. 253: Removing Cover And Strainer From Water Reservoir
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing rings/strainers on washer pumps.

Coat sealing rings of washer pump with anti-friction agent.

Make sure hoses are laid without kinks.

Fill fluid tank for windshield washer system.

NOTE: Drain washer fluid tank.

Unfasten plug connection (1) and disconnect.

Detach hose (2) in direction of arrow from windshield washer pump (3).

If necessary, turn window washer pump (3) and pull in direction of arrow out of washer fluid reservoir (4).

Fig. 254: Detaching Hose

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing ring of windshield washer pump.

Coat sealing ring of windshield washer pump with antiseize agent.

Ensure hose is laid without kinks.

Fill washer fluid reservoir.

ACCESSORIES AND EQUIPMENT

Electrical Drives - Repair Instructions - X3

11 CENTRAL LOCKING UNIT/UNLOCKING UNITS

67 11 510 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR FRONT LEFT OR RIGHT DOOR LOCKING MECHANISM

NOTE: Servodrive for door locking mechanism is integrated in door lock in front door.

Procedure is described in the document [51 21 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT FRONT DOOR](#) .

67 11 530 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR REAR LEFT OR RIGHT DOOR LOCKING MECHANISM

This operation is described in:

[51 22 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT REAR DOOR](#) .

67 11 555 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR TANK FILLER FLAP

Necessary preliminary tasks:

- Remove Right Luggage Compartment Wheel Arch Trim, see **[51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM](#) .**

Unclip emergency actuator (1) on emergency actuator pull strap (2).

Feed out emergency actuator pull strap (2) through opening (3).

Slacken screws (4) and feed servodrive for tank filler flap (5) towards rear out of retaining plate.

If necessary, carry out adjustment of servodrive for tank filler flap (5) via elongated holes of retaining plate. It must be possible to lock or unlock the fuel filler flap completely.

Disconnect associated plug connection and remove servodrive for tank filler flap (5).

Fig. 1: Emergency Actuator And Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert servodrive for tank filler flap (1) in direction of arrow into gaiter (2).

Fig. 2: Tank Filler Flap
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Unhook emergency actuator pull strap (1) from clip (2) and remove from locking pin (3) of servodrive for fuel filler flap (4).

Fig. 3: Servodrive For Fuel Filler Flap
Courtesy of BMW OF NORTH AMERICA, INC.

67 11 560 REPLACING SERVODRIVE FOR REAR LID LOCK

This operation is described under:

51 24 105 REMOVING AND INSTALLING/REPLACING REAR LID LOCK (LOWER SECTION OF LOCK) .

13 MIRROR ADJUSTMENT

67 13 001 REPLACING DRIVE UNIT FOR ELECTRICALLY OPERATED LEFT OR RIGHT DOOR MIRROR

Necessary preliminary tasks:

- Remove Mirror Glass, see **51 16 026 REPLACING MIRROR GLASS** .

Release screws (1).

Fold out drive unit for electrically operated door mirror (2) in direction of arrow.

Fig. 4: Screws And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) and remove drive unit for electrically operated door mirror (2).

IMPORTANT: In order to avoid ingress of water in non-sealed plug housing, coat plug housing (1) at cable and connection ends with battery terminal grease.

Fig. 5: Plug Connection And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

67 13 005 REPLACING DRIVE UNIT FOR ELECTRICALLY ADJUSTABLE LEFT OR RIGHT DOOR MIRROR (WITH MEMORY)

Special tools required:

- **61 1 150 RELEASING TOOL KIT**

Necessary preliminary tasks:

- Remove Mirror Glass, see **51 16 026 REPLACING MIRROR GLASS** .
- Remove Mirror On Left Or Right Front Door, see **51 16 000 REMOVING AND INSTALLING/REPLACING MIRROR ON LEFT OR RIGHT FRONT DOOR** .

Release screws (1).

Remove drive unit for electrically adjustable door mirror (2) in direction of arrow.

Fig. 6: Screws And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip cap (1) with a suitable tool.

Remove sound insulation (2) from mirror. Correctly disconnect cable plug (3) with special tool 61 1 150 .

Feed out cable (4).

Installation:

Make sure ribbon cable (4) is correctly routed. Cable must not be kinked!

Fig. 7: Sound Insulation And Cable Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Sound insulation (1) on mirror (2) must not be damaged.

Fig. 8: Sound Insulation On Mirror
 Courtesy of BMW OF NORTH AMERICA, INC.

31 DRIVE, SEAT ADJUSTMENT

67 31 501 REMOVING AND INSTALLING/REPLACING DRIVE FOR LONGITUDINAL SEAT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (1).

Unclip plug housing (2) in direction of arrow from retaining fixture underneath.

NOTE: Secure drive for longitudinal seat adjustment (4) against falling out.

Release screws (3) and remove drive for longitudinal seat adjustment (4) in direction of arrow from flange (5).

If necessary, remove inner drive shaft from drive for longitudinal seat adjustment (4).

Fig. 9: Plug Housing
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is correctly seated.

Make sure drive for longitudinal seat adjustment (2) is correctly seated on flange (3).

Fig. 10: Drive Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

67 31 511 REMOVING AND INSTALLING/REPLACING DRIVE FOR SEAT TILT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (4).

NOTE: Secure drive for seat tilt adjustment (5) against falling out.

Loosen screws (1).

Remove drive for seat tilt adjustment (5) with fixture for plug connection (3) in direction of arrow from flange (2).

If necessary, remove inner drive shaft from drive for seat tilt adjustment (5).

Fig. 11: Seat Tilt Adjustment

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is correctly seated.

Ensure fixture for plug connection (3) and drive for seat tilt adjustment (4) on flange (2) are correctly seated.

Fig. 12: Drive Shaft And Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

67 31 521 REMOVING AND INSTALLING/REPLACING DRIVE FOR SEAT HEIGHT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (2).

NOTE: **Secure drive for seat height adjustment (3) against falling out.**

Release screws (1).

Remove drive for seat height adjustment (3) with fixture for plug connection (4) in direction of arrow from flange (5).

If necessary, remove inner drive shaft from drive for seat height adjustment (3).

Fig. 13: Seat Height Adjustment And Inner Drive Shaft
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is exactly seated.

Ensure fixture for plug connection (2) and drive for seat height adjustment (3) on flange (4) are correctly seated.

Fig. 14: Drive Shaft And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

67 31 531 REMOVING AND INSTALLING/REPLACING DRIVE FOR BACKREST ANGLE ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (1).

NOTE: **Secure drive for backrest angle adjustment (5) against falling out.**

Release screws (3).

Remove drive for backrest angle adjustment (5) with fixture for plug connection (2) in direction of arrow from

flange (4).

If necessary, remove inner drive shaft from drive for backrest angle adjustment (5).

Fig. 15: Backrest Angle Adjustment
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is exactly seated.

Ensure fixture for plug connection (3) and drive for backrest angle adjustment (4) on flange (2) are correctly seated.

Fig. 16: Drive Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

61 DRIVE, SLIDE-TILT SUNROOF/CONVERTIBLE TOP

67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF)

Necessary preliminary tasks:

- **E53:** Remove mounting bracket from roofliner at front.
- **E83:** Remove Front Roofliner Trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM** .

NOTE: **Secure drive with gear for actuating slide/tilt sunroof (2) against falling out.**

Release screws (1), tightening torque: 1AZ, see **54 13 ELECTRIC SUN ROOF COMPONENTS** .

Lower drive with gear for actuating slide/tilt sunroof (2).

NOTE: **Screws (1) are microencapsulated.**

Unlock plug connection (3), disconnect and remove drive with gear for actuating slide/tilt sunroof (2).

Fig. 17: Screws And Actuating Slide/Tilt Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert gear wheel (1) of drive with gear for actuating slide/tilt sunroof (2) exactly in gear teeth (3).

Fig. 18: Gear Wheel And Gear Teeth

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialize Panorama Glass Roof, see **54 0 ... NOTES ON PANORAMA GLASS ROOF (INITIALIZATION/NORMALIZATION/LEARNING OF CHARACTERISTIC CURVE)** .

67 61 517 REPLACING DRIVE WITH GEAR (REAR) FOR ACTUATING SLIDE/TILT SUNROOF

Necessary preliminary tasks:

- Remove rear grab handles, see **51 16 450 REMOVING AND INSTALLING/REPLACING REAR LEFT/RIGHT GRAB HANDLE** .
- Remove trim for rear left and right roof pillar (C-pillar), see **51 43 251 REMOVING AND INSTALLING/REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (C - PILLAR)** .
- Remove trim for rear left and right roof pillar (D-pillar), see **51 43 252 REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (D-PILLAR)** .
- Remove left and right interior lights, see **63 31 015 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT INTERIOR LIGHT (SIDE ROOFLINER)** .
- Detach mocket in area of roofliner

IMPORTANT: Do not under any circumstance kink roofliner (1).

Unclip roofliner (1) at retaining point (2) towards bottom and lower.

NOTE: Secure drive with gear for actuating slide/tilt sunroof (4) against falling out.

Release screws (3), tightening torque: 1AZ, see **54 13 ELECTRIC SUN ROOF COMPONENTS** .

Lower drive with gear for actuating slide/tilt sunroof (4).

Fig. 19: Roofliner And Actuating Slide/Tilt Sunroof
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Screws (3) are microencapsulated.

Unlock plug connection (5), disconnect and remove drive with gear for actuating slide/tilt sunroof (4).

Installation:

Insert gear wheel (1) of drive with gear for actuating slide/tilt sunroof (2) exactly in gear teeth (3).

Fig. 20: Gear Wheel And Gear Teeth
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialize Panorama Glass Roof, see **54 0 ... NOTES ON PANORAMA GLASS ROOF (INITIALIZATION/NORMALIZATION/LEARNING OF CHARACTERISTIC CURVE)**.

62 DRIVE, WINDOW REGULATOR

67 62 000 REMOVING AND INSTALLING / REPLACING FLAT MOTOR FOR FRONT LEFT OR RIGHT POWER WINDOW UNIT

Special tools required:

- **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Detach sound insulation on front door in working area, see **51 48 060 REMOVING AND INSTALLING/REPLACING SOUND INSULATION IN LEFT OR RIGHT FRONT DOOR**.

NOTE: For clearer illustration, shown with sound insulation removed.

Disconnect plug connection (1).

Unfasten screws (2).

Detach flat motor (3) in direction of arrow from power window unit (4) and remove.

IMPORTANT: If necessary, use special tool 00 9 310 to release flat motor (3) from power window unit (4).

Guide wheel must not be pulled out of power window unit (4).

Fig. 21: Screws And Flat Motor

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit flat motor (3) exactly on teeth of power window unit.

Replacement:

A normalization must be carried out in order to activate anti - trapping protection.

Operating sequence for normalization:

- Open corresponding window completely.
- Operate corresponding power window switch in "Close" position (second switch stage).
- Once the upper end position has been reached, hold power window switch down for approx. 1 second more.

Normalization is thus completed.

NOTE: Carry out function check (one-touch function, anti-trapping protection and, if necessary, comfort function).

67 62 020 REMOVING AND INSTALLING/REPLACING FLAT MOTOR FOR REAR LEFT OR RIGHT POWER WINDOW UNIT

Necessary preliminary tasks:

- Detach sound insulation on rear door in working area, see **51 48 070 REMOVING AND INSTALLING/REPLACING SOUND INSULATION ON LEFT OR RIGHT REAR DOOR** .

NOTE: For clearer illustration, shown with sound insulation removed.

Unfasten plug connection (1) and disconnect.

Release screws (2).

Detach flat motor for power window unit (3) in direction of arrow from power window unit (4) and remove.

Installation:

Fit flat motor for power window unit (3) exactly on teeth of power window unit.

Fig. 22: Screws And Flat Motor

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

A normalization must be carried out in order to activate anti - trapping protection.

Operating sequence for normalization:

- Open corresponding window completely.
- Operate corresponding power window switch in "Close" position (second switch stage).
- Once the upper end position has been reached, hold power window switch down for approx. 1 second more.

Normalization is thus completed.

NOTE: Carry out function check (one-touch function, anti-trapping protection and, if necessary, comfort function).

66 DRIVE, SEAT ADJUSTMENT

67 66 010 REMOVING AND INSTALLING/REPLACING LUMBAR SUPPORT DRIVE MECHANISM ON FRONT SEAT, LEFT OR RIGHT

Necessary preliminary tasks:

- Remove rear panel on front seat backrest, see **52 13 198 REMOVING AND INSTALLING / REPLACING REAR PANEL ON LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/MANUAL)** .

E53 comfort seat:

- Remove rear panel at bottom.

Detach backrest cover (1) in direction of arrow from backrest frame (2).

Fig. 23: Backrest Cover And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Detach transparent hose (2) from valve housing (3).

NOTE: If necessary, gently heat transparent hose (2) if firmly seated.

If necessary, detach fabric adhesive tape (4).

Detach drive unit for lumbar support (5) with jacket in direction of arrow.

Fig. 24: Transparent Hose And Valve Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean adhesive area (1) on backrest frame (2).

Fig. 25: Adhesive Area On Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Transparent hose (1) of drive unit for lumbar support must not be kinked.

Pull off protective film (3) from jacket (2). Stick drive unit for lumbar support to backrest frame.

If necessary, secure jacket (2) with cable strap.

Fig. 26: Transparent Hose And Protective Film
Courtesy of BMW OF NORTH AMERICA, INC.

ELECTRICAL

Electrical System - Operating Fluids

1.0 BATTERY

Only distilled water (available locally) is to be used when topping up the electrolyte level.

If a new battery (delivered dry) is to be placed into service, use only battery electrolyte ("sulfuric acid"), available locally.

2.0 SEALANT/SUPER GLUE/CONTACT CLEANER

Sealant

Aftermarket accessory installations which require routing electrical wires through metal body panels are to have the access holes sealed.

(former BMW Part No. 81 22 9 400 013)

BMW PART NUMBER SPECIFICATION

Wurth	Part No. 893430
-------	-----------------

SUPER GLUE

The rubber seal around the trunk release button of E39 vehicles can be repositioned with Wurth Rubberized Super Glue (Part No. 893 4103).

3.0 ELECTRICAL CONTACT ENHANCER AND CONTACT CLEANER

ELECTRICAL CONTACT/CONNECTOR GREASE

NyoGel 760G is resistive to moisture and can be used for a lubrication of tin-lead type electrical connectors.

NyoGel 760G BMW Part No. 83 23 0 392 297

ELECTRICAL CONTACT ENHANCER

Stabilant 22A evaporates and leaves a thin polymer film which is conductive between the mating surfaces, while staying non-conductive between adjacent pins. At the same time it prevents the formation of any further harmful deposits.

BMW PART NUMBER SPECIFICATION

Wurth	Part No. 893622 (Stabilant 22A)
-------	---------------------------------

NOTE: 1 : Stabilant 22A must not be used on Oxygen Sensor connectors. To function, oxygen sensors require a flow of oxygen through the terminal connector to the sensor element. Stabilant 22A will affect this flow of oxygen, and will result in irreparable damage to the sensor.

NOTE: 2 : Stabilant 22A must not be used on plug connectors which carry fiber optics. Stabilant 22A may migrate to the fiber optic and attenuate the optical signal.

CONTACT CLEANER SPRAY

Use to clean electrical and electronic components of dirt, grease, etc. Will not harm components or epoxy coverings. Allow to air dry. **Do not** dry with shop air supply as this may contaminate the connector.

BMW PART NUMBER SPECIFICATION

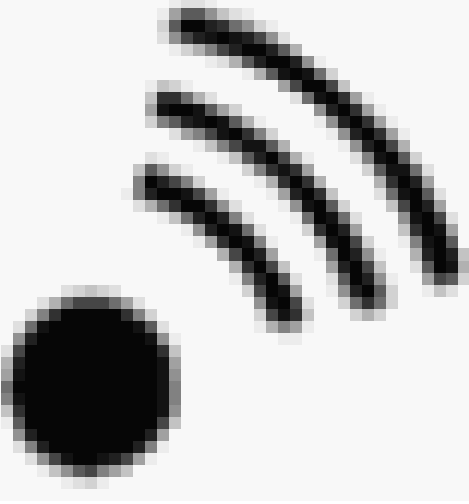

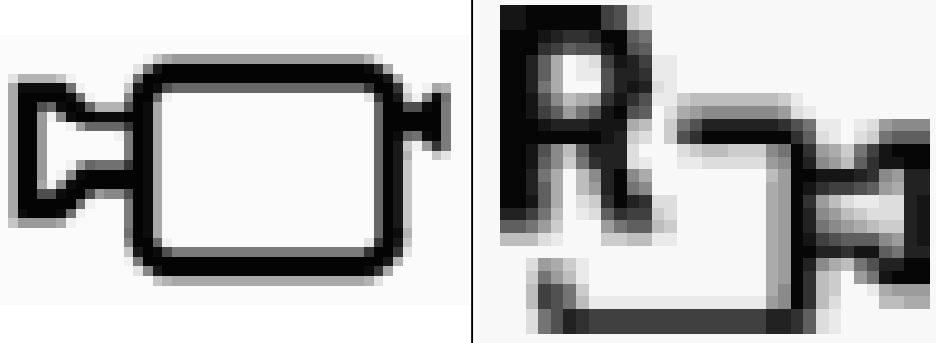

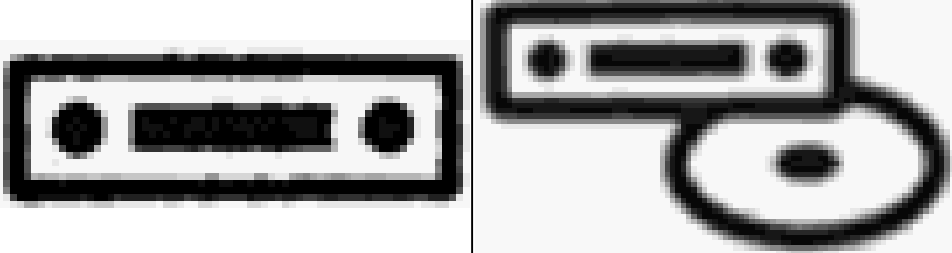

Wurth	Part No. 89365 (Zero Residue Electrical Contact Cleaner)

BMW - X3 (E83) - 2004-10

IDENTIFICATION

WARNING: Vehicles are equipped with air bag supplemental restraint system. Before attempting any repairs involving steering column, instrument panel or related components, see appropriate **AIR BAG SAFETY PRECAUTIONS** and **ACTIVATING AIR BAG SYSTEM** in **AIR BAG RESTRAINT SYSTEMS** article.

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer systems have completed a relearn cycle. See appropriate **COMPUTER RELEARN PROCEDURES** article in **GENERAL INFORMATION** before disconnecting battery.

COMPONENT IDENTIFICATION

ENGINE ELECTRONICS FUSE CARRIER

Engine electronics fuse carrier (A8680 or A6009) is located in left rear of engine compartment. See **Fig. 1**.

INTERIOR MIRROR WITH DIGITAL COMPASS

E70, E83, E90, E91, E92, E93

Fig. 1: Interior Mirror With Digital Compass
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

A digital compass in the interior mirror is offered as an optional extra (option 4NA) for the following BMW vehicles: 3 Series and X3 and X5.

- > **Up to 09/2006**

A small LC display at top right in the interior mirror indicates the point of the compass in which the direction of travel is pointing: e.g. **SW** for South West.

- > **From 09/2006**

The display is effected with transmitted light technology. An LC display (window) is no longer needed. The display can be deactivated.

The compass offers an additional benefit especially in the USA. In large cities the streets are frequently arranged according to the points of the compass. The points of the compass are also marked on signposts.

The compass also makes orientation in European cities easier.

NOTE: Option 4NA only in conjunction with option 430 or 431.

Option 4NA "Interior mirror with digital compass" is offered only in conjunction with the following option:

- Option 430 "Interior mirror and exterior mirrors with automatic antiglare control"
- Option 431 "Interior mirror with automatic antiglare control"

Option 4NA **cannot** be combined with option 449 "Interior mirror with toll function for Japan".

Option 4NA **cannot** be combined with option 802 "Korea version".

Option 4NA **cannot** be combined with option 5AC "Main-beam assistant".

BRIEF DESCRIPTION OF COMPONENTS

The following components deliver signals for the digital compass:

- **Magnetic field sensor**
 - **> up to 09/2006**

The magnetic field sensor is installed in the mirror base. The magnetic field sensor measures the current alignment of the magnetic field. The signal is sent to the control electronics for the compass in the interior mirror.

- **> from 09/2006**

The magnetic field sensor is on the PCB in the interior mirror.

- **Control electronics for the compass**

The interior mirror is electrically connected to the roof control panel (FZD).

The control electronics for the compass are integrated into the board for the interior mirror. The signals from the magnetic field sensor are received by the control electronics. The LCD display is activated directly by the control electronics.

The following components are controlled:

- **Display in interior mirror**

- **> up to 09/2006**

The LC display (window) is situated at top right in the interior mirror.

The points of the compass are presented digitally on the LCD display (LCD: Liquid Crystal Display). The display is divided into eight compass points.

- **> from 09/2006**

The point of the compass is displayed in transparent light technology in the interior mirror as well. The display is likewise situated at top right in the interior mirror. The display is divided into 8 points of the compass.

SYSTEM FUNCTIONS

The following system functions for the digital compass are described:

- Display
- Brightness control of display
- Adjustment of magnetic field zones and calibration
- from 09/2006: Further adjustments
- up to 09/2006: Fault display

Display

The 8 points of the compass are digitally displayed by abbreviations.

- **> From 09/2006**

The display is available in English and German (delivery status: English LHD)

N: North

NE: North East

E: East

SE: South East

S: South

SW: South West

W: West

NW: North West

The changeover between displays is carried out as follows:

- The current vehicle position is the center of a 360° circle.
- The eight points of the compass divide these 360° into sixteen 22.5° segments.
- The display changes over if the direction of travel changes by more than 22.5°.

Brightness control of display

2 photocells in the electrochromic interior mirror record the surrounding brightness (1 photocell for the surrounding brightness coming from the front, 1 photocell for the surrounding brightness coming from the rear).

The photocells deliver the signals for the display brightness control.

The brightness of the display is adjusted by the interior mirror control electronics to suit the surrounding brightness.

Adjustment of magnetic field zones and calibration

The worldwide magnetic field zones are permanently stored in the interior mirror. The magnetic field zones represent the deviations in relation to an ideal magnetic field for earth. The orientation "North" is precisely determined by the magnetic field zones.

The current magnetic field zone may be adjusted according to the geographic location. For example, Germany is located in magnetic field zone "8".

A vehicle has its own magnetic field. This makes it possible for the magnetic field sensor to measure an overlapping of the magnetic field with the earth's magnetic field. This overlapping is "worked out" by calibrating the compass.

A changed magnetic field is normally calibrated "automatically".

The vehicle's magnetic field may change under the following special circumstances:

- Powerful vibration during an accident
- Very large external magnetic field - e.g. if a vehicle passes under a train when travelling through an underpass

However, a manual calibration may speed up the automatic calibration.

For procedure to be followed when setting the magnet field zones as well as manual calibration: see notes for service staff.

from 09/2006: Further adjustments

Different time-based adjustment menus can be obtained by means of the adjustment button:

- 0 to 3 seconds: Display ON/OFF
- 3 to 6 seconds: Adjustment of magnetic field zones (0 - 15)
- 6 to 9 seconds: Calibration (C)
- 9 to 12 seconds: Left-hand drive or right-hand drive (L or R)
- 12 to 15 seconds: English or German (E or O)

Release the adjustment button when the correct menu is obtained. Select values in the menu by pressing briefly.

After approx. 5 seconds the value is stored and the menu is automatically exited.

up to 09/2006: Fault display

The LC matrix for the LCD display lights up completely if a system fault develops. A fault is displayed under the following conditions:

- If the vehicle is highly magnetised (2,200-2,500 milligauss), the measuring range of the magnetic field sensor will be exceeded.
- If a fault develops in the circuitry of the magnetic field sensor.

NOTE: regarding the physical unit "gauss".

Gauss is the unit of measurement for magnetic flux density.

Preconditions for activation

At terminal 15 ON, the display is activated with a test run.

- > **Up to 09/2006**

During this process, the LC matrix lights up completely (approx. 3 seconds). The digital compass is then switched on. There is no switch for turning off the LCD display at terminal 15 ON.

BUS STRUCTURES

All models from E38 and MINI

Fig. 2: Bus Structures
 Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

In the vehicles of today, components and control units are networked by means of data buses. Data buses are capable of transmitting messages and signals.

The connected control units only read off those messages and signals that are of relevance to their operation.

Most buses are CAN buses (CAN: Controller Area Network).

A fibre-optic cable is used for navigation and entertainment: The MOST bus (MOST = "Media Oriented System Transport").

It has its own data wire for diagnosis: the diagnostics cable, also known as the "K-line"

This SI Technology bulletin (SBT) contains system overviews of bus structures for the following model series:

- E38 (7-Series, manufacturing period from 1994 to 2001)
- E39 (5-Series, manufacturing period from 1995 to 2003)
- E46 (3-Series, manufacturing period from 1997 to 2005)
- E52 (Z8, manufacturing period from 1999 to 2003)
- E53 (X5, start of series production 2001)

- E60, E61, E63, E64
 - > E60, E61, E63, E64 from 09/2005:
 - > E60, E61, E63, E64 from 03/2005 until 09/2005:
 - > E60, E61, E63, E64 until 03/2005:
- E65, E66
 - > E65 and E66 from 03/2005:
 - > E65 and E66 from 03/2004 until 03/2005:
 - > E65 and E66 until 03/2004:
- E70 (X5, start of series production 2006)
- E83 (X3, start of series production 2004)
- E85, E86
 - > E85 (Z4), start of series production 2002 until 01/2006:
 - > E85, E86 from 01/2006:
- E87 (1-Series, start of series production 2004)
- E90, E91, E92, E93 (3-Series, start of series production 2005)
- R50, R52, R53 (MINI and MINI Convertible, start of series production 2001)
- R56 (start of series production 2006)

This SI Technology bulletin (SBT) also contains a section with frequently asked questions.

NOTE: Abbreviations for control unit names

In the overviews of bus structures, all diagnosis and programming control units are indicated by abbreviations.

The abbreviated names of the control units are listed in alphabetical order and explained in a separate section "Abbreviations" in the SI Technology bulletin (SBT).

The following control units are numbered:

- Control units that **cannot** be programmed and **cannot** be encoded and which **do not** appear in the quick test.

These control units do not have an abbreviation, just a number.

- Control units with control unit designation from the time before electrical system 2000:

Besides the abbreviation, these control units have a number for entering in the table.

On the history of control unit designations:

Since the start of series production of the E65 (electrical system 2000), the control unit designations have been harmonised. Earlier model series have varying control unit designations.

For technical reasons associated with the system, these control units have not been renamed.

This is because: These control unit designations appear in the quick test on the BMW diagnosis system.

BUSES AND CONTROL UNITS IN THE E60, E61, E63, E64

In the E60, the K-CAN S and K-CAN P from the E65, E66 have been combined to form the K-CAN.

This means the E60 has the following buses: **byteflight** , K-CAN, MOST, F-CAN, PT-CAN plus a local CAN (for the engine control system).

The central interface for exchanging data between buses is the safety and gateway module (SGM).

NOTE: Modifications to the bus structures for the E60 as from 09/2005

From September 2005, the bus structures of the E60 are modified as follows:

- No **byteflight** data bus

The SZL control unit is connected to the PT-CAN and no longer to the **byteflight** .

As before, the SZL control unit is connected to the F-CAN.

Following control units are dropped together with the **byteflight** :

- SBSL: B-pillar satellite, left
- SBSR: B-pillar satellite, right
- TMBF: Door module, front-passenger
- TMFA: Door module, driver

- ACSM is added.

The crash safety system is controlled by a new control unit:

ACSM: crash safety module

The ACSM control unit is on the K-CAN.

("ACSM" = Advanced Crash Safety Module or Management)

- ALBBF and ALBFA are added.

2 new control units for the active backrest width adjustment are added on the PT-CAN.

ALBBF: Active seat back width, front passenger seat

ALBFA: Active seat back width, driver's seat

- CA is added.

A control unit for comfort access is added on the K-CAN.

CA: Comfort Access

- KGM is added.

As of September 2005, the data interface for the buses is the body-gateway module (KGM). The previous data interface for the buses, the safety and gateway module (SGM) has been dropped.

The following functions are integrated in the KGM control unit:

- Data interface for buses
- Outside door handle electronics
- Vehicle center satellite
- micro-power module

- IBS: Intelligent battery sensor

The IBS is connected via the bit-serial data interface (BSD) to the engine control unit. The IBS has been part of the power supply on the BMW 5-Series since start of series production.

- FLA is added.

A new control unit for the main-beam assistant is added on the K-CAN:

FLA: Main-beam assistant

- For US vehicles: IBOC is added.

For US vehicles, a control unit is added to the MOST for analogue and digital radio reception.

IBOC: Digital tuner US

- For Korea vehicles: KNAV is added.

A control unit for the navigation system is added for vehicle in Korea.

KNAV: Korea navigation system

The KNAV control unit is connected to the MOST.

- A new control unit for the night vision assistant is added on the K-CAN:

NVE: night vision electronics

- MPM dropped.

No micro-power module (MPM) on the K-CAN. The KGM control unit performs the functions of the MPM.

- For US vehicles: RDC is added.

For US vehicles, a new control unit added on the K-CAN for monitoring tire pressure has been.

RDC: tire pressure control

- > E60, E61, E63, E64 from 09/2005: Buses and control units:

NOTE: Modifications to the bus structures for the E60 as from 03/2005

From March 2005, the bus structures of the E60 are modified as follows:

- AHL discontinued:

From March 2005, the AHL control unit (adaptive headlights) is integrated into the light module. The light module is connected to the K-CAN and the PT-CAN.

- The VTG is now also integrated: For the E60 and E61, an all-wheel drive vehicle is available. The control unit for the xDrive on the E60 and E61 is known as the VTG: Transfer case.

- > E60, E61, E63, E64 from 03/2005 until 09/2005: Buses and control units:

NOTE: Original version: Buses and control units on E60, E61 E63, E64 up to 03/2005

To support the workshops, a description of the previous version of the bus structures on the E60 is also provided:

- > E60, E61, E63, E64 up to 03/2005: Buses and control units:

BUSES AND CONTROL UNITS IN THE E65 AND E66

The main buses in the E65 and E66 are called: K-CAN P, K-CAN S, MOST, **byteflight** , Local CAN, PT-CAN.

NOTE: Modifications to the bus structures for the E65 and E66 from 03/2005

From March 2005, the AHL control unit (adaptive headlights) is integrated into the light module. The light module is connected to the K-CAN S and the PT-CAN.

- > E65 and E66 from 03/2005: Buses and control units:

NOTE: Predecessor version: Buses and control units on E65, E66 from 03/2004

To support the workshops, a description of the predecessor version of the bus structures on the E65 and E66 is also provided:

The key modification compared to the original version of the bus structures on the E65 and E66 is:

SIM and ZGM have been combined to create the SGM. The SGM is the central data interface for all buses and control units.

(SIM: safety and information module)

(ZGM: central gateway module)

(SGM: safety and gateway module)

- > E65 and E66 from 03/2004 to 03/2005: Buses and control units:

NOTE: Original version: Buses and control units on E65, E66 up to 03/2004

To support the workshops, the original version of the bus structures on the E65 and E66 is also available:

In the original version, the E65, E66 had the two control units SIM and ZGM.

- SIM: safety and information module

The SIM was the data interface for the control units on the **byteflight** data bus.

- ZGM: Central gateway module

The ZGM is the central data interface for all buses and control units.

- > E65 and E66 up to 03/2004: Buses and control units:

BUSES AND CONTROL UNITS IN THE E70

The important buses in the E70 are called: K-CAN, MOST, PT-CAN, F-CAN, FlexRay.

FlexRay is a new communication system that offers extremely efficient, real time data transfer between the electrical and mechatronic components in the vehicle. FlexRay has a data transfer rate of 10 MBit/s.

FlexRay is used for data exchange between the VDM control unit and the shock absorber satellites.

CHAMP: On the US national version, instead of the multi-audio system controller (M-ASK), the Central Headset And Multimedia Platform (CHAMP) operates as the BMW "Professional" radio. In contrast to M-ASK, CHAMP **does not** have a navigation system.

- > E70: Buses and control units

BUSES AND CONTROL UNITS IN THE E87

The important buses in the E87 are called: K-CAN, MOST, PT-CAN and F-CAN.

The MOST, the innovation in the bus structure on the E65 and E66, is now also used in the E87.

The central interface for data transmission is the junction box electronics (JBE) in the junction box.

- > E87: Buses and control units

BUSES AND CONTROL UNITS ON THE E90, E91, E92, E93

The most important buses on the E90 are: K-CAN, MOST, PT-CAN, F-CAN.

The new feature is that the footwell module (FRM) is connected to the PT-CAN. This is because:

- The adaptive headlights are integrated into the footwell module. The adaptive headlights need the high-speed PT-CAN.
- The longitudinal dynamics management sends the signal for the brake light on the PT-CAN.

Compared with the E87, some new control units are connected to the F-CAN, e.g. LDM and ACC (LDM: longitudinal dynamic management; ACC: active cruise control).

- > E90, E91, E92, E93: Buses and control units:

PANORAMA GLASS SUNROOF

E53, E61, E83, E91

TE102094

Fig. 3: Panorama Glass Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

The fully automatic Panorama glass sunroof consists of 2 glass sunroofs and a 2-piece sliding visor. The front glass sunroof works like a sliding/tilting sunroof, the rear glass sunroof is a tilting glass sunroof. The Panorama glass sunroof is actuated in the usual way by its own control unit.

- > E53, E83
- > E61
- > E91

The Panorama glass sunroof is available as special equipment (option 402).

BRIEF DESCRIPTION OF COMPONENTS

The following components supply the input signals for the Panorama glass sunroof:

- **Panorama glass sunroof switch**

The switch is located in the control unit in the roof console.

The switch can be moved in 3 directions (pushed forwards, pushed backwards, pushed upwards).

- **Hall sensors in Panorama glass sunroof drive**

There are 2 Hall sensors integrated in each of the two electric motors for the Panorama glass sunroof. The Hall sensors detect the motor speed. The signals are forwarded to the SHD control unit. These signals enable the control unit to recognize the position of the two glass sunroofs and of the 2-piece sliding visor. Moreover, the closing speed of each electric motor is used to calculate the closing force for the two glass sunroofs and for the sliding visor.

The control units involved in the functions of the Panorama glass sunroof are as follows:

- **SHD control unit (control unit for Panorama glass sunroof)**

The SHD control unit controls all the electrical functions of the Panorama glass sunroof.

- **GM: General module 3 (E53) or general module 5 (E83)**

The general module controls the convenience opening or closing function of the Panorama glass sunroof. The general module forwards the request (from the remote control, for example) to the SHD control unit via the body bus.

- **CAS: Car Access System (E61, E91)**

The CAS controls the convenience opening or closing function of the Panorama glass sunroof. The CAS forwards the request (from the remote control, for example) to the SHD control unit via the Body CAN.

- **CA: Comfort Access**

Option 322 "Comfort Access" allows convenience closing of the Panorama glass sunroof without actively using the ID transmitter.

- **LSZ: Light switch cluster (E53, E83)**

The light switch cluster sends the SHD control unit the request to switch on the locating light via the body bus (terminal 58g).

- **LM: Light module (E61)**

The light module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

- **FRM: Footwell module (E91)**

The footwell module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

- **FZD: Roof control panel (E91)**

The roof control panel picks up the signals from the switch for the Panorama glass sunroof. In addition, the FZD control unit also converts the signal into a CAN message. The CAN message is forwarded to the

SHD control unit via the K-CAN.

- **KOMBI: Instrument cluster**

The instrument cluster sends the road speed signal to the SHD control unit.

- > via the K-bus (body bus) on the **E53, E83**
- > via the K-CAN (Body CAN) on the **E61, E91**

The signal is needed to extend and retract the wind deflector and to adjust the closing force limitation.

The following components are actuated for the purposes of the functions of the Panorama glass sunroof:

- **Panorama glass sunroof drive**

The drive consists of 2 DC motors with reduction gearing. One motor operates the two glass sunroofs, the other motor the sliding visor and the wind deflector.

- **Wind deflector**

The wind deflector is extended to reduce noises inside the vehicle when the sliding/tilting glass sunroof is open. The wind deflector automatically extends depending on the road speed.

- **2-piece sliding visor**

When driving with the Panorama glass sunroof tilted ("vent" position), a suction effect develops on the 2-piece sliding visor. This suction effect can lead to noise disturbance.

- > E53, E61, E83:

To minimize the suction effect, the rear piece of the 2-piece sliding visor is opened approximately 3 cm.

- > E91 :

The 2-piece sliding visor moves back approx. 5 cm and forms an opening at the front.

SYSTEM FUNCTIONS

The Panorama glass sunroof comprises the following functions:

- Opening and closing
- Convenience opening and closing
- Emergency closing
- Anti-trap function (limits closing force)
- Safety functions

Opening and closing

The functions for opening and closing are as follows:

- Manual opening or closing

Push the switch for the Panorama glass sunroof backwards to the first resistance point to open it, or forwards to close it.

The glass sliding/tilting sunroof (front glass sunroof) keeps moving as long as the switch remains pushed.

- Automatic opening or closing

- Automatic opening:

Press the switch for the Panorama glass sunroof beyond the pressure point. The Panorama glass sunroof is partially opened automatically. That means: Depending on the initial position of the Panorama glass sunroof, the sliding visor is first opened fully. Then, if the switch is again pressed beyond the pressure point, the glass sliding/tilting sunroof is opened. When it is opened, the sliding/tilting glass sunroof automatically moves to the comfort position (sliding/tilting glass sunroof approx. 3/4 open). The switch must be pushed again to completely open the glass sliding/tilting sunroof.

- Automatic closing:

The closing procedure is a reverse of the above. When the comfort position is reached during closing, the closing operation is interrupted and must be restarted.

- Automatic opening or closing with a double click

Press the button for the Panorama glass sunroof beyond the pressure point to "Open" or "Close" twice within the space of 2 seconds. The Panorama glass sunroof completely opens or closes automatically. When this happens, the sliding visor and the sliding/tilting glass sunroof open or close together. However, the sliding visor always moves out-of-line with the sliding/tilting glass sunroof. This ensures that the sliding visor is always slightly more open than the sliding/tilting glass sunroof as the sliding/tilting glass sunroof is opened or closed.

- Tilt

- Push the switch for the Panorama glass sunroof upwards until it reaches its mechanical stop. The front glass sliding/tilting sunroof and the rear tilting glass sunroof are automatically lifted from every other position as long as the switch remains pushed.

- Press the switch for the Panorama glass sunroof up twice within the space of 2 seconds. The Panorama glass sunroof moves to the "Vent" position, regardless of the starting position. ("Vent" position means: both glass sunroofs are fully tilted, the rear section of the 2-piece sliding visor is opened approx. 3 cm.)

NOTE: Automatic closing is not possible if the anti-trap function fails.

Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.

Any fault data is then stored in the SHD control unit.

Convenience opening and closing

The controls that can be used for this purpose are as follows:

- Button on remote control (radio-control key)

Press the button on the remote control to "unlock" or "lock" and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Door lock on driver's door

Use the mechanical key to turn the lock in the driver's door to the position for unlocking or locking, and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Driver-side outside door handle and passenger-side outside door handle

If the vehicle is equipped with Comfort Access (CA), **convenience closing** can be started using the outside door handle electronics in the bow handle.

The convenience opening/convenience closing function is stopped if the command is cancelled.

Emergency closing

Emergency closing is a function for deliberate closure of the Panorama glass sunroof without anti-trap function (closing-force limitation). Emergency closing may be necessary if someone attempts to reach into the interior of the car or if mechanical difficulty is experienced in closing the Panorama glass sunroof.

Emergency closing can be activated when the car is stopped or travelling at a speed up to 16 km/h.

To activate emergency closing:

Push the switch for the Panorama glass sunroof in the "close" direction until it reaches its mechanical stop and hold it there. The Panorama glass sunroof is closed with maximum force and maximum speed without anti-trap function.

If the Panorama glass sunroof is blocked, the electric motor continues to run until the overheating protection is activated.

Anti-trap function (closing-force limitation)

WARNING: Note initialization

The Panorama glass sunroof has to be initialized in order for the anti-trap function to work correctly. The Panorama glass sunroof has to be initialized by service staff.

The anti-trap function is active over the entire range of movement in the closing direction.

The anti-trap function works as follows:

- The sliding/tilting glass sunroof and/or the sliding visor is opened approx. 20 cm.
- When closing from the "tilt" position, the sunroof will return to the "tilt" position.

Anti-trap function does not in principle prevent trapping; instead, it limits the maximum permissible force applied to the trapped object (by limiting the closing force).

To prevent impermissibly high closing forces, there are 2 Hall sensors integrated in each of the electric motors. The speed of closure can be measured on the basis of the signals from these two Hall sensors.

The closing force is calculated from the speed of closure.

The mechanical forces involved change with ambient temperature and as a result of ageing. For this reason, the closing forces required are adapted during the closing process.

Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.

SAFETY FUNCTIONS

- **Maximum motor ON time**

If a motor runs in a single direction for longer than 15 seconds, the SHD control unit will deactivate the drive.

- **Overheating protection**

The heating up of the electric motors is computed in the SHD control unit. The outside temperature is available as a temperature signal (via the body bus or CAN). Moreover, there is a temperature sensor on the board of the SHD control unit. After a certain temperature threshold is reached the overheating protection is activated. The drive is switched off.

- **Emergency operation**

In emergency mode, the Panorama glass sunroof can only be moved in small steps.

Emergency mode is possible in the following conditions:

- Encoding of the SHD control unit incorrect

- Implausible signal from a Hall sensor
- Initialization incomplete

NOTE: Mechanical emergency mode is possible

In case of an electrical defect, emergency mode of the Panorama glass sunroof is available.

There is no emergency mode for the sliding visor.

ELECTRICAL

General Electrical System - Special Tools - X3

61 GENERAL ELECTRICAL SYSTEM

61 0 021 FUSE LINK FF 3.15 A / 500 V

Note: For analog/digital multimeter M 2005, M 2007, M2008

Note: Replaces from 09/2005 special tool 61 1 180

18= 61 0 319 Release tool for sensor laminated contacts ("SLK2.8")

Note: Replaces from 09/2005 special tool 61 1 148

19= 61 0 321 Release tool for sensor laminated contacts with unlocking element ("SLK 2.8")

20 = 61 0 322 Release tool for mini laminated contact ("MLK 1.2 mm")

21 = 61 0 323 Release tool for flat spring contacts with a detent lug (MQS)

Note: Replaces from 09/2005 special tool 61 1 152

22 = 61 0 324 Release tool for secondary locking

Note: Universal tool for damage-free opening/removal of secondary locks

23 = 61 0 329 Case with foam inlay without tools

Note: Storage system for release tools from set 61 0 300

24 = 61 0 325 Release tool "JPT"

25 = 61 0 326 Release tool "MQS"

Note: For releasing all micro contacts

26 = 61 0 327 Plug-in aid

Note: For inserting contacts (0.64 - 1.2 mm) in housing

27 = 61 0 328 Plug-in aid

Note: For inserting contacts (2.8 - 4.8 mm) in housing

28 = 61 0 331 Release tool "SLK 5.8"

Note: For releasing "SLK 5.8 mm" contacts

Fig. 5: Releasing Tool (61 0 300)

61 1 150 RELEASING TOOL KIT

Note: For circular connector / press-out tool - Contains kits 61 1 130, 61 1 140 and 61 1 180 Replaced by special tool 61 0 300 from 09/2005.

Series: E12, E21, E23, E24, E28, E30, E31, E32, E34, E36, E38, E39, E46, E52, E53, E65, E66, E83, E85, R50, R53, RR1

Storage location: K 106

Order number: 61 1 150

Releasing tool kit

Consisting of:

61 1 151 Press-out tool

Note: For Power timer contacts / AMP and Bosch Replaced by special tool 61 0 315 from 09/2005.

61 1 152 Press-out tool

Note: For Micro timer contacts Replaced by special tool 61 0 323 from 09/2005.

61 1 153 Releasing tool

Note: For retaining tab of relay holder

61 1 154 Replacement sleeve dia. 1.5 mm for 61 1 139

Note: Order number was temporarily assigned for case inlay in 8/95 on delivery of case Replaced by special

tool 61 0 311 from 09/2005.

61 1 155 Replacement sleeve dia. 3.5 mm for 61 1 133

Note: Replaced by special tool 61 0 306 from 09/2005.

61 1 156 Replacement sleeve dia. 2.5 mm for 61 1 132

Note: Replaced by special tool 61 0 304 from 09/2005.

61 1 157 Replacement sleeve dia. 1.5 mm for 61 1 131

Note: Replaced by special tool 61 0 302 from 09/2005.

61 1 158 Case with inlay

Note: Replaced by special tool 61 0 329 from 09/2005.

61 1 159 Operating instructions

61 1 131 Press-out tool

Note: Replaced by special tool 61 0 301 from 09/2005

61 1 132 Press-out tool

Note: For 2.5 mm round contacts Replaced by special tool 61 0 303 from 09/2005.

61 1 133 Press-out tool

Note: For 3.5 mm round contacts Replaced by special tool 61 0 305 from 09/2005.

61 1 134 Press-out tool

Note: For Mini flat spring contacts Replaced by special tool 61 0 312 from 09/2005.

61 1 135 Press-out tool

Note: For standard flat spring contacts Replaced by special tool 61 0 314 from 09/2005.

61 1 136 Press-out tool

Note: For Power timer contacts (G & H) Replaced by special tool 61 0 316 from 09/2005.

61 1 137 Press-out tool

Note: For timer contacts Replaced by special tool 61 0 313 from 09/2005.

61 1 138 Socket wrench

Note: For telltale lamps (instrument cluster)

61 1 139 Press-out tool

Note: Slotted sleeve for Kostal round contacts with dia. 1.5 mm Replaced by special tool 61 0 311 from 09/2005.

61 1 141 Releasing tool

Note: For D 2.5 / ELA, 4-pin, round

61 1 142 Releasing tool

Note: For D 2.5 / ELA, 7-pin, round

61 1 143 Releasing tool

Note: For D 2.5 / ELA, 12 -pin, round

61 1 144 Releasing tool

Note: For D 2.5 / ELA, 25 -pin, round

61 1 145 Releasing tool

Note: For D 1.5 / ELA, 10 -pin, round

61 1 149 Replacement blades

Note: For press-out tool 61 1 148

61 1 148 Press-out tool for SLK

Note: SLK = sensor laminated contacts Replaced by special tool 61 0 319 from 09/2005.

61 1 180 Press-out tool

Note: For load current contacts Replaced by special tool 61 0 318 from 09/2005.

Fig. 6: Releasing Tool Kit (61 1 150)

Courtesy of BMW OF NORTH AMERICA, INC.

61 1 180 REMOVAL TOOL

Minimum set: Mechanical tools

Note: For load current contacts

Series: All models

SI number: 20600(636)

Order number: 61 1 180

Removal tool

Fig. 7: Removal Tool (61 1 180)

Courtesy of BMW OF NORTH AMERICA, INC.

61 1 190 PLIERS

Note: For insulation displacement connectors for repairing ribbon cables

Series: E60, E61, E63, E64, E65, E66, E67, E81, E82, E83, E86, E87, E90, E91, E92, R50, R52, R55, R56, RR1, RR2

SI number: 1 14 01 (766)

Order number: 61 1 190

Pliers

Fig. 8: Pliers (61 1 190)

Courtesy of BMW OF NORTH AMERICA, INC.

61 1 350 SET OF ASSEMBLY TOOLS

Note: For removing and installing socket in transmission connector on automatic transmission

Transmission: 4 HP 22, 4 HP 24

Storage location: I 103

Order number: 61 1 350

Set of assembly tools

Consisting of:

1 = 61 1 351 Removal tool

2 = 61 1 352 Fitting drift

Fig. 9: Set Of Assembly Tools (61 1 350)
Courtesy of BMW OF NORTH AMERICA, INC.

61 1 410 SET OF DIS TEST PRODS

Series: E12, E21, E23, E24, E28, E30, E31, E32, E34, E36, E38, E39, E39tou, E46, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, RR1

Storage location: H 107

Order number: 61 1 410

Set of DIS test prods

Consisting of:

1 = 61 1 411 Clip SAGK4-K, red

1 = 61 1 421 Clamping test probe XB/100, black

2 = 61 1 412 Clip SAGK4-K, black

3 = 61 1 413 Clip SAGK4, red

4 = 61 1 414 Clip SAGK4, black

5 = 61 1 415 Clip XDK-1033, red

6 = 61 1 416 Clip XDK-1033, black

7 = 61 1 417 Test probe SPP4-S, red

8 = 61 1 418 Test probe SPP4-S, black

9 = 61 1 419 Clamping test probe XB/100, red

Fig. 10: Set Of DIS Test Prods (61 1 410)
 Courtesy of BMW OF NORTH AMERICA, INC.

61 2 250 V-ADAPTER LEAD (RAIL PRESSURE SENSOR)

Minimum set: Measuring and testing equipment

Note: For system check of rail pressure control for common-rail diesel engines. Also suitable for connection to: Crank-/camshaft sensor, boost pressure sensor, particulate filter pressure sensor, swirl flap actuator, oil level sensor etc.

Series: E39, E46, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93

SI number: 02 01 06 283

Order number: 61 2 250

V-adapter lead (rail pressure sensor)

Fig. 11: V-Adapter Lead (61 2 250)

Courtesy of BMW OF NORTH AMERICA, INC.

61 2 410 BATTERY TRICKLE CHARGER

Note: Will in future be replaced by the battery trickle charger "Acctiva easy". Order number 81 39 0 409 468 (Europe version) and 81 39 0 409 471 (USA version)

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E83, E85, E87, R50, R52, R53, RR1

Storage location: Single

SI number: 2 02 00 (545)

Order number: 61 2 410

Battery trickle charger

Consisting of:

1 = 61 2 411 Trickle charger

Note: Including connection cable (ribbon cable) for cigarette lighter socket

3 = 61 2 413 Adapter cable

Note: for direct connection to battery or terminal point

9 = 61 2 419 Operating instructions

Fig. 12: Battery Trickle Charger (61 2 410)

Courtesy of BMW OF NORTH AMERICA, INC.

61 2 440 SYSTEM CONNECTING CABLE (COUNTRY-SPECIFIC)

Note: System connecting cable for battery trickle charger 61 2 410

Order number: 61 2 440

System connecting cable (country specific)

Consisting of:

1 = 61 2 441 System connecting cable (country specific)

Note: Algeria / Armenia / Belarus / Belgium / Brazil / Denmark / Dubai / Egypt / Finland / France / Germany / Greece / Korea / Luxembourg / Martinique / Morocco / Norway / Saudi Arabia / Sweden / Spain and others

2 = 61 2 442 System connecting cable (country specific)

Note: Australia / New Zealand

3 = 61 2 443 System connecting cable (country specific)

Note: Italy

4 = 61 2 444 System connecting cable (country specific)

Note: Bahrain / Brunei Dar es Salaam / England / Hong Kong / India / Kuwait / Nigeria / Northern Ireland / Oman / Qatar / Singapore / Sri Lanka (Ceylon)

5 = 61 2 445 System connecting cable (country specific)

Note: Switzerland

6 = 61 2 446 System connecting cable (country specific)

Note: Argentina / Barbados / Canada / China / Guam / Honduras / Jamaica / Mexico / Panama / Philippines / Tahiti / Taiwan / USA

7 = 61 2 447 System connecting cable (country specific)

Note: Japan

61 3 080 V-ADAPTER LEAD FOR TRANSFER CASE - ECU E83 (8-PIN)

Minimum set: Measuring and testing equipment

Note: For checking function of engine at transfer box (X3)

Series: E83

SI number: 02 08 03 (045)

Order number: 61 3 080

V-adapter lead for transfer case - ECU E83 (8-pin)

Fig. 13: V-Adapter Lead For Transfer Case - ECU E83 (61 3 080)
Courtesy of BMW OF NORTH AMERICA, INC.

61 3 090 V-ADAPTER LEAD DXC CONTROL UNIT E83 (6 -PIN)

Minimum set: Measuring and testing equipment

Note: For checking function of DXC control unit in X3

Series: E83

SI number: 02 08 03 (045)

Order number: 61 3 090

V-adapter lead DXC control unit E83 (6 - pin)

Fig. 14: V-Adapter Lead DXC Control Unit E83 (61 3 090)
Courtesy of BMW OF NORTH AMERICA, INC.

61 3 130 I-ADAPTER LEAD AIRBAG CONTROL UNIT E83 (75-PIN)

Minimum set: Measuring and testing equipment

In conjunction with: Test box 61 4 380

Note: For checking function of airbag control unit in X3

Series: E83

SI number: 02 08 03 (045)

Order number: 61 3 130

I-adapter lead airbag control unit E83 (75-pin)

Fig. 15: I-Adapter Lead Airbag Control Unit E83 (61 3 130)
Courtesy of BMW OF NORTH AMERICA, INC.

61 3 300 REMOVAL TOOL

Minimum set: Mechanical tools

Note: For removing ring antenna at ignition lock

Series: E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/C, E38, E38/3, E39, E39tou, E46, E52, E53, E60, E61, E63, E64, E83, E85, E86, R50, R52, R53

SI number: 1 17 97 (228)

Order number: 61 3 300

Removal tool

Fig. 16: Removal Tool (61 3 300)

Courtesy of BMW OF NORTH AMERICA, INC.

61 4 300 ADAPTER LEAD FOR OBD SOCKET

Note: For connecting diagnosis system to OBD socket from 06/2000.

Storage location: Single

SI number: 2 04 00 (561)

Order number: 61 4 300

Adapter lead for OBD socket

Fig. 17: Adapter Lead For OBD Socket (61 4 300)
Courtesy of BMW OF NORTH AMERICA, INC.

61 4 320 CRIMPING SET WITH PLIERS

Minimum set: Measuring and testing equipment

Note: For repairing fibre optics conductors and cables. Universal crimp head 61 4 328 added as from 06/2006.

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R55, R56, RR1, RR2

SI number: 1 14 01 (766)

Order number: 61 4 320

Crimping set with pliers

Consisting of:

1 = 61 4 321 Pliers without crimping head

2 = 61 4 322 Crimping head

Note: For stripping insulation and cutting fibre optic cable to length

3 = 61 4 323 Crimping head

Note: For crimping fibre optic cable contacts

4 = 61 4 324 Crimping head

Note: For crimping MQS contacts

5 = 61 4 325 Crimping head

Note: For crimping MPQ contacts

6 = 61 4 326 Substitute blade

Note: For face-cutting fibre optic cables

7 = 61 4 327 Substitute blade

Note: With tool for replacing blade in cable stripping unit. Must be ordered separately, not included in 61 4 320 delivery specification!

8 = 61 4 328 Universal crimping head

Note: For crimping contacts (without seal) and cable cross-sections of 0.35 - 2.5 mm.

In conjunction with: in conjunction with 61 4 321

Fig. 18: Crimping Set With Pliers (61 4 320)
Courtesy of BMW OF NORTH AMERICA, INC.

61 4 370 V-ADAPTER LEAD (2-PIN), ZERO-CODED

Minimum set: Measuring and testing equipment

Note: Can be used on different plug housings in engine wiring harness (e.g. from Kostal - "SLK 2.8", Tyco "Junior-Power-Timer" or Bosch) with different codings.

Series: E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E83, E85, E87, E90, E91, R50, R52, R53, RR1

SI number: 02 01 05 186

Order number: 61 4 370

V-adapter lead (2-pin), zero-coded

Fig. 19: V-Adapter Lead (2-Pin), Zero-Coded (61 4 370)
Courtesy of BMW OF NORTH AMERICA, INC.

61 4 380 MEASURING BOX, 105-PIN, COMPLETE

Minimum set: Measuring and testing equipment

Note: For connecting all adapter cables with 61- to 105-pin plug connections

Series: E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1

Storage location: G 110, S 205, U 202, U 205

SI number: 2 04 01(710)

Order number: 61 4 380

Measuring box, 105-pin, complete

Consisting of:

1 = 61 4 381 Measuring box, 105-pin

Note: Without accessories

2 = 61 4 382 Test lead, black

Note: 2 mm system, lead length: 750 mm

3 = 61 4 383 Test lead, red

Note: 2 mm system, lead length: 750 mm

4 = 61 4 384 Test lead set

Note: 2/4 mm system, lead length: 200 mm

5 = 61 4 385 Earth/ground cable

Note: For shield pick-off, lead length: 1.5 m

W61 4 380

61 6 060 UNIVERSAL WIPER ARM PULLER

Minimum set: Mechanical tools

Note: For removing windscreen wiper arm from drive shaft

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E81, E82, E83, E85, E86, E87, E90, E91, RR1, RR2

Storage location: B40

SI number: 1 10 99 (433)

Order number: 61 6 060

Universal wiper arm puller

Consisting of:

1 = 61 6 061 Basic body

2 = 61 6 062 Claw, left/right

3 = 61 6 063 Spindle

4 = 61 6 064 Thrust piece

Fig. 22: Universal Wiper Arm Puller (61 6 060)
Courtesy of BMW OF NORTH AMERICA, INC.

61 6 100 ANGLE MEASURING INSTRUMENT

Minimum set: Mechanical tools

Note: For measuring contact/approach angle of wiper blades to window (angle when setting wiper arms)

Series: E36, E39, E46, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R55, R56, RR1, RR2

SI number: 1 21 05 220

Order number: 61 6 100

Angle measuring instrument

Fig. 23: Angle Measuring Instrument (61 6 100)
Courtesy of BMW OF NORTH AMERICA, INC.

61 6 210 WIPER ARM PULLER

Minimum set: Mechanical tools

Series: E52, E53, E60, E61, E63, E64, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53

SI number: 1 01 05 (172)

Order number: 61 6 210

Wiper arm puller

Order number: 61 8 083

Additions to repair kit III

61 9 040 SET OF TOOLS FOR REPAIR KIT IV

Series: E12, E21, E23, E24, E28, E30, E31, E32, E34, E36, E38, E39, E46, E52, E53, E60, E61, E63, E64, E65, E83, E85, E87, E90, E91, E92, R50, R52, R53

Storage location: K 108

SI number: 2 02 92(505)

Order number: 61 9 040

Set of tools for repair kit IV

Consisting of:

1 = 61 9 041 Hand pliers without crimper

2 = 61 9 042 Crimper

Note: For crimping butt connectors and contact sleeves for strip connectors

3 = 61 9 043 Cable stripper with wire cutter

4 = 61 9 044 Crimper

Note: For crimping antenna connector (antenna cable/radio plug connection)

ENGINE

Cooling System - Operating Fluids

1.0 GENERAL INFORMATION ON LONG-TERM ANTIFREEZE AND CORROSION INHIBITORS

The cooling system of BMW cars must only be filled with reputable brand name ethylene glycol long-term antifreeze having corrosion inhibitors that are compatible with aluminum radiators.

Coolants must fulfill four basic requirements.

- Guarantee sufficient cooling.
- Protect various metals (gray cast iron, steel, aluminum alloys, brass, copper and solder) against corrosion.
- Prevent excessive silicate gel precipitation, which may cause clogging of the cooling system.
- Guarantee operation of cooling system in winter (prevent freezing of coolant) and in summer by boosting the boiling point.

The quality or grade of a long-term antifreeze and corrosion inhibitor is very important to be able to protect metal (gray cast iron, steel, aluminum alloys, brass, copper and solder) in the cooling system against corrosion. It guarantees full operation of the cooling system in winter and also increases the boiling point at high outside temperatures and under heavy loads.

INITIAL FILLING IN FACTORY

The factory fills the cooling system for protection against freezing, for the U.S. and Canada, down to -34°F (-37°C). This means an antifreeze ratio of 50% antifreeze and 50% water. In severely cold areas, the antifreeze can be increased to 60% which provides freezing protection down to -62°F (-52°C). Do not exceed a 60% ratio of antifreeze. The specified antifreeze ratio is important, since an insufficient amount would impair antifreezing and corrosion inhibiting protection. An excessive amount would not improve freezing protection, but instead reduce freezing protection.

CHANGE INTERVALS

Regular checking of coolant concentration is part of Inspection I or II. for change intervals.

LIFETIME COOLANT

The BMW engine coolant has a lifetime rating, except when the cooling system requires repairs. Drained coolant is not to be re-used. Top up with new coolant.

REMARKS AND LIMITATIONS

Only tap water of drinking quality with the following properties may be used as coolant.

DRINKING QUALITY SPECIFICATION

Appearance	-	colorless, clear
Residue	-	without suspended matter
pH value	-	6.5 - 8.0
Total hardness	-	max. 357 PPM Calcium Carbonate
Chloride content	-	max. 100 mg/l
Sulfate content	-	max. 100 mg/l

The antifreeze concentration in a cooling system should be checked before the beginning of winter. When determining the mixture concentration it is important to make sure that there is sufficient protection against freezing.

A hydrometer (radiator antifreeze tester) is required for correct determination of antifreeze concentration. The composition of long-term antifreezes and corrosion inhibitors differs between manufacturers.

BMW Anti-Freeze/Coolant contains no nitrites or phosphates and has been formulated to prevent excessive silicate drop out. Order the 1gallon container under BMW Part No. 82 14 1 467 704.

NOTE: Do not mix BMW Anti-Freeze/Coolant with different antifreezes which contain nitrites and/or phosphates and a high silicate formulation.

2.0 COOLANT ADDITIVES

No aftermarket coolant additives, including but not limited to those which provide additional corrosion inhibition or seal off minor leaks are approved by BMW.

Use of non-approved coolant additives may cause reduced heat transfer from the cylinder head to the coolant and the formation of hot spots. This can cause the burning through of cylinder head gaskets and/or cracking of the cylinder head.

BMW NA cannot accept the liability for the resulting effects and consequential damage caused by the use of coolant additives.

ENGINE

Cooling System - Repair Instructions - X3

00 COOLANT, CHECKING COOLING SYSTEM

00 57 072 RETROFITTING SUPPLEMENTARY OIL COOLER (HIGH-SPEED SCOPE OPTION SA840) (N52K)

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Remove underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION** .
- Replace front left wheel arch trim and replace dust lip
- Replace front left trim grille, see **51 11 185 REMOVING AND INSTALLING/REPLACING SIDE GRILLE IN BUMPER TRIM (FROM 09/2006)** .
- If necessary, replace left crashbox, see **51 11 770 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT DEFORMATION ELEMENT FOR FRONT BUMPER** .
- Remove air filter housing, see **13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K)** .
- Release servo reservoir, see **32 41 250 REMOVING AND INSTALLING/REPLACING FLUID RESERVOIR FOR POWER STEERING (M54, N46, N52)** .
- Remove alternator, see **12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR (N52, N52K, N51, N53)** .
- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD** .
- Drain coolant, see **17 00 005 Draining and adding coolant (N52K)**.
- Remove oil pressure switch , remove oil filter housing

Mount full-flow oil filter and connection housing for oil lines.

Installation:

Tightening torque: 11 42 3AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 1: Locating Mount Full-Flow Oil Filter And Connection Housing For Oil Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil filter housing on crankcase.

To facilitate mounting, remove coolant connection.

Installation:

Tightening torque: 11 42 2AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 2: Locating Mount Oil Filter Housing On Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil pressure switch on new filter housing.

Installation:

Tightening torque 12 61 2AZ.

Fig. 3: Locating Mount Oil Pressure Switch On Filter Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Mount sealing rings on oil supply and return lines.

Mount oil lines on filter housing (M8x28 screw).

Installation:

Lubricate sealing rings lightly with oil.

Tightening torque: 17 22 5AZ, see **17 22 OIL COOLER PIPES** .

Secure oil lines with pre-installed rubber grommet.

Fig. 4: Locating Mount Sealing Rings On Oil Supply And Return Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Remove underbody protection bracket.

Mount holding frame for engine oil cooler on crashbox.

There must be 2 press-in nuts for the radiator bracket on the crashbox, otherwise replace crashbox.

Fig. 5: Locating Underbody Protection Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Mount engine oil cooler on oil cooler bracket (M8x35 screw).

Installation:

Tightening torque: 17 21 2AZ, see **17 21 ENGINE OIL COOLER** .

Fig. 6: Locating Mount Engine Oil Cooler On Oil Cooler Bracket (M8X35 Screw)
Courtesy of BMW OF NORTH AMERICA, INC.

Mount wheel arch cooler bracket with vibration damper (rubber element).

Installation:

Tightening torque: 17 21 3AZ, see **17 21 ENGINE OIL COOLER** .

Fig. 7: Mount Wheel Arch Cooler Bracket With Vibration Damper
Courtesy of BMW OF NORTH AMERICA, INC.

Mount sealing rings on oil supply and return lines.

Mount oil lines on engine oil cooler housing (M8x30 screw).

Installation:

Lubricate sealing rings lightly with oil.

Tightening torque: 17 22 5AZ, see **17 22 OIL COOLER PIPES** .

Fig. 8: Locating Mount Sealing Rings On Oil Supply And Return Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Mount wheel arch cover.

Mount dust lip.

Mount oil cooler protective grille in wheel arch cover.

Fig. 9: Mount Wheel Arch Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Mount air duct on engine oil cooler.

Fig. 10: Locating Mount Air Duct On Engine Oil Cooler
Courtesy of BMW OF NORTH AMERICA, INC.

Replace closed cover in left bumper trim with grille panel.

Fig. 11: Locating Bumper Trim With Grille Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Remove coolant hose between coolant pump, coolant radiator and oil-water heat exchanger.

Install coolant hose between coolant pump and coolant radiator.

Push hose onto coolant pump up to mechanical stop.

Fig. 12: Locating Coolant Hose Between Coolant Pump, Coolant Radiator And Oil-Water Heat Exchanger
Courtesy of BMW OF NORTH AMERICA, INC.

Add final details to vehicle

Fill coolant and engine oil systems

The oil fill quantity is increased after installation of the supplementary cooler by 0.5 l.

NOTE: Now clear the fault memory.

17 00 ... INSTRUCTIONS FOR WORKING ON COOLING SYSTEM

WARNING: Danger of scalding! Work on the cooling system should only be carried out when the engine has cooled down.

IMPORTANT: Wear protective gloves and goggles.

IMPORTANT: Lifetime coolant filling:

Never reuse used coolant.

When replacing and removing components which rely on the corrosion protection effect of the coolant, it is essential to change the coolant. The cooling system must therefore be drained and refilled.

In the case of other removal work involving the draining of partial quantities of coolant, replace these quantities which have been drained with new coolant.

IMPORTANT: Open cooling system only when it has cooled down.
Opening the cooling system while hot can result in air entering the system
This can cause overheating with permanent damage to the engine.

IMPORTANT: When working on the oil, coolant or fuel circuit, protect the alternator against contamination.
Cover alternator with suitable materials.
Failure to comply with this procedure may result in an alternator malfunction.

IMPORTANT: Do not fill coolant expansion tank over MAX level as overfilling will cause the coolant to overflow. This may give rise to traces of residual coolant on the expansion tank or in the engine compartment and wrongly suggest possible leakages.

Recycling

Catch and dispose of drained coolant.

Observe country-specific waste-disposal regulations.

NOTE: Tightening torque, hose clamps: 17 00 1AZ, see 17 00 COOLANT .

Fig. 13: Locating Hose Clamps
Courtesy of BMW OF NORTH AMERICA, INC.

Instructions for disassembly/assembly of coolant hose fast-release couplings

Disassembly of fast-release coupling

Withdraw lock (1/2), disconnect hose.

Fig. 14: Disconnecting Hose And Withdraw Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check O-rings (1).

Do not coat O-rings (1) with antiseize agent.

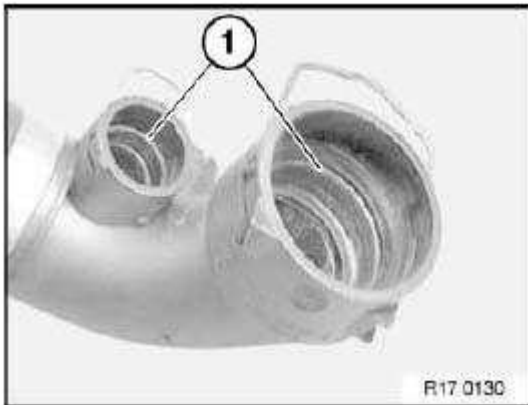

Fig. 15: O-rings
Courtesy of BMW OF NORTH AMERICA, INC.

Assembly of fast-release coupling

Press in lock (1) before installing fast-release coupling.

Push on hose.

Fast-release coupling must clearly snap audibly into place.

Fig. 16: Pushing Hose

Courtesy of BMW OF NORTH AMERICA, INC.

17 00 005 DRAINING AND ADDING COOLANT (N52K)

Necessary preliminary tasks:

- Remove underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION** .

WARNING: Danger of scalding!

Only carry out work on cooling system after engine has cooled down.

Recycling:

Catch and dispose of drained coolant.

Observe country-specific waste-disposal regulations.

Open cap (1) on coolant expansion tank.

Fig. 17: Coolant Expansion Tank And Cap

Courtesy of BMW OF NORTH AMERICA, INC.

E83:

Open drain plug (1) on radiator.

Fig. 18: Drain Plug On Radiator

Courtesy of BMW OF NORTH AMERICA, INC.

Open vent screw (1).

Fig. 19: Vent Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Use only recommended coolant.

Operating Fluids MG17.

NOTE: Adhere to the following work sequence when adding coolant.

- Switch ignition on
- Seat heating to maximum temperature and fan to low speed (heater valves are opened and auxiliary water

- pump starts up).
- Slowly fill expansion tank with coolant.
 - Close vent screw after bubble-free coolant emerges or after filling up to max. cold fill level.

Vent cooling system.

17 00 009 CHECKING COOLING SYSTEM FOR LEAKS (M54, N46, N52)

Special tools required:

See **17 COOLING SYSTEM** .

- 17 0 101
- 17 0 105
- 17 0 106

WARNING: Danger of scalding!
Only perform this work after engine has cooled down.

NOTE: Illustrations feature the E85.

Checking pressure drop in cooling system:

Open cap on coolant expansion tank. Fit special tools 17 0 101 / 17 0 105.

Build up gauge pressure , wait approx. 2 minutes.

Cooling system is impervious to leaks if pressure drop is max. 0.1 bar.

Fig. 20: Special Tool (17 0 105) And (17 0 101)
Courtesy of BMW OF NORTH AMERICA, INC.

Checking pressure relief valve in cap:

Screw cap (1) onto special tool 17 0 106.

Build up pressure with special tool (hand pump) 17 0 101; observe pressure gauge to ascertain when opening pressure is achieved.

Compare opening pressure of pressure relief valve.

Fig. 21: Special Tool (17 0 106) And (17 0 101)
Courtesy of BMW OF NORTH AMERICA, INC.

17 00 009 CHECKING COOLING SYSTEM FOR WATER LEAKS

Special tools required:

See **17 COOLING SYSTEM** .

- 17 0 101
- 17 0 113
- 17 0 114

WARNING: Danger of scalding!
Only perform this work after engine has cooled down.

Checking pressure drop in cooling system:

Open cap on coolant expansion tank. Fit special tools 17 0 101 / 17 0 113.

Build up gauge pressure , wait approx. 2 minutes.

Cooling system is impervious to leaks if pressure drop is max. 0.1 bar.

Fig. 22: Special Tool (17 0 101) And (17 0 113)
Courtesy of BMW OF NORTH AMERICA, INC.

Checking pressure relief valve in cap:

NOTE: While the vehicle is driven at high outside temperatures, the design may cause the pressure relief valve in the cap to open slightly and air together with dissolved coolant to escape. This coolant vapor condenses on the surface of the expansion tank and leaves traces when the vehicle has cooled down. These traces do not indicate whether the cap is defective or not. When the vehicle has been parked up for an extended period of time, the residual escaping coolant can cause the pressure relief valve in the cap to stick; therefore check the cap again 2 to 3 times.

Replace the cap only after you have checked three times and there is an incorrect opening pressure.

Checking pressure relief valve in cap:

Screw cap (1) onto special tool 17 0 114.

Build up pressure with special tool (hand pump) 17 0 101; observe pressure gauge to ascertain when opening pressure is achieved.

Compare opening pressure of pressure relief valve.

Fig. 23: Special Tool (17 0 101), (17 0 102) And (17 0 114)
Courtesy of BMW OF NORTH AMERICA, INC.

17 00 039 VENTING COOLING SYSTEM AND CHECKING FOR LEAKS

WARNING: Danger of scalding!
Only perform these tasks on an engine that has cooled down.

Necessary preliminary tasks:

Draining coolant:

The procedure is described in the section Draining and adding coolant. See **17 00 005 Draining Off And Topping Up Coolant.**

NOTE: Use only recommended coolant.

IMPORTANT: Fill coolant expansion tank up to lower edge of filler neck with recommended coolant. Pour in coolant slowly. Close vent screw (2) when bubble-free coolant emerges. Close cap on expansion tank. Do not open the coolant expansion tank cap during the venting procedure.

Adding coolant:

To ensure the cooling system is properly vented, it is absolutely essential to follow the steps below:

1. Open cap (1) on coolant expansion tank.
2. Open vent screw (2). Connect battery charger. Switch on ignition.
3. Set heater control to maximum temperature. Activate "Automatic" button, then reduce fan to lowest setting.
4. Press accelerator pedal for 10 seconds to floor. Engine must not be started.
5. The venting procedure is started when the accelerator pedal is pressed and takes approx. 12 minutes.

6. Check cooling system for leaks.

G03297592

Fig. 24: Opening Coolant Expansion Tank Cap
Courtesy of BMW OF NORTH AMERICA, INC.

7. If the venting procedure has to be carried out several times, allow DME to drop completely (ignition key removed for approx. 3 minutes), then repeat from step 3.

G03297593

Fig. 25: Locating Expansion Tank Coolant Filling Mark (E 65/E 66 Shown) (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Checking coolant level:

CAUTION: Check coolant level at a maximum coolant temperature of 30°C.

NOTE: If ambient temperature exceeds 30°C, allow engine to cool down at least to ambient temperature.

Open cap carefully.

Fluid level is O.K. when top edge of coolant expansion tank is between both markings (1 and 2) on float needle.

Minimum cold fill level:

- Upper edge of coolant expansion tank is level with marking (1).

Maximum cold fill level:

- Upper edge of coolant expansion tank is level with marking (2).

If necessary, top up coolant.

NOTE: Tank mark indicates the fluid level at approx. 20°C.

Check cooling system for leaks. See 17 00 009 Checking Cooling System For Leaks (M54).

G03297594

11 ENGINE RADIATOR WITH ATTACHMENT

00 57 072 RETROFITTING SUPPLEMENTARY OIL COOLER (HIGH-SPEED SCOPE OPTION SA840) (N52K)

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Remove underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION** .
- Replace front left wheel arch trim and replace dust lip
- Replace front left trim grille, see **51 11 185 REMOVING AND INSTALLING/REPLACING SIDE GRILLE IN BUMPER TRIM (FROM 09/2006)** .
- If necessary, replace left crashbox, see **51 11 770 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT DEFORMATION ELEMENT FOR FRONT BUMPER** .
- Remove air filter housing, see **13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K)** .
- Release servo reservoir, see **32 41 250 REMOVING AND INSTALLING/REPLACING FLUID RESERVOIR FOR POWER STEERING (M54, N46, N52)** .
- Remove alternator, see **12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR (N52, N52K, N51, N53)** .
- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD** .
- Drain coolant, see **17 00 005 Draining and adding coolant (N52K)**.
- Remove oil pressure switch , remove oil filter housing

Mount full-flow oil filter and connection housing for oil lines.

Installation:

Tightening torque: 11 42 3AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 31: Locating Mount Full-Flow Oil Filter And Connection Housing For Oil Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil filter housing on crankcase.

To facilitate mounting, remove coolant connection.

Installation:

Tightening torque: 11 42 2AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 32: Locating Mount Oil Filter Housing On Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil pressure switch on new filter housing.

Installation:

Tightening torque 12 61 2AZ.

Fig. 33: Locating Mount Oil Pressure Switch On Filter Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Mount sealing rings on oil supply and return lines.

Mount oil lines on filter housing (M8x28 screw).

Installation:

Lubricate sealing rings lightly with oil.

Tightening torque: 17 22 5AZ, see **17 22 OIL COOLER PIPES** .

Secure oil lines with pre-installed rubber grommet.

Fig. 34: Locating Mount Sealing Rings On Oil Supply And Return Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Remove underbody protection bracket.

Mount holding frame for engine oil cooler on crashbox.

There must be 2 press-in nuts for the radiator bracket on the crashbox, otherwise replace crashbox.

Fig. 35: Locating Underbody Protection Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Mount engine oil cooler on oil cooler bracket (M8x35 screw).

Installation:

Tightening torque: 17 21 2AZ, see **17 21 ENGINE OIL COOLER** .

Fig. 36: Locating Mount Engine Oil Cooler On Oil Cooler Bracket (M8X35 Screw)
Courtesy of BMW OF NORTH AMERICA, INC.

Mount wheel arch cooler bracket with vibration damper (rubber element).

Installation:

Tightening torque: 17 21 3AZ, see **17 21 ENGINE OIL COOLER** .

Fig. 37: Mount Wheel Arch Cooler Bracket With Vibration Damper
Courtesy of BMW OF NORTH AMERICA, INC.

Mount sealing rings on oil supply and return lines.

Mount oil lines on engine oil cooler housing (M8x30 screw).

Installation:

Lubricate sealing rings lightly with oil.

Tightening torque: 17 22 5AZ, see **17 22 OIL COOLER PIPES** .

Fig. 38: Locating Mount Sealing Rings On Oil Supply And Return Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Mount wheel arch cover.

Mount dust lip.

Mount oil cooler protective grille in wheel arch cover.

Fig. 39: Mount Wheel Arch Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Mount air duct on engine oil cooler.

Fig. 40: Locating Mount Air Duct On Engine Oil Cooler
Courtesy of BMW OF NORTH AMERICA, INC.

Replace closed cover in left bumper trim with grille panel.

Fig. 41: Locating Bumper Trim With Grille Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Remove coolant hose between coolant pump, coolant radiator and oil-water heat exchanger.

Install coolant hose between coolant pump and coolant radiator.

Push hose onto coolant pump up to mechanical stop.

Fig. 42: Locating Coolant Hose Between Coolant Pump, Coolant Radiator And Oil-Water Heat Exchanger
Courtesy of BMW OF NORTH AMERICA, INC.

Add final details to vehicle

Fill coolant and engine oil systems

Data oil fill quantity

The oil fill quantity is increased after installation of the supplementary cooler by 0.5 l.

Adapt DME data status

NOTE: Now clear the fault memory.

17 11 035 REPLACING FAN COWL WITH ELECTRIC FAN (N52K)

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Remove intake duct

Lever out expander rivet.

Unlock plug (1) and remove.

Release screw (2).

Lift out fan cowl (3) with electric fan.

Fig. 43: Removing Electric Fan, Expander Rivet And Plug
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Now clear the fault memory.

17 11 046 REMOVING AND INSTALLING / REPLACING MODULE CARRIER

Necessary preliminary tasks:

- Remove **power steering cooling loop**
- If necessary, slacken A/C condenser and secure against damage and against falling down. Refer to Remove A/C condenser. See **64 53 550 REMOVING AND INSTALLING OR REPLACING CAPACITOR FOR THE HEATING AND AIR CONDITIONING SYSTEM** .

Release expander rivet and remove left module carrier (1). Installation: Rubber mounts fall out easily, ensure correct installation position.

Fig. 44: Release Expander Rivet And Remove Left Module Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Remove right module carrier (1). Make sure rubber mount is in correct installation position.

Fig. 45: Remove Right Module Carrier (1)
Courtesy of BMW OF NORTH AMERICA, INC.

When replacing module carrier: Convert **power steering cooling loop**.

17 11 100 REMOVING AND INSTALLING/REPLACING COOLANT EXPANSION TANK (M54, N46)

WARNING: Danger of scalding!
Only perform this work after engine has cooled down.

Necessary preliminary tasks:

- Follow instructions for working on cooling system, see **17 00 ... Instructions for working on cooling system**.
- E83: Remove intake duct

- Remove fan cowl
- Drain coolant, see **17 00 005 Draining and adding coolant (N52K)**.

Unfasten plug connection (1) and disconnect.

Withdraw lock (2).

Fig. 46: Disconnecting Plug Connection And Withdraw Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Pull locks (1 and 2) upwards and detach coolant hose from radiator/coolant expansion tank.

Fig. 47: Disconnecting Hose And Withdraw Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Pull lock (1) upwards and detach coolant hose from coolant expansion tank.

Fig. 48: Pulling Lock Coolant Hose From Coolant Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

Illustration with radiator removed.

Pull coolant expansion tank upwards slightly out of carrier plate and pull out lower connection piece. Then tilt expansion tank to rear and remove.

Installation:

Check sealing rings. Do not under any circumstances coat sealing rings with antiseize agent before installation.

Retaining lug must engage in opening on carrier plate.

Fig. 49: Pulling Coolant Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

17 11 100 REMOVING AND INSTALLING/REPLACING COOLANT EXPANSION TANK (M57TU, M57T2, M47T2)

Necessary preliminary tasks:

- Drain coolant, see **17 00 005 Draining and adding coolant (N52K)**.

Detach coolant hoses (1) and (3).

Unclip hose (2).

Disconnect connector (4).

Unfasten screws.

Remove expansion tank (5).

Installation:

Insert locating pin in rubber grommet.

Fig. 50: Locating Coolant Hoses, Connector And Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

17 11 370 REMOVING AND INSTALLING/REPLACING COOLING LOOP FOR POWER STEERING

WARNING: Danger of scalding!

Only perform this work after engine has cooled down.

IMPORTANT: When working on the oil, coolant or fuel circuit, you must protect the alternator against contamination.

Cover alternator with suitable materials.

Failure to comply with this procedure may result in an alternator malfunction.

NOTE: After completing this operation, check fluid level in tank of power steering system, see 32 13 006 BLEEDING POWER STEERING UNIT .

Remove radiator.

Lift out expansion rivet (1).

Fig. 51: Lifting Expansion Rivet

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolt (1).

Fig. 52: Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

Remove A/C condenser towards rear top from fixtures.

Tilt condenser towards engine, taking care not to damage condenser.

NOTE: **Lines of A/C system remain connected to condenser.**

Fig. 53: Removing A/C Condenser Top From Fixtures
 Courtesy of BMW OF NORTH AMERICA, INC.

Press lines (1) in direction of cooling loop, pull black locking ring towards rear. Keep locking ring pressed and detach lines (1) from cooling loop.

IMPORTANT: Catch and dispose of emerging fluid.

Press lock (2). Pull cooling loop (3) of power steering towards rear out of module carrier.

Fig. 54: Pulling Cooling Loop Of Power Steering
 Courtesy of BMW OF NORTH AMERICA, INC.

21 OIL COOLER

17 21 500 FLUSHING OIL COOLER WITH LINES (AUTOMATIC TRANSMISSION)

Special tools required:

See **17 COOLING SYSTEM** .

- 17 2 018

- 17 2 019

NOTE: **Carry out the work steps listed when:
Fitting a new or replacement transmission
Flushing can only be carried out with the automatic transmission removed.**

Procedure:

Automatic transmission removed.

Connect appropriate adapters (see description below) to oil lines exiting from automatic transmission.

Connect the connecting line 17 2 019 from the oil collection unit with the quick-release coupling.

Connect drain line 17 2 018 using quick-release coupling.

Feed open end of drain line into a suitable collection container.

Using oil collection unit, flush approx. 1 liter of transmission fluid through oil lines and oil cooler.

Reposition quick-release couplings.

Flush oil lines/oil cooler in opposite direction with approx. 1 liter of transmission fluid.

Disconnect quick-release couplings, remove adapters.

NOTE: **Dispose of flushing oil properly; do not under any circumstances reuse it.**

22 OIL COOLER LINES

00 57 072 RETROFITTING SUPPLEMENTARY OIL COOLER (HIGH-SPEED SCOPE OPTION SA840) (N52K)

Necessary preliminary tasks:

- Read out fault memory of DME control unit

- Switch off ignition
- Remove underbody protection, see **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION** .
- Replace front left wheel arch trim and replace dust lip
- Replace front left trim grille, see **51 11 185 REMOVING AND INSTALLING/REPLACING SIDE GRILLE IN BUMPER TRIM (FROM 09/2006)** .
- If necessary, replace left crashbox, see **51 11 770 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT DEFORMATION ELEMENT FOR FRONT BUMPER** .
- Remove air filter housing, see **13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K)** .
- Release servo reservoir, see **32 41 250 REMOVING AND INSTALLING/REPLACING FLUID RESERVOIR FOR POWER STEERING (M54, N46, N52)** .
- Remove alternator, see **12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR (N52, N52K, N51, N53)** .
- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD** .
- Drain coolant, see **17 00 005 Draining and adding coolant (N52K)**.
- Remove oil pressure switch , remove oil filter housing

Mount full-flow oil filter and connection housing for oil lines.

Installation:

Tightening torque: 11 42 3AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 59: Locating Mount Full-Flow Oil Filter And Connection Housing For Oil Lines
 Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil filter housing on crankcase.

To facilitate mounting, remove coolant connection.

Installation:

Tightening torque: 11 42 2AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 60: Locating Mount Oil Filter Housing On Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

Mount oil pressure switch on new filter housing.

Installation:

Tightening torque 12 61 2AZ.

Fig. 61: Locating Mount Oil Pressure Switch On Filter Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Mount sealing rings on oil supply and return lines.

Mount oil lines on filter housing (M8x28 screw).

Installation:

Lubricate sealing rings lightly with oil.

Tightening torque: 17 22 5AZ, see 17 22 OIL COOLER PIPES .

Secure oil lines with pre-installed rubber grommet.

Fig. 62: Locating Mount Sealing Rings On Oil Supply And Return Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Remove underbody protection bracket.

Mount holding frame for engine oil cooler on crashbox.

There must be 2 press-in nuts for the radiator bracket on the crashbox, otherwise replace crashbox.

Fig. 63: Locating Underbody Protection Bracket

ENGINE

Cooling System - Special Tools - X3

17 COOLING SYSTEM

17 0 000 TESTER

Note: For checking cooling system for leaks and function of pressure relief valve in radiator cap. Replaced by 17 0 100

Storage location: A43, C17

Order number: 17 0 000

Tester

Consisting of:

1 = 17 0 001 Adapter

Note: For checking pressure relief valve in radiator cap / model series: all, except E28

2 = 17 0 002 Tester without adapter

Note: Pressure range 0...2.5 bar / model series: all, except E28

3 = 17 0 003 Screw neck

Note: For screw-on radiator caps (normal thread) / model series: E28, E30, E31, E32 Engine: all, except M51

4 = 17 0 004 Adapter

Note: For screw-on radiator caps (normal thread) / model series: E28, E30, E32 / Engine: M51

5 = 17 0 005 Screw neck

Note: For screw-on radiator caps (buttress thread) / model series: E31, E32, E34, E36, E38, E39

7 = 17 0 007 Adapter

Note: For checking expansion tank cap / model series: E31, E32, E34, E36, E38, E39

8 = 17 0 008 Pressure hose

9 = 17 0 009 Adapter for radiator expansion tank

Note: Model series: E36 / Model: M3 US Engine W10

17 2 010 SET OF ADAPTERS

Note: For oil dispensers for flushing oil coolers of automatic transmissions

Transmission: A4S 310R, A5S 300J, A5S 310Z, A5S 325Z, A5S 360R, A5S 390G, A5S 440Z, A5S 560Z, GA6 HP19Z, GA6 HP26Z, GA6 HP32Z

SI number: 1 12 96(103)

Order number: 17 2 010

Set of adapters

Consisting of:

1 = 17 2 011 Adapter

Note: For connecting oil cooler lines to oil dispensing unit - transmission: A5S 310Z, A5S 560Z, A5S 325Z

In conjunction with: 17 2 015, 17 2 016, 17 2 017, 17 2 018, 17 2 019

1 = 17 2 021 Retaining plate

Note: For Adapter 17 2 011 transmission: A5S 325Z

2 = 17 2 012 Adapter (2 x)

Note: For connecting oil cooler lines to oil dispensing unit - transmission: A4S 310R

In conjunction with: 17 2 015, 17 2 016, 17 2 017, 17 2 01, 17 2 018, 17 2 019

3 = 17 2 013 Banjo bolt (2 x)

Note: M18x1.5 thread with nut and seal for connecting oil cooler lines to oil dispensing unit-transmission: A5S 440Z

In conjunction with: 17 2 012, 17 2 015, 17 2 016, 17 2 017, 17 2 018, 17 2 019

4 = 17 2 014 Banjo bolt (2 x)

Note: M16x1.5 thread with nut, seal and threaded piece for connecting oil cooler lines to oil dispensing unit-transmission: A5S 300J

In conjunction with: 17 2 012, 17 2 015, 17 2 016, 17 2 017, 17 2 018, 17 2 019

5 = 17 2 015 Connecting piece

Note: For Tecalemit oil dispensing unit

6 = 17 2 016 Connecting piece

Note: For Horn oil dispensing unit

7 = 17 2 017 Coupling (2 x)

8 = 17 2 018 Hose, long

9 = 17 2 019 Hose, short

ENGINE

Engine - Operating Fluids

1.0 GENERAL INFORMATION

The specified engine oil is extremely important for the operation and service life of an engine.

Engine oil requirements will depend on the engine design, operating conditions, oil change intervals and, in the case of diesel engines, the fuel grade.

A modern engine oil provides more than just a lubrication function. The following qualities are required:

GOOD WEAR PROTECTION AND FRICTION REDUCTION

Frictional losses will lead to a reduction of engine power and efficiency. An approved engine oil will minimize frictional losses. Excessive wear will lead to a reduction in service life (e.g. wear of bearings, piston rings, cam lobes) or to mechanical failure.

LIMITED TENDENCY TO PRODUCE COMBUSTION RESIDUE

During engine operation, a limited amount of oil enters the combustion chamber, where it is burned. Combustion residues or deposits, which build up in the combustion chamber, lead to unwanted increases in compression and promote surface ignition ("pinging"). Any approved engine oil will help prevent such a condition.

FAVORABLE VISCOSITY TEMPERATURE BEHAVIOR

Viscosity is the tendency of oil to resist flowing. Engine oil, when cold, should be thin enough so that the engine can be cranked over. Hot oil should be thick enough to maintain proper lubrication.

ANTI-FOAMING

The oil is forcefully mixed with air during engine operation. Heavy foaming will lead to impaired lubrication and reduction in oil flow rate. To prevent foaming, antifoaming additives are mixed with the oil.

GOOD CORROSION INHIBITION

The engine oil must prevent corrosion on engine components under all circumstances. Corrosion and rust inhibitors are added to displace water and acids from metal surfaces so that oil coats them.

MIXING ABILITY/COMPATIBILITY

It must be possible to mix all engine oils with each other, even synthetic with mineral oils, without causing any incompatibility problems. A further requirement is the compatibility with all materials contacted by oil, in particular oil seals, hoses and paint.

GOOD THERMAL CONDUCTIVITY/GOOD COOLING PROPERTY

Engine oil makes an important contribution to the cooling of an engine. It must transfer heat from friction surfaces, and combustion heat away from affected areas. The oil absorbed heat is carried back to the oil pan where it is transferred to the surrounding air.

GOOD DISPERSANT/DETERGENT QUALITIES

To limit or slow down the formation of combustion deposits and acidic components, together with abrasive particles and dirt from the intake air, good engine oils contain a detergent additive. Deposits of carbon and dirt are loosened and suspended in the oil, being drained away at the next oil change.

OXIDATION INHIBITORS AND AGING STABILITY

Oxidation can be described as the oxygen absorption of hydrocarbons formed in the oil. The results of oxidation have a negative impact on viscosity causing corrosion on certain metals and the formation of sludge. Inhibitors are added to prevent oxidation from occurring. A good engine oil must maintain its stability during the required oil change intervals.

Good Lubricating Oil Must:

1. Lubricate moving parts to minimize wear.
2. Lubricate moving parts to minimize loss from friction.
3. Remove heat from engine parts by acting as a cooling agent.
4. Absorb shocks between bearings and other engine parts, reducing engine noise and extending engine life.
5. Form a good seal between piston rings and cylinder walls.
6. Act as a cleaning agent.

2.0 GRADING OF OILS

VISCOSITY NUMBER

A method of classifying an oil by number, based on its resistance to flow at a high temperature.

These numbers are usually prefixed by SAE which is the abbreviation for the Society of Automotive Engineers. A lower SAE Number (i.e. SAE 5W) indicates a thinner oil with a higher flow rate, for use at lower temperatures. A higher SAE Number (i.e. SAE 30) indicates a thicker oil with a slower flow rate, for use at higher temperatures.

MULTIGRADE OILS

A multigrade, or multiviscosity oil has the qualities of a lower number oil at low temperatures and those of a higher number oil at high temperatures. Multigrade oils have numbers such as SAE 5W-30 and SAE 10W-40. For reliable engine performance in all temperature ranges mineral based engine oil viscosity must be matched to the temperature range at which the vehicle will be operated.

SINGLE GRADE OILS

A single grade viscosity oil has a limited temperature/viscosity range compared with multigrade oils. Due to the limited temperature/viscosity range of these oils they are no longer used in BMW engines and thus no longer listed in the BMW Engine Oil Temperature/Viscosity Table.

OIL CLASSIFICATIONS

A method of classifying oil was jointly developed by the SAE, API (American Petroleum Institute), and ASTM (American Society for Testing and Materials). Engine oils are rated according to two engine use categories:

C = Compression Ignition (i.e. CC)

Compression Ignition (C) oils are those that are used for diesel engines. The current service ratings for diesel-engine lubricating oils are: CA, CB, CC, CD, CE, CF and CG. The oils differ in their properties and in the additives they contain.

S = Spark Ignition (i.e. SE)

Spark Ignition (S) oils are those that are used for gasoline engines. The current service ratings for gasoline-engine lubricating oils are: SA, SB, SC, SD, SE, SF, SG, SH and SJ. These oils differ in their properties and in the additives they contain.

Another method of classifying minimum performance standards for gasoline-fueled engine oils has been developed through ILSAC (International Lubrication Standardization Approval Committee). Oils that meet ILSAC GF-1 performance standards must have a "starburst" certification mark displayed on the print of the oil product packaging.

3.0 ENGINE OIL REQUIREMENTS AND SPECIFICATIONS

APPROVED ENGINE OILS

- For BMW gasoline engines with two valves per cylinder, all reputable multiple grade engine oils* which meet or exceed the API classification of SH. (Combination with diesel oil specifications CD or CE quality classifications are also permitted, e.g. SH/CE etc.)

For BMW gasoline engines with four valves per cylinder, only reputable multiple grade engine oils* which meet or exceed the API classification of SH. (Combination with diesel oil specifications CD or CE quality classifications are also permitted, e.g. SH/CE etc.)

- For BMW turbocharged diesel engines, all reputable multiple grade engine oils* which meet or exceed the API classification CD/CE.

*Engine oil may be mineral or synthetic based.

Special Oils category has been replaced by BMW **High Performance Synthetic** Engine Oil (5W-30). It eliminates the need for seasonal oil changes since it covers all ambient temperature ranges.

BMW of North America has introduced a line of exclusively formulated High Performance Engine Oils which exceed existing international quality specifications (SAE/CCMC) for motor oils. BMW part numbers are:

ENGINE OIL REQUIREMENTS AND SPECIFICATIONS

SAE 5W-30 (SJ/CF) BMW High Performance Synthetic Oil	1 quart	Part No. 07 51 0 017 866
SAE 15W-40 (SJ/CF) BMW High Performance Mineral Oil	1 quart	Part No. 07 51 0 017 868

Motorsport Engines

E46 M3 / S54E36 M roadster, M coupe / S54 from start of production

E39 M5 / S62 Up to 3/2000

E52 Z8 / S62 Up to 3/2000

E60 M5 / S85 From start of production

E63 M6 From start of production

E64 M6 From start of production

E85 Z4 M Coupe / Z4 M Roadster From start of production

BMW High Performance Synthetic Oil Castrol RS SAE 10W-60 also called Castrol TWS Motorsport SAE 10W-60 Synthetic Oil Part No. 07 51 0 009 420 (1quart)

E39 M5 / S62 From 3/2000

E52 Z8 / S62 From 3/2000

BMW High Performance Synthetic Oil SAE 5W-30 Part No. 07 51 0 017 866 Or BMW High Performance Synthetic Oil Castrol RS SAE 10W-60 also called Castrol TWS Motorsport SAE 10W-60 Synthetic Oil Part No. 07 51 0 009 420 (1quart)

BMW High Performance Synthetic Oil 5W-30 and 10W-60 offer several benefits over conventional mineral based oils.

SUPERIOR THERMAL STABILITY

The synthetic based oil resists thickening at very low ambient temperatures providing improved flow, lubrication and less internal engine resistance during cold starts.

Under high heat conditions, the oil resists thermal breakdown/shearing which causes a loss of lubrication quality compared with conventional oils.

SUPERIOR LUBRICATION THROUGHOUT THE LIFE OF THE OIL

Compared to conventional engine oils, BMW High Performance Synthetic Oil is better able to keep engine combustion contaminants in suspension and is less susceptible to the harmful effects of oxidation.

The oil resists sludge buildup thus allowing extended oil change intervals. Synthetic based oils also have a lower volatility which makes them less susceptible to evaporation thereby reducing oil consumption.

This oil has been durability tested on BMW engines and supplies superior lubrication under all operating conditions and over the extended BMW oil change intervals.

4.0 ENGINE OIL CHANGE INTERVALS

With the introduction of the 1999 Model Year vehicles BMW has introduced an extended oil change interval of approximately 15,000 miles (depending on engine operating conditions) on most models.

To coincide with the increased oil change interval, BMW has also introduced "BMW High Performance Synthetic Oil" which must be used on all 1999 Model Year vehicles (except E36 318ti, 323is/iC, 328is/iC, M3, M Roadster and M Coupe models) whenever a service is necessary to avoid engine damage.

NOTE: Only if it is necessary to top up the engine oil between oil changes is it permissible to use synthetic low viscosity engine oils which conform to the API classification SJ or higher.

A label in the engine compartment states the oil specifications and refers to the BMW website (www.bmwusa.com) and toll free number (1-800-831-1117) for additional information.

Fig. 1: Identifying Label In Engine Compartment States
Courtesy of BMW OF NORTH AMERICA, INC.

BMW High Performance Synthetic Engine Oil may also be used on Model Year 1999 E36 (3-Series and M models) as well as Model Year 1998 and earlier BMW models.

The oil change intervals should not be extended due to the greater durability of a fully synthetic engine oil. The engine oil and filter should always be changed as per the vehicle's Service Interval Indicator when the "Oil Service" or the "Inspection" display appears regardless of the type of oil being used.

BMW mineral-based High Performance engine oil is also offered for model year 1998 and earlier BMW

models. However, for reliable engine performance in all temperature ranges mineral-based engine oil viscosity must be matched to the temperature range at which the vehicle will be operated. See Engine Oil Temperature/Viscosity Table below.

Fig. 2: Identifying BMW Engine Oil Temperature/Viscosity Table
 Courtesy of BMW OF NORTH AMERICA, INC.

Other Oil Changes For Cars Without Service Indicator:

MODEL YEAR/MILLAGE REFERENCE

Model Year(s)	Mileage
1980 and later	7,500
1975 thru 1979	6,500
1974 or earlier	4,000

Including oil filter. However, at least twice annually, preferably before and after the winter season.

Under severe driving conditions it is recommended to increase the number of oil services.

5.0 CONDITION BASED SERVICE

Models: E90, 91, 92, E60, E61, E63, E64 E65, E66

Condition Based Service measures, monitors, and determines the required maintenance of several service items independent from each other. This technology prompts the customer to bring the vehicle for service whenever one of the CBS items requires maintenance or replacement. CBS strikes a compromise between too frequent

maintenance and too rigid service intervals that call for the replacement of service items which may still have substantial remaining useful life. CBS also details the recommended, due, and overdue required maintenance during and after the BMW Vehicle Maintenance Program Agreement. Thus, CBS allows BMW customers to experience a technology that makes service more convenient, transparent and structured.

6.0 ENGINE OIL ADDITIVES

The use of engine oil additives is not recommended and not necessary on BMW engines. Instead, it is mandatory to use BMW High Performance Synthetic Oil in 1999 model year and later BMW models and recommended to use either BMW High Performance Synthetic Oil, BMW High Performance Mineral Oil or one of today's highly advanced brand name lubricating oils conforming to API classification SH or higher in 1998 and earlier BMW models.

7.0 BREAK-IN INSTRUCTIONS

During the break-in period of a new engine or parts of a reconditioned engine (new bearings, crankshaft, pistons, etc.) BMW engines do not require special break-in oils.

All of the multiple grade engine oils can be used, as long as they conform with BMW specifications.

8.0 N52, N52KP AND N54 FRONT AND REAR RADIAL SEAL SEALANT

When replacing the front or rear radial crankshaft seals on new generation 6 cylinder engines, a special Loctite® sealant must be applied to fill the seal grooves at the bedplate seam. Follow the appropriate repair instruction in TIS:

RA 11 14 005 - Front radial crankshaft seal replacement

RA 11 14 151 - Replacing crankshaft radial seal (rear)

All special tools required to perform these repairs have been sent out through the automatic tool shipment program and are listed in S.I. Bulletin 04 01 06.

Required Materials:

P/N 83 19 7 536 051 - Loctite® 128357 sealant compound\

P/N 83 19 7 515 683 - Loctite® 171000 primer

P/N 83 19 7 515 684 - Stamp

10.0 LUBRICANT FOR OXYGEN SENSOR

Apply Bostik NEVER-SEEZ® (Part No. NSBT-16) to threads of oxygen sensor.

11.0 OIL CONSUMPTION

All engines normally consume a certain amount of oil. This is necessary in order to properly lubricate the cylinder walls, pistons, piston rings etc. In addition, engines with less than 6,000 miles will generally consume additional oil because the components are not fully seated. Therefore, oil consumption complaints received prior to 6,000 miles cannot be considered.

Once a new or rebuilt engine has accumulated 6,000 miles this procedure should be used if there is a drastic change in the oil consumption rate (i.e. the oil consumption rate triples) under similar driving conditions or if the oil consumption rate exceeds 1 qt. per 750 miles at any time..

All Motorsport Engines:

Due to their increased output and maximum engine speeds, these engines are allowed a maximum consumption of 2.5 quarts per 1,000 miles.

13.0 OPERATING FLUIDS TABLE AND ALTERNATE SUPPLIERS

OPERATING FLUIDS TABLE AND ALTERNATE SUPPLIERS

VACUUM SUPPLY

All models

T1105013

Fig. 1: Vacuum Supply System
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

Vacuum is principally used for the brake booster.

The vacuum in the inlet pipe depends on the varying engine load.

Diesel engines do not normally have any vacuum in the inlet pipe. Vacuum on diesel engines is provided by a pump that generates the required vacuum.

On spark-ignition engines with Valvetronic, the throttle valve is almost always open when driving. This means that there is a lower low air pressure in the intake manifold.

Spark-ignition engines with low vacuum in the inlet pipe also have a pump that generates additional vacuum.

BRIEF DESCRIPTION OF COMPONENTS

The following components are involved in the vacuum supply system:

- **Mechanical vacuum pump**

A mechanic vacuum pump is fitted to diesel engines and spark-ignition engines with Valvetronic.

The vacuum pump is mechanically driven by the engine, e.g. via the exhaust camshaft.

- **Suction-jet pump**

As a rule, the suction-jet pump boosts the vacuum in the inlet pipe.

- **Electric vacuum pump**

On some engines, an electric vacuum pump is fitted for additional vacuum supply.

In certain temporary operating situations, the vacuum in the inlet pipe may be too low. In such cases, the inlet pipe vacuum cannot be adequately boosted by the suction-jet pump. In these situations, the electric vacuum pump ensures that sufficient vacuum is available.

Reason: After a cold start, an operating situation occurs in which there is very little inlet pipe vacuum due to the higher load. The electric vacuum pump is actuated for a certain time. This ensures that the brake is sufficiently boosted when maneuvering.

After a cold start, the DME will actuate the electric vacuum pump **once only** for max. 60 seconds.

The electric vacuum pump is actuated in the following situations:

- Engine-running signal from DME
- Coolant temperature below 60 °C

The electric vacuum pump is a vane-cell pump.

- **Throttle valve**

The throttle valve changes the cross-sectional area of the inlet pipe. This creates an inlet pipe vacuum behind the throttle valve, especially in overrun mode.

- **DME or DDE: Digital engine electronics or digital diesel electronics**

The DME or DDE actuates the components needed for system functions (e.g. solenoid valves, electric switching valves, electropneumatic pressure converters).

SYSTEM FUNCTIONS

The system functions of the vacuum system are described using the following examples:

- Power assist for brakes
- Actuation of exhaust flaps
- Adjustment of variable turbine geometry
- Actuation of controlled damping mounts
- Exhaust gas recirculation
- Drawing off of blow-by gases from crankcase
- Blowing out activated charcoal filter

Power assist for brakes

The brake booster amplifies the force exerted at the brake pedal. To do this, the brake booster stores part of the vacuum generated by the engine. The vacuum then amplifies the force generated by pressure on the brake pedal.

Actuation of exhaust flap

A controlled electropneumatic exhaust flap is fitted in the exhaust system. The exhaust flap enhances active sound-damping. The exhaust flap is closed by vacuum.

Adjustment of variable turbine geometry

The variable turbine geometry controls the boost pressure via adjustable guide vanes. The guide vanes are actuated by vacuum.

Actuation of controlled damping mounts

In the basic setting, there is no vacuum at the control component of the mount. The bypass in the mount is closed. Hydraulic fluid flows back and forth through a ring channel between the upper and lower chambers in the mount. The mount acts like a conventional hydraulic bearing. The mount has hard damping. If a vacuum is applied to the mount's control component, the bypass will open. The hydraulic fluid then flows back and forth between the chambers through a larger cross-sectional area. The mount has softer damping.

Exhaust gas recirculation

With exhaust gas recirculation, part of the exhaust gas is taken from behind the exhaust manifold. This is then fed back into the engine through the intake air duct. The exhaust gas recirculation pipe is located at the inlet to the intake manifold.

If a vacuum is applied to the exhaust gas recirculation valve, the exhaust gas recirculation pipe will open. The level of vacuum is determined by the opening in the exhaust gas recirculation valve.

Exhaust gases flow through a connecting pipe to the exhaust manifold and into the intake manifold.

Drawing off of blow-by gases from crankcase

The crankcase ventilation system uses vacuum to bleed the blow-by gases out of the engine block. Blow-by gases are the small portion of the cylinder fill that passes by the piston rings and into the crankcase during compression. If the blow-by gases are not bled from the engine block through the crankcase ventilation system, they will accumulate in the crankcase. The blow-by gases would then apply pressure on the pistons from below. This would have a negative effect on the downward movement of the pistons in the intake stroke and operating stroke.

Blowing out activated charcoal filter

The fuel tank vent hose is connected to an activated charcoal filter. Vapors from the fuel tank are collected in the activated charcoal filter. The activated charcoal filter is connected to the intake manifold by a pipe. A fuel evaporation control valve is fitted in this pipe. When the fuel evaporation control valve is opened, the vacuum in the manifold draws in fresh air. At the same time, the fresh air blows out the fuel vapors collected in the activated charcoal filter.

11 0 250 ENGINE SUPPORT

Minimum set: Mechanical tools

Note: For preventing inclination of engine (removing transmission, removing and installing engine mounts, etc.).

Series: E83

Storage location: C47, C48

SI number: 1 24 03 (040)

Order number: 11 0 250

Engine support

Fig. 2: Engine Support (11 0 250)

11 4 190 1-4" EXTENSION PIECE

Minimum set: Mechanical tools

In conjunction with: 11 3 390, 00 2 050

Note: M73 For removing and installing pedal travel sensor M60 Pretensioning timing chain E53 Mounting airbag control unit

Series: All models

Storage location: B6

SI number: 1 06 94(801)

Order number: 11 4 190

1/4" extension piece

Crankshaft bearing clearance, radial	mm	0.020...0.046
Max. permitted runout at center crankshaft journal	mm	0.150

23 VIBRATION DAMPER

11 23 VIBRATION DAMPER N52K B25

TECHNICAL DATA - VIBRATION DAMPER N52K B25

Max. permitted radial runout	mm	0.100
Max. permitted axial runout	mm	0.100

11 23 VIBRATION DAMPER N52K B30

TECHNICAL DATA - VIBRATION DAMPER N52K B30

Max. permitted radial runout	mm	0.100
Max. permitted axial runout	mm	0.100

24 CONNECTING ROD WITH BEARING

11 24 CONNECTING RODS AND BEARINGS N52K B25

TECHNICAL DATA - CONNECTING RODS AND BEARINGS N52K B25

Z Large connecting rod eye (without bearing)	mm	53.600 ^{+0.016}
Conrod bushing: Inside diameter	mm	20.000 ^{+0.013} +0.004
Permissible total deviation of connecting rods in one engine (without bearing shells)	g	± 5

11 24 CONNECTING RODS AND BEARINGS N52K B30

TECHNICAL DATA - CONNECTING RODS AND BEARINGS N52K B30

Z Large connecting rod eye (without bearing)	mm	53.600 ^{+0.016}
Conrod bushing: Inside diameter	mm	20.000 ^{+0.013} +0.004
Permissible total deviation of connecting rods in one engine (without bearing shells)	g	± 5

25 PISTON WITH RINGS AND PIN

11 25 PISTONS WITH RINGS AND PINS N52K B25

TECHNICAL DATA - PISTONS WITH RINGS AND PINS N52K B25

Piston and pin are paired to each other - replace together only.		
Measuring point "A" (position)	mm	10
Piston diameter at measuring point "A"		

Original (new dimension)	mm	81.985 ^{±0.014}
Repair stage (new dimension)	mm	%
Oversize (new dimension)	mm	82.235 ^{±0.014}
Piston installation clearance (piston new)	mm	0.000...0.043
Piston installation clearance (piston worn)	mm	0.020...0.047
Permissible total wear tolerance between piston and cylinder (engine operated)	mm	0.150

11 25 PISTONS WITH RINGS AND PINS N52K B25

TECHNICAL DATA - PISTONS WITH RINGS AND PINS N52K B25

1st groove		
End clearance	mm	0.180 ... 0.330
Axial play	mm	0.020 ... 0.060
2nd groove		
End clearance	mm	0.300 ... 0.500
Axial play	mm	0.020 ... 0.060
3rd groove		
End clearance	mm	cannot be measured
Axial play	mm	cannot be measured

11 25 PISTONS WITH RINGS AND PINS N52K B30

TECHNICAL DATA - PISTONS WITH RINGS AND PINS N52K B30

Piston and pin are paired to each other - replace together only.		
Measuring point "A" (position)	mm	14
Piston diameter at measuring point "A"		
Original (new dimension)	mm	84.990 ^{±0.010}
Repair stage (new dimension)	mm	%
Oversize (new dimension)	mm	85.240 ^{±0.010}
Piston installation clearance (piston new)	mm	0.000...0.034
Piston installation clearance (piston worn)	mm	0.020...0.047
Permissible total wear tolerance between piston and cylinder (engine operated)	mm	0.150

11 25 PISTONS WITH RINGS AND PINS N52K B30

TECHNICAL DATA - PISTONS WITH RINGS AND PINS N52K B30

1st groove		
End clearance	mm	0.150 ... 0.300
Axial play	mm	0.020 ... 0.070
2nd groove		
End clearance	mm	0.300 ... 0.500

Axial play	mm	0.020 ... 0.060

Control pressure (engine at normal operating temperature)	bar	4.0 ... 6.0

ENGINE

Engine - Tightening Torques - X3, X5 (6-Cyl.)

11 ENGINE BLOCK

11 11 CRANKCASE

CRANKCASE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screws (14 x) Bedplate to crankcase.	N52K	M10 x 100	Replace screws. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	20 Nm
			Torque angle	70 °
2AZ ASA screws (25 x) Bedplate to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M10 x 27	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	15 Nm
			Torque angle	90 °
3AZ ASA screws (4x) Bedplate to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M8 x 37	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	8 Nm
			Torque angle	90 °
4AZ ASA screws (2x) Bedplate to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M10 x 41	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	15 Nm
			Torque angle	90 °
5AZ Oil spray nozzles (6 x) Oil spray nozzles in crankcase.	N52K	M8 x 1		12 Nm
6AZ Plug (1 x) Coolant drain to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M14 x 1.5	Replace screw and sealing ring. Thread repairs are not permitted!	50 Nm
7AZ Plug				

(1 x) Assembly opening to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M22 x 1.5	Replace screw. Thread repairs are not permitted!	50 Nm
8AZ Plug (1 x) Assembly opening to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M16 x 1.5	Replace screw. Thread repairs are not permitted!	27 Nm

12 CYLINDER HEAD WITH COVER

11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER

CYLINDER HEAD WITH CYLINDER HEAD COVER - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ISA screws (cylinder head bolts) (10 x) Cylinder head to crankcase.	N52K	M10 x 125	Replace screws. Tighten screws from inside outwards. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	30 Nm
			1st angle of rotation	90 °
			2. Angle of rotation	90 °
			3. Angle of rotation	45 °
2AZ ISA screws (cylinder head bolts) (1 x M9 x 95) (3 x M9 x 125) Cylinder head to crankcase.	N52K	M9	Replace screws. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	30 Nm
			1st angle of rotation	90 °
			2. Angle of rotation	omitted
			3. Angle of rotation	45 °
3AZ Al screw (1 x) Cylinder head to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M9 x 30	Replace screw. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	10 Nm
			Torque angle	90 °
4AZ ASA screws (3 x) Cylinder head to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M9 x 70	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	

			Jointing torque	10 Nm
			Torque angle	135 °
5AZ ASA screws (15 x M7 x 33.5 round) (1 x M7 x 33.5 oval) (1 x M7 x 35) (2 x M7 x 36) Hexagon screw (1 x M7 x 46) Studs (2 x M7 x 75) Cylinder head cover to cylinder head.	N52K	M7		9 Nm
6AZ Fillister head screws (4 x) Ignition coil cover to cylinder head cover.	N52K	M6 x 20		4 Nm
7AZ ISA screws (12 x) Bearing cap of eccentric shaft to cylinder head.	N52K	M6 x 30.5		9 Nm
8AZ Seal plugs (3 x) Seal, oil channel, in cylinder head.	N52K	M16 x 1.5	Thread must be oiled.	40 Nm
9AZ Towing eye (1 x) Towing eye to cylinder head.	N52K	M16	Use towing eye exclusively with M16 thread. Use towing eye for engine transportation only.	30 Nm

11 12 CYLINDER HEAD WITH COVER

CYLINDER HEAD WITH COVER - TIGHTENING TORQUES

	Type	thread	tightening specification	Measure
11AZ Cylinder head cover	All	M6		10 Nm
	All	M7		15 Nm
	M21	M8		15 Nm
12AZ Oil trap to cylinder head cover	M21	M8		17 Nm
13AZ Timing case to cylinder head	All	M7		15 Nm
	All	M8		20 Nm
14AZ Plug for oil channel (microencapsulated)	M47/M57	M12 x 1.5		20 Nm
15AZ Vent plugs to cylinder head (coolant)	M67			2 Nm

13 OIL SUMP

11 13 OIL PAN

OIL PAN - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
Optional extra designation: SA205 = Automatic transmission				
1AZ Plug (1 x) Oil drain to oil sump.	N52K	M12 x 1.5	Replace sealing ring.	25 Nm
2AZ ASA screws (20 x) Oil sump (aluminium) to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M8 x 26	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	8 Nm
			Torque angle	90 °
3AZ ASA screws (5 x M8 x 112) (3 x M8 x 92) Oil sump (aluminium) to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M8	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	8 Nm
			Torque angle	180 °
4AZ ASA screws (7 x) Oil deflector to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 20	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	4 Nm
			Torque angle	90 °
5AZ ASA screws (3 x) Transmission to oil sump.	N52K	M8 x 50		19 Nm
6AZ Hexagon nuts (2 x) Holder, transmission oil cooler line, to oil sump for vehicles with optional extra SA205.	N52K	BM6		8 Nm
7AZ Hexagon nut (1 x) Holder, coolant hose, to oil sump.	N52K	M6		9 Nm
8AZ Hexagon screw (1 x) Holder, coolant hose, to oil sump.	N52K	M10 x 18		21 Nm

11 14 TRANSMISSION CLOSING PLATE

TRANSMISSION CLOSING PLATE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (4 x) Transmission cover plate to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 16	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	4 Nm
			Torque angle	45 °

21 CRANKSHAFT WITH BEARING

11 21 CRANKSHAFT AND BEARINGS

CRANKSHAFT AND BEARINGS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Increment wheel on crankshaft	S54	M5 10.9	Replace screws	
			Jointing torque	5.0 Nm
			Torque angle	45 °
Increment wheel on crankshaft		M5 10.9	Replace screws	13 Nm
Increment wheel on crankshaft		M5 8.8	Replace screws	5.5 Nm

11 21 CRANKSHAFT AND BEARINGS

CRANKSHAFT AND BEARINGS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screw (central screw) (1 x) Hub of vibration damper to crankshaft.	N52K	M16 x 80	Replace screw. Screw and thread are lightly oiled. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	100 Nm
			Torque angle	360 °

22 FLYWHEEL

11 22 FLYWHEEL

FLYWHEEL - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screws				

(6 x) Flywheel to crankshaft for vehicles with SA205 (automatic transmission).	N52K	M12 x 25.5	Replace screws. Jointing torque and final tightening must be observed without fail.	
			1. Jointing torque	30 Nm
			2. Final tightening	125 Nm
2AZ ISA screws (6 x) Flywheel to crankshaft for vehicles without SA205 (automatic transmission).	N52K	M12 x 25	Replace screws.	120 Nm

23 VIBRATION DAMPER

11 23 VIBRATION DAMPER

VIBRATION DAMPER - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
3AZ Belt pulley/vibration damper to hub	S38 / B36	M8 10.9		34 Nm
	N40 / N42 / N45 / N46 / S38 / B38	M8 10.9		34 Nm
	All / others	M8		22 Nm
4AZ Belt pulley to vibration damper	S38 / B35	M8 8.8		22 Nm
	S50	M8 8.8		22 Nm
5AZ Sprocket with hub or hub to crankshaft	M40	M16 x 1.5	Replace screw	310 Nm
	M42 / M43 / M43TU / M44	M16 x 1.5	Replace screw	330 Nm
6AZ Hub to crankshaft	N40 / N42 / N45 / N46	M16 x 1.5	Replace screw	300 Nm

11 23 VIBRATION DAMPER

VIBRATION DAMPER - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (6 x) Vibration damper to hub.	N52K	M8 x 16		35 Nm

24 CONNECTING ROD WITH BEARING

11 24 CONNECTING RODS AND BEARINGS

CONNECTING RODS AND BEARINGS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (connecting rod bolts) (12 x) Connecting rod bearing cap to connecting rod.	N52K	M8 x 47	Replace screws. Screws washed and oiled. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	20 Nm
			Torque angle	70 °

28 V-RIBBED BELT WITH TENSIONER

11 28 RIBBED V-BELT WITH TENSION AND DEFLECTION SYSTEM

RIBBED V-BELT WITH TENSION AND DEFLECTION SYSTEM - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screw (1 x) Belt tensioner to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K / Not for E70 N52K B30	M11 x 65	Replace screw. Thread repairs are not permitted! Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	25 Nm
			Torque angle	90 °
2AZ ASA screw (1 x) Belt tensioner with deflection pulley to crankcase. The end faces of the aluminium screw heads are painted blue.	E70 N52K B30	M11 x 99	Replace screw. Thread repairs are not permitted! Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	25 Nm
			Torque angle	90 °
3AZ Hexagon screw (1 x) Deflection pulley to alternator.	N52K	M10 x 45		40 Nm

31 CAMSHAFT

11 31 CAMSHAFT

CAMSHAFT - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (15 x) Upper and lower bearing banks of exhaust camshaft to cylinder head.	N52K	M7 x 70	Insert screws dry. Tighten screws from inside outwards. Jointing torque and angle of rotation must be observed without fail.	

			Jointing torque	8 Nm
			Torque angle	60 °
2AZ ISA screws (14 x) Bearing cap of inlet camshaft to cylinder head.	N52K	M6 x 30.5		9 Nm
3AZ ASA screws (2 x) Timing chain module to cylinder head.	N52K	M6 x 35		9 Nm
4AZ Bearing pin (1 x) Timing chain module to crankcase.	N52K	M8		20 Nm
5AZ Bearing pin (1 x) Timing chain module to cylinder head.	N52K	M7		14 Nm
6AZ Chain tensioner (1 x) Chain tensioner to cylinder head.	N52K	M22 x 1.5	Replace sealing ring.	55 Nm
7AZ Plug (1 x) Assembly opening to cylinder head.	N52K	M18 x 1.5		25 Nm

36 VARIABLE CAMSHAFT TIMING

11 36 VARIABLE CAMSHAFT CONTROL VANOS

VARIABLE CAMSHAFT CONTROL VANOS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screws (central bolts) (2 x) VANOS with sensor gear to inlet and exhaust camshafts.	N52K	M10 x 94	Replace screws. Grip inlet and exhaust camshafts at dihedron when tightening. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	20 Nm
			Torque angle	180 °
2AZ Non-return valve (2 x) Non-return valve for VANOS to cylinder head	N52K	M14 x 1.5	Replace sealing ring.	13 Nm
3AZ Hexagon screws (2 x) Inlet and exhaust solenoid valve with holder to cylinder head.	N52K	M6 x 12	Replace support and sealing rings.	9 Nm

37 VARIABLE VALVE GEAR

11 37 VARIABLE VALVE GEAR

VARIABLE VALVE GEAR - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (11 x) Guide block to timing case.	N52K	M6 x 23	Only one screw (inside) plus the oil spray nozzle are fitted on cylinder no. 3.	10 Nm
2AZ ASA screws (6 x) Torsion spring to cylinder head.	N52K	M6 x 20		10 Nm
3AZ ASA screws (2 x on cylinder head) (1 x on cylinder head cover) Electric servomotor to cylinder head and to cylinder head cover.	N52K	M6 x 16	<ol style="list-style-type: none"> 1. Join screws hand-tight to cylinder head. 2. Join screw hand-tight to cylinder head cover. 3. Jointing torque on cylinder head. 4. Jointing torque on cylinder head cover. 	10 Nm
4AZ ASA screw (1 x) Oil spray nozzle to guide block.	N52K	M6 x 30	Oil spray nozzle is fitted on cylinder no. 3 (outside).	10 Nm
5AZ Stop screw (1 x) Stop screw of eccentric shaft to cylinder head.	N52K	M6		10 Nm

41 OIL PUMP WITH FILTER

11 41 OIL PUMP WITH STRAINER AND DRIVE

OIL PUMP WITH STRAINER AND DRIVE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
Optional extra designation: SA203 = All-wheel drive				
1AZ ASA screws (2 x with optional extra SA203) (3 x without optional extra SA203) Suction pipe to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 30	<p>Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.</p>	
			Jointing torque	4 Nm
			Torque angle	100 °
2AZ ASA screw (1 x) Oil pump to bedplate.	N52K	M8 x 123	<p>Replace screw. Thread repairs exclusively with aluminium Helicoil threaded insert.</p>	

The end faces of the aluminium screw heads are painted blue.			Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	10 Nm
			Torque angle	180 °
3AZ ASA screws (2 x) Oil pump to bedplate. The end faces of the aluminium screw heads are painted blue.	N52K	M8 x 31	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	10 Nm
			Torque angle	90 °
4AZ ASA screw (1 x) Chain module to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 16	Replace screw. Thread repairs are not permitted! Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	4 Nm
			Torque angle	45 °
5AZ ASA screws (2 x) Chain module to oil pump. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 16	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	4 Nm
			Torque angle	45 °
6AZ Fillister head bolt (1 x) Sprocket wheel to oil pump.	N52K	M8 x 20	Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	20 Nm
			Torque angle	45 °

42 OIL FILTER AND LINES

11 42 OIL FILTER ELEMENT WITH CONNECTIONS

OIL FILTER ELEMENT WITH CONNECTIONS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Oil filter cap (1 x) Oil filter cap to oil-filter housing.	N52K		Replace sealing ring.	25 Nm
2AZ ASA screws (1 x M8 x 28) (1 x M8 x 43) (1 x M8 x 78)	N52K	M8	Replace seal.	22 Nm

Oil filter housing to cylinder head.				
3AZ Tapping screws (3 x)	N52K	M8 x 20	Replace seal.	16 Nm
Oil/water heat exchanger to oil filter housing.				

51 WATER PUMP WITH DRIVE

11 51 ELECTRIC WATER PUMP WITH DRIVE

ELECTRIC WATER PUMP WITH DRIVE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ASA screws (3 x) Electric water pump to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K / Not for E70 N52K B30	M8 x 32	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	10 Nm
			Torque angle	90 °
2AZ ASA screws (3 x) Electric water pump to crankcase. The end faces of the aluminium screw heads are painted blue.	E70 N52K B30	M8 x 28	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	10 Nm
			Torque angle	90 °

53 THERMOSTAT AND CONNECTIONS

11 53 COOLANT THERMOSTAT WITH CONNECTIONS

COOLANT THERMOSTAT WITH CONNECTIONS - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screws (2 x) Coolant thermostat to electric water pump.	N52K	M6 x 25		9 Nm
2AZ ASA screws (2 x) Feed line (from electric water pump) to crankcase.	N52K	M6 x 16	Replace sealing ring and seal.	9 Nm
3AZ Hose clamp (1 x) Feed line (from crankcase) to electric	N52K	L42-48		3 Nm

water pump.				
4AZ Hose clamps (2 x) Coolant hose between oil-water heat exchanger and feed line.	N52K	L18-24		3 Nm
5AZ Hose clamps (2 x) Coolant hose between coolant thermostat and electric water pump.	N52K	L42-48		3 Nm
6AZ Hose clamp (1 x) Coolant hose (from cylinder head) to coolant thermostat.	N52K	L23-35		3 Nm
7AZ Hexagon screws (2 x) Coolant hose (from coolant thermostat) to cylinder head.	N52K	M6 x 25		9 Nm
8AZ ASA screw (1 x) Spacer to cylinder head.	N52K	M6 x 12		8 Nm
9AZ ASA screws (2 x) Dual bracket to crankcase. The end faces of the aluminium screw heads are painted blue.	N52K	M6 x 16	Replace screws. Thread repairs exclusively with aluminium Helicoil threaded insert. Jointing torque and angle of rotation must be observed without fail.	
			Jointing torque	4 Nm
			Torque angle	45 °

61 INTAKE MANIFOLD

11 61 INTAKE MANIFOLD

INTAKE MANIFOLD - TIGHTENING TORQUES

	Type	thread	tightening specification	Measure
1AZ Intake manifold on cylinder head	All	M8		22 Nm
	All	M7		15 Nm
	All	M6		10 Nm
2AZ Soundproofing hood to holder	M60/1 / M60/2 / M62	M6		8 Nm

11 61 AIR INTAKE MANIFOLD

AIR INTAKE MANIFOLD - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Hexagon screws (4 x)	N52K	M7 x 50		15 Nm

Air intake manifold to cylinder head.				
2AZ Hexagon nuts (3 x) Air intake manifold to cylinder head.	N52K	AM7 (to DIN 439)		15 Nm

62 EXHAUST MANIFOLD

11 62 EXHAUST MANIFOLD

EXHAUST MANIFOLD - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Exhaust manifold to cylinder head Coat screw connections with CRC copper paste	All	M6	Replace nuts	10 Nm
	M50 / M52 / M52TU / M54 / M56 / S52 / S50 US	M7	Replace nuts	20 Nm
	All / others	M7	Replace nuts	15 Nm
	M10	M8	Upper row of staybolts installed with bolt cement	
				23 Nm
	M21	M8		12 Nm
			Replace nuts Retighten after 2000 km Slacken nuts by a 1/4 turn	
				12 Nm
	M41 / M47 / M47TU / M51 / M57 / M57TU	M8	Replace nuts	20 Nm
	All / others	M8	Replace nuts	23 Nm

66 VACUUM PUMP

11 66 VACUUM PUMP

VACUUM PUMP - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ ISA flat mushroom head screws 10.9 (3 x) Vacuum pump to crankcase.	N52K	M6 x 40		10 Nm
2AZ ISA screw (1 x)	N52K	M10 x 30		66 Nm

Sprocket wheel to vacuum pump.

72 AIR PUMP, LINES AND CONTROL VALVE

11 72 AIR PUMP, LINES AND CONTROL VALVES

AIR PUMP, LINES AND CONTROL VALVES - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Secondary air valve to cylinder head	N52K	M6		8 Nm
2AZ Secondary air pump to mounting bracket/pump carrier	N52K	M6		8 Nm
3AZ Intake hose / intake line to body	N52K	M6		8 Nm

78 EMISSION CONTROL, OXYGEN SENSOR

11 78 EXHAUST GAS CONTROL, LAMBDA CONTROL SENSOR / LAMBDA MONITOR SENSOR

EXHAUST GAS CONTROL, LAMBDA CONTROL SENSOR / LAMBDA MONITOR SENSOR - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Lambda control sensor LSU 4.9 Lambda monitor sensor LSF 4.2	N52K	M18 x 1.5		50 Nm
2AZ ASA screws (2 x) Bracket, lambda control sensors, to cylinder head.	N52K	M6 x 12		8 Nm
3AZ Hexagon screw (1 x) Bracket, lambda monitor sensors, side, to transmission.	N52K / Not for E6x and E85	M8 x 16		19 Nm
4AZ Bracket, plug connection, lambda monitor sensors, bottom, to transmission.	N52K			

ENGINE

Engine And Gearbox - Repair Instructions - X3

11 ENGINE SUSPENSION

22 11 001 REPLACING RIGHT ENGINE MOUNT (N52K)

Necessary preliminary tasks:

- Remove right engine support arm, see [22 11 100 Replacing right engine support arm \(N52K\)](#).

Release screws (1) and remove engine mount (2).

Tightening torque, see 1AZ in [22 11 ENGINE SUSPENSION](#) .

Fig. 1: Engine Mount

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Ensure lug (1) is correctly located.

Engine mount designations:

Right engine mount

- Even component number

Left engine mount

- Odd component number

Fig. 2: Lug

Courtesy of BMW OF NORTH AMERICA, INC.

22 11 011 REPLACING LEFT ENGINE MOUNT (N52K)

Necessary preliminary tasks:

- Remove left engine support arm, see **22 11 110 Replacing left engine support arm (N52K)**.

Release screws (1) and remove engine mount (2).

Tightening torque, see 1AZ in **22 11 ENGINE SUSPENSION** .

Fig. 3: Engine Mount

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Note installation position.

Threaded pin (1) must point outwards.

Engine mount designations:

Right engine mount

- Even component number

Left engine mount

- Odd component number

Fig. 4: Threaded Pin

Courtesy of BMW OF NORTH AMERICA, INC.

22 11 100 REPLACING RIGHT ENGINE SUPPORT ARM (N52K)

Necessary preliminary tasks:

- Secure engine in installation position, see **11 00 670 SECURING ENGINE IN INSTALLATION POSITION (N52)** .
- Remove the reinforcement plate, see **31 10 010 REMOVING AND INSTALLING/REPLACING REINFORCEMENT PLATE** .

Release screws.

Remove engine support arm (1).

Tightening torque 3AZ, see **22 11 ENGINE SUSPENSION** .

Fig. 5: Engine Support Arm

Courtesy of BMW OF NORTH AMERICA, INC.

22 11 110 REPLACING LEFT ENGINE SUPPORT ARM (N52K)

Necessary preliminary tasks:

- Secure engine in installation position, see **11 00 670 SECURING ENGINE IN INSTALLATION POSITION (N52)** .
- Remove the reinforcement plate, see **31 10 010 REMOVING AND INSTALLING/REPLACING REINFORCEMENT PLATE** .

Disconnect connector (1).

Detach oil line (2) from engine support arm.

Release screws and remove engine support arm (3).

Tightening torque, see 3AZ in **22 11 ENGINE SUSPENSION** .

Fig. 6: Connector, Oil Line And Engine Support Arm

Courtesy of BMW OF NORTH AMERICA, INC.

31 TRANSMISSION SUSPENSION, MANUAL TRANSMISSION

22 31 001 REPLACING RUBBER MOUNT FOR TRANSMISSION MOUNTING

Special tools required:

See 22 1 010 SET OF TOOLS .

- 22 1 011
- 22 1 014
- 22 1 016
- 22 1 021
- 33 3 144

Necessary preliminary tasks:

- Remove complete exhaust system, see 18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM (M54) .
- Remove heat shield
- Support transmission with hydraulic lifter.

Unfasten screws and remove transmission cross-member.

Fig. 7: Transmission Cross-Member Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Position special tool 22 1 016 on opening (2) and twist in screw (3) hand-tight against housing.

Pull out rubber mount with special tools 22 1 011 / 33 3 144 and nut (1).

Nut (1) = M 12x1.5 nut

Fig. 8: Pulling Out Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Arrow on rubber mount must point to arrow on housing.

Coat housing bore and rubber mount with Circolight.

Fig. 9: Arrow On Rubber Mount And Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 22 1 014 with pins into openings of rubber mount.

Fig. 10: Special Tool 22 1 014
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in rubber mount with special tools 22 1 014 / 22 1 021 / 33 3 144 and nut (1).

Nut (1) = M12x1.5

Fig. 11: Installing Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

22 31 050 REPLACING CROSS-MEMBER FOR TRANSMISSION MOUNTING

Operation is identical to **22 31 001 Replacing rubber mount for transmission mounting.**

22 31 050 REPLACING CROSS-MEMBER FOR TRANSMISSION MOUNTING

Operation is identical to **22 31 001 Replacing rubber mount for transmission mounting.**

32 TRANSMISSION SUSPENSION, AUTOMATIC TRANSMISSION

22 31 001 REPLACING RUBBER MOUNT FOR TRANSMISSION MOUNTING

Special tools required:

See **22 1 010 SET OF TOOLS** .

- 22 1 011
- 22 1 014
- 22 1 016
- 22 1 021
- 33 3 144

Necessary preliminary tasks:

- Remove complete exhaust system, see **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM (M54)** .
- Remove heat shield
- Support transmission with hydraulic lifter.

Unfasten screws and remove transmission cross-member.

Tightening torque 10AZ, see **27 00 TRANSFER BOX IN GENERAL** .

Fig. 12: Transmission Cross-Member Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Position special tool 22 1 016 on opening (2) and twist in screw (3) hand-tight against housing.

Pull out rubber mount with special tools 22 1 011 / 33 3 144 and nut (1).

Nut (1) = M 12x1.5 nut

Fig. 13: Pulling Out Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Arrow on rubber mount must point to arrow on housing.

Coat housing bore and rubber mount with Circolight.

Fig. 14: Arrow On Rubber Mount And Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 22 1 014 with pins into openings of rubber mount.

Fig. 15: Special Tool 22 1 014
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in rubber mount with special tools 22 1 014 / 22 1 021 / 33 3 144 and nut (1).

Nut (1) = M12x1.5

Fig. 16: Installing Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

22 32 001 REPLACING RUBBER MOUNT FOR TRANSMISSION MOUNTING

Special tools required:

See **22 1 010 SET OF TOOLS** .

- 22 1 011
- 22 1 014
- 22 1 016
- 22 1 021
- 33 3 144

Necessary preliminary tasks:

- Remove complete exhaust system, see **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM**
- Remove heat shield
- Support transmission with hydraulic lifter.
- Remove transfer case, see **27 10 010 REMOVING AND INSTALLING TRANSFER CASE (ATC 400 X-DRIVE)** .

Position special tool 22 1 016 on opening (2) and twist in screw (3) hand-tight against housing.

Pull out rubber mount with special tools 22 1 011 / 33 3 144 and nut (1).

Nut (1) = M 12x1.5 nut

Fig. 17: Pulling Out Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Arrow on rubber mount must point to arrow on housing.

Coat housing bore and rubber mount with Circolight.

Fig. 18: Arrow On Rubber Mount And Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 22 1 014 with pins into openings of rubber mount.

Fig. 19: Special Tool 22 1 014
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in rubber mount with special tools 22 1 014 / 22 1 021 / 33 3 144 and nut (1).

Nut (1) = M12x1.5

Fig. 20: Installing Rubber Mount

Courtesy of BMW OF NORTH AMERICA, INC.

22 32 050 REPLACING CROSS-MEMBER FOR TRANSMISSION MOUNTING

Operation is identical to **Replacing rubber mount for transmission mounting.**

ENGINE

Engine and Gearbox Suspension - Special Tools - X3

22 1 010 SET OF TOOLS

Minimum set: Mechanical tools

In conjunction with: 33 3 144

Note: For removing and installing transfer box rubber mount 22 1 018 for E67 and RR

Series: E46/16, E53, E60, E61, E67, E70, E83, E90, E91, E92, RR1

Storage location: B41, C34, C35, C47

SI number: 1 15 99 (483)

Order number: 22 1 010

Set of tools

Consisting of:

3 = 22 1 013 Thrust piece

Note: For installing transfer case rubber mount - model series: E53

4 = 22 1 014 Thrust piece

Note: For installing transfer box rubber mount - model series: E46/16, E83

5 = 22 1 015 Washer

Note: Model series: E46/16

6 = 22 1 016 Bridge

Note: For removing transfer box rubber mount. Model series: E46/16, E83

7 = 22 1 017 Nut

Note: For installing and removing transfer box rubber mount - model series: E46/16

8 = 22 1 018 Sleeve

Note: For removing transfer box rubber mount - model series: E53, E83, E90

9 = 22 1 019 Washer

Note: For installing transfer box rubber mount - Model series: E53

10 = 22 1 021 Washer

Note: For installing rubber mount in transfer box: ATC400 Model series: E83

12 7 121 COUNTERHOLDER WRENCH

In conjunction with: Socket

Note: Alternator N42 engine

Order number: 12 7 121

Counterholder wrench

12 7 122 SOCKET

In conjunction with: Counterholder wrench

Note: Hazet 8808 lg10

SI number: 1 28 03 (051)

Order number: 12 7 122

Socket

12 7 190 EPROM TOOLS / ID MARKING

Note: Set no longer available. Antistatic mat can be ordered using number 12 7 060.

Storage location: J 101

Order number: 12 7 190

Eprom tools / ID marking

Consisting of:

1 = 12 7 191 Eprom puller pliers

Note: No longer available. Antistatic mat can be ordered using special tool number 12 7 060.

2 = 12 7 192 Antistatic mat

Note: Is replaced by main number 12 7 060.

12 7 200 SET OF TOOLS

Note: For opening & closing control unit box

Storage location: J 106

Order number: 12 7 200

Set of tools

Consisting of:

1 = 12 7 201 Pliers

Note: For bending open tab washers

2 = 12 7 202 Lever

Note: For bending tab washers

3 = 12 7 203 Pliers

Note: For closing tab washers

4 = 12 7 204 Torx socket T20

5 = 12 7 205 Torx socket T10

6 = 12 7 206 Fine pen

Note: Black, waterproof

8 = 12 7 208 Slotted screwdriver 2 mm

9 = 12 7 209 Straightening tool

Note: For Eprom connections

12 7 210 CONTROL UNIT SEAL

Storage location: J 106

Order number: 12 7 210

Control unit seal

Consisting of:

1 = 12 7 211 Seal marks

2 = 12 7 212 Hole punch

Note: For seal mark dating

Assemble engine.

MOUNTING ENGINE ON ASSEMBLY STAND (N52K)

Special tools required:

- **00 1 450 ASSEMBLY STAND**
- 11 3 370
- 11 4 440
- 11 9 261
- 11 9 265

IMPORTANT: Aluminum screws/bolts must be replaced each time they are released. The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification. Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove engine

Bolt engine or engine block with steel bolts (1) and aluminum bolts (2) to special tool 11 4 440 .

To release central bolt, bolt on special tools 11 9 261 and 11 9 265 as well.

Mount engine with special tool 11 3 370 to special tool 00 1 450 .

Fig. 17: Engine Block With Steel And Aluminum Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

00 00 250 BMW ENGINE OIL SERVICE INCLUDING SUPPLEMENTARY SERVICE (N52K)

Special tools required:

- 11 9 240

Only the engine oil service will be described in these repair instructions.

The supplementary service is made up of the following operations which must be taken from the relevant repair instructions:

- Reset service interval indicator according to factory specification, see **00 00 ... RESETTING SERVICE INTERVAL INDICATOR ACCORDING TO FACTORY SPECIFICATIONS** .
- Replace microfilter for interior ventilation
- Check brake lining thickness, see **34 00 010 CHECKING THICKNESS OF BRAKE PAD** .

- Adjust handbrake/parking brake, see 34 10 014 ADJUSTING HANDBRAKE .
- Parking brake function check

**IMPORTANT: Adhere to exact filling quantities.
Overfilling the engine with engine oil will result in engine damage.**

Checking and drip-off times must be observed.

**IMPORTANT: When working on the engine oil, coolant or fuel circuit, you must always protect the alternator against contamination.
Risk of damage!**

The alternator must therefore be covered with suitable apparatus.

Recycling:

Catch and dispose of drained engine oil in a suitable container.

Observe country-specific waste-disposal regulations.

NOTE: Adhere to the following work steps in sequence:

1. Open oil filter cap.
2. Release screw plug in oil sump.

NOTE: Picture shows the E93 by way of example. Other model series may differ in certain details.

Release oil filter cap with special tool 11 9 240 .

Engine oil flows out of the oil filter housing and back into the oil sump.

Fig. 18: Special Tool (11 9 240)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove and insert oil filter element (1) in direction of arrow.

Installation:

Replace oil filter element (1) and sealing rings (2).

Installation:

Moisten sealing rings (2) with engine oil.

Tightening torque: 11 42 1AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 19: Sealing Rings

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, the picture shows the assembly underside protection and reinforcement plate removed.

Unclip service opening on reinforcement plate.

Open screw plug (1) in oil sump.

Drain engine oil.

Installation:

Replace sealing ring.

Tightening torque: 11 13 1AZ, see **11 13 OIL PAN** .

Pour in engine oil.

Fig. 20: Screw Plug

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Start engine and run at idle until oil pressure warning lamp goes out.

Turn off engine.

Check oil filter cap and screw plug (1) on oil sump for leaks.

Assemble engine.

Checking engine oil level:

- Park vehicle on a horizontal surface
- Allow engine at normal operating temperature to run for three minutes with increased revs (approx. 1100 RPM)
- Read off engine oil level in instrument cluster or on Control Display
- Top up engine oil if necessary

11 00 REMOVING AND INSTALLING/REPLACING IGNITION COIL COVER (N52K)

Release screws.

Tightening torque: 11 12 6AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Remove ignition coil cover (1).

Fig. 21: Ignition Coil Cover

Courtesy of BMW OF NORTH AMERICA, INC.

11 00 670 SECURING ENGINE IN INSTALLATION POSITION (N52)

Special tools required:

- **00 0 200 CROSS MEMBER**
- 00 0 202
- 00 0 204
- 00 0 208
- 11 0 000

WARNING: Danger of injury!

Observe following instructions relating to special tool:

1. Prior to each use, check the special tools for defects, modifications and operational reliability.
2. Damaged/modified special tools must not be used!
3. No changes or modifications may be made to the special tools!
4. Keep special tools dry, clean and free of grease.

Necessary preliminary tasks:

- Secure engine bonnet/hood in service position, see **51 00 ... SERVICE POSITION OF ENGINE HOOD/BONNET (X3)** or **51 00 ... SERVICE POSITION OF ENGINE HOOD/BONNET 9X5)** .
- Remove cover for windscreen cowl panel, see **51 13 115 REMOVING AND INSTALLING/REPLACING COWL PANEL COVER (X3)** or **51 13 116 REMOVING AND INSTALLING/REPLACING COWL PANEL COVER (X5)** .
- Remove microfilter housing
- Remove tension strut on spring strut dome, see **51 71 373 REMOVING AND INSTALLING/REPLACING TENSION STRUT ON SPRING STRUT DOME (X3)** or **51 71 372**

REMOVING AND INSTALLING/REPLACING BOTH TENSION STRUTS ON SPRING STRUT DOMES (X5) .

- Remove acoustic cover
- Remove intake filter housing with rubber gaiter, see **13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K) (X3)** or **13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K) (X5)** .

Assemble cross member 00 0 200 with special tools 00 0 202 , 00 0 204 , 00 0 208 .

Fig. 22: Special Tool (00 0 200)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Use towing hook (72 15 8 108 670).

Fig. 23: Towing Hook (72 15 8 108 670)

Courtesy of BMW OF NORTH AMERICA, INC.

Cut open cable tie (2).

Detach quick-release fastener (1) and place vent line (3) to one side.

Installation:

Make sure the quick-release fastener is fitted correctly.

Fig. 24: Open Cable Tie, Quick-Release Fastener And Vent Line
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Avoid a change of engine position in the transverse or longitudinal direction. Always make sure there is sufficient clearance between the engine (or its attachment parts) and the body.

IMPORTANT: Risk of damage!
With the aid of an assistant and the supports (1), place cross member 00 0 200 on the screw connections of the side panels.

Screw in towing hook (2) and tighten down to approx. 30 Nm.

Secure special tool 11 0 000 to spindle 00 0 202 .

Fit suitable chains to special tool 11 0 000 and attach to towing hook (2) or engine lifting eye.

Fig. 25: Special Tools (00 0 202), (00 0 200) And (11 0 000)

Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Danger of injury!
Tighten down all adjusting screws and nuts on cross member 00 0 200 .

Fig. 26: Special Tool (00 0 200)

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nuts (1).

Raise engine approx. 10 mm with cross member.

Installation:

Replace self-locking nuts.

Tightening torque: 22 11 2AZ, see **22 11 ENGINE SUSPENSION** .

Fig. 27: Cross Member Nut

Courtesy of BMW OF NORTH AMERICA, INC.

12 CYLINDER HEAD WITH COVER

11 12 000 REMOVING AND INSTALLING/SEALING CYLINDER HEAD COVER (N52K)

IMPORTANT: Aluminium-magnesium materials

- No steel screws/bolts may be used due to the threat of electrochemical corrosion.
- A magnesium crankcase requires aluminum screws/bolts exclusively.
- Aluminum screws/bolts must be replaced each time they are released.
- Aluminum screws/bolts are permitted with and without color coding (blue).
- For reliable identification: Aluminum screws/bolts are not magnetic.
- Jointing torque and angle of rotation must be observed without fail (risk of damage).

Necessary preliminary tasks:

- Remove ignition coils. See 12 13 511 REPLACING IGNITION COIL (N52, N52K, N51) .
- Release ignition wiring harness in cylinder head cover area. See 12 51 100 REPLACING WIRING HARNESS SECTION FOR IGNITION COIL (N52K) .
- Remove tension strut.

Unlock and detach vent hose (1). If necessary, pull off metal bracket (2) in direction of arrow. Release screws (3) on electric servomotor. Tightening torque, see 11 37 3AZ in 37 VARIABLE VALVE GEAR .

NOTE: A further screw, which cannot be seen in the picture, must be released under the electric servomotor (4).

Fig. 28: Pull Off Metal Bracket (2) In Direction Of Arrow
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw on electric servomotor. Tightening torque, see 11 37 3AZ in **37 VARIABLE VALVE GEAR** . Remove servomotor (4) in direction of arrow. If necessary, release nuts (5). Tightening torque, see 11 72 1AZ in **72 AIR PUMP, LINES AND CONTROL VALVE** . If necessary, remove secondary air valve (6).

IMPORTANT: Observe different screw lengths. Installation location of screws (1 and 2) is specified by the different bushing shapes.

Fig. 29: Installation Location Of Screws (1 And 2) Is Specified By The Different Bushing Shapes
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws in area (1). Tightening torque, see 11 12 5AZ in **12 CYLINDER HEAD WITH COVER** .
Installation: Replace aluminum screws.

Release threaded pin (2). Tightening torque, see 11 12 5AZ in **12 CYLINDER HEAD WITH COVER** .
Installation: Replace aluminum screws.

Installation: Slotted sleeves (2) for guiding ignition coils in cylinder head cover (1) must be replaced. Remove slotted sleeves (2).

Fig. 30: Slotted Sleeves (2) For Guiding Ignition Coils In Cylinder Head Cover (1) Must Be Replaced

Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Clean all sealing faces (1 and 2).

Fig. 31: Clean All Sealing Faces (1 And 2)

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not use any metal-cutting tool

Installation: Replace gaskets (1 and 2).

Assemble engine.

11 12 100 REMOVING AND INSTALLING CYLINDER HEAD (N52K)

Special tools required:

- 11 0 320
- 11 4 420
- 11 4 430
- 11 4 471
- 11 4 472
- 11 8 580

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of

damage).

Necessary preliminary tasks:

- Remove exhaust system, see **EXHAUST SYSTEM COMPLETE** .
- Drain coolant, see **17 00 005 DRAINING AND ADDING COOLANT IN RADIATOR (N52K) (X5)**
or **17 00 005 DRAINING AND ADDING COOLANT (N52K) (X3)** .
- Drain off engine oil
- Remove both exhaust manifolds
- Remove intake air manifold
- Detach coolant hoses from cylinder head
- Remove inlet and exhaust adjustment unit

**IMPORTANT: Fit new cylinder head screws.
Do not wash off bolt coating.
There must be no coolant, water or engine oil in the pocket holes.**

Risk of corrosion and cracking!

Release screws (1).

Unclip timing chain module (2) at junction (3) and remove towards top.

Set down timing chain.

**IMPORTANT: If the timing chain is stowed in the gearcase, the crankshaft must no longer be rotated.
This would cause the timing chain on the crankshaft sprocket wheel to jam or jump.**

Installation:

The timing chain is lifted out with a hook only during assembly.

Fig. 32: Timing Chain Module, Junction And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release bolts (2) for eccentric shaft sensor (1).

Remove eccentric shaft sensor (1) towards front.

Fig. 33: Removing Eccentric Shaft Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Screw (1) is not magnetic and must be secured against falling down.

Release screw (1).

Remove magnet wheel (2) towards front.

Fig. 34: Removing Magnet Wheel

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Magnet wheel (1) is highly magnetic and must be protected against metal filings/borings.

After removing, place magnet wheel (1) in a plastic bag (2) with a seal.

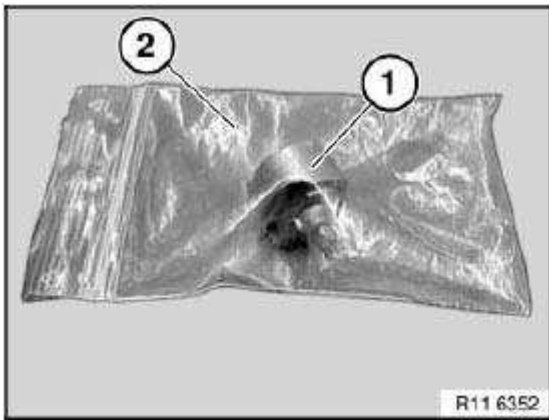

Fig. 35: Magnet Wheel And Plastic Bag

Courtesy of BMW OF NORTH AMERICA, INC.

Pretension eccentric shaft (1) upwards in direction of arrow.

Remove stop screw between 1st and 2nd cylinders.

Tightening torque: 11 37 5AZ, see **11 37 VARIABLE VALVE GEAR** .

Fig. 36: Eccentric Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Bolt (2) can only be released when the timing chain module is pressed forward slightly.

IMPORTANT: Secure bolt (2) with a gripper against falling down.

Release screw (2).

Tightening torque: 11 12 3AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Release screws (1).

Tightening torque: 11 12 4AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Installation:

Replace aluminum screws.

Fig. 37: Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Observe different bolt heads.

Release M10 cylinder head bolts (1) with special tool 11 8 580 .

Release M9 cylinder head bolts (2) with special tool 11 4 420 .

NOTE: Picture shows inlet and exhaust camshafts removed.

Fig. 38: Special Tools (11 8 580) And (11 4 420)
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Observe different M9 bolt lengths (1 and 3).

Release M9 cylinder head bolts (1 and 3) with special tool 11 4 420 .

Tightening torque: 11 12 2AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Release M10 cylinder head bolts (2) with special tool 11 8 580 from outside inwards.

Tightening torque: 11 12 1AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Fig. 39: Cylinder Head Bolts

Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: All cylinder head bolts (1, 2 and 3) must be replaced.
Jointing torque and angle of rotation must be observed without fail.
Risk of damage!**

Secure special tool 11 0 320 with existing cylinder head cover bolts (1).

Tightening torque: 11 12 5AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

**IMPORTANT: Removing and install cylinder head with a second person helping.
Weight of cylinder head with add-on parts is approx. 40 kg.
Do not rest cylinder head on sealing surface. Risk of damage to valves!**

Fig. 40: Special Tool (11 0 320)

Courtesy of BMW OF NORTH AMERICA, INC.

Insert special tool 11 4 430 into bores.

Fig. 41: Special Tool (11 4 430)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove coarse residues on sealing faces with special tool 11 4 471 from cylinder head and crankcase.

IMPORTANT: Do not use any metal-cutting tools.

Fig. 42: Special Tool (11 4 471)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove fine residues on sealing faces with special tool 11 4 472 from cylinder head and crankcase.

IMPORTANT: Do not use any metal-cutting tools.

There must be no coolant, water or engine oil in the pocket holes.

Risk of corrosion and cracking!

Clean all pocket holes.

Replace cylinder head gasket.

Fig. 43: Special Tool (11 4 472)

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Observe sequence for tightening cylinder head bolts without fail.

Fit new cylinder head screws.

Insert cylinder head bolts (1 to 10) with special tool 11 8 580 .

Tightening torque: 11 12 1AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER .**

Insert cylinder head bolts (11 to 14) with special tool 11 4 420 .

Tightening torque: 11 12 2AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER .**

NOTE: Picture shows inlet and exhaust camshafts removed.

Fig. 44: Cylinder Head Bolts Tightening Sequence

Courtesy of BMW OF NORTH AMERICA, INC.

Observe sequence for tightening cylinder head bolts without fail.

IMPORTANT: The 2nd torsion angle relates only to cylinder head bolts 1 to 10.

Installation:

- Jointing torque:

All cylinder head bolts 1 to 14 to 30 Nm

- 1st angle of rotation:

All cylinder head bolts 1 to 14 to 90°

- 2nd angle of rotation:

Only cylinder head bolts 1 to 10 to 90°

- 3rd angle of rotation:

All cylinder head bolts 1 to 14 to 45°

Insert bolts (1).

Tightening torque: 11 12 4AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

IMPORTANT: Secure bolt (2) with a gripper against falling down.

Insert bolt (2).

Tightening torque: 11 12 3AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Installation:

Replace aluminum screws.

Fig. 45: Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 12 101 REPLACING CYLINDER HEAD GASKET (N52K)

Special tools required:

- 11 4 430
- 11 4 470

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released .

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove cylinder head, see **11 12 100 Removing and installing cylinder head (N52K)**.

Insert special tool 11 4 430 into bores.

Remove cylinder head seal.

IMPORTANT: Check marking (1) on cylinder head gasket (B25 or B30).

- **B = petrol/gasoline engine**
- **30= displacement (3 liters)**

Do not mix them up as this will cause engine damage .

Fig. 46: Special Tool (11 4 430)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove remnants of oil and dirt from pocket holes (1).

**IMPORTANT: Work on sealing face on engine block and on cylinder head with special tool 11 4 470 only.
Do not use any metal-cutting tools.**

Fig. 47: Pocket Holes

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Rubber coating (2) on cylinder head gasket (3) must not under any circumstances be damaged (electrochemical corrosion).

Cylinder head gasket (3) is a sheet-metal gasket.

Fig. 48: Rubber Coating And Cylinder Head Gasket
 Courtesy of BMW OF NORTH AMERICA, INC.

Check adapter sleeves (1) for damage and firm seating.

Place cylinder head gasket (2) in direction of arrow on engine block.

Fig. 49: Cylinder Head Gasket And Adapter Sleeves
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check cylinder head for deviation from flatness, see 11 12 719 Resurfacing cylinder head sealing face (N52K).
 Check cylinder head for water leaks, see 11 12 729 Checking cylinder head for water leaks (N52K).

Assemble engine.

11 12 719 RESURFACING CYLINDER HEAD SEALING FACE (N52K)

Necessary preliminary tasks:

- Remove cylinder head, see 11 12 100 Removing and installing cylinder head (N52K).

- Remove exhaust camshaft, see [11 31 028 Removing and installing/replacing exhaust camshaft \(N52K\)](#).
- Remove intermediate lever on inlet side, see [11 37 010 Removing and installing/replacing intermediate levers \(N52K\)](#).

Check evenness of cylinder head sealing faces with a standard straight-edge (1).

NOTE: Max. deviation from level (longitudinal) 0.10 mm

Fig. 50: Standard Straight-Edge On Cylinder Head Sealing Faces
 Courtesy of BMW OF NORTH AMERICA, INC.

Check evenness of cylinder head sealing faces with a standard straight-edge (1).

NOTE: Max. deviation from level (transversal) 0.05 mm

Fig. 51: Standard Straight-Edge On Cylinder Head Sealing Faces
 Courtesy of BMW OF NORTH AMERICA, INC.

Check cylinder head for water leaks, see [11 12 729 Checking cylinder head for water leaks \(N52K\)](#).

Assemble engine.

11 12 729 CHECKING CYLINDER HEAD FOR WATER LEAKS (N52K)

Special tools required:

- 11 4 341
- 11 4 342
- 11 4 344
- 11 4 345

IMPORTANT: Pressure-test cylinder head to max. 3 bar.
Heat cylinder head to 60°.
Check for bubble formation in a water bath.

Necessary preliminary tasks:

- Remove cylinder head, see 11 12 100 Removing and installing cylinder head (N52K).
- Disassemble cylinder head, see 11 34 560 Replacing all valve stem seals (N52K).

NOTE: Observe mounting of special tool 11 4 341 on cylinder.

Secure special tool 11 4 341 with bolts 11 4 345 to 25 Nm.

Fig. 52: Cylinder Head

Courtesy of BMW OF NORTH AMERICA, INC.

Install special tool 11 4 341 with special tool 11 4 345 .

Installation:

Cylinder no. 1 is marked.

Fig. 53: Special Tool (11 4 341)
Courtesy of BMW OF NORTH AMERICA, INC.

Fit special tool 11 4 342 with bolts (1). Screw in knurled screw in direction of arrow.

Sealing flange must rest flat.

Fig. 54: Special Tool (11 4 342) With Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 344 with bolts (1).

NOTE: **Compressed air at valve max. 3 bar.**
 Heat cylinder head to 60°.
 Check for bubble formation in a water bath.

Fig. 55: Special Tool (11 4 344) With Bolts
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

13 OIL SUMP

11 13 000 REMOVING AND INSTALLING, SEALING OR REPLACING OIL SUMP (N52K)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail.

Risk of damage!

Necessary preliminary tasks:

- Lower front axle, see **31 11 506 LOWERING/RAISING FRONT AXLE CARRIER (X3)** or **31 11 506 LOWERING/RAISING FRONT AXLE CARRIER (UNIVERSAL LIFTER) (X5)**
- Remove front differential, see **31 50 001 REMOVING AND INSTALLING/REPLACING FRONT DIFFERENTIAL (X3)** or **31 50 001 REMOVING AND INSTALLING/REPLACING FRONT DIFFERENTIAL (X5)**.

Release screw (1) from grounding cable (2) on right bearing block (3).

Lay grounding cable (2) to one side.

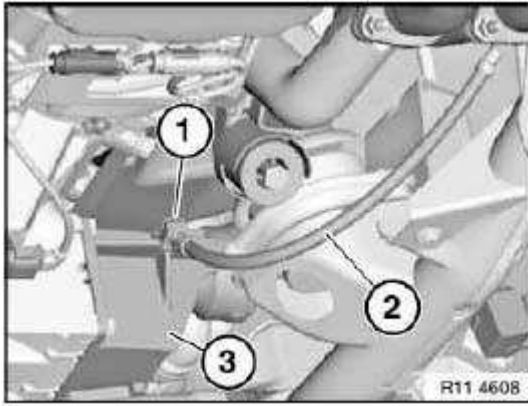

Fig. 56: Grounding Cable, Bearing Block And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Picture shows an E92 by way of example. Other model series may differ in certain details.

Unclip electric leads (2) of oxygen monitor sensors from holder (3).

Disconnect plug connections (1) of oxygen monitor sensors and lay to one side.

Release bolts (5) on transmission.

Tightening torque: 11 13 5AZ, see **11 13 OIL PAN** .

Disconnect plug connection (4) on oil level sensor.

Lay holder (3) to one side.

Fig. 57: Plug Connections, Holder, Electric Leads And Bolts
 Courtesy of BMW OF NORTH AMERICA, INC.

For vehicles with optional extra SA205 (automatic transmission):

NOTE: Transmission fluid cooler lines (2) (supply and return) are secured to the oil sump with two holders (3).

If necessary, release oil pump and lay to one side.

Unscrew nuts (1).

Tightening torque: 11 13 6AZ, see 11 13 OIL PAN .

Release holders (3) with transmission fluid cooler lines (2) from oil sump guides.

Fig. 58: Fluid Cooler Lines, Holders And Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

For all vehicles:

NOTE: For purposes of clarity, the picture shows the front axle carrier and stabilizer bar removed.

Unscrew nut (3).

Tightening torque: 11 13 7AZ, see 11 13 OIL PAN .

Release screw (2).

Tightening torque: 11 13 8AZ, see 11 13 OIL PAN .

Release both holders with coolant hose (1) from oil sump guide.

Fig. 59: Coolant Hose, Screw And Nut
 Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Bolts of oil sump have different lengths.
 Observe different tightening torques.**

Release bolts along line (1).

Tightening torque: 11 13 2AZ, see 11 13 OIL PAN .

Tightening torque: 11 13 3AZ, see 11 13 OIL PAN .

Installation:

Replace aluminum screws.

If necessary, remove oil level sensor (2) and right bearing block (3).

Fig. 60: Oil Level Sensor And Bearing Block
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: There must be no adhesive residues in the bedplate retaining threads.

Clean retaining threads.

Installation:

Replace all seals.

Assemble engine.

14 HOUSING COVER

11 14 005 REPLACING FRONT CRANKSHAFT RADIAL SEAL (N52K)

Special tools required:

- 11 9 221
- 11 9 222
- 11 9 223
- 11 9 224
- 11 9 231
- 11 9 232
- 11 9 233

Necessary preliminary tasks:

- Remove VIBRATION DAMPER

IMPORTANT: Do not release central bolt.

If the central bolt is released, the sprocket wheels of the timing chain and the oil pump will no longer be non - positively connected to the crankshaft. Inlet and exhaust camshafts can turn in relation to crankshaft.

Risk of damage!

Fig. 61: Central Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

Turn back special tool 11 9 222 .

Push special tool 11 9 221 onto crankshaft.

IMPORTANT: When screws are tightened down (special tool 11 9 224) , crankshaft radial seal is pressed inwards approx. 1 mm and thus slackened for subsequent removal.

Insert screws (special tool 11 9 224) and tighten down to approx. 20 Nm.

Fig. 62: Special Tools (11 9 221), (11 9 222) And (11 9 224)

Courtesy of BMW OF NORTH AMERICA, INC.

Insert screws (special tool 11 9 223) and screw in until they make contact without play.

IMPORTANT: Do not overload special tool 11 9 223 (metal screws).

Fig. 63: Special Tool (11 9 223)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove screws (special tool 11 9 224).

Fig. 64: Special Tool (11 9 224)
Courtesy of BMW OF NORTH AMERICA, INC.

Insert screw (special tool 11 9 222) carefully and slowly withdraw crankshaft radial seal (1).

Fig. 65: Special Tool (11 9 222)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean sealing surface (1) and degrease thoroughly in area of housing partition.

Apply a light coat of oil to running surface (2) of crankshaft radial seal.

Fig. 66: Sealing And Running Surface
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Support bushing (1) is contained in scope of delivery of crankshaft radial seal (2).
 When crankshaft radial seal (2) is installed, only support bushing (1) may be used as a slip bushing.

Crankshaft radial seal (2) has a groove on both left and right sides.

IMPORTANT: After installation, the grooves must be filled with sealing compound.

Fig. 67: Crankshaft Radial Seal And Support Bushing
 Courtesy of BMW OF NORTH AMERICA, INC.

Attach support bushing (2) with crankshaft radial seal (1).

Push on crankshaft radial seal (1) in direction of arrow.

Fig. 68: Pushing Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Pay attention to opening on crankshaft radial seal (1) on left and right.

Remove support bushing (2).

Fig. 69: Crankshaft Radial Seal And Support Bushing
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: The following text describes installation and sealing between the engine block and crankshaft radial seal.
The engine block will not be leakproof at the outside of the crankshaft radial seal if you fail to comply with the individual work steps and the work sequence.

NOTE: The required parts are available from the BMW Parts Service (EPC).

Remove screw caps (1) from injector (2).

Screw on metering needle.

Insert piston for pressing out.

Injector (2) contains the sealing compound Loctite, manufacturer's number 128357.

Bottle (3) contains the primer Loctite, manufacturer's number 171000.

Fig. 70: Screw Caps, Injector And Bottle
Courtesy of BMW OF NORTH AMERICA, INC.

Fit special tool 11 9 232 .

Coat both grooves on crankshaft radial shaft seal with Loctite primer, manufacturer's number 171000, and expose to air for approx. one minute.

Fig. 71: Special Tool (11 9 232)
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in crankshaft radial seal with special tool 11 9 231 in conjunction with special tool 11 9 233 until flush.

Fig. 72: Crankshaft Radial Seal And Support Bushing
Courtesy of BMW OF NORTH AMERICA, INC.

Before filling with sealing compound:

Moisten brush with Loctite primer, manufacturer's number 171000. Insert brush as far as possible into grooves (1) on crankshaft radial seal in order to coat housing partition on engine block.

Fig. 73: Grooves On Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Using injector (2), fill both grooves (3) flush with Loctite sealing compound, manufacturer's number 128357.

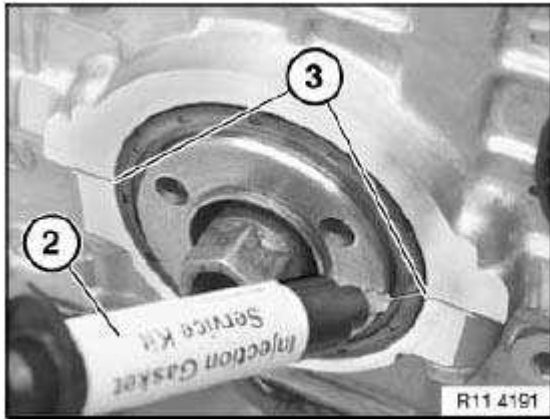

Fig. 74: Injector And Grooves On Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **Loctite primer, manufacturer's number 171000, binds the Loctite sealing compound, manufacturer's number 128357, and prevents leakage.**

Coat surface of sealing compound in both grooves (1) with Loctite primer, manufacturer's number 171000.

Fig. 75: Grooves On Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 14 010 REPLACING SEALING COVER FOR VACUUM PUMP (N52K)

Special tools required:

- 11 4 361
- 11 4 362
- 11 4 363
- 11 4 364

- 11 9 200

Necessary preliminary tasks:

- Remove fan cowl with electric fan
- Remove alternator drive belt
- Remove drive belt tensioner

NOTE: **The procedure is the same as for the crankshaft radial seal.
Expose removal openings on sealing cover.**

Fig. 76: Locating Openings On Sealing Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Convert special tool 11 9 200 (see illustration).

Screw special tool 11 9 200 onto sealing cover.

NOTE: **Insert screws until flush only with special tool 11 9 200 .**

Fig. 77: Special Tool (11 9 200)

Courtesy of BMW OF NORTH AMERICA, INC.

Screw in special tool 11 4 362 .

Fig. 78: Special Tool (11 4 362)

Courtesy of BMW OF NORTH AMERICA, INC.

Attach special tool 11 4 361 to bedplate construction screw connection (see arrow).

Secure with knurled screw (1).

Screw special tool 11 4 364 into special tool 11 9 200 and screw out in direction of arrow.

NOTE: For purposes of clarity, the picture shows the alternator and power steering pump removed.

Fig. 79: Special Tools (11 4 361), (11 4 364) And (11 9 200)

Courtesy of BMW OF NORTH AMERICA, INC.

Prepare new sealing cover (1) with special tool 11 9 200 **without** screws.

Screw in sealing cover with special tool 11 4 363 until it is flush.

Fig. 80: Special Tools (11 9 200) And (11 4 363)
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 14 151 REPLACING CRANKSHAFT RADIAL SEAL (TRANSMISSION SIDE) (N52K)

Special tools required:

- 11 9 181
- 11 9 182
- 11 9 183
- 11 9 184
- 11 9 200

Necessary preliminary tasks:

- Remove transmission
- Remove flywheel, see **11 22 500 Removing and installing/replacing flywheel (N52K)**

NOTE: Crankshaft radial seal has six removal openings for removal with special tool 11 9 200 .

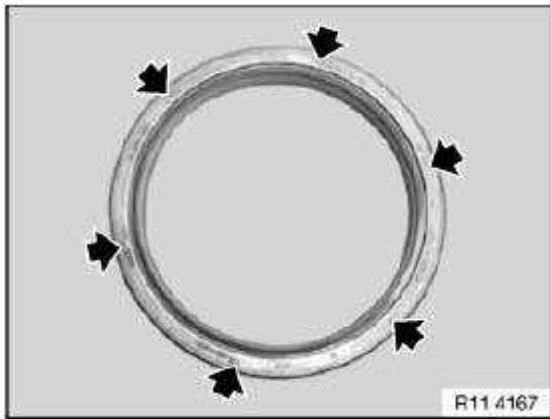

Fig. 81: Locating Openings On Sealing Cover

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: If necessary, remove rubber coating (1) on top side of crankshaft radial seal and expose a removal opening (2) (see illustration).

Fig. 82: Rubber Coating And Crankshaft Radial Seal Removal Opening

Courtesy of BMW OF NORTH AMERICA, INC.

Fit special tool 11 9 200 . Insert sheet metal screws into removal opening of crankshaft radial seal and fasten without play (do **not** overtighten sheet metal screws).

Screw in spindle (1) slowly and carefully and detach crankshaft radial seal.

Fig. 83: Special Tool (11 9 200)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean sealing surface (1) and degrease thoroughly in area of housing partition.

Apply a light coat of oil to running surface (2) of crankshaft radial seal.

Fig. 84: Sealing And Running Surface Of Crankshaft Radial Seal
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Support bushing (4) is contained in scope of delivery of crankshaft radial seal (1).
 When crankshaft radial seal (1) is installed, only support bushing (4) may be used as a slip bushing.
 Crankshaft radial seal (1) has a groove (2) on both left and right sides.

IMPORTANT: After installation, grooves (2) must be filled with sealing compound.

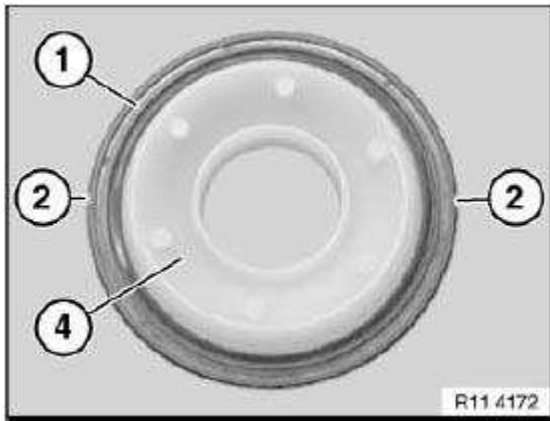

Fig. 85: Bushing, Crankshaft Radial Seal And Grooves
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: The following text describes installation and sealing between the engine block and crankshaft radial seal.
The engine block will not be leakproof at the outside of the crankshaft radial seal if you fail to comply with the individual work steps and the work sequence.

NOTE: The required parts are available from the BMW Parts Service (ETK).
Remove screw caps (1) from injector (2).

Screw on metering needle.

Insert piston for pressing out.

Injector (2) contains the sealing compound Loctite, manufacturer's number 128357.

Bottle (3) contains the primer Loctite, manufacturer's number 171000.

Fig. 86: Screw Caps, Injector And Bottle
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit support bushing (4) with crankshaft radial seal (1) on crankshaft.

Align groove (2) centrally to housing partition (3).

Coat both grooves (2) on crankshaft radial seal (1) with Loctite primer, manufacturer's number 171000, and expose to air for approx. one minute.

Push crankshaft radial seal (1) by hand as far as possible onto running surface.

Carefully remove support sleeve (4).

Fig. 87: Support Bushing, Crankshaft Radial Seal With Groove And Housing Partition
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Spacer ring (1) is supplied with radial shaft seal.

Screw special tool 11 9 182 with screws (special tool 11 9 184) to crankshaft.

Fit spacer ring (1) on preassembled radial shaft seal.

Fig. 88: Special Tools (11 9 184) And (11 9 182)
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in radial shaft seal and spacer ring with special tool 11 9 181 in conjunction with special tool 11 9 183 .
Then remove spacer ring again.

Fig. 89: Special Tools (11 9 181) And (11 9 183)
Courtesy of BMW OF NORTH AMERICA, INC.

Before filling with sealing compound:

Moisten brush with Loctite primer, manufacturer's number 171000. Insert brush as far as possible into grooves (1) on crankshaft radial seal in order to coat housing partition on engine block.

Fig. 90: Grooves On Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Using injector, fill both grooves (1) flush with Loctite sealing compound, manufacturer's number 128357.

Fig. 91: Grooves With Loctite Primer
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Loctite primer, manufacturer's number 171000, binds the Loctite sealing compound, manufacturer's number 128357, and prevents leakage. Coat surface of sealing compound in both grooves (1) with Loctite primer, manufacturer's number 171000.

Fig. 92: Grooves On Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

21 CRANKSHAFT WITH BEARING

11 21 500 REPLACING CRANKSHAFT (N52K)

Special tools required:

- **00 2 510 DIAL GAUGE WITH FEELER**
- **00 9 120 TORQUE ANGLE MEASURING DIAL**

- 11 4 370
- 11 4 440
- 11 4 470
- 11 9 360

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove engine
- Mount engine on assembly stand, see [Mounting engine on assembly stand \(N52K\)](#).
- Remove **VIBRATION DAMPER**
- Remove oil sump
- Remove oil pump, see [11 41 000 Removing and installing/replacing oil pump \(N52K\)](#)
- Remove oil pump/vacuum pump chain module, see [11 41 010 Removing and installing/replacing chain module for oil pump/vacuum pump \(N52K\)](#)
- Remove timing chain module, see [11 31 051 Replacing timing chain \(N52K\)](#)
- Remove cylinder head, see [11 12 100 Removing and installing cylinder head \(N52K\)](#).
- Remove flywheel, see [11 22 500 Removing and installing/replacing flywheel \(N52K\)](#)
- Removing all pistons, see [11 25 530 Removing and installing/replacing all pistons \(N52K\)](#)

Release screws (1).

Tightening torque: 11 13 6AZ, see [11 13 OIL PAN](#) .

Installation:

Replace aluminum screws.

Remove oil deflector (2).

NOTE: Picture shows the screw connection of the oil deflector (2) for vehicles with optional extra SA203 (all-wheel drive).

Fig. 93: Oil Deflector And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Tightening torque: 11 11 2AZ, see **11 11 CRANKCASE** .

Release screws (2).

Tightening torque: 11 11 3AZ, see **11 11 CRANKCASE** .

Installation:

Replace aluminum screws.

Fig. 94: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Tightening torque: 11 11 4AZ, see **11 11 CRANKCASE** .

Release screws (2).

Tightening torque: 11 11 2AZ, see 11 11 CRANKCASE .

Installation:

Replace aluminum screws.

Release steel screws (1 to 14) from outside inwards.

Tightening torque: 11 11 1AZ, see 11 11 CRANKCASE .

Fig. 95: Crankshaft Bolts Tightening Sequence
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Tightening torque: 11 11 3AZ, see 11 11 CRANKCASE .

Installation:

Replace aluminum screws.

Lift out bedplate.

Fig. 96: Bedplate Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Remove crankshaft (1) in direction of arrow.

**IMPORTANT: Remove crankshaft with aid of a second person.
Weight of crankshaft approx. 25 kg.**

Remove bearing shells (2) and guide bearing shell (3), replace if necessary, see **11 21 531 Replacing all main crankshaft bearing shells (N52K)**.

Clean all sealing faces with special tool 11 4 470 .

Fig. 97: Bearing Shells

Courtesy of BMW OF NORTH AMERICA, INC.

Check adapter sleeves (1) for damage and secure seating; replace if necessary.

Install all bearing shells, see **11 21 531 Replacing all main crankshaft bearing shells (N52K)**.

Installation:

Lubricate all bearing points with engine oil.

NOTE: Picture shows N46.

Fig. 98: Adapter Sleeves

Courtesy of BMW OF NORTH AMERICA, INC.

Insert crankshaft (1).

IMPORTANT: Install crankshaft with aid of a second person.
Weight of crankshaft approx. 25 kg.

Fig. 99: Crankshaft

Courtesy of BMW OF NORTH AMERICA, INC.

Tighten steel screws (1 to 14) from inside outwards.

Tightening torque: 11 11 1AZ, see **11 11 CRANKCASE** .

Tighten screws (2) from inside outwards.

Tightening torque: 11 11 2AZ, see 11 11 CRANKCASE .

Tighten screws (1).

Tightening torque: 11 11 4AZ, see 11 11 CRANKCASE .

Installation:

Replace aluminum screws.

Fig. 100: Crankshaft Bolts Tightening Sequence
Courtesy of BMW OF NORTH AMERICA, INC.

Tighten aluminum screws exclusively with special tool 00 9 120 .

IMPORTANT: In the case of aluminum screws, jointing torque and angle of rotation must be observed without fail.

Fig. 101: Special Tool (00 9 120)
Courtesy of BMW OF NORTH AMERICA, INC.

Set up stand with magnetic foot (1) on special tool 11 4 440 .

Set up special tool 00 2 510 on stand.

Position special tool 00 2 510 on crankshaft.

Move crankshaft in direction of arrow.

Determine bearing play .

Fig. 102: Moving Crankshaft

Courtesy of BMW OF NORTH AMERICA, INC.

Drive in both nozzles (1) with special tool 11 9 360 on left and right into crankcase.

Installation:

Always replace nozzles (1).

Fig. 103: Nozzles With Special Tool (11 9 360)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Prepare sealing compound (1) in special tool 11 4 370 .

Screw on nozzle (2) for injecting sealing compound.

Slowly insert sealing compound (1) with special tool 11 4 370 in direction of arrow.

Fig. 104: Inserting Sealing Compound With Special Tool (11 4 370)
Courtesy of BMW OF NORTH AMERICA, INC.

Replace crankshaft radial seal at front, see **11 14 005 Replacing front crankshaft radial seal (N52K)**.

Replace crankshaft radial seal (transmission side), see **11 14 151 Replacing crankshaft radial seal (transmission side) (N52K)**.

Assemble engine.

11 21 505 SEALING THE CRANKCASE'S LOWER PART (N52K)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are **released**.

Aluminum screws/bolts are permitted with and without color coding (blue).

For reliable identification:

Aluminum screws/bolts are **not magnetic**.

Risk of damage!

Joining torque and angle of rotation must be observed without fail.

IMPORTANT: Changed procedure.

It is not necessary to remove the cylinder head and the crankshaft.

Necessary preliminary tasks

- Remove ENGINE.
- .
- Remove CLUTCH (if fitted). See **21 21 500 REMOVING AND INSTALLING/REPLACING CLUTCH (SAC) (X3)**
- Remove left and right engine support arm
- Remove **OIL SUMP**.

Release screws (1).

Pull out oil pump intake pipe (2).

Tightening torque: 11 13

Fig. 105: Removing Intake Pipe

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Tightening torque, see 11 13 6AZ in **11 13 OIL PAN** .

Installation:

Replace aluminum screws

Remove oil deflector (2).

Fig. 106: Identifying Screws And Oil Deflector
 Courtesy of BMW OF NORTH AMERICA, INC.

Secure oil pump sprocket with steel pin 6.0 mm (3) to oil pump.

**IMPORTANT: Release central bolt (2) only together with steel pin 6.0 mm (3).
 Do not remove sprocket.**

Release central bolt (2).

Tightening torque, see 11 41 6AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Fig. 107: Identifying Oil Deflector And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws (2).

Tightening torque: see 11 41 5AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws

Fig. 108: Identifying Bolt And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Remove screw plug (1) from crankcase at front.

NOTE: **Replace gasket.**

Fig. 109: Identifying Screw Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) for oil pump triangular drive with special tool **11 8 640** .

NOTE: **It is not necessary to remove the triangular drive.**

Fig. 110: Identifying Oil Pump Triangular Drive Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Version 1

IMPORTANT: Observe different screw lengths.

Release screws (1).

Tightening torque, see 11 41 2AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Tightening torque, see 11 41 3AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws

Fig. 111: Identifying Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Version 2

IMPORTANT: Observe different screw lengths.

Release oil pump screws (1).

Tightening torque, see 11 41 2AZ in 11 41 OIL PUMP WITH STRAINER AND DRIVE .

Installation:

Replace aluminum screws

Fig. 112: Identifying Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Detach sprocket (1) in direction of arrow.

NOTE: The chain tensioner pushes the timing chain (3) of the triangular drive upward.

Do **not** remove camshaft sprocket.

Remove oil pump (2) in direction of arrow.

Fig. 113: Pulling Drive Gear
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation

Check spacer bushings (1) for secure seating and damage; replace if necessary.

Align twin surface (3) on oil pump (2) to sprocket wheel.

Install oil pump (2).

Fig. 114: Identifying Spacer Bushings And Oil Pump
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The special tool bore for the TDC position is located on the inlet side underneath the starter motor.

Rotate engine at central bolt and secure flywheel in position with special tool 11 0 300.

Fig. 115: Securing Crankshaft

Courtesy of BMW OF NORTH AMERICA, INC.

Secure flywheel with special tool (1)

11 9 260 and special tool (2) 11 9 266.

Tightening torque

NOTE: Make sure that the special tool (1) completely engages in the flywheel teeth (see arrow)

Fig. 116: Securing Flywheel Using Special Tool 11 9 260/11 9 266

Courtesy of BMW OF NORTH AMERICA, INC.

Automatic transmission

Release flywheel bolts (1).

Release special tool (2).

Remove flywheel (3).

Fig. 117: Identifying Flywheel With Bolts And Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Manual gearbox

IMPORTANT: Position crankshaft at TDC.

Remove dual-mass flywheel.

Secure flywheel with special tool 11 9 260.

Remove VIBRATION DAMPER .

Release flywheel bolts with special tool 11 4 180.

Fig. 118: Removing Flywheel Bolts Using Special Tool 11 4 180
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 119: Identifying Crankshaft Bolt Mounting Area
Courtesy of BMW OF NORTH AMERICA, INC.

Release all crankcase bolts (1) along line (2).

Fig. 120: Identifying Crankshaft Bolt Releasing Sequence
Courtesy of BMW OF NORTH AMERICA, INC.

Release crankcase bolts M10 in sequence 14 to 1.

Release crankcase lower section (1) from crankcase upper section (2) with suitable tool (3)

Remove crankcase lower section (1) upwards.

IMPORTANT: Do not rotate crankshaft without crankcase lower section (1) (risk of damage).

Fig. 121: Removing Crankshaft (Lower Section And Upper Section) Using Tool
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Timing chain is pre-tensioned.
Do not raise crankshaft.**

Carefully remove radial shaft seal (1).

Catch escaping engine oil with a cloth (2).

Fig. 122: Removing Radial Shaft Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Carefully remove radial shaft seal (1) towards front.

Catch escaping engine oil with a cloth (2).

Fig. 123: Catching Escaping Engine Oil Using Cloth
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Protect crankcase against sealant residues with a cloth (1).

Fig. 124: Protecting Crankcase Against Sealant Residues Using Cloth
Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealant residues (1) with special tool 11 4 470.

Remove injector nozzles (2) for liquid sealing compound on left and right.

Installation:

Replace injector nozzles (2).

Clean all threads with compressed air.

Fig. 125: Identifying Injector Nozzle And Sealant Residue
Courtesy of BMW OF NORTH AMERICA, INC.

Position crankcase lower section (1) on crankcase upper section.

Screw in all M10 crankcase bolts.

Joint all M10 crankcase bolts (1) to 20 Nm from inside outwards.

Fig. 126: Screwing In All M10 Crankcase Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

Identify all M10 crankcase bolts with a colored marking (1) for checking.

Fig. 127: Identify M10 Crankcase Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 128: Identifying Crankcase Bolts Tightening Sequence
Courtesy of BMW OF NORTH AMERICA, INC.

Secure crankcase bolts M10 in sequence 1 to 14 with special tool 00 9 120.

Tightening torque 11 11 1AZ, see **11 11 CRANKCASE**

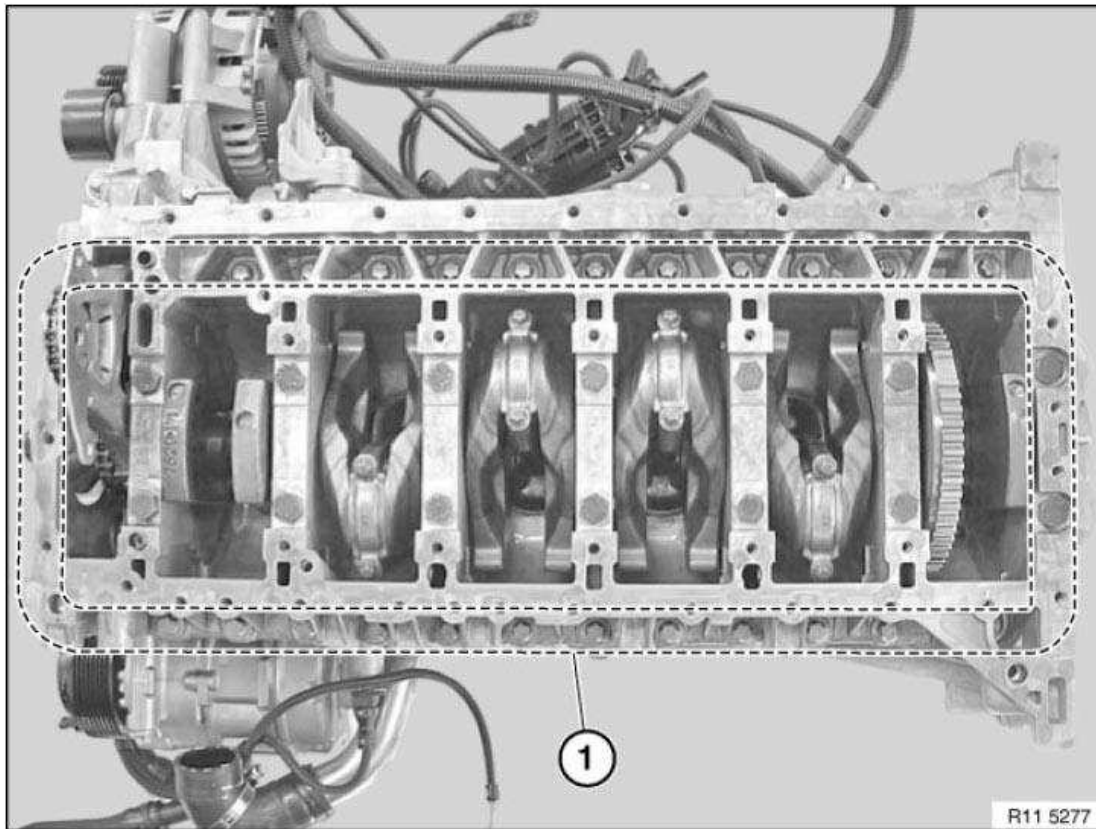

Fig. 129: Identifying Crankcase Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

Insert all crankcase bolts (1).

IMPORTANT: Observe different lengths and sizes of the bolts.

Tightening torque 11 11 2, 3 and 4AZ, see 11 11 CRANKCASE

Tighten screw (1) for oil pump triangular drive with special tool 11 8 640 .

NOTE: Replace screw.

Tightening torque, see 11 41 4 AZ in 11 41 OIL PUMP WITH STRAINER AND DRIVE .

Fig. 130: Identifying Oil Pump Triangular Drive Mounting Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Tighten screw plug on front of crankcase.

Tightening torque, see 11 11 8 AZ in **11 11 CRANKCASE** .

Installation:

Replace sealing ring.

Fig. 131: Identifying Screw Plug On Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

Prepare radial shaft seal (1) on special tool 11 8 220.

Fig. 132: Identifying Radial Shaft Seal On Special Tool 11 8 220
Courtesy of BMW OF NORTH AMERICA, INC.

Position radial shaft seal (1) with special tool 11 8 220 on the crankshaft.

Fig. 133: Positioning Radial Shaft Seal Using Special Tool 11 8 220 On Crankshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Brush radial shaft seal (1) over the special tool 11 8 220.

Move radial shaft seal (1) parallel up against the crankcase.

Fig. 134: Moving Radial Shaft Seal Parallel Up Against Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

Screw special tool 11 9 182 with screws (special tool 11 9 184) to crankshaft.

Fig. 135: Screwing Special Tool 11 9 182 With Screws (Special Tool 11 9 184) To Crankshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Prepare special tool 11 9 181 for installation. Connect special tool 11 9 185 onto special tool 11 8 181.

Fig. 136: Connecting Special Tool 11 9 185 Onto Special Tool 11 8 181
Courtesy of BMW OF NORTH AMERICA, INC.

Pull on radial shaft seal with special tool 11 9 181 and 11 9 185 in combination with special tool 11 9 183.

Fig. 137: Pulling Radial Shaft Seal Using Special Tool 11 9 181/11 9 185/11 9 183
Courtesy of BMW OF NORTH AMERICA, INC.

Screw on radial shaft seal with special tool 11 9 183 to limit position.

Fig. 138: Screwing On Radial Shaft Seal Using Special Tool 11 9 183
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean sealing surface (1) and degrease thoroughly in area of housing partition.

Apply a light coat of oil to running surface (2) of radial seal.

NOTE: **Graphic N42.**

Fig. 139: Identifying Sealing Surface And Running Surface For Crankshaft Radial Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Push radial shaft seal (1) 11 9 235 carefully in direction of arrow on the special tool.

Fig. 140: Pushing Radial Shaft Seal (11 9 235) On Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: 11 9 235 Special tool can only be fastened with
2 opposite bolts.
Determine hole pattern on special tool.

Fig. 141: Mounting Special Tool 11 9 235 With Special Tool 11 9 234 On Crankshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Screw special tool 11 9 235 with special tool 11 9 234 on crankshaft.

Align groove (2) of radial shaft seal (1) centered to the housing partition (3).

IMPORTANT: After installation, the grooves must be filled with sealing compound.

Fig. 142: Identifying Radial Shaft Seal , Housing Partition And Groove
Courtesy of BMW OF NORTH AMERICA, INC.

Draw in radial seal with special tool 11 9 231 in conjunction with special tool 11 9 233 until flush.

Fig. 143: Inserting Radial Seal With Special Tool 11 9 231 And 11 9 233
Courtesy of BMW OF NORTH AMERICA, INC.

Drive both injector nozzles (1) on left and right with special tool 11 9 360 into crankcase up to stop.

Fig. 144: Inserting Nozzles Using Special Tool 11 9 360
Courtesy of BMW OF NORTH AMERICA, INC.

After fitting both sealing rings, check both sealing ducts for clearance.

Blow compressed air (1) at max. 6 bar into injector nozzle (2).

Compressed air must emerge at both sealing rings on left and right from the outlet bores.

IMPORTANT: If the compressed air does not flow out of all ducts. the crankcase must again be taken apart and cleaned.

Fig. 145: Blowing Compressed Air Into Injector Nozzle
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Use PRIMER 1.3 AND LIQUID SEAL 1.4.

Prepare liquid sealing compound (1) in special tool 11 4 370.

Injector nozzles for injecting sealing compound are not required.

Fig. 146: Identifying Injector With Primer Bottle
Courtesy of BMW OF NORTH AMERICA, INC.

Slowly insert liquid sealing compound (1) with special tool 11 4 370 in direction of arrow.

Liquid sealing compound must emerge at radial shaft seals at front and rear.

Fig. 147: Inserting Liquid Sealing Compound Using Special Tool 11 4 370
Courtesy of BMW OF NORTH AMERICA, INC.

Stop (seal off) escaping liquid gasket with primer 1.3.

Fig. 148: Coating Surface Of Sealing Compound In Both Grooves Using Loctite Primer
Courtesy of BMW OF NORTH AMERICA, INC.

Stop (seal off) escaping liquid gasket with primer 1.3.

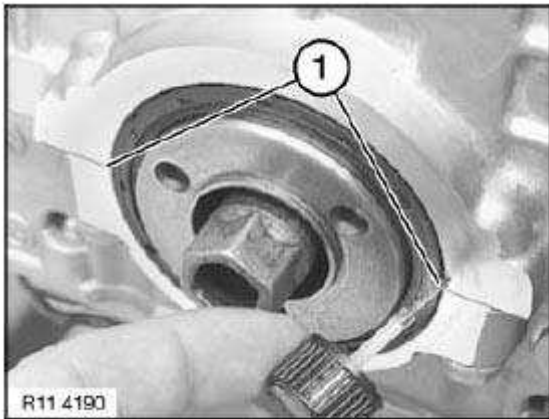

Fig. 149: Sealing Escaping Liquid Gasket With Primer
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 21 531 REPLACING ALL MAIN CRANKSHAFT BEARING SHELLS (N52K)

Special tools required:

- **00 2 590 PLASTIGAGE (5)**
- 11 4 251
- 11 4 252
- 11 4 470

IMPORTANT: Aluminium-magnesium materials.
No steel screws/bolts may be used due to the threat of electrochemical

corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively. Aluminum screws/bolts must be replaced each time they are released . The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove crankshaft, see **11 21 500 Replacing crankshaft (N52K)**

Checking position of oil spray nozzles:

Insert special tool 11 4 251 in screw connection of main bearing.

NOTE: Special tool 11 4 252 must be pre-installed at the seventh main bearing.

Check position of oil spray nozzle (2) according to position (1) on special tool 11 4 251 .

If necessary, adjust and secure oil spray nozzle (2).

Tightening torque: 11 11 5AZ, see **11 11 CRANKCASE** .

Fig. 150: Oil Spray Nozzle, Special Tools (11 4 251) And (11 4 252)
Courtesy of BMW OF NORTH AMERICA, INC.

Remove bearing shells (2) and guide bearing shell (3).

NOTE: Guide bearing shell (3) is a thrust bearing. Observe bearing classification.

Fig. 151: Bearing Shells
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Bearing shell (1) with lubricant groove must be fitted in crankcase.

Bearing shell (2) without lubricant groove must be fitted in bedplate.

Fig. 152: Bearing Shells
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: It is not possible to remachine the crankshaft.

Surface (1) for marking.

Seven-digit part number (2).

Bearing classification (3) on bedplate (see table: values of 1/2/3).

Fig. 153: Bearing Classification On Bedplate
 Courtesy of BMW OF NORTH AMERICA, INC.

Bearing classification (1) on crankcase (see table: values of A/B/C).

Installation:

When all the letters and number code have been determined, the color of the bearing shells must be allocated (see table).

IMPORTANT: Excessively small bearing play will result in engine damage.
The color combination Yellow and Red must not be fitted.
Possible color combinations (see table).

Fig. 154: Bearing Classification On Crankcase
 Courtesy of BMW OF NORTH AMERICA, INC.

BEARING SHELL COLOR COMBINATIONS SPECIFICATION

(A1) Bedplate / Yellow	(B1) Bedplate / Yellow	(C1) Bedplate / Green
(A1) Crankcase / Yellow	(B1) Crankcase / Green	(C1) Crankcase / Green
(A2) Bedplate / Green	(B2) Bedplate / Green	(C2) Bedplate / Green

(A2) Crankcase / Yellow	(B2) Crankcase / Green	(C2) Crankcase / Red
(A3) Bedplate / Green	(B3) Bedplate / Red	(C3) Bedplate / Red
(A3) Crankcase / Green	(B3) Crankcase / Green	(C3) Crankcase / Red

Install bearing shells (2) and guide bearing shell (3).

Installation:

Clean all sealing surfaces.

IMPORTANT: Do not use any metal-cutting tools.

Clean sealing faces with special tool 11 4 470 only.

Determine bearing play with special tool 00 2 590 .

Installation:

All measuring points must be clean and free from oil and grease. If necessary, clean all measuring points.

Fig. 155: Bearing Shells

Courtesy of BMW OF NORTH AMERICA, INC.

Use the existing screws to determine the bearing play.

Set up bedplate with bearing shells, see **11 21 500 Replacing crankshaft (N52K)**.

Remove bedplate.

Read off bearing play at width of flattened plastic thread and measurement scale.

Installation:

Remove plastic thread.

Apply a light coat of oil to bearing shells and crankshaft.

Fig. 156: Reading Bearing Play At Width Of Flattened Plastic Thread And Measurement Scale
Courtesy of BMW OF NORTH AMERICA, INC.

Install bedplate **11 21 500 Replacing crankshaft (N52K)**.

Assemble engine.

11 21 571 REPLACING ROLLER BALL BEARING IN CRANKSHAFT (N52K)

Necessary preliminary tasks

- Remove clutch.

Remove guide bearing with special tool 11 2 340.

Fig. 157: Removing Guide Bearing Using Special Tool 11 2 340
Courtesy of BMW OF NORTH AMERICA, INC.

Install new thrust bearing and drive firmly home with special tool 11 2 350 in conjunction with special tool 00 5 500.

Fig. 158: Installing New Thrust Bearing Using Special Tool 11 2 350 And 00 5 500
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

22 FLYWHEEL

11 22 500 REMOVING AND INSTALLING/REPLACING FLYWHEEL (N52K)

Special tools required:

- 11 4 180
- 11 9 260
- 11 9 265

**IMPORTANT: Aluminum screws/bolts must be replaced each time they are released .
The end faces of aluminum screws/bolts are painted blue for the purposes of
reliable identification.
Jointing torque and angle of rotation must be observed without fail (risk of
damage) .**

Necessary preliminary tasks:

- Remove transmission
- Remove clutch, see **21 21 500 REMOVING AND INSTALLING/REPLACING CLUTCH (SAC)
(X3)** or .

For vehicles with optional extra SA205 (automatic transmission):

Secure flywheel (1) with existing transmission bolt (2) and special tool 11 9 260 .

Installation:

Replace aluminum screws.

Unfasten flywheel screws.

Tightening torque: 11 22 1AZ, see **11 22 FLYWHEEL** .

Installation:

Flywheel (1) is secured with an alignment pin.

Fit new flywheel screws.

Clean all threads for flywheel screws in crankshaft.

Fig. 159: Special Tool (11 9 260), Flywheel And Transmission Bolt
Courtesy of BMW OF NORTH AMERICA, INC.

For vehicles without optional extra SA205 (automatic transmission):

Secure flywheel with existing transmission bolt (1) and special tools 11 9 260 and 11 9 265 .

Installation:

Replace aluminum screws.

Release flywheel screws with special tool 11 4 180 .

Tightening torque: 11 22 2AZ, see **11 22 FLYWHEEL** .

Installation:

Flywheel is secured with a dowel pin.

Fit new flywheel screws.

Clean all threads for flywheel screws in crankshaft.

Assemble engine.

Fig. 160: Special Tools (11 9 260), (11 9 265) And (11 4 180)
 Courtesy of BMW OF NORTH AMERICA, INC.

11 22 513 REPLACING ROLLER BEARING FOR DUAL-MASS FLYWHEEL

Special tools required:

- 21 2 051
- 21 2 052

NOTE: Flywheel removed!

Using hydraulic press (1) and special tool 21 2 051 , press out dual-mass flywheel downwards on engine side.

IMPORTANT: Risk of damage:
 Roller bearing must not be driven out.

Fig. 161: Hydraulic Press And Special Tool (21 2 051)
 Courtesy of BMW OF NORTH AMERICA, INC.

Push roller bearing (2) onto special tool 21 2 052 .

Using hydraulic press (1), press roller bearing into dual-mass flywheel as far as it will go on clutch side.

IMPORTANT: Risk of damage:

Observe press-in instruction:

- Roller bearing must not be driven in.
- Roller bearing mounting force/travel monitored:

Min. 2000N 1 mm before end of pressing in.

Max. 15000N during entire press-in procedure.

Fig. 162: Hydraulic Press, Roller Bearing And Special Tool (21 2 052)
Courtesy of BMW OF NORTH AMERICA, INC.

1123 VIBRATION DAMPER

11 23 010 REMOVING AND INSTALLING/REPLACING VIBRATION DAMPER (N52K)

Necessary preliminary tasks

- Remove underbody protection **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT ASSEMBLY UNDERSIDE PROTECTION (X5)** or **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION (X3)** .
- Remove alternator drive belt.

Release screws (1).

Tightening torque, see **23 VIBRATION DAMPER** .

Remove vibration damper (2).

Fig. 163: Identifying Screws And Vibration Damper
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

24 CONNECTING ROD WITH BEARING

11 24 571 REPLACING ALL CONNECTING ROD BEARING SHELLS (N52K)

Special tools required:

- **00 2 590 PLASTIGAGE (5)**
- **00 9 120 TORQUE ANGLE MEASURING DIAL**

IMPORTANT: All crank pins are connected with the crankshaft.

Modified procedure: The colors of the connecting rod bearing shells are the same at the top and bottom.

The Blue / Red connecting rod bearing shell colors are no longer fitted in combination.

Necessary preliminary tasks:

- Remove oil sump

IMPORTANT: All crankshaft crank pins are classified.

Possible classifications per connecting rod at top and bottom:

r: Red

b: Blue

Only **one** color may be fitted per big end bearing cap and connecting rod.

In direction of arrow from (1 to 2) crank pin (1 to 6).

Example:

Possible classification: rbbrrb

Fig. 164: Connecting Rod Classifications
Courtesy of BMW OF NORTH AMERICA, INC.

Cylinder Classification Red / Red

1. Cylinder Classification Blue / Blue
2. Cylinder Classification Blue / Blue
3. Cylinder Classification Red / Red
4. Cylinder Classification Red / Red
5. Cylinder Classification Blue / Blue

Release conrod bolts (1).

Remove connecting rod bearing cap (2).

Fig. 165: Conrod Bolts And Connecting Rod Bearing Cap
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage to cylinder wall and to crankshaft.

Gently release connecting rod from crankshaft.

Remove connecting rod bearing shells (1 and 2).

Install new conrod bearing shells.

Installation:

Pay attention to guide lugs during installation.

IMPORTANT: All crankshaft crank pins are classified.

Fig. 166: Connecting Rod Bearing Shells
Courtesy of BMW OF NORTH AMERICA, INC.

In each case insert only one color of connecting rod bearing shell (1 and 2) for each connecting rod.

Check conrod bearing clearance.

Piston in BDC position.

To determine the connecting rod bearing play, make sure that the bearing points are clean and free from oil and grease.

Fit special tool 00 2 590 (Plastigage Type PG 1) to the oil-free crankshaft.

Fit conrod bearing cap so that pairing letters match up.

Fig. 167: Locating Conrod Bearing Clearance
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not distort conrods or crankshaft.

Use the old conrod bolts to check conrod clearance.

Tighten down conrod bolts with special tool 00 9 120 .

Tightening torque: 11 24 1AZ, see **11 24 CONNECTING RODS AND BEARINGS** .

Fig. 168: Special Tool (00 9 120)
 Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew conrod bearing cover. Read off conrod bearing play at width of flattened plastic thread on measurement scale.

Conrod bearing clearance, see **11 24 CONNECTING RODS AND BEARINGS N52K B25** .

- Remove Plastigage
- Coat crankshaft and connecting rod bearing shells with oil

- Install new conrod bolts and tighten down with special tool 00 9 120 .

Tightening torque: 11 24 1AZ, see **11 24 CONNECTING RODS AND BEARINGS** .

Fig. 169: Reading Conrod Bearing Play At Width Of Flattened Plastic Thread On Measurement Scale
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

25 PISTON WITH RINGS AND PIN

11 25 530 REMOVING AND INSTALLING/REPLACING ALL PISTONS (N52K)

Special tools required:

- **00 9 120 TORQUE ANGLE MEASURING DIAL**
- 11 4 491
- 11 4 492
- 11 4 493
- 11 4 494
- 11 6 241
- 11 6 261
- 11 8 330

WARNING: Danger of injury!

Carry out work on piston pin circlip wearing protective goggles only.

IMPORTANT: If piston, connecting rod, big end bearing cap and connecting rod bearing shell are to be reused, they must be installed in the same position.
 Individual replacement of a connecting rod is not permitted. Connecting rods

are classified by weight categories and are only available as a set for all cylinders.

Connecting rod and big end bearing cap are marked with identical pairing letters and must not be mixed up.

Danger of engine damage!

Piston and piston pins are paired and must not be fitted individually.

Necessary preliminary tasks:

- Remove engine
- Mount engine on assembly stand, see **Mounting engine on assembly stand (N52K)**.
- Remove intake air manifold
- Remove cylinder head, see **11 12 100 Removing and installing cylinder head (N52K)**.
- Remove oil sump
- Remove oil pump, see **11 41 000 Removing and installing/replacing oil pump (N52K)**

NOTE: Carefully remove heavy oil carbon residues from the cylinder wall (arrow).

IMPORTANT: Do not use any metal-cutting tools.

Fig. 170: Locating Cylinder Wall

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Oil spray nozzle (2) must not be maladjusted or bent.
Risk of damage!

Do **not** release screw (1) of oil spray nozzle (2).

If necessary, readjust oil spray nozzle (2), see **11 21 531 Replacing all main crankshaft bearing shells (N52K)**.

Fig. 171: Spray Nozzle And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Release conrod bolts (1).

Tightening torque: 11 24 1AZ, see **11 24 CONNECTING RODS AND BEARINGS** .

Installation:

Replace screws.

Remove conrod bearing cap (2) in direction of arrow.

IMPORTANT: Connecting rod and big end bearing cap (2) are marked with identical pairing letters and must not be mixed up.

Danger of engine damage!

Fig. 172: Removing Conrod Bearing Cap
 Courtesy of BMW OF NORTH AMERICA, INC.

Attach special tool 11 8 330 to connecting rod.

Press out connecting rod and piston with special tool 11 8 330 to cylinder head side.

NOTE: Special tool 11 8 330 simultaneously serves to prevent connecting rod and piston from falling down.

IMPORTANT: Do not touch the oil spray nozzle when removing the components.
Risk of damage!

Fig. 173: Special Tool (11 8 330)
Courtesy of BMW OF NORTH AMERICA, INC.

Preliminary work:

Clamp special tool 11 4 491 in vice.

Secure piston (1) with connecting rod to special tool 11 4 491 .

Fig. 174: Securing Piston With Connecting Rod To Special Tool (11 4 491)
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Danger of injury!

Carry out work on piston pin circlip wearing protective goggles only.

WARNING: Protective goggles must be worn.

Lever out piston pin circlip with special tool 11 4 492 in direction of arrow.

Fig. 175: Removing Piston Pin Circlip With Special Tool (11 4 492)
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, replace connecting rods.

IMPORTANT: Individual replacement of a connecting rod is not permitted. Connecting rods are classified by weight categories and are only available as a set for all cylinders. Existing and new connecting rods must not be installed in mixed combinations.

Installation:

It must be possible for the piston pin to be pressed with minimal force by hand through the small end bushing. There must be no noticeable play.

Fig. 176: Installing Piston Pin Into Small End Bushing
Courtesy of BMW OF NORTH AMERICA, INC.

Measure piston installation clearance:

Measure piston diameter with micrometer at measuring point "A" from lower edge of piston and offset by 90° to piston pin axis.

Piston diameter at measuring point "A", see **11 25 PISTONS WITH RINGS AND PINS N52K B25** .

Fig. 177: Measuring Piston Diameter
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust micrometer to cylinder bore of crankcase. Set internal caliper on micrometer to "zero". Measure bottom, center and top of cylinder bore in direction of travel and direction of engine rotation.

Diameter of cylinder bore.

Piston installation clearance.

Total permissible wear tolerance, see **11 25 PISTONS WITH RINGS AND PINS N52K B25**

If necessary, replace piston.

Fig. 178: Measuring Diameter Of Cylinder Bore
 Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Protective goggles must be worn.

Insert piston pin circlip (2) into groove (1) of special tool 11 4 493 .

Move piston pin circlip (2) into installation position.

Fig. 179: Piston Pin Circlip And Groove
 Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Protective goggles must be worn.

Guide lug and cutout on special tool 11 4 493 must point to piston crown. Only then can special tool 11 4 494 be correctly fitted.

When special tools 11 4 493 and 11 4 494 are correctly positioned, the piston pin circlip must be driven in with a plastic hammer in the direction of the arrow.

Fig. 180: Installing Piston Pin Circlip

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For vehicles with B30 engines.

Install all piston rings, see **11 25 671 Replacing piston rings on all pistons (N52K)**.

Install all connecting rod bearing shells, see **11 24 571 Replacing all connecting rod bearing shells (N52K)**.

Coat piston (2) and piston rings with oil.

Pre-install piston (2) in special tool 11 6 261 .

Attach special tool 11 8 330 to connecting rod (1).

Installation:

Check protective lugs on special tool 11 8 330 for correct position and damage.

Fig. 181: Connecting Rod, Piston And Special Tools (11 8 330) And (11 6 261)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For vehicles with B25 engines.

Install all piston rings, see **11 25 671 Replacing piston rings on all pistons (N52K).**

Install all connecting rod bearing shells, see **11 24 571 Replacing all connecting rod bearing shells (N52K).**

Coat piston (2) and piston rings with oil.

Pre-install piston (2) in special tool 11 6 241 .

Attach special tool 11 8 330 to connecting rod (1).

Installation:

Check protective lugs on special tool 11 8 330 for correct position and damage.

Fig. 182: Connecting Rod, Piston And Special Tools (11 8 330) And (11 6 241)
Courtesy of BMW OF NORTH AMERICA, INC.

Insert piston (1) with connecting rod in cylinder.

IMPORTANT: Do not touch the oil spray nozzle when installing the components.
Risk of damage!
Danger of piston ring failure.

Press in piston (1) at marked points (see arrows) with finger pressure only, do not drive in.

Insert piston (1) so that arrow (2) on piston crown points to camshaft drive.

Press in piston (1) with special tools 11 6 261 / 11 6 241 .

Fig. 183: Pressing Piston With Special Tools (11 6 261)
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Connecting rod and big end bearing cap are marked with identical pairing letters (1) and must not be mixed up. Mixing them up or incorrectly fitting the big end bearing cap on the connecting rod will result in engine damage .

Fig. 184: Connecting Rod Identical Pairing Letters
Courtesy of BMW OF NORTH AMERICA, INC.

Apply a light coat of oil to connecting rod bearing journal. Join connecting rod and connecting rod bearing journal.

Detach special tool 11 8 330 .

Fig. 185: Special Tool (11 8 330)
Courtesy of BMW OF NORTH AMERICA, INC.

Fit conrod bearing caps (2) so that pairing letters match up.

Installation:

Replace screws.

Install new conrod bolts (1).

**IMPORTANT: Jointing torque and angle of rotation must be observed without fail.
Risk of damage!**

Tightening torque: 11 24 1AZ, see **11 24 CONNECTING RODS AND BEARINGS** .

Fig. 186: Conrod Bolts And Connecting Rod Bearing Cap
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, tighten connecting rod bolts to torsion angle with special tool 00 9 120 .

Tightening torque: 11 24 1AZ, see **11 24 CONNECTING RODS AND BEARINGS** .

Fig. 187: Special Tool (00 9 120)

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 25 671 REPLACING PISTON RINGS ON ALL PISTONS (N52K)

Necessary preliminary tasks:

- Removing all pistons, see **11 25 530 Removing and installing/replacing all pistons (N52K)**

Measuring axial clearance of piston rings in piston ring groove.

Technical Data.

NOTE: It is not possible to measure the axial clearance of the U-flex rings.

Fig. 188: Measuring Axial Clearance Of Piston Rings In Piston Ring Groove

Courtesy of BMW OF NORTH AMERICA, INC.

Remove plain compression ring and stepped ring upwards with piston ring pliers.

The U-flex ring comprises two steel band rings and a support spring.

NOTE: **The U-flex ring cannot be removed with piston ring pliers.
Put aside all piston rings in correct sequence and installation position.
It might not be possible to find the identification on used piston rings.**

Installation:

New pistons may only be installed together with new piston rings.

Fig. 189: Removing Plain Compression Ring And Stepped Ring With Piston Ring Pliers
Courtesy of BMW OF NORTH AMERICA, INC.

Determine end clearance with a feeler gauge, see **11 25 PISTONS WITH RINGS AND PINS N52K B25** .

Fig. 190: Measuring Ring End Clearance With Feeler Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **Schematic diagram of piston rings.**

Installation:

Piston rings with "TOP" identification must point to piston crown.

1. Plain compression ring
2. Stepped ring "TOP"
3. U-flex ring

Fig. 191: Piston Rings Installation Position

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The U-flex ring comprises two steel band rings (1) and a support spring (2).

Installation:

Insert support spring (2) into piston ring groove and then fit steel band rings (1) so that contact points are offset by approx. 120°.

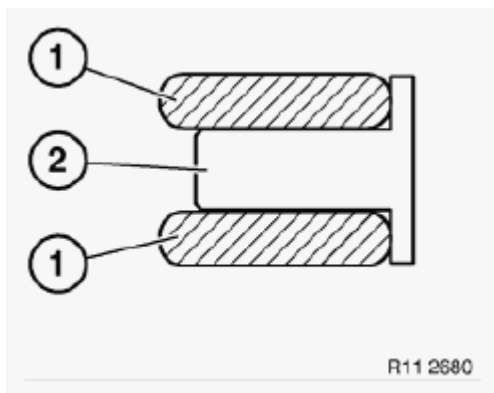

Fig. 192: Support Spring And Steel Band Rings

Courtesy of BMW OF NORTH AMERICA, INC.

The contact points (1) of the piston rings must be arranged offset by approx. 120°. However, the contact points (1) must not be arranged over the piston pin boss.

NOTE: Picture shows N52.

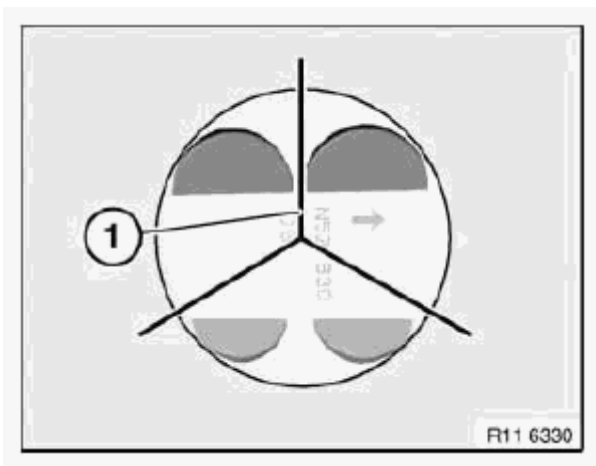

Fig. 193: Contact Points Of Piston Rings
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

28 V-RIBBED BELT WITH TENSIONER / DEFLECT ELEMENT

11 28 010 REPLACING ALTERNATOR DRIVE BELT (N51)

Special tools required:

- 11 3 340

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (*risk of damage*).

Necessary preliminary tasks:

- Remove Fan Cowl with electric fan.

NOTE: Mark the direction of rotation of the drive belt if it is to be reused.

Layout of drive belt.

Fig. 194: Drive Belt Tensioner, Mounting Screw And Removal Direction
Courtesy of BMW OF NORTH AMERICA, INC.

Turn belt tensioner (4) in direction of arrow until bore (2) is flush on housing.

Hold belt tensioner (4) under tension.

Fig. 195: Belt Tensioner And Bore
Courtesy of BMW OF NORTH AMERICA, INC.

Secure belt tensioner with special tool 11 3 340.

NOTE: Illustration N42.

Fig. 196: Special Tool (11 3 340) And Belt Tensioner
Courtesy of BMW OF NORTH AMERICA, INC.

Remove drive belt (1) towards top.

Fig. 197: Identifying Belt Tensioner
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Installation:

Check that drive belt for is in correct installation position - **risk of damage.**

11 28 010 REPLACING ALTERNATOR DRIVE BELT (N52K)

Special tools required:

- 11 3 340

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Joining torque and angle of rotation must be observed without fail (*risk of damage*).

Necessary preliminary tasks:

- Remove Fan Cowl with electric fan

NOTE: Mark the direction of rotation of the drive belt if it is to be reused.

Course of E9x drive belt:

Turn belt tensioner (4) in direction of arrow until bore (2) is flush on housing.

Hold belt tensioner (4) under tension.

Load is removed from tensioning pulley.

Fig. 198: Belt Tensioner And Bore
Courtesy of BMW OF NORTH AMERICA, INC.

Course of E85 drive belt:

Turn belt tensioner (1) in direction of arrow until bore is flush on housing.

Hold belt tensioner (1) under tension.

Load is removed from tensioning pulley (2).

Fig. 199: Belt Tensioner And Tensioning Pulley
Courtesy of BMW OF NORTH AMERICA, INC.

All:

Secure belt tensioner (1) with special tool 11 3 340.

Remove drive belt upwards.

Fig. 200: Special Tool (11 3 340) And Belt Tensioner
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Installation:

Check that drive belt for is in correct installation position - **risk of damage.**

11 28 020 REPLACING TENSIONING DEVICE FOR ALTERNATOR DRIVE BELT (N51)

Special tools required:

- 11 3 340

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released .

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove Drive Belt.

Remove special tool 11 3 340.

Release screw (3).

For tightening torque refer to 11 28 1AZ in **28 V-RIBBED BELT WITH TENSIONER** .

Installation:

Replace aluminum screws.

Fig. 201: Belt Tensioner And Belt Tensioner Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 28 020 REPLACING TENSIONING DEVICE FOR ALTERNATOR DRIVE BELT (N52K)

Special tools required:

- 11 3 340

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released .

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove Drive Belt

E9x only:

Remove special tool 11 3 340.

Release screw (3) on belt tensioner (4).

For tightening torque refer to 11 28 1AZ in **28 V-RIBBED BELT WITH TENSIONER** .

Installation:

Replace aluminum screws.

Remove belt tensioner (4).

Fig. 202: Belt Tensioner And Belt Tensioner Screw
Courtesy of BMW OF NORTH AMERICA, INC.

E85 only:

Remove special tool 11 3 340.

Release screw on belt tensioner (1).

For tightening torque refer to 11 28 1AZ in **28 V-RIBBED BELT WITH TENSIONER** .

Installation:

Replace aluminum screws.

Remove belt tensioner (1).

Fig. 203: Belt Tensioner And Drive Belt
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

31 CAMSHAFT

11 31 005 CHECKING TIMING OF CAMSHAFT(S) (N52K)

Special tools required:

- 11 0 300
- 11 4 281
- 11 4 282
- 11 4 283

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove underbody protection. See **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT ASSEMBLY UNDERSIDE PROTECTION (X5)** or **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION (X3)**

Remove fastener (1) in direction of arrow.

Installation:

Install fastener (1) with bore facing outwards.

Fig. 204: Fastener

Courtesy of BMW OF NORTH AMERICA, INC.

Rotate crankshaft at central bolt into TDC position.

Slide special tool 11 0 300 in direction of arrow into special tool bore and secure crankshaft.

IMPORTANT: On vehicles with optional extra SA205 (automatic transmission), there is a large bore for the TDC position shortly before the special tool bore. This bore can be confused with the special tool bore.

If the flywheel is secured in the correct special tool bore with special tool 11 0 300 , the engine can no longer be moved at the central bolt.

Fig. 205: Securing Crankshaft Using Special Tool (11 0 300)

Courtesy of BMW OF NORTH AMERICA, INC.

With 1st cylinder in firing TDC position, cams of inlet camshaft (1) at 1st cylinder point upwards at an angle.

Fig. 206: Inlet Camshaft

Courtesy of BMW OF NORTH AMERICA, INC.

The timings are correct when the part numbers (2) on the inlet and exhaust camshafts (1) point upwards.

Fig. 207: Part Numbers On Inlet And Exhaust Camshafts

Courtesy of BMW OF NORTH AMERICA, INC.

With 1st cylinder in firing TDC position, cams of exhaust camshaft (3) at 6th cylinder point downwards at an angle.

Cam follower (1) is not actuated.

NOTE: When the engine is installed, the position of the exhaust camshaft (3) for the timing can only be checked with a mirror.

Fig. 208: Exhaust Camshaft And Cam Follower
 Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 283 to cylinder head with bolts (1).

NOTE: Fit special tool 11 4 282 underneath on side of inlet camshaft.
 Mount special tool 11 4 281 on inlet and exhaust camshafts.

Fig. 209: Cylinder Head Bolts And Special Tools (11 4 282) And (11 4 281)
 Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, adjust valve timing, see **11 31 505 Adjusting timing of camshaft(s) (N52K)**.

Assemble engine.

11 31 025 REMOVING AND INSTALLING/REPLACING INLET CAMSHAFT (N52K)

Special tools required:

- 11 4 281
- 11 4 481

**IMPORTANT: Aluminum screws/bolts must be replaced each time they are released .
The end faces of aluminum screws/bolts are painted blue for the purposes of
reliable identification.
Jointing torque and angle of rotation must be observed without fail (risk of
damage) .**

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove inlet adjustment unit
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.
- Adjust valve timing, see **11 31 505 Adjusting timing of camshaft(s) (N52K)**.

NOTE: All bearing caps (1 and 2) are marked with numbers from 1 to 6.

Bearing cap (1) is a thrust bearing.

Release screws on bearing caps 1 to 6 (1 and 2).

Tightening torque: 11 31 2AZ, see **11 31 CAMSHAFT** .

Set all bearing caps down in special tool 11 4 481 in a tidy and orderly fashion.

Fig. 210: Bearing Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Remove inlet camshaft (2) towards top.

Installation:

Clean all bearing points and lubricate with oil.

Check plain compression rings (1) for damage and replace if necessary.

Fig. 211: Removing Inlet Camshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Plain compression rings (1) are engaged at joint.

Press plain compression rings (1) apart upwards and downwards and removed towards front.

IMPORTANT: Plain compression rings (1) can easily break.

Fig. 212: Removing Plain Compression Rings
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Markings of inlet and exhaust camshafts are different.
Mixing up the inlet and exhaust camshaft will result in engine damage .**

A Exhaust camshaft.
E Inlet camshaft

Fig. 213: Markings Of Inlet And Exhaust Camshafts
Courtesy of BMW OF NORTH AMERICA, INC.

Insert inlet camshaft (1) so that part number on twin surface points upwards.

Position inlet camshaft (1) so that cams point upwards at an angle.

Attach special tool 11 4 281 to twin surface.

Fig. 214: Inlet Camshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 31 028 REMOVING AND INSTALLING/REPLACING EXHAUST CAMSHAFT (N52K)

Special tools required:

- 00 9 120
- 11 4 350
- 11 4 461

- 11 4 462
- 11 4 463
- 11 9 000

IMPORTANT: It is absolutely essential to follow an exact procedure for removing and installing the exhaust camshaft.

Risk of damage!

The upper and lower bearing banks must be tensioned with a total of six special tools 11 4 461.

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove exhaust adjustment unit
- Adjust valve timing

The screw connection of the bearing banks must be released from the outside inwards.

Lift out upper and lower bearing banks (1) with exhaust camshaft.

Remove upper bearing bank (1).

Remove exhaust camshaft from lower bearing bank.

Fig. 215: Upper And Lower Bearing Banks

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Markings of inlet and exhaust camshafts are different.

Mixing up the inlet and exhaust camshaft will result in **engine damage** .

Fig. 216: Markings Of Inlet And Exhaust Camshafts
Courtesy of BMW OF NORTH AMERICA, INC.

Check plain compression rings (1) for damage and replace if necessary.

Plain compression rings (1) are engaged at joint.

Press plain compression rings (1) apart upwards and downwards and removed towards front.

IMPORTANT: Plain compression rings (1) can easily break.

Fig. 217: Removing Plain Compression Rings
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Removal on engine:

Set engine to firing TDC at 1st cylinder.

Removed cylinder head:

When using special tool 11 9 000, it will be necessary to remove the aluminum profile insert.

Mounting bearing bank:

Pre-install special tool 11 4 462 on cylinder no. 2.

Insert special tool 11 4 463 in screw connection of cylinder head cover.

IMPORTANT: Special tool 11 4 463 is a special screw.

Press down cam followers (3) on cylinder no. 2 with spindle nut (2) of special tool 11 4 462.

Fig. 218: Cam Followers, Spindle Nut And Special Tools
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Before mounting the exhaust camshaft on the correct cam follower seat (1), pay attention to the hydraulic valve clearance adjustment element and the valve.

Refer to **REMOVING AND INSTALLING/REPLACING ALL CAM FOLLOWERS.**

Fig. 219: Cam Follower Seat
Courtesy of BMW OF NORTH AMERICA, INC.

Position lower bearing bank (1) with exhaust camshaft (2) cam followers.

Align exhaust camshaft (2).

Cylinder nos. 2 and 4 are at valve overlap.

Cams (3) on cylinder no. 1 point upwards at an angle.

Part number (4) on twin surface of exhaust camshaft (2) points upwards.

Fig. 220: Lower Bearing Bank, Exhaust Camshaft With Part Number And Cams
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: There must be no adhesive residues in the cylinder head tapped holes.
Clean tapped holes.**

Fit upper bearing bank (1).

Insert bolts dry.

Tension down upper bearing bank (1) with exhaust camshaft at bearing points 3 and 5 through a 1/2 bolt turn.

Join exhaust camshaft to upper and lower bearing banks (1) with torque wrench (2) from inside outwards to **8 Nm** .

Release all screws of upper bearing bank (1) from outside inwards by 90°.

Fig. 221: Upper And Lower Bearing Banks
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Upper and lower bearing banks must be aligned to each other at ground surfaces (1 and 2).

Make sure that the thrust piece and the legs of special tools 11 4 461 rest on the milled surfaces.

Fig. 222: Ground Surfaces
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Schematic depiction of special tool 11 4 461 at upper bearing bank (1) and lower bearing bank (2).

Pretension all special tools 11 4 461 with special tool 11 4 350 only.

IMPORTANT: Tighten screw (3) on thrust piece to 2 Nm. Risk of damage!

Fig. 223: Screw, Upper And Lower Bearing Bank
Courtesy of BMW OF NORTH AMERICA, INC.

Position special tool 11 4 461 over screw connection of bearing banks.

Make sure that the legs rest exactly on the ground surfaces of the upper bearing bank (2) and lower bearing bank (1).

Fig. 224: Special Tool (11 4 461), Upper And Lower Bearing Bank
Courtesy of BMW OF NORTH AMERICA, INC.

Initially tighten screw of special tool 11 4 461 to ground surfaces of upper bearing bank (1) and lower bearing bank (2).

IMPORTANT: Tighten screws on thrust piece to 2 Nm. Risk of damage!

Fig. 225: Tightening Special Tool (11 4 461) Screw On Upper And Lower Bearing Bank Ground Surfaces
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Set special tool 11 4 350 to 2 Nm.
Pretension all special tools 11 4 461 with special tool 11 4 350 only.

Fig. 226: Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Mount special tools 11 4 461 with screw (1) to inside of cylinder head.

Mount special tool 11 4 461 with screw facing outwards on cylinder no. 2.

Position special tools 11 4 461 so that screw connections (2) of bearing bank are easily accessible.

Fig. 227: Special Tools (11 4 461) And (11 4 350)
Courtesy of BMW OF NORTH AMERICA, INC.

Tighten upper and lower bearing banks with special tool 00 9 120.

Tightening torque: 11 31 1AZ, see **11 31 CAMSHAFT** .

IMPORTANT: Remove special tool 11 4 461 only when exhaust camshaft screw connection is completed .

Fig. 228: Special Tools (11 4 461) And (00 9 120)
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 31 051 REPLACING TIMING CHAIN (N52K)

Special tools required:

- 00 9 140
- 11 0 300

- 11 4 280
- 11 4 281
- 11 4 282
- 11 4 283
- 11 4 360
- 11 4 362
- 11 5 200
- 11 9 280

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove all spark plugs
- Remove chain tensioner, see **11 31 090 Installing and removing/replacing chain tensioner piston (N52K)**
- Remove crankshaft radial seal at front, see **11 14 005 Replacing front crankshaft radial seal (N52K)**
- Remove drive belt tensioner
- Remove **VIBRATION DAMPER**

Remove fastener (1) in direction of arrow.

Installation:

Install fastener (1) with bore facing outwards.

Fig. 229: Fastener

Courtesy of BMW OF NORTH AMERICA, INC.

Rotate crankshaft at central bolt into TDC position.

Slide special tool 11 0 300 in direction of arrow into special tool bore and secure crankshaft.

IMPORTANT: On vehicles with optional extra SA205 (automatic transmission), there is a large bore for the TDC position shortly before the special tool bore. This bore can be confused with the special tool bore.

If the flywheel is secured in the correct special tool bore with special tool 11 0 300 , the engine can no longer be moved at the central bolt.

Fig. 230: Securing Crankshaft Using Special Tool (11 0 300)
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not remove special tool 11 0 300 to release central bolt (1).
Employ a second person for gripping when releasing central bolt (1).

Screw special tool 11 9 280 onto hub of vibration damper.

Release central bolt (1).

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Remove hub towards front.

Fig. 231: Central Bolt With Special Tool (11 9 280)
Courtesy of BMW OF NORTH AMERICA, INC.

Open plug (1).

Tightening torque: 11 31 7AZ, see **11 31 CAMSHAFT** .

Fig. 232: Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Open plug (1).

Tightening torque: 11 11 7AZ, see **11 11 CRANKCASE** .

Installation:

Replace aluminum screws.

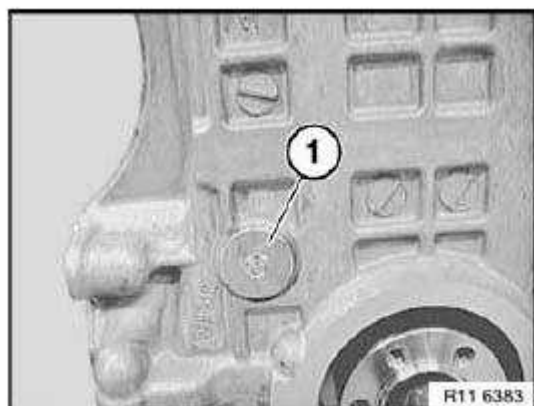

Fig. 233: Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Release bearing pin (1) from timing chain module on cylinder head.

Tightening torque: 11 31 5AZ, see 11 31 CAMSHAFT .

Fig. 234: Bearing Pin

Courtesy of BMW OF NORTH AMERICA, INC.

Release bearing pin (1) from timing chain module on crankcase.

Tightening torque: 11 31 4AZ, see 11 31 CAMSHAFT .

Fig. 235: Bearing Pin

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Install special tool 11 4 280 to release the central bolts on the inlet and exhaust adjustment units.

Secure special tool 11 4 283 to cylinder head with bolts (1).

NOTE: Fit special tool 11 4 282 underneath on side of inlet camshaft.

Mount special tool 11 4 281 on inlet and exhaust camshafts.

Do not remove special tool 11 4 280 .

Fig. 236: Cylinder Head Bolts And Special Tools (11 4 282) And (11 4 281)
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove inlet and exhaust adjustment unit.

Release bolts (1) from timing chain module on cylinder head.

Tightening torque: 11 31 3AZ, see **11 31 CAMSHAFT** .

Remove chain module with timing chain and sprocket wheel upwards in direction of arrow.

Fig. 237: Removing Timing Chain Module Bolts
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Note installation direction of sprocket wheel (2).
 Collar (see arrow) on sprocket wheel (2) points to engine .
 Incorrect assembly will result in engine damage .

Fig. 238: Collar On Sprocket Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Pull timing chain (1) upwards until sprocket wheel (2) engages chain guide (3).

Install timing chain (1) and sprocket wheel (2) in this position.

Installation:

Always hold timing chain (1) under tension. Timing chain (1) may jam on chain guide (3).

Fig. 239: Timing Chain, Sprocket Wheel And Chain Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Install hub with central bolt.

Tighten down special tool 11 5 200 with screws (1) to hub.

Fig. 240: Screws With Special Tool (11 5 200)
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove tensioner for drive belt.

Screw in special tool 11 4 362 from special tool kit 11 4 360 .

Mount special tool 11 9 280 on 11 5 200 .

Support special tool 11 9 280 on special tool 11 4 362 .

Special tool 11 0 300 secures crankshaft.

Tighten central bolt to jointing torque.

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Mark central bolt and hub with paint.

Fig. 241: Special Tools (11 9 280), (11 0 300), (11 4 360) And (11 5 200)
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark special tools with colored line (1).

See picture.

**IMPORTANT: Do not remove the special tool while tightening the central bolt to torsion angle.
Risk of damage!**

If necessary, tighten central bolt to torsion angle with special tool 00 9 140 .

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Fig. 242: Marking Special Tools With Colored Line
Courtesy of BMW OF NORTH AMERICA, INC.

Tighten central bolt with a second person helping.

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Install inlet and exhaust adjustment units.

Install chain tensioner, see **11 31 090 Installing and removing/replacing chain tensioner piston (N52K)**.

Fig. 243: Special Tools (11 9 280), (11 0 300), (11 4 360) And (11 5 200)
Courtesy of BMW OF NORTH AMERICA, INC.

Crank engine twice.

Check timing, see **11 31 005 Checking timing of camshaft(s) (N52K)**.

If necessary, adjust valve timing, see **11 31 505 Adjusting timing of camshaft(s) (N52K)**.

Assemble engine.

11 31 090 INSTALLING AND REMOVING/REPLACING CHAIN TENSIONER PISTON (N52K)

Release chain tensioner (1).

Tightening torque: 11 31 6AZ, see **11 31 CAMSHAFT** .

**IMPORTANT: Have a cleaning cloth ready. A small quantity of engine oil will emerge after the screw connection has been released.
Make sure no engine oil runs onto belt drive.**

Installation:

No sealing ring is fitted during series-production assembly.

A sealing ring must be fitted by service personnel when the chain tensioner is fitted.

Fig. 244: Chain Tensioner

Courtesy of BMW OF NORTH AMERICA, INC.

If the chain tensioner is reused, its oil chamber must be drained. Place chain tensioner on a level working surface and slowly compress.

Repeat procedure twice.

Fig. 245: Compressing Chain Tensioner On A Level Working Surface

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 31 505 ADJUSTING TIMING OF CAMSHAFT(S) (N52K)

Special tools required:

- **00 9 120 TORQUE ANGLE MEASURING DIAL**
- **00 9 250 TORSION ANGLE WRENCH WITH FLEXIBLE EXTENSION**
- 11 0 300
- 11 4 280

- 11 4 281
- 11 4 282
- 11 4 283
- 11 4 290
- 11 9 340

Necessary preliminary tasks:

- Remove cylinder head cover

Remove fastener (1) in direction of arrow.

Installation:

Install fastener (1) with bore facing outwards.

Fig. 246: Fastener

Courtesy of BMW OF NORTH AMERICA, INC.

Rotate crankshaft at central bolt into TDC position.

Slide special tool 11 0 300 in direction of arrow into special tool bore and secure crankshaft.

IMPORTANT: On vehicles with optional extra SA205 (automatic transmission), there is a large bore for the TDC position shortly before the special tool bore. This bore can be confused with the special tool bore.

If the flywheel is secured in the correct special tool bore with special tool 11 0 300 , the engine can no longer be moved at the central bolt.

Fig. 247: Securing Crankshaft Using Special Tool (11 0 300)
Courtesy of BMW OF NORTH AMERICA, INC.

With 1st cylinder in firing TDC position, cams of inlet camshaft (1) at 1st cylinder point upwards at an angle.

Fig. 248: Inlet Camshaft
Courtesy of BMW OF NORTH AMERICA, INC.

Part numbers (2) on inlet and exhaust camshafts (1) point upwards.

Fig. 249: Part Numbers On Inlet And Exhaust Camshafts
 Courtesy of BMW OF NORTH AMERICA, INC.

With 1st cylinder in firing TDC position, cams of exhaust camshaft (3) at 6th cylinder point downwards at an angle.

Cam follower (1) is not actuated.

NOTE: When the engine is installed, the position of the exhaust camshaft (3) for the timing can only be checked with a mirror.

Fig. 250: Exhaust Camshaft And Cam Follower
 Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 283 to cylinder head with bolts (1).

NOTE: Fit special tool 11 4 282 underneath on side of inlet camshaft.

Mount special tool 11 4 281 on inlet and exhaust camshafts.

Fig. 251: Cylinder Head Bolts And Special Tools (11 4 282) And (11 4 281)
Courtesy of BMW OF NORTH AMERICA, INC.

Release central bolts (1).

Release central bolts (1) with special tool 11 4 280 only.

Release chain tensioner (2) (have a cleaning cloth ready).

NOTE: **Picture in CAD and does not show special tools.**

Fig. 252: Central Bolts And Chain Tensioner
Courtesy of BMW OF NORTH AMERICA, INC.

Turn sensor gears (2) in direction of arrow until locating pins (1) on special tool 11 4 290 match up.

Slide on special tool 11 4 290 in direction of arrow.

Fig. 253: Sensor Gears, Locating Pins And Special Tool (11 4 290)
 Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 290 with bolts (1).

Screw special tool 11 9 340 into cylinder head.

Pretension timing chain with special tool 00 9 250 to **0.6 Nm** .

Secure both central bolts of inlet and exhaust adjustment units with special tool 00 9 120 to inlet and exhaust camshafts.

Tightening torque: 11 36 1AZ, see **11 36 VARIABLE CAMSHAFT CONTROL VANOS** .

Fig. 254: Special Tools (00 9 250), (11 9 340) And (11 4 290)
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

33 ROCKER ARM WITH BEARING MOUNT

11 33 050 REMOVING AND INSTALLING/REPLACING ALL CAM FOLLOWERS (N52K)

Special tools required:

- 11 4 480

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.
- Remove exhaust camshaft, see **11 31 028 Removing and installing/replacing exhaust camshaft (N52K)**.

IMPORTANT: Rocker arms (1) are divided into bearing categories.

The tolerance classes are marked according to the picture in numbers from 1 to 5.

Already used rocker arms (1) may only be reused in the same position.

Detach cam followers (1) from HVCA element and remove.

Set down all cam followers (1) in neat order in special tool 11 4 480 .

Installation:

Before installing exhaust camshaft or intermediate levers, make sure cam followers (1) are correctly seated.

Fig. 255: Cam Follower Seat

Courtesy of BMW OF NORTH AMERICA, INC.

Remove HVCA element (1) in direction of arrow.

Installation:

If the HVCA elements (1) are reused, they must be placed together with the cam followers in neat order in special tool 11 4 480 .

Fig. 256: Removing HVCA Element
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Check function of DME; if necessary, readjust uniform mixture distribution.

34 VALVES WITH SPRINGS

11 34 552 REMOVING AND INSTALLING/REPLACING ALL VALVES (N52K)

Special tools required:

- 11 4 480

Necessary preliminary tasks:

- Remove cylinder head, see **11 12 100 Removing and installing cylinder head (N52K)**.
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.
- Remove eccentric shaft, see **11 37 005 Removing and installing/replacing eccentric shaft (N52K)**.
- Remove inlet camshaft, see **11 31 025 Removing and installing/replacing inlet camshaft (N52K)**.
- Remove exhaust camshaft, see **11 31 028 Removing and installing/replacing exhaust camshaft (N52K)**.
- Remove cam followers, see **11 33 050 Removing and installing/replacing all cam followers (N52K)**.
- Remove valve springs, see **11 34 715 Replacing all valve springs (N52K)**.
- Remove valve stem seals, see **11 34 560 Replacing all valve stem seals (N52K)**.

Arrangement:

1. Valve
2. Valve stem seal with lower spring plate

3. Valve spring
4. Upper spring plate
5. Valve tapers

If the valves are to be reused, they must be placed in neat order in special tool 11 4 480 .

Fig. 257: Upper Spring Plate, Valve Tapers And Spring
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Check function of DME; if necessary, readjust uniform mixture distribution.

11 34 560 REPLACING ALL VALVE STEM SEALS (N52K)

Special tools required:

- 11 1 480
- 11 6 380

Necessary preliminary tasks:

- Remove cylinder head, see **11 12 100 Removing and installing cylinder head (N52K)**.
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.
- Remove eccentric shaft, see **11 37 005 Removing and installing/replacing eccentric shaft (N52K)**
- Remove inlet camshaft, see **11 31 025 Removing and installing/replacing inlet camshaft (N52K)**
- Remove exhaust camshaft, see **11 31 028 Removing and installing/replacing exhaust camshaft (N52K)**.
- Remove cam followers, see **11 33 050 Removing and installing/replacing all cam followers (N52K)**

Firmly press special tool 11 1 480 onto old valve stem seals.

Detach valve stem seal from valve stem by turning and simultaneously pulling special tool 11 1 480 .

Installation:

Insert all valves.

Fig. 258: Special Tool (11 1 480)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For use on the N52K engine, special tool 11 6 380 must be remachined according to the picture with a 10 mm dia. drill bit to a depth of B = approx. 23 mm.
This modification has already been taken into account for reordering.

Fig. 259: Special Tool (11 6 380) With Dimensions
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Different diameters at valve stem.
All valve stem seals are color-coded.**

For 5 mm dia. valves, the valve stem seal is marked red or brown.

For 6 mm dia. valves, the valve stem seal is marked green or light green.

Fig. 260: Valve Stem Seals Color-Coded, Green (Grün), and Red (Rot)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit the mounting sleeves (plastic sleeves) contained in the delivery specification on the valve stem end.

Lubricate mounting sleeve.

Press on valve stem seal by hand with special tool 11 6 380 as far as it will go.

Fig. 261: Special Tool (11 6 380)

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 34 715 REPLACING ALL VALVE SPRINGS (N52K)

Special tools required:

- 11 0 346
- 11 4 480
- 11 9 000
- 11 9 017

Necessary preliminary tasks:

- Remove cylinder head, see **11 12 100 Removing and installing cylinder head (N52K)**.
- Remove exhaust camshaft, see **11 31 028 Removing and installing/replacing exhaust camshaft (N52K)**.
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.
- Remove inlet camshaft, see **11 31 025 Removing and installing/replacing inlet camshaft (N52K)**
- Remove cam followers, see **11 33 050 Removing and installing/replacing all cam followers (N52K)**

Place cylinder head on special tool 11 9 000 .

Press down **inlet valves** with special tool 11 9 017 .

Press down **exhaust valves** with special tool 11 0 346 .

Fig. 262: Special Tool (11 9 017) And (11 9 000)
Courtesy of BMW OF NORTH AMERICA, INC.

Remove valve cotters with a magnet.

Remove valve spring with spring plates.

If the individual components are to be reused, they must be placed in neat order in special tool 11 4 480 .

R11 0347

Fig. 263: Removing Valve Cotters With Magnet
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Incorrect installation possible.
Incorrect installation will result in valve spring breakage.
Risk of mixing up the valve springs for the inlet and exhaust valves.**

The valve spring is color-coded (1) at the lower end.

Install the valve spring so that the larger diameter points to the lower spring plate.

Fig. 264: Valve Spring Color-Coded
Courtesy of BMW OF NORTH AMERICA, INC.

Arrangement:

1. Valve
2. Valve stem seal with lower spring plate
3. Valve spring
4. Upper spring plate
5. Valve tapers

Fig. 265: Upper Spring Plate, Valve Tapers And Spring
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Check function of DME; if necessary, readjust uniform mixture distribution.

37 VARIABLE VALVE GEAR

11 37 005 REMOVING AND INSTALLING/REPLACING ECCENTRIC SHAFT (N52K)

Special tools required:

- 11 4 481

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove intermediate lever, see **11 37 010 Removing and installing/replacing intermediate levers (N52K)**.

If necessary, move eccentric shaft (1) on twin surface to minimum lift (2).

Fig. 266: Eccentric Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: All bearing caps (1 and 2) of eccentric shaft are marked with numbers from 1 to 6 (1 for 1st cylinder to 6 for 6th cylinder).

Bearing cap 6 (1) is provided with a stop.

Release screws on bearing cap 6 (1).

Release screws on bearing caps 1 to 5 (2).

Set all bearing caps down in special tool 11 4 481 in a tidy and orderly fashion.

Remove eccentric shaft with gentle tilting and turning movements.

Fig. 267: Bearing Caps

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Screw is not magnetic and must be secured against falling down.

Release screw.

Remove magnet wheel (1).

Fig. 268: Magnet Wheel

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Magnet wheel (1) is highly magnetic and must be protected against metal filings/borings.

After removing, place magnet wheel (1) in a plastic bag (2) with a seal.

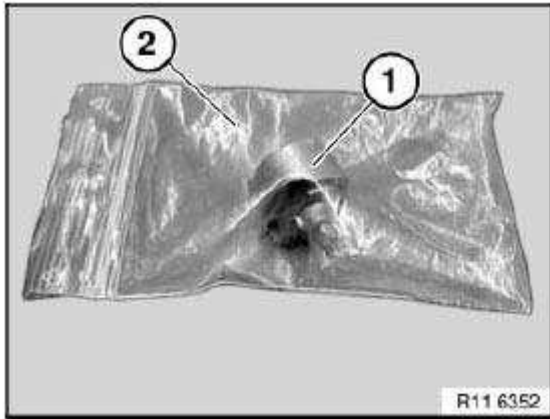

Fig. 269: Magnet Wheel And Plastic Bag
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Needle bearing (1) can break very easily.

Carefully pull needle bearing (1) apart at point of separation.

Remove all needle bearings (1) from eccentric shaft.

Fig. 270: Removing Needle Bearings From Eccentric Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Install bearing shells (1) as pictured.

NOTE: Always replace bearing shells (1) and needle bearings together.

Fig. 271: Bearing Shells

Courtesy of BMW OF NORTH AMERICA, INC.

Install bearing shell (1) with tip facing down (see arrow) in cylinder head.

Install bearing shell (2) with tip facing up in bearing cap.

Fig. 272: Bearing Shells

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: All bearing caps (1 and 2) of eccentric shaft are marked with numbers from 1 to 6 (1 for 1st cylinder to 6 for 6th cylinder).

Bearing cap 6 (1) is provided with a stop.

Insert eccentric shaft.

Adjust eccentric shaft on dihedron to minimum stroke.

Fit all bearing caps (1 and 2).

Insert all screws.

Tightening torque: 11 12 7AZ, see **11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER** .

Fig. 273: Bearing Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 37 010 REMOVING AND INSTALLING/REPLACING INTERMEDIATE LEVERS (N52K)

Special tools required:

- 11 4 270
- 11 4 450
- 11 4 481

**IMPORTANT: Aluminum screws/bolts must be replaced each time they are released .
The end faces of aluminum screws/bolts are painted blue for the purposes of
reliable identification.
Jointing torque and angle of rotation must be observed without fail (risk of
damage) .**

Necessary preliminary tasks:

- Remove cylinder head cover

If necessary, move eccentric shaft (1) on twin surface to minimum lift (2).

Fig. 274: Eccentric Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Oil spray nozzle must be removed from 3rd cylinder (make a note of installation position of oil spray nozzle).

Secure special tool 11 4 270 with gripping pliers (3) to guide block (2).

IMPORTANT: Special tool 11 4 270 is only secured to guide block (2).
Adjusting the gripping pliers (3) on special tool 11 4 270 is not permitted. Risk of damage!

Fig. 275: Special Tool (11 4 270) - Gripping Pliers And Guide Block

Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Risk of injury in event of incorrect use.

IMPORTANT: Improper handling. Risk of damage!

Secure both bearing pins (2) in torsion springs with knurled screw (1) of special tool 11 4 270 .

Press special tool 11 4 270 in direction of arrow as far as it will go.

Fig. 276: Securing Bearing Pins In Torsion Springs With Knurled Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (2) of torsion spring.

Tightening torque: 11 37 2AZ, see **11 37 VARIABLE VALVE GEAR** .

To avoid jamming of screw (2) with torsion spring, it is necessary when releasing screw (2) to relieve the pretension on special tool 11 4 270 uniformly.

IMPORTANT: Thread on cylinder head. Risk of damage!

Fig. 277: Torsion Spring Screw And Special Tool (11 4 270)
Courtesy of BMW OF NORTH AMERICA, INC.

Relieve tension on torsion spring (1) with special tool 11 4 270 .

NOTE: Metal lug (2) cannot be disassembled and must not be removed.

Installation:

Replace torsion spring (1) if metal lug (2) is faulty.

Fig. 278: Special Tool (11 4 270), Torsion Spring And Metal Lug
Courtesy of BMW OF NORTH AMERICA, INC.

Press torsion spring apart at positions (1).

Remove torsion spring towards top.

Fig. 279: Removing Torsion Spring
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Uniform distribution must not be changed.
Place all components in clean and neat order in special tool 11 4 481.

All components must be reinstalled in the same positions in an engine which has already been in use.

Fig. 280: Torsion Springs, Inlet Camshaft, Guide Blocks And Special Tools (11 4 481)
Courtesy of BMW OF NORTH AMERICA, INC.

1. Eccentric shaft with bearing
2. Bearing caps of eccentric shaft (set out in order)
3. Inlet camshaft
4. Bearing caps of inlet camshaft (set out in order)
5. Inlet valves with valve springs
6. Valve plates and valve cotters
7. Cam followers with HVCA elements (set out in order)
8. Torsion springs
9. Guide blocks (set out in order)
10. Intermediate levers (set out in order)

Release screws (1) on guide block (2).

Tightening torque: 11 37 1AZ, see **11 37 VARIABLE VALVE GEAR** .

Place all guide blocks (2) in neat order in special tool 11 4 481 .

Installation:

Mixing up the guide blocks (2) will cause the engine to suffer idle-speed fluctuations.

This will result in maladjustment of uniform distribution .

Fig. 281: Screws And Guide Block
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

All contact surfaces (1) of guide block must be clean and free from oil and grease. If necessary, clean contact surfaces (1).

Fig. 282: Guide Block Contact Surfaces
Courtesy of BMW OF NORTH AMERICA, INC.

Lift out intermediate levers (2).

Place all intermediate levers (2) in neat order in special tool 11 4 481 .

Installation:

Mixing up the intermediate levers (2) will cause the engine to suffer idle-speed fluctuations.

Installation:

All contact surfaces (1) must be clean and free from oil and grease. If necessary, clean contact surfaces (1).

Fig. 283: Contact Surfaces And Intermediate Levers
Courtesy of BMW OF NORTH AMERICA, INC.

All intermediate levers (1) are classified.

All intermediate levers (1) must be reinstalled in the same positions in an engine which has already been in use.

Fig. 284: Intermediate Lever Classification
Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Before installing intermediate levers (2), make sure cam followers are correctly positioned.
Risk of damage!**

Install intermediate levers (2).

Fig. 285: Contact Surfaces And Intermediate Levers
Courtesy of BMW OF NORTH AMERICA, INC.

Fit guide block (2) cleanly into opening.

Tighten screws (1) hand-tight.

Check that intermediate levers are in correct installation position.

Release screws (1) by a 1/4 turn.

Fig. 286: Screws And Guide Block
Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 450 to bolt connection (1) of eccentric shaft.

Turn eccentric lever (3) on special tool 11 4 450 in direction of arrow.

Guide block is now pretensioned.

Insert screws (2) of guide blocks.

Tightening torque: 11 37 1AZ, see **11 37 VARIABLE VALVE GEAR** .

Installation:

At cylinder no. 3, the guide block can be pre-installed with one screw (internal) only.

Oil spray nozzle is fitted only after torsion spring has been installed.

Fig. 287: Turning Eccentric Lever On Special Tool (11 4 450)
Courtesy of BMW OF NORTH AMERICA, INC.

Install torsion spring (2) on guide block.

Installation:

Insert torsion spring (2) in intermediate lever (1) (see arrow).

Check that cam follower (3) is in correct installation position.

Fig. 288: Inserting Torsion Spring In Intermediate Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 11 4 270 with gripping pliers (3) to guide block (2).

**IMPORTANT: Special tool 11 4 270 is only secured to guide block (2).
Adjusting the gripping pliers (3) on special tool 11 4 270 is not permitted. Risk
of damage!**

Fig. 289: Special Tool (11 4 270) - Gripping Pliers And Guide Block
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Risk of injury in event of incorrect use.

IMPORTANT: Improper handling. Risk of damage!

Secure both bearing pins (2) in torsion springs with knurled screw (1) of special tool 11 4 270 .

**IMPORTANT: Check torsion spring on intermediate lever to ensure correct installation
position.**

Press special tool 11 4 270 in direction of arrow as far as it will go.

Fig. 290: Securing Bearing Pins In Torsion Springs With Knurled Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Insert screw (2) of torsion spring.

Tightening torque: 11 37 2AZ, see **11 37 VARIABLE VALVE GEAR** .

To avoid jamming of screw (2) with torsion spring, it is necessary when inserting screw (2) to increase pretension on special tool 11 4 270 uniformly.

IMPORTANT: Thread on cylinder head. Risk of damage!

Remove special tool 11 4 270 .

Fig. 291: Torsion Spring Screw And Special Tool (11 4 270)
 Courtesy of BMW OF NORTH AMERICA, INC.

At cylinder no. 3, adjust oil spray nozzle (2) so that oil spray points precisely towards spline teeth (3).

Insert screw (1) with oil spray nozzle (2) (external).

Tightening torque: 11 37 4AZ, see **11 37 VARIABLE VALVE GEAR** .

Fig. 292: Screw And Oil Spray Nozzle
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

40 OIL SUPPLY

11 40 000 CHECKING ENGINE OIL PRESSURE (N52, N52K)

IMPORTANT: The regulated oil pump can only be checked and measured with the diagnosis system.

Vehicles with a regulated oil pump have a HYDRAULIC VALVE fitted.

Necessary preliminary tasks

- Remove engine cover.
- Protect drive belt against dirt
- Have a cleaning cloth ready to catch escaping oil

Disconnect plug connection on oil pressure switch (3)

Remove oil pressure switch (3).

Fig. 293: Releasing Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Screw in special tool 11 4 050 with sealing ring. See **Fig. 294**.

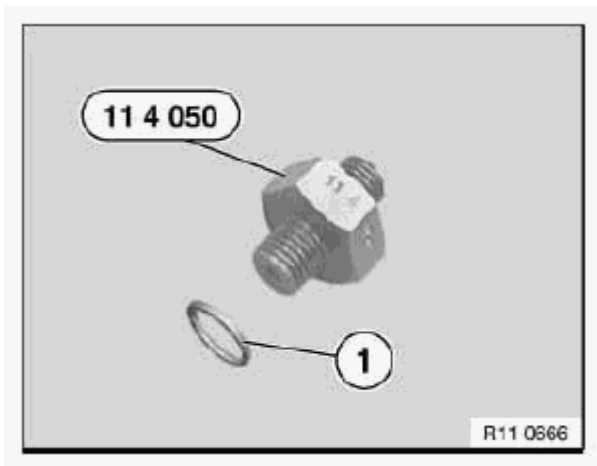

Fig. 294: Identifying Special Tool (11 4 050) And Sealing Ring

Courtesy of BMW OF NORTH AMERICA, INC.

Check engine oil pressure with diagnosis system

Connect special tools 13 6 054 and 13 6 051.

Check engine oil pressure with pressure gauge

Connect special tools 13 3 063 and 13 3 061.

Start engine and check engine oil pressure.

See **41 OIL PUMP WITH FILTER AND DRIVE** .

Fig. 295: Checking Engine Oil Pressure
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

41 OIL PUMP WITH FILTER AND DRIVE

11 41 000 REMOVING AND INSTALLING/REPLACING OIL PUMP (N52K)

Necessary preliminary tasks:

- Remove oil sump

Release screws (1).

Tightening torque, see 11 41 1AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws.

Remove intake pipe (2) in direction of arrow.

Installation:

Replace sealing ring.

Fig. 296: Removing Intake Pipe

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: To release bolt (1), insert a 6 mm drill bit between sprocket wheel and oil pump housing.

Release bolt (1).

Tightening torque: 11 41 6AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Release screws (2).

Tightening torque: 11 41 5AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws.

Fig. 297: Bolt And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Observe different screw lengths.

Release screws (1).

Tightening torque: 11 41 2AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Tightening torque: 11 41 3AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws.

Fig. 298: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Detach sprocket wheel (1) in direction of arrow.

**NOTE: Chain tensioner presses timing chain (3) upwards.
Do not remove sprocket wheel (1).**

Remove oil pump (2) in direction of arrow.

Fig. 299: Removing Sprocket Wheel
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check spacers (1) for secure seating and damage; replace if necessary.

Align twin surface (3) on oil pump (2) to sprocket wheel (4).

Install oil pump (2).

Fig. 300: Spacers, Oil Pump And Sprocket Wheel
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

11 41 010 REMOVING AND INSTALLING/REPLACING CHAIN MODULE FOR OIL PUMP/VACUUM PUMP (N52K)

Special tools required:

- 00 9 140

- 11 0 290
- 11 0 300
- 11 4 120
- 11 4 280
- 11 4 360
- 11 4 362
- 11 4 440
- 11 5 200
- 11 9 280

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released .

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove cylinder head cover
- Remove oil sump
- Remove drive belt
- Remove drive belt tensioner
- Remove **VIBRATION DAMPER**
- Remove sealing cover for vacuum pump

Procedure on installed engine:

Turn sprocket wheel (3) with central bolt at crankshaft into position until special tool 11 0 290 can be secured.

Simultaneously secure special tool 11 0 290 to sprocket wheel (3) and special tool 11 4 362 .

Release screw (2) for sprocket wheel (3).

Tightening torque: 11 66 2AZ, see **11 66 VACUUM PUMP** .

Fig. 301: Special Tool (11 4 362) And (11 0 290), Screw And Sprocket Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Press timing chain with chain tensioner (1) in direction of arrow.

Disconnect timing chain with special tool 11 4 120 .

Feed out sprocket wheel (3) at hexagon head (4) of vacuum pump.

Installation:

If the chain module is replaced, a mounting bar (2) is already pre-installed.

Fig. 302: Pressing Piston With Special Tools (11 6 261)
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: To release bolt (1), insert a 6 mm drill bit between sprocket wheel and oil pump housing.

Release screw (1) for sprocket wheel.

Tightening torque: 11 41 6AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Release screws (2) for chain module.

Tightening torque: 11 41 5AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws.

Fig. 303: Bolt And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Secure crankshaft and camshaft with special tools 11 0 300 and 11 4 280

**IMPORTANT: Do not remove special tools 11 0 300 and 11 4 280 to release central bolt (1).
Employ a second person for gripping when releasing central bolt (1).**

Screw special tool 11 9 280 onto hub of vibration damper.

Release central bolt (1).

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Fig. 304: Central Bolt With Special Tool (11 9 280)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace central bolt (1).

Remove hub (2) towards front.

Installation:

Replace crankshaft radial seal at front, see **11 14 005 Replacing front crankshaft radial seal (N52K)**.

Fig. 305: Hub
Courtesy of BMW OF NORTH AMERICA, INC.

Open screw plug on bedplate.

Tightening torque: 11 11 8AZ, see **11 11 CRANKCASE** .

Installation:

Replace aluminum screws.

Release screw for chain module (1).

Tightening torque: 11 41 4AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Installation:

Replace aluminum screws.

Remove chain module (1) in direction of arrow.

Fig. 306: Removing Chain Module

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Note installation direction of sprocket wheel (2).
Collar (see arrow) on sprocket wheel (2) points to engine .
Incorrect assembly will result in engine damage .

Fig. 307: Collar On Sprocket Wheel

Courtesy of BMW OF NORTH AMERICA, INC.

Procedure on removed engine:

NOTE: Engine is mounted on special tool 11 4 440 .

Release screw (1) for sprocket wheel.

Tightening torque: 11 66 2AZ, see **11 66 VACUUM PUMP** .

Release screw (2) for sprocket wheel.

Tightening torque: 11 41 6AZ, see **11 41 OIL PUMP WITH STRAINER AND DRIVE** .

Release central bolt (3).

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Fig. 308: Releasing Central Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Mark central bolt (3) with a colored dot.

Replace central bolt (3).

Remove hub (4) towards front.

All:

Install hub with new central bolt.

Tighten down special tool 11 5 200 with screws (1) to hub.

Do **not** remove special tools 11 0 300 and 11 4 280 .

Fig. 309: Screws With Special Tool (11 5 200)
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove tensioner for drive belt.

Screw in special tool 11 4 362 from special tool kit 11 4 360 .

Mount special tool 11 9 280 on 11 5 200 .

Support special tool 11 9 280 on special tool 11 4 362 .

Special tool 11 0 300 secures crankshaft.

Tighten central bolt to jointing torque.

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Mark central bolt and hub with paint.

Fig. 310: Special Tools (11 9 280), (11 0 300), (11 4 360) And (11 5 200)
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark special tools with colored line (1).

See picture.

**IMPORTANT: Do not remove the special tool while tightening the central bolt to torsion angle.
Risk of damage!**

If necessary, tighten central bolt to torsion angle with special tool 00 9 140 .

Tightening torque: 11 21 1AZ, see **11 21 CRANKSHAFT AND BEARINGS** .

Fig. 311: Marking Special Tools With Colored Line
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace crankshaft radial seal at front, see **11 14 005 Replacing front crankshaft radial seal (N52K)**.

Assemble engine.

11 41 115 REMOVING AND INSTALLING/REPLACING HYDRAULIC VALVE (N52K)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are **released**.

Aluminum screws/bolts are permitted with and without
color coding (blue).

For reliable identification:

Aluminum screws/bolts are **not magnetic**.

Jointing torque and angle of rotation must be observed without fail (**risk of damage**).

Necessary preliminary tasks

- Remove front underbody protection. See **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT ASSEMBLY UNDERSIDE PROTECTION (X5)** or **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION (X3)**
- Have a cleaning cloth ready to catch escaping oil

Detach plug (1) from hydraulic valve (2).

Fig. 312: Identifying Hydraulic Valve With Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) and remove hydraulic valve (2).

Tightening torque

Fig. 313: Identifying Hydraulic Valve With Mounting Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Replace O-ring (1).

Fig. 314: Identifying O-Ring
Courtesy of BMW OF NORTH AMERICA, INC.

1142 OIL FILTER AND LINES

11 42 020 REMOVING AND INSTALLING/REPLACING FULLFLOW OIL FILTER (N52)

WARNING: Danger of scalding!

Only perform these tasks on an engine that has cooled down.

Recycling

Catch and dispose of drained coolant.

Observe country-specific waste-disposal regulations.

Necessary preliminary tasks

- Drain COOLANT. See **17 00 005 DRAINING AND ADDING COOLANT (N52K) (X3)** or **17 00 005 DRAINING AND ADDING COOLANT IN RADIATOR (N52K) (X5)** .
- Remove intake air **MANIFOLD** .
- Unfasten oil filter cover.
- Protect drive belt against dirt.

Release screw (1).

Tightening torque, see 11 42 2AZ in **11 42 OIL FILTER ELEMENT WITH CONNECTIONS**

Fig. 315: Identifying Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws (2).

NOTE: Have cleaning cloth ready to catch residual oil.

Tightening torque: see 11 42 2AZ in **11 42 OIL FILTER ELEMENT WITH CONNECTIONS**

Installation:

Replace all seals.

If necessary, replace filter element.

Fig. 316: Releasing Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

NOTE: Protect drive belt against dirt.

Installation:

For VENTING INSTRUCTIONS see **17 00 039 VENTING COOLING SYSTEM AND CHECKING FOR LEAKS (X3)** or **17 00 039 VENTING COOLING SYSTEM AND CHECKING FOR WATER LEAKS (N52K) (X5)**.

51 WATER PUMP WITH DRIVE

11 51 000 REMOVING AND INSTALLING/REPLACING WATER PUMP (N52K)

WARNING: Danger of scalding!

Only perform this work after engine has cooled down.

Recycling:

Catch and dispose of drained coolant in a suitable container.

Observe country-specific waste-disposal regulations.

IMPORTANT: If a water pump that has already been operated is reused, it must be filled with coolant immediately after removal.

Mixture ratio, water : coolant = 1 : 1

Protect plug connections against coolant and contamination.

Cover plug connections with suitable materials.

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminum screws/bolts exclusively.

Aluminum screws/bolts must be replaced each time they are released.

The end faces of aluminum screws/bolts are painted blue for the purposes of reliable identification

Jointing torque and angle of rotation must be observed without fail (risk of damage) .

Necessary preliminary tasks:

- Remove coolant thermostat

Unfasten hose clip (1).

For tightening torque refer to 11 53 5AZ in **11 53 COOLANT THERMOSTAT WITH CONNECTIONS** .

Remove coolant hose.

Unfasten hose clip (2).

For tightening torque refer to 11 53 3AZ in **11 53 COOLANT THERMOSTAT WITH CONNECTIONS** .

Remove coolant hose.

Disconnect plug connection (3).

Release screws (4).

For tightening torque refer to 11 51 1AZ in **11 51 ELECTRIC WATER PUMP WITH DRIVE** .

Fig. 317: Plug Connection, Screws And Hoses
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace aluminum screws.

Remove electric water pump (x) via x.

Installation:

If the electric water pump is reused, it must be rotated one turn due to the breakaway torque at the blade wheels.

Assemble engine.

Venting instructions must be observed without fail. . See **17 00 005 DRAINING AND ADDING COOLANT (N52K)** .

53 THERMOSTAT AND CONNECTIONS

11 53 000 REMOVING AND INSTALLING/REPLACING COOLANT THERMOSTAT (N52K)

WARNING: Danger of scalding!

Only perform this work after engine has cooled down.

Recycling

Catch and dispose of drained coolant in a suitable container.

Observe country-specific waste-disposal regulations.

IMPORTANT: Protect plug connections against coolant and contamination.

Cover plug connections with suitable materials.

Necessary preliminary tasks:

- Drain Coolant

NOTE: For purposes of clarity, the picture and text refer to the component when removed.

Unfasten hose clip (1).

For tightening torque refer to 11 53 5AZ in **11 53 COOLANT THERMOSTAT WITH CONNECTIONS** .

Remove coolant hose.

Unfasten hose clip (2).

For tightening torque refer to 11 53 6AZ in **11 53 COOLANT THERMOSTAT WITH CONNECTIONS** .

Remove coolant hose.

Unlock and detach coolant hose (3).

Unlock and detach coolant hose (4).

Disconnect plug connection (5).

Release screws (6).

For tightening torque refer to 11 53 1AZ in **11 53 COOLANT THERMOSTAT WITH CONNECTIONS** .

Remove coolant thermostat (7).

Assemble engine.

Fig. 318: Hose Clips, Hoses, Screws, Coolant Thermostat And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

61 INTAKE MANIFOLD

11 61 050 REMOVING AND INSTALLING AIR INTAKE MANIFOLD (N52K)

Necessary preliminary tasks:

- Remove Tension Strut
- Remove Intake Filter Housing
- Remove Ignition Coil Cover

Open holder (2).

Disconnect plug connection (1) under of air intake manifold.

Release both crankcase breathers (3).

Fig. 319: Crankcase Breathers, Plug Connection And Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Disconnect plug connection (3).

Release screws (4).

Detach engine wiring harness (2) from air intake manifold and lay to one side.

Fig. 320: Engine Wiring Harness, Screws And Plug Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) on oil pressure switch (2).

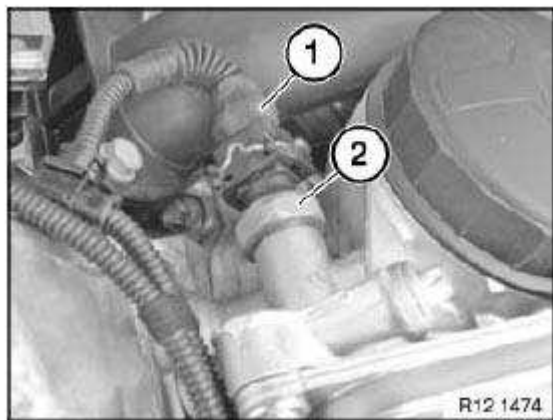

Fig. 321: Plug Connection And Oil Pressure Switch
Courtesy of BMW OF NORTH AMERICA, INC.

Release fuel rail (2) and lay to one side.

NOTE: Do not detach fuel line.

Release screws (1).

For tightening torque refer to 11 61 1AZ in **11 61 AIR INTAKE MANIFOLD** .

Unscrew nuts (3).

For tightening torque refer to 11 61 2AZ in **11 61 AIR INTAKE MANIFOLD** .

Fig. 322: Fuel Rail, Nuts And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Raise air intake manifold approx. 10 cm.

Disconnect plug connections (1) at bottom.

Release tank vent line behind throttle valve assembly.

Fig. 323: Plug Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace all seals.

Assemble engine.

62 EXHAUST MANIFOLD

18 40 050 REMOVING AND INSTALLING/REPLACING FRONT EXHAUST MANIFOLD (N52/ N52K/ N51)

Necessary preliminary tasks:

- Remove rear exhaust manifold

NOTE: The oxygen sensors are in danger of being damaged when the exhaust manifolds are removed and installed.

Remove control sensor from cylinders 1 to 3.

Remove monitor sensor from cylinders 1 to 3.

Tightening torque: 11 78 1AZ, see 11 78 EXHAUST GAS CONTROL, LAMBDA CONTROL SENSOR / LAMBDA MONITOR SENSOR .

Unscrew nuts.

Remove exhaust manifold (1).

Installation:

Clean sealing faces and replace seals.

Replace nuts.

Fig. 324: Locating Exhaust Manifold Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

1166 VACUUM PUMP

11 66 000 REMOVING AND INSTALLING OR REPLACING VACUUM/OIL PUMP (N47 D20 O1)

IMPORTANT: It is possible to remove and install the vacuum oil pump without removing the transmission.

Necessary preliminary work

- Removing oil sump.

Release screws (1).

Remove intake snorkel in direction of arrow.

Fig. 325: Removing Intake Snorkel
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Fig. 326: Identifying Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Installation note:

Clean and blow out thread

Fig. 327: Identifying Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

When installed, the oil pump chain must be fed out from the sprocket wheel of the oil pump drive gear; the sprocket wheel cannot be removed.

NOTE: Illustration shows gear case cover removed.

Fig. 328: Identifying Gear Case Cover Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Oil vacuum pump must be fed out at chain drive (1).

Fig. 329: Identifying Chain Drive
Courtesy of BMW OF NORTH AMERICA, INC.

Feed out oil vacuum pump (1) in direction of arrow and remove.

Installation in reverse sequence.

Installation note:

Clean all sealing surfaces.

Fig. 330: Removing Oil Vacuum Pump
Courtesy of BMW OF NORTH AMERICA, INC.

Install all screws (1) and tighten down.

Tightening torque, see 11 41 1AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE**

Fig. 331: Identifying Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Install and tighten down screws (1).

Fig. 332: Identifying Gear Case Cover Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Installation note:

Clean and blow out thread

Insert and secure screw (1).

Secure screw (1) with special tool 00 9 120 .

Tightening torque, see 11 41 2AZ in **11 41 OIL PUMP WITH STRAINER AND DRIVE**

Fig. 333: Identifying Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

1178 EMISSION CONTROL, OXYGEN SENSOR

11 78 513 REPLACING BOTH LAMBDA OXYGEN CONTROL SENSORS (N52K)

WARNING: Risk of burning!

Work should only be carried out on an exhaust system that has cooled down.

Installation note:

The threads of new oxygen control sensors are already coated with Never Seez Compound.

If a oxygen control sensor is to be reused, apply a thin and even coating of Never Seez compound to the thread only.

The part of the lambda control sensor which projects into the exhaust system branch (sensor ceramics) must **not** be cleaned and **not** coated with lubricant.

Lambda control sensor, cylinder nos. 1 to 3

NOTE: The lambda control sensor on the exhaust manifold of cylinder nos. 1 to 3 is accessible from above. The exhaust system does not have to be removed.

Lambda control sensor, cylinder nos. 1 to 3

Necessary preliminary tasks:

- Remove complete exhaust system **EXHAUST SYSTEM (X3)** or **EXHAUST SYSTEM (X5)** .

Disconnect plug connection on oxygen control sensor (1).

Release lambda control sensor (1) on exhaust manifold of cylinder nos. 4 to 6 with special tool 11 4 260.

Fig. 334: Removing Lambda Oxygen Control Sensor Using Special Tool 11 4 260
Courtesy of BMW OF NORTH AMERICA, INC.

All:

Installation note:

Cable color of lambda control sensor, cylinders nos. 1 to 3 = black.

Cable color of lambda control sensor, cylinders nos. 4 to 6 = grey.

Tightening torque, see 11 78 1AZ in **78 EMISSION CONTROL, OXYGEN SENSOR** .

Assemble engine.

Check function of DME.

11 78 545 REPLACING BOTH LAMBDA OXYGEN MONITORING SENSORS (N52K)

WARNING: Risk of burning!

Work should only be carried out on an exhaust system that has cooled down.

Necessary preliminary tasks:

- Remove underbody protection. See **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT ASSEMBLY UNDERSIDE PROTECTION (X5)** or **51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION (X3)** .

Installation note:

The threads of new lambda monitoring sensors are already coated with Never Seez Compound (refer to BMW Parts Department).

If a lambda monitoring sensor is to be reused, apply a thin and even coating of Never Seez Compound to the thread only.

The part of the lambda monitoring sensor which projects into the exhaust system branch (sensor ceramics) must **not** be cleaned and **not** coated with lubricant.

Disconnect plug connection on lambda monitoring sensor (1).

Release lambda monitoring sensor (1) on exhaust manifold of cylinder nos. 1 to 3 with special tool 11 9 150.

Tightening torque, see 11 78 1AZ in **78 EMISSION CONTROL, OXYGEN SENSOR** .

Installation note:

Cable color of lambda monitoring sensor (1), cylinders nos. 1 to 3 = black.

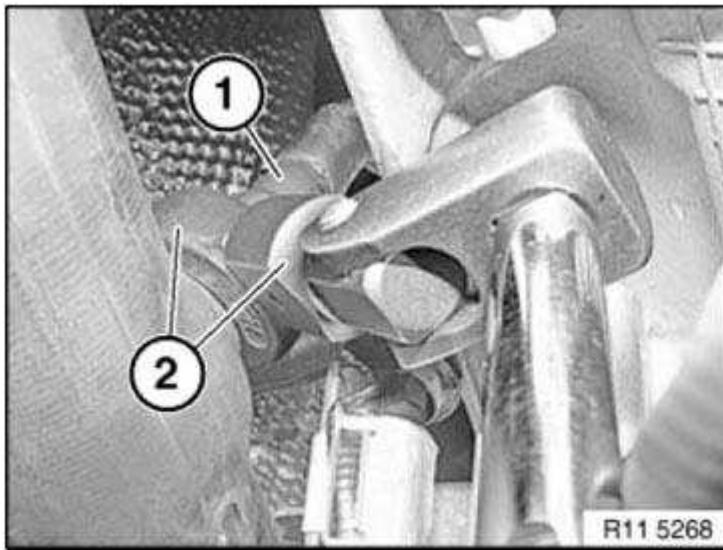

Fig. 335: Removing Lambda Monitoring Sensor Plug Connection Using Special Tool (11 9 150)
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection on lambda monitoring sensor (1).

Release lambda monitoring sensor (1) on exhaust manifold of cylinder nos. 4 to 6 with special tool 11 9 150.

Tightening torque, see 11 78 1AZ in **78 EMISSION CONTROL, OXYGEN SENSOR** .

Installation note:

Cable color of lambda monitoring sensor (1), cylinders nos. 4 to 6 = grey.

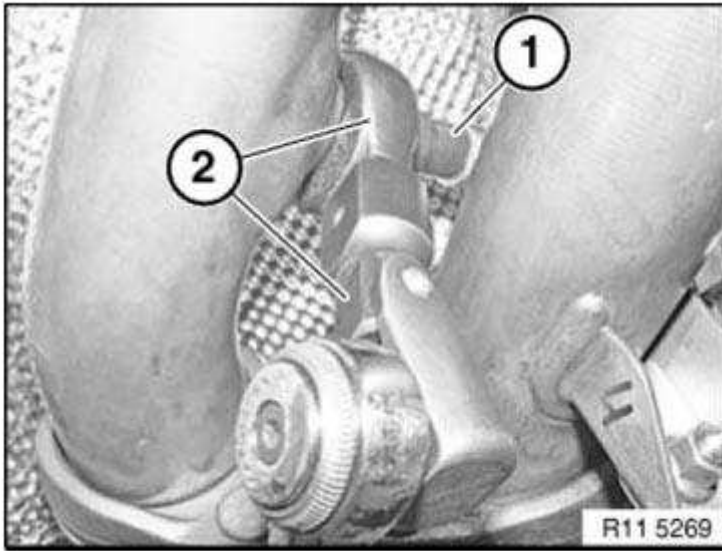

Fig. 336: Removing Lambda Monitoring Sensor Plug Connection Using Special Tool (11 9 150)
Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Check function of DME.

ENGINE

Exhaust System - Operating Fluids

1.0 GENERAL INFORMATION

Detachable joints such as exhaust manifold bolts and exhaust system flange connections can be treated with a grease able to withstand high temperatures and corrosive conditions.

Use Copper Paste (former BMW Part No. 81 22 9 400 794).

BMW PART NUMBER SPECIFICATION

3M	Part No. 8945
CRC	Part No. 3046010

ENGINE

Exhaust System - Tightening Torques - X3

00 EXHAUST SYSTEM, COMPLETE

18 00 EXHAUST ASSEMBLY

EXHAUST ASSEMBLY - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Primary catalytic converter to turbocharger/or jacket pipe to catalytic converter	M57 / M57TU	M10		42 Nm
	M67			15 Nm
	M30 / M70		Tighten down compression spring with nut uniformly to full extent, then slacken by 1.5 turns	10 Nm
	M51		Preload compression springs with nut to 27 ± 1 mm	
	S50	M10		30 Nm
	S54 / ECE	M10		27 Nm
	S54 / US	M10		24 Nm
2AZ Exhaust pipe to flow section	E23			25 Nm
3AZ Clamp for final muffler	All	M8		15 Nm
4AZ Catalytic converter on silencer	E36 / M42 / M43 / M44		Version with compression spring: Evenly preload compression springs with nuts to 30 mm	
5AZ Connection of positive and negative leads to E catalytic converter	M73			5 Nm
6AZ Rear muffler to intermediate muffler	E53	M8		30 Nm
7AZ Vacuum tank to retaining plate	E46 / M54	M8		10 Nm
8AZ Exhaust system to exhaust manifold	M40 / M42 / M43 / M44	M10		45 Nm
9AZ Primary cat. to exhaust system	M57TU / E65			55 Nm

Exhaust Systems - Repair Instructions - X3 & X5

EXHAUST SYSTEM COMPLETE

18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM (M54/N52)

Special tools required:

- 31 2 220

WARNING: Scalding hazard!

Only perform these tasks after exhaust system has cooled down.

Support exhaust system with jack and special tool 31 2 220 and secure against falling out.

Fig. 1: Supporting Exhaust System

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Removal of the exhaust system must be carried out with the assistance of a second person.

Pull off vacuum hose (1).

G03310772

Fig. 2: Locating Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nuts.

Unfasten screws.

G03310773

Fig. 3: Removing Muffler Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and remove complete exhaust system.

G03310774

Fig. 4: Removing Complete Exhaust System
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace nuts.

MUFFLERS, PETROL

18 12 030 REPLACING REAR MUFFLER (M54/N52)

Special tools required:

- 00 2 210

WARNING: Scalding hazard!

Only perform these tasks after exhaust system has cooled down.

Cutting line (4) between center muffler (3) and rear muffler (5).

G03310775

Fig. 5: Locating Cutting Line Between Center Muffler And Rear Muffler
Courtesy of BMW OF NORTH AMERICA, INC.

Determine pipe length on new rear muffler (5).

Carry over dimensions to faulty rear muffler (5) and mark cutting line.

Cut exhaust pipe with special tool 00 2 210 at marked points and deburr.

G03310776

Fig. 6: Cutting Exhaust Pipe

Courtesy of BMW OF NORTH AMERICA, INC.

Pull off vacuum hose (1).

G03310777

Fig. 7: Locating Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts and remove rear muffler.

Connect rear muffler (5) using clamping sleeve.

G03310778

Fig. 8: Connecting Rear Muffler

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Align clamping sleeve so that:

- Nuts point downwards.
- Cutting line is in middle of clamping sleeve.
- There is sufficient spacing to adjoining components.

18 12 040 REMOVING AND INSTALLING/REPLACING FRONT MUFFLER (M54/N52)

Special tools required:

- 00 2 210

WARNING: Scalding hazard!

These tasks should only be carried out on an exhaust system that has cooled down!

Cutting line (2) between front muffler (1) and center muffler (3).

G03310779

Fig. 9: Locating Cutting Line Between Front Muffler And Center Muffler
Courtesy of BMW OF NORTH AMERICA, INC.

Determine pipe length on new front muffler (1).

Carry over dimension to faulty front muffler (1) and mark cutting line.

Cut exhaust pipes with special tool 00 2 210 at marked points and deburr.

G03310780

Fig. 10: Cutting Exhaust Pipes
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nuts (1).

G03310781

Fig. 11: Removing Muffler Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace self-locking nuts.

Installation:

Replace both seals (1).

G03310782

Fig. 12: Replacing Seals

Courtesy of BMW OF NORTH AMERICA, INC.

Connect front muffler (1) to center muffler (3).

G03310783

Fig. 13: Connecting Front Muffler To Center Muffler
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Align clamping sleeves so that:

- Nuts point downwards.
- Cutting line is in middle of clamping sleeve.
- There is sufficient spacing to adjoining components.

18 12 045 REPLACING CENTER MUFFLER (M54/N52)

Special tools required:

- 00 2 210
- 31 2 220

WARNING: Scalding hazard!

Only perform these tasks after exhaust system has cooled down.

Support exhaust system with jack and special tool 31 2 220 and secure against falling out.

Cutting line (2) and (4) between front muffler (1) and rear muffler (5).

G03310786

Fig. 16: Locating Cutting Line And Between Front Muffler And Rear Muffler
Courtesy of BMW OF NORTH AMERICA, INC.

Determine pipe length on new center muffler (3).

Carry over measurement to faulty center muffler (3) and mark cutting lines.

Cut exhaust pipes with special tool 00 2 210 at marked points and deburr.

G03310787

Fig. 17: Cutting Exhaust Pipes

Courtesy of BMW OF NORTH AMERICA, INC.

Connect center muffler (3) to front muffler (1) and rear muffler (5).

G03310788

Fig. 18: Connecting Center Muffler To Front Muffler And Rear Muffler
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Align clamping sleeves so that:

- Nuts point downwards.
- Cutting line is in middle of clamping sleeve.
- There is sufficient spacing to adjoining components.

EXHAUST MANIFOLD WITH INTEGRATED CATALYTIC CONVERTER

18 40 050 REMOVING AND INSTALLING/REPLACING FRONT EXHAUST MANIFOLD (M54/N52)

Necessary preliminary tasks:

- Secure engine in installation position.

- Remove reinforcement plate
- Remove complete exhaust system, refer to **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM**
- Detach grounding cable from body.
- Remove right engine support arm with engine mount
- M54: Remove air pump

NOTE: **The oxygen sensors are in danger of being damaged when the exhaust manifolds are removed and installed.**

Remove front control sensor. Refer to **11 78 511 REPLACING OXYGEN CONTROL SENSOR (CYLINDERS 1-3)**.

Remove cover from fuel injectors.

G03310789

Fig. 19: Removing Cover From Fuel Injectors
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Do not mix up monitor sensors for cylinders 1 to 3 and 4 to 6 at plug connection to wiring harness.
Mark plug connections.
Unclip cable from holder. Disconnect plug connection. Unclip cable on rear side of engine from cable guide.

Remove monitor sensor from cylinders 1 to 3. Refer to **11 78 611 REPLACING OXYGEN MONITOR SENSOR (CYLINDERS 1-3)**.

Unscrew nuts.

G03310790

Fig. 20: Removing Exhaust Manifold
Courtesy of BMW OF NORTH AMERICA, INC.

Remove exhaust manifold (1).

Installation:

Clean sealing faces, replace gaskets.

Replace nuts.

Tightening torque 11 62 1AZ. Refer to **ENGINE - TIGHTENING TORQUES** .

18 40 060 REMOVING AND INSTALLING/REPLACING REAR EXHAUST MANIFOLD (M54/N52)

Necessary preliminary tasks:

- Remove reinforcement plate
- Remove complete exhaust system, refer to **18 00 020 REMOVING AND INSTALLING COMPLETE EXHAUST SYSTEM**
- M54: Remove air pump

NOTE: **The oxygen sensors are in danger of being damaged when the exhaust manifolds are removed and installed.**

Remove rear control sensor. Refer to **11 78 512 REPLACING OXYGEN CONTROL SENSOR (CYLINDERS 4-6)** .

Remove cover from fuel injectors.

G03310791

Fig. 21: Removing Cover From Fuel Injectors
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Do not mix up monitor sensors for cylinders 1 to 3 and 4 to 6 at plug connection to wiring harness.
Mark plug connections.
Unclip cable from holder. Disconnect plug connection. Unclip cable on rear side of engine from cable guide.

Remove monitor sensor from cylinders 4 to 6. Refer to **11 78 612 REPLACING OXYGEN MONITOR SENSOR (CYLINDERS 4-6)**.

Unscrew nuts.

G03310792

Fig. 22: Removing Exhaust Manifold
Courtesy of BMW OF NORTH AMERICA, INC.

Remove exhaust manifold (1).

Installation:

Clean sealing faces, replace gaskets.

Replace nuts.

Tightening torque, see 11 62 1AZ in **ENGINE - TIGHTENING TORQUES** .

Fuel Supply System - Special Tools - X3

16 FUEL SUPPLY SYSTEM

16 1 020 PIN WRENCH

Minimum set: Mechanical tools

Note: For removing and installing fuel level sensor in fuel tank

Series: E31, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

Storage location: C21

SI number: 1 04 99 (425)

Order number: 16 1 020

Pin wrench

Consisting of:

1 = 16 1 021 Basic wrench

2 = 16 1 022 Attachment (2 x)

Note: Model series: E46, E38, E39, R50, R53

Fig. 1: Pin Wrench (16 1 020)

Courtesy of BMW OF NORTH AMERICA, INC.

16 1 080 HOSE GUIDE

Minimum set: Mechanical tools

Note: For unlocking new fuel tank flap systems with safety lock (incorrect fuelling, diesel/petrol/gasoline)

Series: E46, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56

4AZ El. fuel pump control unit to body / holder	E60 / E61 / E63 / E64 / E85 / E86	M6		8 Nm

ENGINE

Fuel System - Operating Fluids

1.0 FUELS FOR GASOLINE ENGINES

Use only unleaded gasoline in vehicles equipped with a catalytic converter.

Fuels containing up to and including 10% of ethanol or other oxygenates with up to 2.8% oxygen by weight, that is, 15% MTBE (methyl tertiary butyl ether) or 3% methanol plus an equivalent amount of co-solvent, will not void the applicable warranties with respect to defects in materials or workmanship.

Although, usage of such alcohol fuel blends may result in driveability, starting, and stalling problems due to reduced volatility and lower energy content of the fuel. Those driveability problems may be especially evident under certain environmental conditions, such as: high or low ambient temperatures and high altitude.

Only specially adapted vehicles (FFV-Flexible Fuel Vehicles) can run on high alcohol fuel blends. BMW, for the various technical and environmental reasons explained below, does not offer FFV models.

Usage of E85, or any other high alcohol content blend (e.g. E30) in BMW vehicles, will cause various driveability complaints (cold start problems, stalling, reduced performance, poor fuel economy, etc.), may cause excessive emissions, and may cause irreversible damage to engine, emission control and fuel delivery systems due to incompatibility of materials with alcohols.

General Notes Regarding E85 Fuel.

E85 fuel contains 85% (by volume) of ethanol and 15% of gasoline. Ethanol can be produced chemically from ethylene or biologically from grains, agricultural wastes, or any organic material containing starch or sugar. In the US, ethanol is mainly produced from corn and is classified as a renewable fuel.

Similar to gasoline, ethanol contains hydrogen and carbon; with additional oxygen molecules build into its chemical chain. This chemical structure makes ethanol's burning process slightly cleaner compared to the gasoline (lower tailpipe emissions).

On the other hand, due to lower carbon content, ethanol provides 27% less energy (for identical volume) than gasoline, resulting in the reduced fuel economy of E85 vehicles (approximately 22% higher consumption). Increased fuel consumption requires the appropriately enlarged fuel tank capacities (usually 30% increase), and the specific DME calibrations for the E85 lower Stoichiometric air/fuel ratio (10 compared to 14.7 for gasoline engines).

E85 fuel volatility is typically lower than gasoline (RVP 6-10 psi, compared to 8-15 psi for gasoline). Lower fuel volatility will reduce vehicle evaporative emissions, but it may cause cold starting problems especially with lower ambient temperatures.

Under certain environmental conditions, mainly lower ambient temperatures, ethanol separates from gasoline/alcohol mixture and absorbs water. The ethanol absorbed water molecules are heavier than gasoline or ethanol, they remain at the bottom of fuel tank and when introduced into combustion process they tend to form

an extremely lean mixture resulting in misfire, rough idle and cold starting problems.

Certain materials, commonly used with gasoline are totally incompatible with alcohols. When these materials come in contact with ethanol, they may dissolve in the fuel, which may damage engine components and may result in poor vehicle driveability.

Some metals (e.g. zinc, brass, lead, aluminum) become degraded by long exposure to ethanol fuel blends. Also, some nonmetallic materials used in automotive industry such as: natural rubber, polyurethane, cork gasket material, leather, polyvinyl chloride (PVC), polyamides, methyl-methacrylate plastics, and certain thermo & thermoset plastics degrade when in contact with fuel ethanol.

In order to safely and effectively operate a motor vehicle running on E85, the vehicle must be compatible with alcohol use. Some manufacturers have developed vehicles called FFV (Flexible Fuel Vehicle) that can operate on any blend of ethanol and gasoline (from 0% ethanol and 100% gasoline, up to 85% ethanol and 15% gasoline). Ethanol FFVs are similar to gasoline vehicles, with main differences in materials used in fuel management and delivery systems, and DME control module calibrations. In some cases, also E85 vehicles require special lubricating oils.

Aftermarket conversions of gasoline-powered vehicles to ethanol-fueled vehicles, although possible, are not recommended due to internal materials and DME software incompatibility, as well, as the high costs of conversion.

TOP TIER DETERGENT GASOLINE

Deposit-control additives have been required by the EPA in all gasoline from 1995, however, since the introduction of the lowest additive concentration (LAC) most gasoline manufacturers have actually reduced the concentration level of detergent additives by up to 50%.

Low content of cleaning additives results in an excessive accumulation of deposits on fuel injectors, the intake valves, the exhaust manifold or inside the combustion chamber. Due to deposits build-up, customers may experience various driveability problems (e.g. cold start problems, rough idle), increased emissions with Service Engine Soon light illumination, reduced engine performance and poor fuel economy.

In order to increase the level of detergent additives in gasoline, the TOP TIER Detergent Gasoline requirements were approved by four automotive companies (BMW, GM, Honda and Toyota).

Usage of the TOP TIER Gasoline will help keep engines cleaner, and will reduce deposits-related concerns.

A number of gasoline retailers have already met the TOP TIER Detergent Gasoline requirements and are offering this product in all octane grades in all of their respective marketing areas. The current TOP TIER Gasoline retailers are: QuickTrip®, ChevronTexaco®; ConocoPhillips®; 76®; Shell®; Entec Stations®; MFA Oil Company®; Kwik Trip®/Kwik Star®; The Somerset Refinery, Inc.®; Aloha Petroleum®; Jiffy Mart®; Mahalo®; Trip-Par Oil Company®. All gasoline outlets carrying the brand of the approved retailer must conform to TOP TIER requirements on products advertised as such.

BMW recommends using TOP TIER Detergent Gasoline of minimum octane rating of AKI 91 and with alcohol content of less than 10% by volume (or any other oxygenates with up to 2.8% of oxygen by weight). Only the exclusive usage of TOP TIER Gasoline provides the full benefit of reducing deposits build-up.

ALCOHOL DETECTION PROCEDURE

Fuel Blends containing a high percentage (10% and above) of alcohol, mainly ethanol, are becoming more commercially available. Usage of E85, or any other high alcohol content blend (e.g. E30) in BMW vehicles, will cause various driveability complaints (cold start problems, stalling, reduced performance, poor fuel economy, etc.), may cause excessive emissions, and may cause irreversible damage to engine, emission control and fuel delivery systems due to incompatibility of materials with alcohols.

In order to correctly diagnose various driveability complaints caused by fuel blends with a high level of ethanol content, BMW is providing you with an alcohol detection test tool.

Distribution of the following tool will be through the Automatic Tool Shipment Program. Additional tools may be purchased through your PDC. All prices on this bulletin are introductory prices and are only valid during the Automatic Tool Shipment.

Procedure

Safety Precautions:

Gasoline is highly flammable; observe normal precautions for working with flammable liquids. Perform all tests away from any source of ignition. A class B fire extinguisher must be available. Wear protective eye protection with side shields and Nitrile rubber gloves for handling syringe. Please adhere to any applicable OSHA regulations when handling Gasoline. Dispose of the mixture according to local, state and federal regulations.

Fill a clean container with gasoline drawn from the fuel system of the affected vehicle then fill another container with water. Only a small amount of fuel is needed to perform the test (5 ounces of each fluid).

Slowly draw 3cc of water into the syringe. Note: To remove air, draw at least 5cc to 6cc of water, invert the syringe and squirt the water out until the top rim of the rubber plunger is at the 3cc mark.

Slowly draw gasoline into the syringe until the fluid reaches the 12cc mark. Place your finger over the tip of the syringe, vigorously shake the syringe for one minute. Relieve built-up pressure by occasionally removing your finger.

Place the syringe on a flat surface with the nozzle pointing up, allow the syringe to stand for one minute.

If alcohol is present in the fuel, it will separate from the gasoline and dissolve in the water.

Empty the syringe and rinse thoroughly with water, allow drying and apply a silicone lubricant to the rubber plunger before storing.

ALCOHOL PERCENTAGE REFERENCE

Boundary Line	% Alcohol	Boundary Line	% Alcohol
9.0cc	0%	5.0cc	45%
8.6cc	5%	4.5cc	55%
8.1cc	10%	4.1cc	60%
7.7cc	15%	3.6cc	65%

7.2cc	20%	3.2cc	70%
6.8cc	25%	2.7cc	75%
6.3cc	30%	2.3cc	80%
5.9cc	35%	1.8cc	85%
5.4cc	40%	1.4cc	90%

WARRANTY INFORMATION

Components damage/malfunctions, or any driveability problems caused by use of fuels containing more than 10% ethanol (or other oxygenates with more than 2.8% oxygen by weight) will not be covered under BMW warranties with respect to defects in materials or workmanship. Please document the results found on the vehicle repair order whenever performing this test

ANTI-KNOCK PROPERTIES

The anti-knock value is the quality rating for gasoline and is a requirement for controlled combustion. Anti-knock value is expressed with an octane number. A higher number indicates better anti-knock properties of a gasoline. Internationally approved methods are used to determine the Research Octane Number (RON) and the Motor Octane Number (MON). In the United States the Anti-Knock Index (AKI) is displayed at the gas pumps.

$$AKI = \frac{RON + MON}{2}$$

Fig. 2: Identifying Formula
Courtesy of BMW OF NORTH AMERICA, INC.

BOILING RANGE AND VAPOR PRESSURE

Gasolines must be highly volatile. The boiling range and vapor pressure values are used for evaluation. Gasolines do not have a boiling "point", but rather a boiling "line", since they are produced from a mixture of various hydrocarbon components.

The boiling line (boiling range) and therefore vapor pressure have influence on, for example,

- vapor lock
- starting behavior
- evaporation loss
- transition and driving behavior
- engine oil dilution
- perfect combustion

The boiling range is different for summer and winter gasolines. The vapor pressure test is another means of determining the behavior of a gasoline.

SPECIFIC GRAVITY

The specific gravity is determined by gasoline components. The volume changes with the temperature. Due to the different compositions there are different values for premium grade and regular grade gasolines.

CALORIFIC VALUE

The calorific value expresses the power content of a gasoline. The calorific value of a combustible fuel/air mixture is of prime importance for the power output of engines.

PURITY, COMBUSTION DEPOSITS

Gasolines must be free of contamination. Pumps, jets, injectors, valves and lines must not be clogged or plugged up. Residue and deposits in the intake system and combustion chamber will impair engine operation. The solid residue from evaporation of gasoline provides information on the degree of contamination.

SULFUR CONTENT

The sulfur content of all gasolines should be as low as possible. In this manner there will be less sulfuric acids or sulfur acids in the combustion residue, which would lead to corrosion and sulfuric emissions on an engine running without reaching operating temperature.

1.1 MINIMUM OCTANE AND AKI RATINGS FOR GASOLINE ENGINES

Up to 2005 model year

MINIMUM OCTANE AND AKI RATINGS FOR GASOLINE ENGINES

	Leaded Gasoline Premium Grade	Regular Grade
RON (Research Octane No.)		at least 91.0
MON (Motor Octane No.)		at least 82.7

AKI*		at least 93.0	at least 87.0
		Unleaded Gasoline	
	Premium Grade	Mid-Range	Grade Regular Grade
RON	at least 98.0	at least 95.0	at least 91.0
MON	at least 88.0	at least 85.0	at least 82.5
AKI*	at least 93.0	at least 90.0	at least 87.0

*Anti-Knock Index $AKI = \frac{RON + MON}{2}$

2.0 FUEL SYSTEM CLEANER PLUS

Recent field experiences have shown a significant increase in various driveability complaints due to excessive carbon deposits in engine's combustion chambers, on the intake valves and fuel injectors.

The overall rise in carbon deposits accumulation is generally attributed to poor gasoline quality, namely, low level of cleaning additives and fuel contamination.

TECHNICAL BACKGROUND

Combustion chamber deposit formation is a by-product of the gasoline burning process. Fuel injector and intake valve deposits may become less troublesome with the recently introduced Top Tier Detergent Gasoline deposit control standards, which are exceeding the detergent requirements imposed by the EPA since 1995.

However, vehicles that do not exclusively use a Top Tier Detergent Gasoline, or are regularly driven in severe service conditions, such as stop-and-go traffic, high ambient temperatures, and high altitude can experience performance problems caused by intake system and combustion chamber deposits.

The most common customer complaints may include:

FUEL INJECTORS

Deposits at the injector's tip can impact fuel flow, upsetting the air/fuel mixture ratio.

Symptoms: Hesitation or stumble during acceleration, even loss of power. Poor fuel efficiency. Increased emissions of HC and CO. "Service Engine Soon" light illumination due to intermittent misfire faults, or lean mixture adaptation values

INTAKE VALVES:

Deposits at the valves and on the intake manifold ports can absorb fuel during the warm-up phase, leaning out

the air/fuel mixture ratio. Carbon build-up may disturb mixture flow at low throttle conditions/idle speeds.

Symptoms: Poor driveability, loss of power, unstable/rough idle, increased emissions of HC, CO and NOx. "Service Engine Soon" light illumination due to intermittent misfire faults.

COMBUSTION CHAMBER:

Combustion Chamber Deposit Interference, or CCDI, occurs when there is a contact between carbon deposits on the piston crown and cylinder head. The noise can be confused or misdiagnosed as ping, knock or other noises that could indicate a mechanical failure. CCDI occurs first as a cold start noise that can fade as the engine warms to operating temperature. The noise will reoccur at the next cold start. As deposits build, there is an increase in compression temperature that may cause pre-ignition detonations.

Symptoms: Knocking, pinging, run-on, poor acceleration, octane requirement increase, increased emissions of NOx, engine idle speed surges.

Depending on the manufacturer, fuels may contain various additives such as: oxidation and corrosion inhibitors, metal deactivators, emulsifiers, anti-icing agents & dyes, plus they are required to include some form of an intake system deposit control package. Unfortunately, not all fuels are created equal, and some additive packages are not effective enough to maintain integrity of the intake systems in high performance engines, or engines operating in severe environmental conditions. Even worse, the intake system deposit control additives in some fuels may actually contribute to the combustion chamber deposits accumulation, and to the problems associated with those deposits: knock, run-on and increased emissions of oxides of nitrogen.

RECOMMENDATION

BMW recommends using TOP TIER Detergent Gasoline of minimum octane rating of AKI 91 and with alcohol content of less than 10% by volume (or any other oxygenates with up to 2.8% of oxygen by weight). Only the exclusive usage of TOP TIER Detergent Gasoline provides the full benefit of reducing deposits formation.

If the TOP TIER Detergent Gasoline is unavailable, we recommend BMW Group Fuel System Cleaner Plus (PN 82 14 0 413 341) be added to the gas tank. For optimum cleaning and deposits control, add a 20 fl. oz. bottle every 3,000 miles when refueling.

Regular use of BMW Group Fuel System Cleaner Plus can help address carbon deposits related symptoms listed above. By removing these deposits, an engine may experience restored power, performance and fuel efficiency, a smoother idle running, lower emissions, and reduced octane requirement.

BMW Group Fuel System Cleaner Plus uses polyether amine TECHRON® based technology developed and patented by Chevron. BMW Group Fuel System Cleaner Plus has proven to clean up deposits in fuel injectors, ports & intake valves and reduces the harmful effects of combustion chamber deposits. It helps restore performance lost due to deposit buildup.

Chevron and BMW have run an extensive "no harm" tests with polyether amine technology. When used as directed, it will not harm catalytic converters, oxygen sensors, or any other mechanical components of the engine, or fuel delivery system.

The effectiveness of the additive depends on its presence in the gasoline in large concentrations for short

periods of time. One treatment is usually sufficient, but a second treatment (one 20 oz bottle per each, consecutive full tank of gas) may give additional benefits. To keep your fuel intake system clean, we recommend usage at every 3000 miles.

Additionally, vehicle's fuel sending units equipped with silver plated resistor card/contacts are especially vulnerable to attacks by elemental sulfur and/or hydrogen sulfide found in fuels. Adding BMW Group Fuel System Cleaner Plus immediately upon noticing erratic fuel gauge behavior may, in many cases, restore proper performance due to the additive's ability to remove the harmful sulfur compounds from the sending unit's contact surface. Additionally, BMW Group Fuel System Cleaner Plus can help protect the fuel gauge from future malfunctioning by coating all metal surfaces of the fuel system.

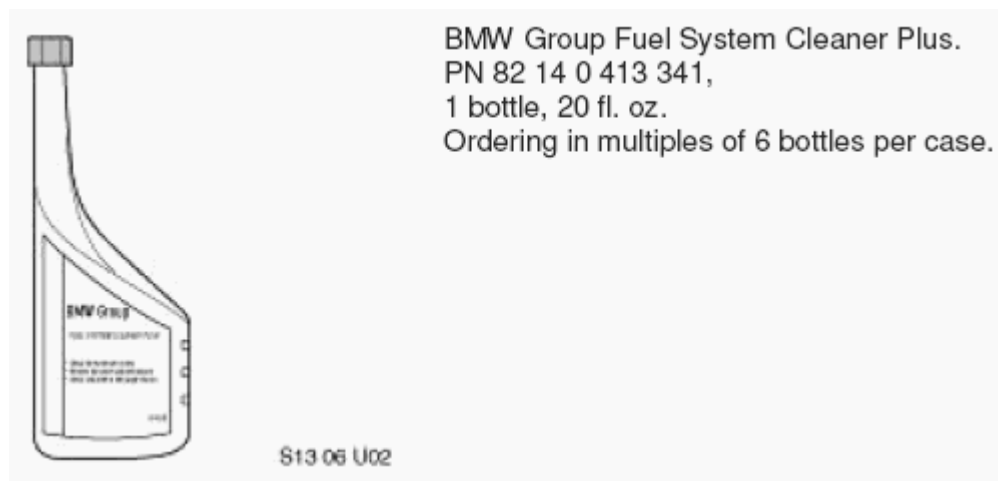

Fig. 4: Identifying BMW Group Fuel System Cleaner Plus
Courtesy of BMW OF NORTH AMERICA, INC.

WARRANTY INFORMATION

Because carbon deposit build-up is related to fuel quality, it cannot be considered as a defect in vehicle's materials or workmanship. Consequently, usage of BMW Group Fuel System Cleaner Plus is not covered under the terms of the BMW New Vehicle Limited Warranty or maintenance plan.

ENGINE

Fuel System - Repair Instructions - X3

00 FUEL PICK-UP, CLEANING SYSTEM

16 00 GENERAL FUNCTION DESCRIPTION FOR FUEL SUPPLY SYSTEMS

Fuel supply systems, spark-ignition engines

Fuel system

The electric fuel pump in the fuel tank generates the pressure in the fuel system which is set by the pressure regulator to a specific level.

Tank venting system

The tank venting system is an enclosed system which is vented via a carbon canister. The carbon is incorporated in the carbon canister as granulate. The large surface of the carbon stores the fuel vapors which occur in the fuel tank. The carbon canister must be regenerated on a regular basis so as to be able to continue storing fuel vapors. Regeneration is performed by way of purging with fresh air via the intake manifold. This process is controlled by the engine control unit.

Fuel supply systems, diesel engines

Fuel system

The electric fuel pump in the fuel tank supplies the engine with fuel. Two types of high-pressure pump are used for cylinder injection.

1. The distributor injection pump supplies each cylinder directly with fuel via the corresponding injection nozzle.
2. The high-pressure pump for the common rail systems generates in the fuel rail the necessary pressure for all the injection nozzles.

In common rail systems, a further pump (inline pump, M57/gear pump, M67) is connected between the high-pressure pump and the electric fuel pump. This pump supports the fuel pump in the fuel tank in the event of a high fuel demand.

Tank venting system

Diesel fuel is non-volatile and therefore a carbon canister is not required. The fuel tank is vented directly to atmosphere.

16 00 ... FUEL SUPPLY SYSTEM (PETROL/GASOLINE)

1. **General**

Fig. 2: Identifying Fuel Supply System Components (US Version)
 Courtesy of BMW OF NORTH AMERICA, INC.

3. Function description (see also drawing)

Fuel system

The saddle-shaped fuel tank contains the surge chamber with integrated electric fuel pump on its right side.

The surge chamber ensures that the fuel pump is properly supplied in all vehicle operating states.

The fuel is pumped from the right side of the fuel tank into the surge chamber via the suction jet pump integrated in the surge chamber.

The suction jet pump in the left fuel tank half pumps the fuel through the tank expansion line to the right side of the fuel tank.

The suction jet pump is operated via the fuel feed line.

Return line, pressure regulator and fuel filter are located in the tank.

Fuel supply to engine:

The fuel is routed from the electric fuel pump via the fuel feed line and the fuel filter/pressure regulator unit to the fuel rail.

Pressure regulator and fuel filter are incorporated in a single unit in the tank. There is thus no need for a fuel return line.

The fuel passes through the pressure regulator into the left side of the fuel tank and thereby drives a suction jet pump. This pump repumps the fuel from the left side of the tank to the right side.

The fuel rail is return-free.

Tank venting system (US version):

The fuel tank is vented during refuelling via the refuelling vent line.

Because of its large cross-section, the refuelling vent line directs the displaced volume (fuel vapors) at high speed through the expansion volume to the carbon canister.

The activated carbon retains the fuel contained in the fuel vapors. The cleaned air is discharged to atmosphere via the evaporation line, the tank leak diagnosis module and the dust filter.

During driving, the system tank is vented in the same way via the vent line.

The condensed constituents of the fuel vapors remain in the tank because the tank has an integrated compensating volume.

The refuelling shutoff valve in the fuel tank is closed by the rising fuel if the fuel tank is overfilled. The ventilation function is maintained by a second float valve.

All three valves are designed as rollover valves. This prevents fuel from escaping from the fuel tank in extreme vehicle positions (overturning, inclined position).

The carbon canister is regenerated by purging with fresh air.

The DME control unit opens the tank vent valve. Thus the vacuum pressure of the engine intake manifold is applied at the purge air line. The carbon canister is purged in this way. The fresh air needed for this purpose is supplied via the tank leak diagnosis module and the dust filter. The fuel constituents bound by the activated carbon are flushed out by the supplied air and directed via the purge line to the engine for combustion.

This operation is only possible while the engine is running.

Tank venting system (worldwide):

Refer to Tank venting system (US version) with following differences:

1. Carbon canister has a smaller capacity.
2. No tank leak diagnosis module or dust filter.

Leak diagnosis for tank venting system (US version):

The tank leak diagnosis module (see drawing 5.2) serves to diagnose leakages for the tank venting system within the on - board diagnosis laid down by legislation.

The tank venting system is pressurized and the pressure loss is detected in the event of a leak.

The tank leak diagnosis module is activated by the DME control unit and detects the pressure loss by way of the power consumption of the integrated pump. The air required for this purpose is supplied via the dust filter.

The pressure test line establishes the connection between fuel tank and fuel filler neck. This enables a leak to be detected in the fuel filler pipe - fuel tank cap area.

Determining fill level in fuel tank:

The fuel level is measured by means of lever-type sensors on both sides of the fuel tank. The combination of the determined ohm values from the right and left lever-type sensors produces the actual level in the fuel tank.

4. Service data, fuel system

Fuel pump operating pressure.

16 00 005 DRAINING AND FILLING FUEL TANK

Special tools required:

- 16 1 020
- 16 1 080

IMPORTANT: Observe country-specific safety regulations.

Ensure adequate ventilation in the place of work!

Connect the exhaust and extraction systems to the exhaust tailpipe.

The electric fuel pump must not operate without fuel! After completing repairs but before starting the engine for the first time, fill the fuel tank with min. 5 l fuel through the fuel filler pipe.

Do not damage non-return flap when pulling out extraction hose.

Diesel vehicles:

Before starting the engine for the first time, if the tank has been run dry or drawn off, fill with diesel fuel and turn on ignition for approx. 1 minute. The fuel circuit is thus filled and vented, which results in the engine firing more quickly.

Drawing off fuel:

Start engine and allow to run.

The electric fuel pump runs.

In this way, the fuel is repumped through the suction jet pump from the left to the right side of the fuel tank.

NOTE: Fuel can be drawn out of left and right sides of tank through filler neck, leaving only a small residue. The residual quantity is drawn off through the service opening (on right/left).

Insert special tool 16 1 080 into filler neck.

Special tool 16 1 080 has two different diameters for petrol/gasoline and diesel vehicles!

Slide extraction hose of extractor unit through special tool 16 1 080 into the fuel filler pipe, turning in the process if necessary.

Insertion length of extraction hose: 120-130 cm.

Draw off fuel as much as possible with extractor unit.

Follow drawing off of fuel on fuel gauge in instrument cluster.

Fig. 3: Special Tool 16 1 080

Courtesy of BMW OF NORTH AMERICA, INC.

Drawing off residual fuel quantity:

IMPORTANT: Ensure car interior is adequately ventilated.
Catch dripping fuel in a suitable container.
Release sealing ring with special tool 16 1 020 and remove cap for service opening (left/right).
Tightening torque: 16 14 2AZ, see 16 14 FUEL PUMP .

Draw off residual fuel quantity through service openings.

Fig. 4: Special Tool 16 1 020
Courtesy of BMW OF NORTH AMERICA, INC.

Fuel filling:

Insert special tool 16 1 080 into filler neck.

Special tool 16 1 080 has two different diameters for petrol/gasoline and diesel vehicles!

Slide extraction hose of extractor unit approx. 40 cm into fuel filler pipe.

Fill fuel from suction extractor unit.

Fig. 5: Special Tool 16 1 080

Courtesy of BMW OF NORTH AMERICA, INC.

Drawing off after fault in suction jet pump:

Draw off right half of tank completely through fuel filler pipe.

Remove cap from left service opening.

Insert extraction hose through service opening in tank, fuel (also residual quantity) can be drawn off.

Fig. 6: Extraction Hose

Courtesy of BMW OF NORTH AMERICA, INC.

16 00 510 CONDUCTING LEAK TEST ON FUEL TANK AND TANK VENTING SYSTEM

NOTE: The following procedure is only applicable to vehicles with the tank leak diagnosis module (DMTL).
For vehicles without tank leak diagnosis module:
Pressurize fuel tank and tank venting system.
During the leak test with a leak detector, be sure to follow the operating instructions of the equipment manufacturer.

NOTE: Select "Tank leak diagnosis module (DMTL)" on Diagnosis and Information System (DIS).

- The leak diagnosis pump pressurizes the fuel tank and tank ventilation system for 30 sec.
- If pressure is needed for longer than 30 sec., press "Activate" button again after 30 sec.

IMPORTANT: On vehicles with tank leak diagnosis modules (DMTL), do not work with external pressurization as the tank ventilation system will leak under this condition.
On account of emerging fuel vapors, carry out all work in well ventilated rooms.
Or use a suitable extractor system.

Observe country-specific accident prevention and occupational safety regulations.

The leak test can be carried out with a leak detector. Possible causes may be:

- Tank cap leaking check tank cap pressure relief valve, see **16 11 130 Checking filler cap pressure relief valve.**
- Tank venting lines leaking (fuel tank - carbon canister - tank venting valve).
- Tank vent line leaking (engine compartment).
- Fuel level sensor flange on tank leaking.

Fig. 7: Leak Detector

Courtesy of BMW OF NORTH AMERICA, INC.

11 FUEL TANK WITH MOUNTING

16 11 030 REMOVING AND INSTALLING/REPLACING FUEL TANK

Special tools required:

See .

- 13 5 281
- 13 5 282

IMPORTANT: After installation of fuel tank/prior to first engine start-up:

- Check ground connection at fuel filler neck to body for continuity. If necessary, clean contact surface between body and fuel filler pipe screw connection.
- Fill fuel tank with min. 5 l fuel.

Necessary preliminary tasks:

- Draw off fuel from fuel tank, see **16 00 005 Draining and filling fuel tank**
- Remove rear seat bench, see **52 26 005 REMOVING AND INSTALLING/REPLACING REAR SEAT (THROUGH-LOADING SYSTEM)** .
- Remove underbody panelling, see **51 47 ... REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT UNDERBODY PANELLING** .
- Remove handbrake Bowden cables, see **34 41 120 REMOVING AND INSTALLING/REPLACING BOTH HANDBRAKE BOWDEN CABLES** .
- Remove complete propeller shaft, see **26 11 000 REMOVING AND INSTALLING PROPELLER SHAFT (CARDAN UNIVERSAL JOINT) COMPLETELY** .

Release screws (1) and remove cover (2) from right side of fuel tank.

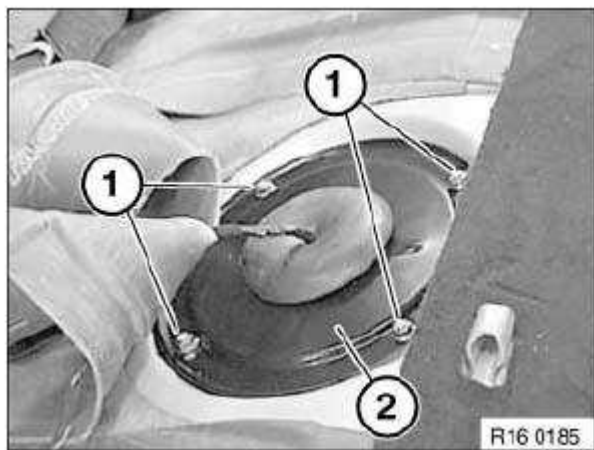

Fig. 8: Cover Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Right side:

Disconnect plug (1) and service vent line (3) from delivery unit.

Fig. 9: Plug And Service Vent Line

Courtesy of BMW OF NORTH AMERICA, INC.

Left side (diesel only):

Unlock quick-release fastener (1) and detach vent line.

Fig. 10: Quick-Release Fastener

Courtesy of BMW OF NORTH AMERICA, INC.

Release hose clamp (1) and detach fuel filler hose (2).

Installation:

Tightening torque: 16 12 10AZ, see **16 12 FUEL DELIVERY** .

Unclip line (3) from holders.

Fig. 11: Hose Clamp And Fuel Filler Hose

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and disconnect fuel feed line (1).

Unlock and disconnect fuel return line (2).

Fig. 12: Fuel Feed Line And Fuel Return Line
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw and unclip lines (1) from holder.

IMPORTANT: Risk of damage: Do not kink lines.

Fig. 13: Fuel Lines
Courtesy of BMW OF NORTH AMERICA, INC.

Seal fuel feed line with special tools 13 5 281 and 13 5 282 .

Fig. 14: Special Tools 13 5 281 And 13 5 282
Courtesy of BMW OF NORTH AMERICA, INC.

Heavily support the fuel tank.

Fig. 15: Supporting Fuel Tank
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw.

Installation:

Tightening torque: 16 11 1AZ, see **16 11 FUEL TANK AND MOUNTING PARTS** .

Fig. 16: Locating Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws for tightening straps on left and right and remove tightening straps.

Installation:

Tightening torque: 16 11 1AZ, see **16 11 FUEL TANK AND MOUNTING PARTS** .

Fig. 17: Locating Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Note rubber mount with spacer bush.

Wide collar on spacer bush points to screw head.

Fig. 18: Locating Rubber Mount Spacer Bush
Courtesy of BMW OF NORTH AMERICA, INC.

Lower tank until line (1) is accessible.

Unclip line (1) from holders.

Remove fuel tank downwards.

**IMPORTANT: Risk of damage: Feed out fuel line (2).
Do not kink fuel line.**

NOTE: Illustration shows: tank removed.

Fig. 19: Fuel Lines
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The following components must be modified when the fuel tank is replaced:

- Left sensor unit
- Right sensor unit
- Fuel lines on tank

16 11 060 REMOVING AND INSTALLING OR REPLACING FUEL FILLER PIPE

Necessary preliminary tasks:

- Remove rear right wheel arch trim, see **51 71 041 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT WHEEL ARCH COVER** .
- Draw off fuel from fuel tank, see **16 00 005 Draining and filling fuel tank**.

Unhook retaining strap (1) from tank flap.

Open cap and set to one side.

Fig. 20: Retaining Strap

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten hose clip (4).

Installation:

Replace hose clip.

Tightening torque: 16 12 10AZ, see **16 12 FUEL DELIVERY** .

Fig. 21: Hose Clamp And Fuel Filler Hose
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: With petrol/gasoline engine only!

Detach vent line (1) and (2) from fuel filler pipe.

Fig. 22: Vent Lines
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: With diesel engine only!

Unclip vent line (1) from holder on fuel filler pipe (2).

Fig. 23: Vent Line And Fuel Filler Pipe
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nuts.

Tightening torque: 16 12 11AZ, see **16 12 FUEL DELIVERY** .

Unclip vent line (2) from holder on fuel filler pipe (1).

Fig. 24: Vent Line And Fuel Filler Pipe
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nut (1).

Tightening torque: 16 12 16AZ, see **16 12 FUEL DELIVERY** .

Withdraw fuel filler pipe (2) completely out of rubber gaiter at wheel arch.

Installation:

Make sure rubber gaiter is correctly seated.

Fig. 25: Removing Fuel Filler Pipe

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean **contact surface** on body and grounding lead on fuel filler pipe.

Ground connection must be guaranteed.

16 11 130 CHECKING FILLER CAP PRESSURE RELIEF VALVE

Special tools required:

See , **16 FUEL SUPPLY SYSTEM** .

- 13 3 010
- 16 1 171
- 16 1 172

Set pressure regulator on special tool 16 1 171 fully in " -" direction.

Connect special tool 16 1 171 via compressed air line (1) to workshop/garage compressed air system (8 ... 10 bar).

Connect pressure sensor (2) from Diagnosis and Information System.

Fig. 26: Special Tool 16 1 171 And Pressure Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

Connect special tool 16 1 172 to fast-release coupling of special tool 16 1 171 .

Install fuel tank cap on special tool 16 1 172 (3).

Fig. 27: Special Tool 16 1 172
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Only the absolute pressure is indicated in the display of the Diagnosis and Information System (DIS). The current ambient air pressure is already displayed without additional pressurization.

Check testing equipment for leaks!

Select "Measurement/ Pressure" function on Diagnosis and Information System (DIS).

Increase pressure by 0.2 bar with pressure regulator on special tool 16 1 171 .

Using special tool 13 3 010 , disconnect supply line from special tool 16 1 171 .

Read off and note down pressure.

Wait 60 secs.

Read off pressure again and compare with starting pressure value.

Measurement evaluation:

FILLER CAP PRESSURE RELIEF VALVE MEASUREMENT EVALUATION

Pressure drop > 0.012 bar	Testing equipment leaking. Check connection points for leaks.
---------------------------	--

Check filler cap pressure relief!

Select "Measurement/ Pressure" function on Diagnosis and Information System (DIS).

Increase pressure by 0.3 bar with pressure regulator on special tool 16 1 171 .

Using special tool 13 3 010 , disconnect supply line from special tool 16 1 171 .

Read off and note down pressure.

Wait 60 secs.

Read off pressure value again and compare with starting pressure value.

Measurement evaluation:

FILLER CAP PRESSURE RELIEF VALVE MEASUREMENT EVALUATION

Pressure drop > 0.012 bar	Filler cap pressure relief valve faulty. Replace fuel tank cap.
---------------------------	--

16 11 350 REPLACING CLAMPING BANDS FOR FUEL TANK

Necessary preliminary tasks:

- Remove **UNDERBODY PANELLING**

IMPORTANT: Secure fuel tank against slipping and falling out.

Heavily support the fuel tank.

Fig. 28: Heavily Support The Fuel Tank
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove clamping band. Installation: tightening torque, 16 11 1AZ, see **16 11 FUEL TANK AND MOUNTING PARTS** .

Fig. 29: Release Screws (1) And Remove Clamping Band
Courtesy of BMW OF NORTH AMERICA, INC.

16 11 071 REPLACING RUBBER SLEEVE BETWEEN FUEL FILLER PIPE AND FUEL TANK

Recycling

- Fuel escapes when fuel lines are detached. Have a suitable collecting container ready.
- Catch and dispose of escaping fuel.
- Observe country-specific waste-disposal regulations.

Important

- Ensure adequate ventilation in the place of work!

- Avoid skin contact (wear gloves)!
- Before starting the engine for the first time: Fill fuel tank with at least 5 litres of fuel.

Necessary preliminary tasks:

- Draw off **fuel from fuel tank**
- Remove right underbody panelling. See **51 47 ... REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT UNDERBODY PANELLING** .

Loosen hose clamps (1). Detach rubber sleeve (2) first from fuel filler pipe and then from fuel tank. Installation: Tightening torque 16 12 10AZ, see **16 12 FUEL DELIVERY** .

Fig. 30: Detaching Rubber Sleeve

Courtesy of BMW OF NORTH AMERICA, INC.

12 FUEL DELIVERY, SENSOR FOR DISPLAY

16 12 ... CHECKING REPUMPING FUNCTION OF SUCTION - JET PUMP WITH BMW DIAGNOSIS SYSTEM

IMPORTANT: Ensure adequate ventilation in the place of work!

Ensure absolute cleanliness when working on the open fuel tank.

Contaminants in the fuel tank can impair driving operation or may even result in vehicle breakdown!

Catch escaping fuel in a suitable container.

Necessary preliminary tasks:

- Fill level must be less than or equal to 28 l
 - Draw off fuel from fuel tank, see **16 00 005 Draining and filling fuel tank**.
- Pour two to three litres of fuel into the left tank chamber via the flange opening
- Connect diagnosis system

- Path:
 - Brief test KOMBI Instrument cluster
 - Diagnosis control unit functions
 - Diagnosis requests
 - Tank sensor 1, tank sensor 2

NOTE: Tank sensor 1 = right tank sensor
Tank sensor 2 = left tank sensor

Start engine.

Compare display for left and right tank chambers.

Repumping function OK

If fill level of tank sensor 2 (left chamber) is falling (approx. one litre per minute).

Repumping function not OK

If fill level of tank sensor 2 (left chamber) is stable or rising.

16 12 000 REMOVING AND INSTALLING/REPLACING FUEL GAUGE SENSOR (PETROL/GASOLINE, RIGHT, N52)

Special tools required:

See **16 FUEL SUPPLY SYSTEM** , **61 GENERAL ELECTRICAL SYSTEM** .

- 16 1 020
- 61 0 300
- 61 0 307

IMPORTANT: Ensure adequate ventilation in the place of work!
Ensure absolute cleanliness when working on the open fuel tank.
Contaminants in the fuel tank can impair driving operation or may even result in vehicle breakdown!

NOTE:

- **Removed lever-type sensor with cable length of 400 mm must no longer be fitted.**
- **Only lever-type sensor with cable length of 335 mm may be refitted.**

Necessary preliminary tasks:

- Draw off fuel from fuel tank, see **16 00 005 Draining and filling fuel tank.**

- Remove rear seat bench, see **52 26 005 REMOVING AND INSTALLING/REPLACING REAR SEAT (THROUGH-LOADING SYSTEM)** .

Release screws (1) and remove cover (2) from right side of fuel tank.

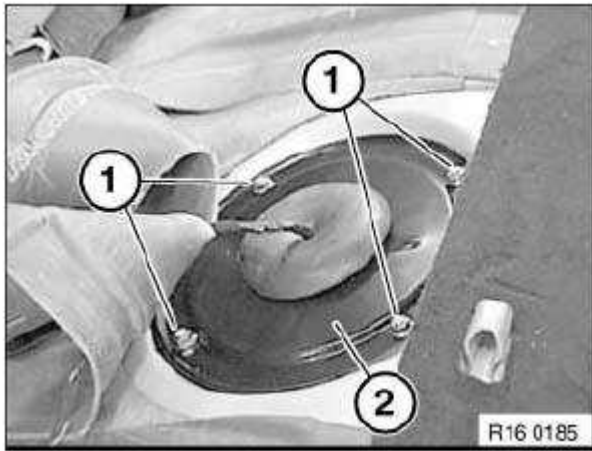

Fig. 31: Cover Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten plug connection (1) and disconnect.

Unlock and disconnect fuel feed line (2).

IMPORTANT:

- **Press the blue button to unlock the quick-release fastener. Then carefully detach fuel feed line vertically upwards.**
- **Do not use any mechanical tools or means to detach the quick-release fastener.**
- **Quick-release fastener must be attached vertically without mechanical tools/means. It must snap audibly into place.**
- **Then carry out a leak test with engine running.**
- **Damaged or leaking quick-release fasteners must be replaced.**

Unlock and detach vent line (3).

Fig. 32: Plug And Service Vent Line
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw cap with special tool 16 1 020 and remove.

Installation:

Tightening torque: 16 14 2AZ, see **16 14 FUEL PUMP** .

Fig. 33: Special Tool 16 1 020
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Service cap can only be installed in one position.

When installing, make sure lug (1) of service cap engages in corresponding opening (2) on fuel tank.

During torque tightening, notch (3) on screw cap can be clearly heard and felt to engage toothed segment (4) on fuel tank.

Replace rubber gasket.

Fig. 34: Service Cap Lug And Notch

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Make sure that tab (1) of adapter ring lies completely in recess (2).

Fig. 35: Tab Of Adapter Ring

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully raise service cap (4).

Unlock and detach fuel line (2).

Unlock and detach vent line (3).

Disconnect connector (1).

IMPORTANT: Carefully release quick-release fasteners and detach.
Make sure quick-release fasteners are correctly engaged.
Test the quick-release fasteners by pulling on them.

Fig. 36: Service Cap, Fuel Line, Vent Line And Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Cable (1) must be laid in a loop around the corrugated tube (2).

Cable must not restrict freedom of movement of lever-type sensor!

Fig. 37: Cable And Tube
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and disconnect plug connection (1) using a screwdriver (2).

Fig. 38: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Unpin cables (1) issuing from lever-type sensor on blue plug using special tool 61 0 307 from special tool kit 61 0 300 .

Fig. 39: Cables And Special Tool 61 0 307

Courtesy of BMW OF NORTH AMERICA, INC.

Removing fuel level sensor:

- Disengage cable from guides (3 and 4).
- Carefully pull tab (1) in direction of arrow; at the same time, press tab (2) in direction of arrow and press out fuel level sensor downwards.

IMPORTANT: Risk of damage:

Carefully feed cable out of cable guides (3 and 4). Do not kink cable.

Fig. 40: Pulling Tab

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Observe the following procedure when installing the fuel level sensor.

1. Carefully push fuel level sensor (1) in direction of arrow onto sensor holder (2).
2. Fuel level sensor must snap audibly into place!
3. Carefully feed cable into cable guides (3).

Do not kink cable.

Make sure fuel level sensor is correctly positioned in both guides (see arrows).

Fig. 41: Pushing Fuel Level Sensor Onto Sensor Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Lay cable (1) through upper loop of tank support (2).

Illustration shows cutaway model:

Fig. 42: Cable And Tank Support

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Cable (1) must be laid under line (2) and engaged in cable holder (3).

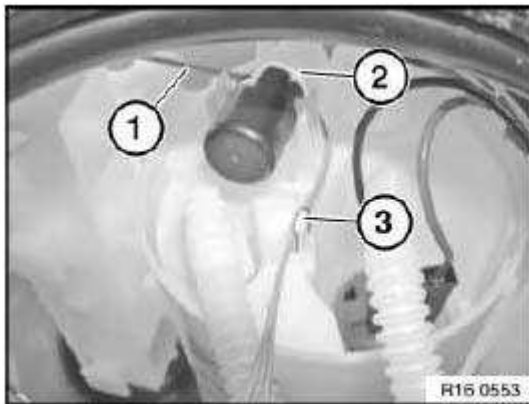

Fig. 43: Cable And Cable Holder

Courtesy of BMW OF NORTH AMERICA, INC.

16 12 001 REMOVING AND INSTALLING/REPLACING FUEL GAUGE SENSOR (PETROL/GASOLINE, LEFT)

Special tools required:

- **16 1 020 PIN WRENCH** .

IMPORTANT: Ensure adequate ventilation in the place of work!

Ensure absolute cleanliness when working on the open fuel tank.

Contaminants in the fuel tank can impair driving operation or may even result

in vehicle breakdown!

Necessary preliminary tasks:

- Draw off fuel from fuel tank, see **16 00 005 Draining and filling fuel tank.**
- Remove rear seat bench, see **52 26 005 REMOVING AND INSTALLING/REPLACING REAR SEAT (THROUGH-LOADING SYSTEM) .**

Release screws (1) and remove cover (2) from left side of fuel tank.

Fig. 44: Cover Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw cap with special tool 16 1 020 and remove.

Installation:

Tightening torque: 16 14 2AZ, see **16 14 FUEL PUMP .**

Fig. 45: Special Tool 16 1 020

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Service cap can only be installed in one position.

When installing, make sure lug (1) of service cap engages in corresponding opening on fuel tank.

During torque tightening, notch (3) on screw cap can be clearly heard and felt to engage toothed segment (4) on fuel tank.

Replace rubber gasket.

Fig. 46: Service Cap Lug And Notch

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Make sure that tab (1) of adapter ring lies completely in recess (2).

Fig. 47: Tab Of Adapter Ring

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug (1) from fuel level sensor.

Fig. 48: Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Removing fuel level sensor:

- Disengage cable from guides (3 and 4).
- Carefully pull tab (1) in direction of arrow; at the same time, press tab (2) in direction of arrow and press out fuel level sensor downwards.

IMPORTANT: Risk of damage:

Carefully feed cable out of cable guides (3 and 4). Do not kink cable.

Fig. 49: Pulling Tab

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Observe the following procedure when installing the fuel level sensor.

1. Carefully push fuel level sensor (1) in direction of arrow onto sensor holder (2).

2. Push on fuel level sensor up to end stop. Fuel level sensor must snap audibly into place!
3. Carefully feed cable into cable guide (3). Do not kink cable.

Make sure fuel level sensor is correctly positioned in both guides (see arrow).

Fig. 50: Pushing Fuel Level Sensor Onto Sensor Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Engage cable (1) in cable guide (2) and lay behind lines (3).

Cable must not restrict freedom of movement of lever-type sensor!

Fig. 51: Engaging Cable In Cable Guide
 Courtesy of BMW OF NORTH AMERICA, INC.

16 12 010 REMOVING AND INSTALLING OR REPLACING CARBON CANISTER

Necessary preliminary tasks:

- Remove rear right wheel. **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL**

- Remove rear right wheel arch trim. See **51 71 041 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT WHEEL ARCH COVER** .

Disconnect vent line (1) and (2) from carbon canister (3). Unfasten nut. Tightening torque, see 16 13 2AZ in **16 13 TANK VENTILATION** . Remove carbon canister (3).

Fig. 52: Disconnect Vent Line (1) And (2) From Carbon Canister (3)
 Courtesy of BMW OF NORTH AMERICA, INC.

16 12 010 REMOVING AND INSTALLING/REPLACING CARBON CANISTER WITH DM-TL (DIAGNOSIS MODULE FOR TANK LEAKAGE)

- Remove rear right wheel. **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL**
- Remove rear right wheel arch trim. See **51 71 041 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT WHEEL ARCH COVER** .

Unlock lines (1), (2) and plug (3) and detach:

- Scavenging air line
- Vent line to tank

Release screws (5) and remove carbon canister with DM-TL towards bottom. Tightening torque 16 13 2AZ, see **16 13 TANK VENTILATION** .

Fig. 53: Removing/Installing Carbon Canister With DM-TL
 Courtesy of BMW OF NORTH AMERICA, INC.

13 FUEL VENTILATION/DEAERATION

16 13 015 REMOVING AND INSTALLING/REPLACING TANK LEAK DIAGNOSIS MODULE

Necessary preliminary tasks:

- Remove carbon canister with DMTL.

Unlock and disconnect line (1) from tank leakage diagnosis module.

Release screws (2).

Tightening torque: 16 13 3AZ, see **16 13 TANK VENTILATION** .

Detach DMTL from carbon canister.

Fig. 54: Fuel Line
 Courtesy of BMW OF NORTH AMERICA, INC.

14 FUEL PUMP

16 14 010 REMOVING AND INSTALLING/REPLACING FUEL PUMP (PETROL/GASOLINE, N52)

Special tools required:

See 16 FUEL SUPPLY SYSTEM , 61 GENERAL ELECTRICAL SYSTEM .

- 16 1 020
- 61 0 300
- 61 0 307

IMPORTANT: Ensure adequate ventilation in the place of work!
Ensure absolute cleanliness when working on the open fuel tank.
Contaminants in the fuel tank can impair driving operation or may even result in vehicle breakdown!

Necessary preliminary tasks:

- Draw off fuel from fuel tank, see 16 00 005 Draining and filling fuel tank.
- Remove rear seat bench, see 52 26 005 REMOVING AND INSTALLING/REPLACING REAR SEAT (THROUGH-LOADING SYSTEM) .

Release screws (1) and remove cover (2) from right side of fuel tank.

Fig. 55: Cover Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and detach plug (1), fuel feed line (2) and service vent line (3).

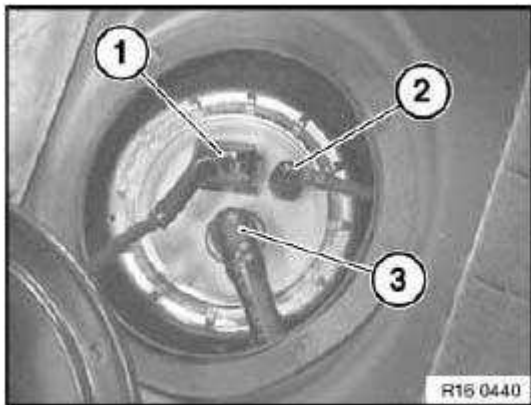

Fig. 56: Plug And Service Vent Line
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw cap with special tool 16 1 020 and remove service cap.

Installation:

Tightening torque: 16 14 2AZ, see **16 14 FUEL PUMP** .

Fig. 57: Special Tool 16 1 020
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Service cap can only be installed in one position.

When installing, make sure lug (1) of service cap engages in corresponding opening (2) on fuel tank.

During torque tightening, notch (3) on screw cap can be clearly heard and felt to engage toothed segment (4) on fuel tank.

Replace rubber gasket.

Fig. 58: Service Cap Lug And Notch

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Make sure that tab (1) of adapter ring lies completely in recess (2).

Fig. 59: Tab Of Adapter Ring

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully raise service cap (4) on right.

Unlock and detach fuel line (2).

Detach vent line (3).

Disconnect connector (1).

IMPORTANT: Carefully release quick-release fasteners and detach.
Make sure quick-release fasteners are correctly engaged.
Test the quick-release fasteners by pulling on them.

Fig. 60: Service Cap, Fuel Line, Vent Line And Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Cable (1) must be laid in a loop around the corrugated tube (2).

Cable must not restrict freedom of movement of lever-type sensor!

Fig. 61: Cable And Tube
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and disconnect plug housing (1) using a screwdriver (2).

Fig. 62: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Unpin cables (1) issuing from lever-type sensor on blue plug using special tool 61 0 307 from special tool kit 61 0 300 .

NOTE: **Plug connection on fuel pump must not be disconnected!**
When the fuel pump is replaced, the cables and the blue plug are included in the delivery specification.

Fig. 63: Cables And Special Tool 61 0 307

Courtesy of BMW OF NORTH AMERICA, INC.

Press retaining lug (2) together simultaneously in direction of arrow and detach fuel line (1) from pressure regulator.

Fig. 64: Pressing Retaining Lug
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock quick-release fastener (1) by pressing both white surfaces and detach.

Fig. 65: Unlocking Quick-Release Fastener
Courtesy of BMW OF NORTH AMERICA, INC.

Press retaining lug (1) in direction of arrow towards rear and lift out fuel pump with surge chamber (2).

Installation:

Fuel pump can only be installed in one position.

Make sure lug (4) of mounting engages opening in fuel pump.

Make sure fuel pump (2) is correctly positioned in guides (3).

Fig. 66: Pressing Retaining Lug

Courtesy of BMW OF NORTH AMERICA, INC.

16 14 060 REMOVING AND INSTALLING/REPLACING DUST FILTER FOR TANK LEAKAGE DIAGNOSIS MODULE (DM-TL)

Necessary preliminary tasks:

- Remove rear right wheel arch trim. See **51 71 041 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT WHEEL ARCH COVER** .
- Remove carbon canister.

Disconnect line (2) from DM-TL. Release screw. Tightening torque, see 16 13 4AZ in **16 13 TANK VENTILATION** . Remove dust filter (1) with line (2).

Fig. 67: Disconnect Line (2) From DM-TL

Courtesy of BMW OF NORTH AMERICA, INC.

ENGINE

Ignition System - Repair Instructions - X3

00 TROUBLESHOOTING

12 00 ... INSTRUCTIONS FOR DISCONNECTING AND CONNECTING BATTERY

Observe safety instructions for handling vehicle battery, see 61 00 ... SAFETY INSTRUCTIONS FOR HANDLING VEHICLE BATTERY .

Before disconnecting battery:

Turn off the ignition and other electrical loads/consumers to prevent sparking when reconnecting.

NOTE: If the ignition is not turned off when the battery is disconnected, fault memories may be set in some control units.

IMPORTANT:

- There is a danger of mixing up battery leads: If the battery positive and negative leads are the same color and you are in doubt, follow the polarity to the battery, then mark and cover the leads.
- On vehicles with radio code: After disconnecting the battery, the radio code must be re-entered. Therefore obtain the radio code card from the customer beforehand. Note stored stations and restore them after connecting the battery.
- Stored settings of the on-board computer and clock will also be lost.
- All available central keys must be recoded for cars with first generation infrared transmitter locking systems.

General notes on disconnecting battery:

- Do not disconnect battery leads and leads from alternator and starter motor while engine is running.
- Cars with IBS on battery negative terminal:

Do not under any circumstances pull/lever off pole shoes by force.

Do not under any circumstances release socket-head cap screw of IBS.

- Detach negative lead from car battery and second battery if fitted. Cover battery negative terminal(s) and secure, see 61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD .
- When work is carried out on the electrical system, faults may be caused in the fault memories of some control units when the battery is connected.
- When installing battery terminal: Tightening torque: 61 21 1AZ, see 61 21 BATTERY WITH TERMINAL .

After connecting battery:

IMPORTANT: After a power supply interruption some equipment is disabled and must be reactivated.

Likewise, individual settings are lost and must be activated.

Example:

- **Vehicles with build date from 03/2007:**

Teach-in mid-position for power steering

- **If necessary, activate sliding sunroof**
- **If necessary, carry out adjustment of active front steering**
- **If necessary, activate power windows**
- **If necessary, activate mirror with compass**

Vehicles with a two-battery system

Starter and equipment batteries

A two-battery system has a starter battery circuit and an equipment battery circuit. A secondary control unit monitors both battery circuits. Depending on the situation, the battery circuits are connected to or isolated from the secondary control unit via an isolating relay.

Two AGM batteries, whose design and properties are described in AGM batteries , are used as a storage battery.

IMPORTANT: These batteries must not under any circumstances be charged with a voltage in excess of 14.8 V. Rapid programs must not be used either.

Receiving/giving starting assistance via jump start terminal

The engine can be jump-started with an external voltage supply via the jump start terminal on the right side of the engine compartment.

NOTE: **The starter battery is isolated from the alternators when the engine hood/bonnet is open.**

Giving starting assistance via the jump start terminal is thus limited by the capacity of the starter battery when the engine hood/bonnet is open.

Charging starter and equipment batteries via jump start terminal

The starter battery is charged as a matter of priority with a charger connected to the jump start terminal. The voltage at the starter battery is the decisive factor in determining whether the equipment battery is also included in the charging operation. The secondary control unit automatically detects a charging operation at a charging

voltage at the starter battery of greater than or equal to 13.5 V. The isolating relay is closed and thus the equipment battery is connected in parallel. Both batteries are now charged.

Prerequisite:

- Terminal 61 inactive
- Terminal 15 inactive

If terminal 15 becomes "active" during the charging operation, the isolating relay is opened immediately and again only the starter battery is charged.

NOTE: When the engine hood is open, the isolating relay is also opened in normal operation when the engine is running.
A special mode can be set by means of diagnosis for workshop/garage operation. The isolating relay is closed from terminal R in this operating mode. This mode is automatically reset once a distance of 5 km has been driven.

Trickle charging

The increased closed-circuit current consumption can be compensated for via the jump-start connection point with the aid of the "Acctiva easy" battery trickle charger.

IMPORTANT: The cigarette lighter is isolated from the electrical system after terminal R "OFF" on a timed basis (60 mins.), thereby interrupting charging of the equipment battery via the cigarette lighter. This is prevented if the battery master switch (on the right side of the luggage compartment behind the panel) is turned on and off again twice within 2 seconds. (Cigarette light battery charging function).

12 00... INSTRUCTIONS FOR REMOVING AND INSTALLING ELECTRONIC CONTROL UNITS

IMPORTANT:

- Disconnecting the vehicle battery will cancel the fault memories of control units. Consequently, before disconnecting the car's battery, always interrogate the fault memories. Investigate stored faults and, once any faults have been remedied, cancel the fault memory.
- Control unit plugs should only ever be connected and disconnected while the ignition is turned off.
- The removal and installation of components, relays, fuses etc. can cause faults to be stored in fault memories capable of self diagnosis. Always interrogate the fault memories after completing work on the electrical system.
- Investigate stored faults and, once any faults have been remedied, cancel the fault memory.

Comply with the following when replacing the DME/DDE (Digital Motor

Electronics/Digital Diesel Electronics):

- **Always read out hardware/software version of the corresponding control unit with DIS tester.**

Comply with the instructions of the DIS tester on the steps coding and programming.

On vehicles with electronic vehicle immobilization, comply with the instructions of the DIS tester.

- **Each control unit is programmed with certain basic values, which serve as mean values. The control unit receives different input values, depending on engine condition, which are compared with the stored values. The adaptive system compares the input values with the stored map values. The control commands are routed to the relevant actuators.**
- **If, for example, the DME control unit would be without current for a long time (more than an hour), its adaptive system would lose the stored values. When a cleared control unit is restarted or a new control unit is installed, the adaptive system must read in and store the input values of the associated engine as new basic values itself.**
- **This procedure could lead to erratic idling and disturbed overrunning of the engine after starting. Depending on the engine it could require some time before all values are adapted to the engine condition.**
- **Therefore observe the following procedure before replacing or reinstalling a DME/DDE control unit:**
 - 1. If possible before exchanging control unit, run engine up to operating temperature.**
 - 2. Remove the control unit, install a new control unit and operate vehicle at different engine speeds.**

12 13 NOTES ON CHECKING IGNITION SYSTEM

Troubleshooting -> Fault in fuel injection system

-> Spark plug faults

-> Ignition coil faults

-> Further fault patterns with evaluation

-> Additional fault notes for troubleshooting

Oscillograms -> Normal oscillogram

-> Oscillograms of ignition coils from different manufacturers

Check -> Secondary signal for stationary ignition distribution

12 IGNITION WIRES, SPARK PLUGS

FIRING ORDER

FIRING ORDER

Application	Firing Order
6-Cylinder	1 - 5 - 3 - 6 - 2 - 4

FIRING ORDER 1-5-3-6-2-4

G00214257

Fig. 1: Firing Order (6-Cylinder)

Courtesy of BMW OF NORTH AMERICA, INC.

12 12 011 REPLACING ALL SPARK PLUGS (N42, N40, N46, N45, N52, N52K, N51)

Special tools required:

See 12 ENGINE ELECTRICAL SYSTEM .

- 12 1 171
- 12 1 200

Necessary preliminary tasks:

- Switch off ignition
- Remove ignition coils, see 12 13 511 Replacing ignition coils (N52, N52K, N51).

Unscrew spark plugs with special tool 12 1 171.

Installation:

Tighten down spark plugs with special tool 12 1 171 and special tool 12 1 200 (torque limiter).

Without special tool 12 1 200 , observe tightening torque.

Tightening torque: 12 12 1AZ, see **12 12 SPARK PLUGS** .

Fig. 2: Special Tool 12 1 171 And 12 1 200
Courtesy of BMW OF NORTH AMERICA, INC.

13 IGNITION COIL

12 13 NOTES ON CHECKING IGNITION SYSTEM

Troubleshooting -> Fault in fuel injection system

-> Spark plug faults

-> Ignition coil faults

-> Further fault patterns with evaluation

-> Additional fault notes for troubleshooting

Oscillograms -> Normal oscillogram

-> Oscillograms of ignition coils from different manufacturers

Check -> Secondary signal for stationary ignition distribution

12 13 511 REPLACING IGNITION COILS (N52, N52K, N51)

Necessary preliminary tasks:

- Read out fault memory of DME control unit.
- Check stored fault messages

- Switch off ignition
- Remove ignition coil cover

Unlock plug retainer of ignition coil (1) and disconnect plug.

Pull ignition coil (1) up and out.

This procedure is applicable to all ignition coils.

Fig. 3: Pulling Out Ignition Coil

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check that rubber seal of ignition coil (1) is correctly seated.

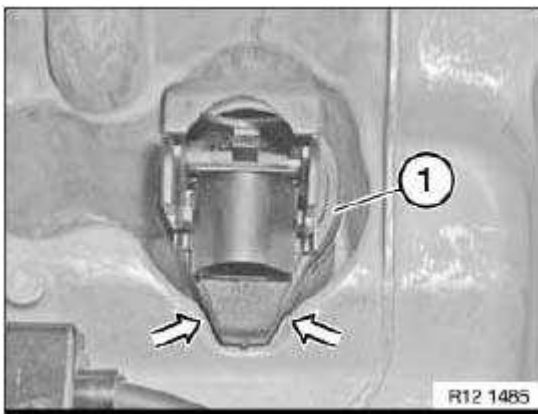

Fig. 4: Rubber Seal Of Ignition Coil

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Push plug (1) with plug retainer (2) open onto ignition coil.

Carefully close plug retainer (2) in direction of arrow.

Fig. 5: Closing Plug Retainer

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The plug retainer must snap into place without great effort.

Fig. 6: Plug Retainer

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Now clear the fault memory.

12 13 009 CHECKING ROD-TYPE IGNITION COILS (M54, M56, N40, N42, N43, N45, N46, N52, N62, N62TU, N73)

Special Tools Required

- 12 1 301
- 12 7 050 (ADAPTER LEAD)

Necessary preliminary tasks:

- Read out fault memory in DME (Digital Engine Electronics)
- N52: Remove sound absorption hood

Unlock plug fastener (1) of ignition coil.

Fig. 7: Identifying Plug Fastener Of Ignition Coil
Courtesy of BMW OF NORTH AMERICA, INC.

Detach plug (1) in direction of arrow.

Pull out ignition coil (2) towards top.

NOTE: Procedure applies to all rod-type ignition coils.

Fig. 8: Pulling Out Ignition Coil & Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Install special tool **12 7 050** .

Installation:

Special tool **12 7 050** is attached between spark plug and rodtype ignition coil.

Fig. 9: Identifying Special Tool (12 7 050)
Courtesy of BMW OF NORTH AMERICA, INC.

Secondary measurement:

Connect KV clip-on probe (1) of DIS Tester to special tool **12 7 050** .

Procedure on DIS Tester:

- Select < Measurement >.
- Select < Preset measurement >.
- Select < Secondary ignition signal >.
- Connect < TD cable to diagnostic head >.
- Select < static ignition distribution >.
- Select < Number of cylinders >.

For subsequent procedure, follow DIS instructions.

Fig. 10: Identifying KV Clip-On Probe Of DIS Tester
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Illustration shows: KV clip-on probe (1) US version.

Primary measurement:

Connect 26-pin pin box with special tool **12 1 301** to connector (1) DME module 5.

Procedure on DIS Tester:

- Select < Measurement >.
- Select < Preset measurement >.
- Select < Ignition signal term.1 >.

For subsequent procedure, follow DIS instructions.

NOTE: Pin assignment acc. to connection scheme.

Fig. 11: Identifying DME Module 5 Connector

Courtesy of BMW OF NORTH AMERICA, INC.

Illustration N42.

IMPORTANT: Ignition signal is a multiple spark ignition.

Illustration of multiple spark ignition

1. Start of ignition peak.
2. Level of ignition voltage.
3. Level of sparking voltage.
4. Spark duration.
5. Sparking voltage curve.
6. Start of decay process.
7. Decay process.

Fig. 12: Illustration Of Multiple Spark Ignition
Courtesy of BMW OF NORTH AMERICA, INC.

M54/M56/N40/N42/N45/N46/N62/N73:

The following ignition oscillogram applies to engines with **multiple spark ignition** from a production date of April 2001:

Depending on engine temperature (approx. -20° to 100°) and engine speed (< 2000 rpm.), some ignition voltage peaks (approx. 1-5 ignition peaks) can occur before the typical ignition voltage characteristic.

The additional ignition peaks play **no** role in diagnosis.

The last ignition peak (1) on the oscillogram is decisive.

Fig. 13: Ignition Voltage Characteristic Graph
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The display of the ignition voltage peak is approx. 20-25% lower than the real value.

It is not the height of the ignition voltage peaks but rather the uniformity of all the cylinders that is important.

Differences of 3000 to 4000 volts are permitted.

14 ELECTRONIC SWITCHING OR CONTROL UNIT

12 14 523 REPLACING INLET CAMSHAFT PULSE GENERATOR (N52, N52K, N51, N53)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- If necessary, remove radiator cover

Unlock plug (1) and remove.

Release bolt.

Installation:

Replace screw.

Tightening torque: 12 14 3AZ, see 12 14 ELECTRONIC SHIFT UNITS OR CONTROL UNITS .

Remove pulse generator (2).

Fig. 14: Plug And Pulse Generator

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

12 14 524 REPLACING EXHAUST CAMSHAFT PULSE GENERATOR (N52, N52K, N51, N53)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- If necessary, remove radiator cover

Unlock plug (1) and remove.

Release bolt.

Installation:

Replace screw.

Tightening torque: 12 14 4AZ, see **12 14 ELECTRONIC SHIFT UNITS OR CONTROL UNITS** .

Remove pulse generator (2).

Fig. 15: Plug And Pulse Generator

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

12 14 600 REMOVING/REPLACING KNOCK SENSORS (N52, N52K, N51)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminium screws/bolts exclusively.

Aluminium screws/bolts must be replaced each time they are released.

The end faces of aluminium screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage).

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Disconnect battery negative lead **61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD**
- Remove intake air manifold

Unlock plug (1) and remove.

Fig. 16: Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws on both knock sensors (1) and remove knock sensors (1).

Installation:

Replace aluminium screws.

Tightening torque: 12 14 1AZ, see **12 14 ELECTRONIC SHIFT UNITS OR CONTROL UNITS** .

Fig. 17: Knock Sensors

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean support face of knock sensors on engine block.

Fig. 18: Support Face Of Knock Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **Check stored fault messages.**
 Now clear the fault memory.

12 14 700 CODING CONTROL MODULE (DME / DDE)

Switch off ignition.

Connect MoDiC or DIS/GT1 Tester.

Switch on ignition.

Select "Coding" program.

For subsequent procedure, follow instructions in MoDiC or DIS/GT1 Tester.

Carry out adjustment of following control units:

- EWS (electronic immobilizer)
- DME (Digital Motor Electronics) or
- DDE (Digital Diesel Electronics)

12 14 705 PROGRAMMING CONTROL UNIT (DME / DDE)

Switch off ignition.

Connect MoDiC or DIS/GT1 Tester.

Switch on ignition.

Select "Programming".

For subsequent procedure, follow instructions in MoDiC or DIS/GT1 Tester.

Carry out adjustment of following control units:

- EWS (electronic immobilizer)
- DME (Digital Motor Electronics) or
- DDE (Digital Diesel Electronics)

31 ALTERNATOR WITH DRIVE AND MOUNTING

12 31... REPLACING ALTERNATOR BELT PULLEY

Special tools required:

See **12 ENGINE ELECTRICAL SYSTEM**

- 12 7 110

Remove and install alternator drive belt.

Depending on alternator type, grip shaft with:

- hexagon socket
- multi-tooth socket or
- Torx socket wrench

Release nut with special tool 12 7 110.

Installation:

Tightening torque: 12 31 2AZ / 12 31 3AZ, see **12 31 ALTERNATOR WITH DRIVE AND MOUNTING PARTS**.

Fig. 19: Special Tool 12 7 110

Courtesy of BMW OF NORTH AMERICA, INC.

12 31... REPLACING ALTERNATOR BELT PULLEY

Special tools required:

See **12 ENGINE ELECTRICAL SYSTEM**

- 12 7 121
- 12 7 122

Illustrations show N42:

If fitted, remove cover cap from belt pulley.

Depending on alternator type, slacken screw with:

- Torx socket wrench
- Slacken multi-tooth socket wrench (special tool 12 7 122).

Grip freewheel with special tool 12 7 121.

Installation:

Tightening torque: 12 31 8AZ, see **12 31 ALTERNATOR WITH DRIVE AND MOUNTING PARTS** .

Remove alternator drive belt.

Release screw and if necessary remove freewheel.

Fig. 20: Special Tool 12 7 121 And 12 7 122

Courtesy of BMW OF NORTH AMERICA, INC.

12 31 ... REPLACING ALTERNATOR BELT PULLEY (WITH OVERRUNNING CLUTCH)

Special tools required:

See 12 ENGINE ELECTRICAL SYSTEM

- 12 7 120

Remove and install alternator drive belt. Grip alternator shaft with: - internal serration. Release nut with special tools 12 7 120.

Installation: Tightening torque, see 12 31 3AZ in 31 ALTERNATOR WITH DRIVE AND MOUNT .

Fig. 21: Release Nut With Special Tools 12 7 120
Courtesy of BMW OF NORTH AMERICA, INC.

12 31 009 CHECKING ALTERNATOR (BSD)

Necessary preliminary tasks:

- Correct connections on charged battery
- Correct connections on alternator and starter motor
- Good ground connection between engine and body
- Tensioned ribbed V-belt
- Read out DME/DDE fault memory.

NOTE: **The alternator with BSD interface can communicate with the engine control unit (DME/DDE).**
 The alternator is not connected to the charge telltale light.
 The alternator can identify various faults.

BSD alternator can be recognized by the plug connection on the alternator.

Connect diagnosis tester.

- Function selection
- Complete vehicle
- Drive
- Voltage and current regulation
- Voltage and current generation
- Alternator
- Follow instruction in diagnostic program

Oscillogram for a fault-free alternator:

Open circuit in exciter diode.

Repair/exchange alternator.

Fig. 28: Oscillogram Graph - Open Circuit In Exciter Diode
 Courtesy of BMW OF NORTH AMERICA, INC.

Assemble engine.

Check function of DME/DDE.

12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR (N52, N52K, N51, N53)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminium screws/bolts exclusively.

Aluminium screws/bolts must be replaced each time they are released.

The end faces of aluminium screws/bolts are painted blue for the purposes of reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage).

Necessary preliminary tasks:

- Switch off ignition
- Disconnect battery negative lead **61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD**
- Remove intake filter housing
- Remove alternator drive belt

Unlock plug (1) and remove.

Slacken nut (2).

Installation:

Tightening torque 12 31 1AZ.

Release screws and remove alternator (3).

Installation:

Replace aluminium screws.

Tightening torque 12 31 2AZ.

Fig. 29: Plug And Alternator

32 REGULATOR

12 32 501 REPLACING VOLTAGE REGULATOR

Necessary preliminary tasks:

- Switch off ignition
- Disconnect battery negative lead **61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD**
- Notes on removing and installing electronic control units
- Remove alternator

Bosch:

Release protective caps (1).

Fig. 30: Protective Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Bosch:

Release screw (1) and nuts (2), remove cover.

Fig. 31: Cover Screw And Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

Bosch:

Release screws and remove regulator switch (1) in direction of arrow.

Fig. 32: Removing Regulator Switch

Courtesy of BMW OF NORTH AMERICA, INC.

Bosch:

Installation:

Clean contact surfaces and check pretension of contact spring, replace regulator switch if necessary.

Measurement A = min. 5 mm.

Check collector ring for wear and recondition if necessary.

Fig. 33: Pretension Of Contact Spring

Courtesy of BMW OF NORTH AMERICA, INC.

Valeo:

Unscrew nut (1).

Slacken nut (2).

Release screws (3).

Release cover (4).

Fig. 34: Cover Nuts And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Valeo:

Release screws.

Remove regulator switch (1) towards top.

Fig. 35: Regulator Switch
Courtesy of BMW OF NORTH AMERICA, INC.

Valeo:

Installation:

Clean contact surfaces and check pretension of contact spring, replace regulator switch if necessary.

Measurement A = min. 5 mm.

Check collector ring for wear and recondition if necessary.

Fig. 36: Pretension Of Contact Spring
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit new regulator (1) with attached mounting sleeve (2) or locked carbon brush.

Pull off mounting sleeve (2) and replace with cover (3).

Fig. 37: Regulator With Mounting Sleeve
 Courtesy of BMW OF NORTH AMERICA, INC.

41 STARTER WITH MOUNTING

12 41 020 REMOVING AND INSTALLING/REPLACING STARTER (N52, N52K, N51, N53, N54)

IMPORTANT: Aluminium-magnesium materials.

No steel screws/bolts may be used due to the threat of electrochemical corrosion.

A magnesium crankcase requires aluminium screws/bolts exclusively.

Aluminium screws/bolts must be replaced each time they are released.

The end faces of aluminium screws/bolts are painted blue for the purposes of

reliable identification.

Jointing torque and angle of rotation must be observed without fail (risk of damage).

Necessary preliminary tasks:

- Switch off ignition
- Disconnect battery negative lead **61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD**
- Remove intake air manifold

Unlock plug (1) and remove.

Unfasten nut.

Tightening torque: 12 41 3AZ, see **12 41 STARTER MOTOR WITH MOUNTING**

Remove battery positive lead (2).

Fig. 38: Plug And Battery Positive Lead
Courtesy of BMW OF NORTH AMERICA, INC.

Release bolt (1).

Installation:

Replace aluminium screws.

Tightening torque: 12 41 1AZ, see **12 41 STARTER MOTOR WITH MOUNTING** .

Release screws (2).

Fig. 39: Starter Motor

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace aluminium screws.

Tightening torque: 12 41 2AZ, see **12 41 STARTER MOTOR WITH MOUNTING**

Remove starter motor (3).

Installation:

Check starter pinion and ring gear for damage, replace starter motor if necessary.

12 41 041 REPLACING SOLENOID SWITCH

Turn off ignition.

Remove starter motor.

Release nut (1).

Remove cable lug (2).

Fig. 40: Cable Lug

Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Do not turn cable lug (2) while tightening down - risk of short circuit to starter motor housing.

Tightening torque: 12 41 4AZ, see 12 41 STARTER MOTOR WITH MOUNTING

Release screws (1).

Fig. 41: Starter Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Remove solenoid switch (1) and spring (2).

Unhook pin (3).

Installation:

Check pin (3) for wear and apply grease.

Fig. 42: Solenoid Switch, Pin And Spring
Courtesy of BMW OF NORTH AMERICA, INC.

61 OIL PRESSURE-OIL TEMPERATURE GAUGE

12 61 280 REMOVING AND INSTALLING/REPLACING OIL PRESSURE SENSOR (N52, N52K, N51, N54, N53)

Necessary preliminary tasks:

- Switch off ignition
- **N52, N52K, N51, N53 only:**
 - Remove ignition coil cover
- **N54 only:**
 - Remove intake filter housing

WARNING: Scalding hazard!
Only perform this task on an engine that has cooled down.

Installation location:

Oil filter housing, front left.

Engine oil may emerge when oil pressure sensor is replaced; have a cleaning cloth ready.

Unlock plug (1) and remove.

Release oil pressure sensor (2).

Tightening torque: 12 61 1AZ, see **12 61 ENGINE OIL PRESSURE, ENGINE OIL TEMPERATURE, OIL CONDITION DISPLAY** .

Installation:

Check engine oil level, top up engine oil if necessary.

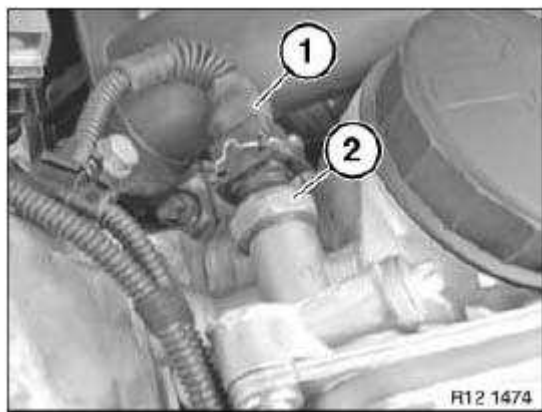

Fig. 43: Plug And Oil Pressure Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

12 61 285 REPLACING ENGINE OIL LEVEL SENSOR (N52, N52K, N51, N46, N54, N53)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Switch off ignition
- E60 / E63 / E64 / E83 / E85 / E86 / E70 only: Remove reinforcement plate, see **31 10 010 REMOVING AND INSTALLING/REPLACING REINFORCEMENT PLATE** .
- E81 / E87 / E90 / E91 / E92 / E93 only: Remove underbody protection
- Drain off engine oil

Unlock plug (1) and remove.

Unscrew nuts.

Tightening torque: 12 61 2AZ, see **12 61 ENGINE OIL PRESSURE, ENGINE OIL TEMPERATURE, OIL CONDITION DISPLAY** .

Remove oil level sensor (2).

Installation:

Clean sealing face on oil sump.

Replace seal on oil level sensor.

An excessively low torque value will result in oil leaks.

An excessively high torque value will result in damage to the oil level sensor.

Top up engine oil.

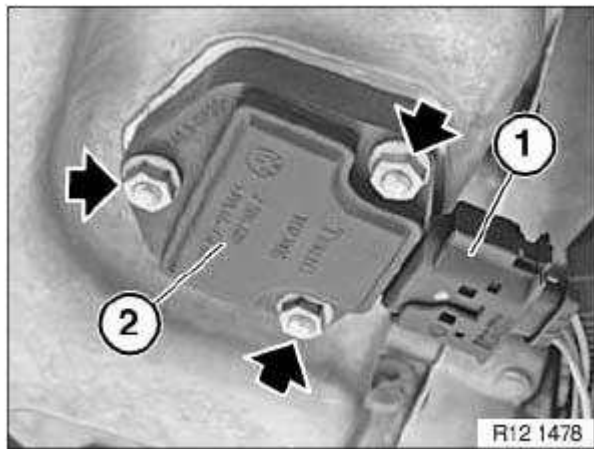

Fig. 44: Oil Level Sensor And Plug

Courtesy of BMW OF NORTH AMERICA, INC.

ENGINE PERFORMANCE

Diagnostic Trouble Codes - MSV80 Engine Operating System

BMW MSV80

MSV80 engine operating system applies to N54 engine.

DIAGNOSTIC TROUBLE CODES TABLE

DTC	Description
<u>DTC P0010</u>	'A' Camshaft Position - Actuator Circuit/Open (Bank 1) (SIG)
<u>DTC P0012</u>	'A' Camshaft Position - Timing Over-Retarded (Bank 1) (PLAUS)
<u>DTC P0013</u>	'B' Camshaft Position - Actuator Circuit/Open (Bank 1) (SIG)
<u>DTC P0015</u>	'B' Camshaft Position - Timing Over-Retarded (Bank 1) (PLAUS)
<u>DTC P0016</u>	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A) (MAX)
<u>DTC P0017</u>	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B) (MAX)
<u>DTC P0030</u>	HO2S Heater Control Circuit (Bank 1 Sensor 1) (SIG)
<u>DTC P0031</u>	HO2S Heater Control Circuit Low (Bank 1 Sensor 1) (MIN)
<u>DTC P0032</u>	HO2S Heater Control Circuit High (Bank 1 Sensor 1) (MAX)
<u>DTC P0036</u>	HO2S Heater Control Circuit (Bank 1 Sensor 2) (SIG)
<u>DTC P0037</u>	HO2S Heater Control Circuit Low (Bank 1 Sensor 2) (MIN)
<u>DTC P0038</u>	HO2S Heater Control Circuit High (Bank 1 Sensor 2) (MAX)
<u>DTC P0040</u>	O2 Sensor Signals Swapped Bank 1 Sensor 1 / Bank 2 Sensor 1 (PLAUS)
<u>DTC P0041</u>	O2 Sensor Signals Swapped Bank 1 Sensor 2 / Bank 2 Sensor 2 (PLAUS)
<u>DTC P0050</u>	HO2S Heater Control Circuit (Bank 2 Sensor 1) (SIG)
<u>DTC P0051</u>	HO2S Heater Control Circuit Low (Bank 2 Sensor 1) (MIN)
<u>DTC P0052</u>	HO2S Heater Control Circuit High (Bank 2 Sensor 1) (MAX)
<u>DTC P0056</u>	HO2S Heater Control Circuit (Bank 2 Sensor 2) (SIG)
<u>DTC P0057</u>	HO2S Heater Control Circuit Low (Bank 2 Sensor 2) (MIN)
<u>DTC P0058</u>	HO2S Heater Control Circuit High (Bank 2 Sensor 2) (MAX)
<u>DTC P0070</u>	Ambient Air Temperature Sensor Circuit (SIG)
<u>DTC P0071</u>	Ambient Air Temperature Sensor Range/Performance (PLAUS)
<u>DTC P0072</u>	Ambient Air Temperature Sensor Circuit Low (MIN)
<u>DTC P0073</u>	Ambient Air Temperature Sensor Circuit High (MAX)
<u>DTC P00B2</u>	Radiator Coolant Temperature Sensor Circuit Range/Performance (PLAUS)
<u>DTC P00B3</u>	Radiator Coolant Temperature Sensor Circuit Low (MIN)
<u>DTC P00B4</u>	Radiator Coolant Temperature Sensor Circuit High (MAX)
<u>DTC P0100</u>	Mass or Volume Air Flow 'A' Circuit (MAX)
<u>DTC P0111</u>	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1) (PLAUS)
<u>DTC P0112</u>	Intake Air Temperature Sensor 1 Circuit Low (Bank 1) (MIN)
<u>DTC P0113</u>	Intake Air Temperature Sensor 1 Circuit High (Bank 1) (MAX)
<u>DTC P0117</u>	Engine Coolant Temperature Sensor 1 Circuit Low (MIN)

<u>DTC P0118</u>	Engine Coolant Temperature Sensor 1 Circuit High (MAX)
<u>DTC P0121</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit Range/Performance (PLAUS)
<u>DTC P0122</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit Low (MIN)
<u>DTC P0123</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit High (MAX)
<u>DTC P0128</u>	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature) (PLAUS)
<u>DTC P0131</u>	O2 Sensor Circuit Low Voltage (Bank 1 Sensor 1) (MIN)
<u>DTC P0132</u>	O2 Sensor Circuit High Voltage (Bank 1 Sensor 1) (MAX)
<u>DTC P0133</u>	O2 Sensor Circuit Slow Response (Bank 1 Sensor 1) (MAX)
<u>DTC P0135</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 1) (MAX)
<u>DTC P0135</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 1) (MIN)
<u>DTC P0137</u>	O2 Sensor Circuit Low Voltage (Bank 1 Sensor 2) (MIN)
<u>DTC P0138</u>	O2 Sensor Circuit High Voltage (Bank 1 Sensor 2) (MAX)
<u>DTC P0139</u>	O2 Sensor Circuit Slow Response (Bank 1 Sensor 2) (PLAUS)
<u>DTC P0140</u>	O2 Sensor Circuit No Activity Detected (Bank 1 Sensor 2) (SIG)
<u>DTC P0141</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 2) (MAX)
<u>DTC P0151</u>	O2 Sensor Circuit Low Voltage (Bank 2 Sensor 1) (MIN)
<u>DTC P0152</u>	O2 Sensor Circuit High Voltage (Bank 2 Sensor 1) (MAX)
<u>DTC P0153</u>	O2 Sensor Circuit Slow Response (Bank 2 Sensor 1) (MAX)
<u>DTC P0155</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 1) (MAX)
<u>DTC P0155</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 1) (MIN)
<u>DTC P0157</u>	O2 Sensor Circuit Low Voltage (Bank 2 Sensor 2) (MIN)
<u>DTC P0158</u>	O2 Sensor Circuit High Voltage (Bank 2 Sensor 2) (MAX)
<u>DTC P0159</u>	O2 Sensor Circuit Slow Response (Bank 2 Sensor 2) (PLAUS)
<u>DTC P0160</u>	O2 Sensor Circuit No Activity Detected (Bank 2 Sensor 2) (SIG)
<u>DTC P0161</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 2) (MAX)
<u>DTC P0171</u>	System Too Lean (Bank 1) (MAX)
<u>DTC P0172</u>	System Too Rich (Bank 1) (MIN)
<u>DTC P0174</u>	System Too Lean (Bank 2) (MAX)
<u>DTC P0175</u>	System Too Rich (Bank 2) (MIN)
<u>DTC P0201</u>	Injector Circuit/Open - Cylinder 1 (SIG)
<u>DTC P0202</u>	Injector Circuit/Open - Cylinder 2 (SIG)
<u>DTC P0203</u>	Injector Circuit/Open - Cylinder 3 (SIG)
<u>DTC P0204</u>	Injector Circuit/Open - Cylinder 4 (SIG)
<u>DTC P0205</u>	Injector Circuit/Open - Cylinder 5 (SIG)
<u>DTC P0206</u>	Injector Circuit/Open - Cylinder 6 (SIG)
<u>DTC P0221</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit Range/Performance (PLAUS)
<u>DTC P0222</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit Low (MIN)
<u>DTC P0223</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit High (MAX)
<u>DTC P0261</u>	Cylinder 1 Injector Circuit Low (MIN)
<u>DTC P0262</u>	Cylinder 1 Injector Circuit High (MAX)

<u>DTC P0264</u>	Cylinder 2 Injector Circuit Low (MIN)
<u>DTC P0265</u>	Cylinder 2 Injector Circuit High (MAX)
<u>DTC P0267</u>	Cylinder 3 Injector Circuit Low (MIN)
<u>DTC P0268</u>	Cylinder 3 Injector Circuit High (MAX)
<u>DTC P0270</u>	Cylinder 4 Injector Circuit Low (MIN)
<u>DTC P0271</u>	Cylinder 4 Injector Circuit High (MAX)
<u>DTC P0273</u>	Cylinder 5 Injector Circuit Low (MIN)
<u>DTC P0274</u>	Cylinder 5 Injector Circuit High (MAX)

<u>DTC P0277</u>	Cylinder 6 Injector Circuit High (MAX)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (MAX)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (MIN)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (PLAUS)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (SIG)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (MAX)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (MIN)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (SIG)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (MAX)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (MIN)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (SIG)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (MAX)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (MIN)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (SIG)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (MAX)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (MIN)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (SIG)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (MAX)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (MIN)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (SIG)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (MAX)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (MIN)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (SIG)
<u>DTC P0313</u>	Misfire Detected With Low Fuel (MIN)
<u>DTC P0326</u>	Knock Sensor 1 Circuit Range/Performance (Bank 1 or Single Sensor) (PLAUS)
<u>DTC P0327</u>	Knock Sensor 1 Circuit Low (Bank 1 or Single Sensor) (MIN)
<u>DTC P0328</u>	Knock Sensor 1 Circuit High (Bank 1 or Single Sensor) (MAX)
<u>DTC P0335</u>	Crankshaft Position Sensor 'A' Circuit (MAX)
<u>DTC P0335</u>	Crankshaft Position Sensor 'A' Circuit (MIN)
<u>DTC P0340</u>	Camshaft Position Sensor 'A' Circuit (Bank 1 or Single Sensor) (MAX)
<u>DTC P0341</u>	Camshaft Position Sensor 'A' Circuit Range/Performance (Bank 1 or Single Sensor) (MAX)

<u>DTC P0344</u>	Camshaft Position Sensor 'A' Circuit Intermittent (Bank 1 or Single Sensor) (MAX)
<u>DTC P0351</u>	Ignition Coil 'A' Primary/Secondary Circuit (MAX)
<u>DTC P0352</u>	Ignition Coil 'B' Primary/Secondary Circuit (MAX)
<u>DTC P0353</u>	Ignition Coil 'C' Primary/Secondary Circuit (MAX)
<u>DTC P0354</u>	Ignition Coil 'D' Primary/Secondary Circuit (MAX)
<u>DTC P0355</u>	Ignition Coil 'E' Primary/Secondary Circuit (MAX)
<u>DTC P0356</u>	Ignition Coil 'F' Primary/Secondary Circuit (MAX)
<u>DTC P0365</u>	Camshaft Position Sensor 'B' Circuit (Bank 1) (MAX)
<u>DTC P0366</u>	Camshaft Position Sensor 'B' Circuit Range/Performance (Bank 1) (MAX)
<u>DTC P0369</u>	Camshaft Position Sensor 'B' Circuit Intermittent (Bank 1) (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MIN)
<u>DTC P0373</u>	Timing Reference High Resolution Signal 'A' Intermittent/Erratic Pulses (MAX)
<u>DTC P0420</u>	Catalyst System Efficiency Below Threshold (Bank 1) (MAX)
<u>DTC P0420</u>	Catalyst System Efficiency Below Threshold (Bank 1) (MIN)
<u>DTC P0430</u>	Catalyst System Efficiency Below Threshold (Bank 2) (MAX)
<u>DTC P0430</u>	Catalyst System Efficiency Below Threshold (Bank 2) (MIN)
<u>DTC P0440</u>	Evaporative Emission System (PLAUS)
<u>DTC P0441</u>	Evaporative Emission System Incorrect Purge Flow (SIG)
<u>DTC P0442</u>	Evaporative Emission System Leak Detected (small leak) (MAX)
<u>DTC P0444</u>	Evaporative Emission System Purge Control Valve Circuit Open (SIG)
<u>DTC P0456</u>	Evaporative Emission System Leak Detected (very small leak) (MIN)
<u>DTC P0458</u>	Evaporative Emission System Purge Control Valve Circuit Low (MIN)
<u>DTC P0459</u>	Evaporative Emission System Purge Control Valve Circuit High (MAX)
<u>DTC P0461</u>	Fuel Level Sensor 'A' Circuit Range/Performance (PLAUS)
<u>DTC P0462</u>	Fuel Level Sensor 'A' Circuit Low (MIN)
<u>DTC P0463</u>	Fuel Level Sensor 'A' Circuit High (MAX)
<u>DTC P0475</u>	Exhaust Pressure Control Valve (SIG)
<u>DTC P0477</u>	Exhaust Pressure Control Valve Low (MIN)
<u>DTC P0478</u>	Exhaust Pressure Control Valve High (MAX)

BMW Fault Code Description VS-Text

Oxygen sensor heating behind catalytic converter, function

Component

Oxygen Sensor, Rear

Subcomponent

Heater

Monitoring criteria

Check internal resistance of O2 sensor to check sensor heater => If the heater is too weak, the O2 sensor's internal resistance rises too high (= sensor too cold). No fault memories.

Fault debouncing

Internal resistance $R > 12000$ Ohm (US) or 15000 Ohm (ECE)

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Exhaust-gas temperature less than 700°C

Time conditions

approximately 400 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

O2 sensor is too cool; contact resistance at terminals in heater wire too high; heater too weak owing to aging

Repair procedures (plant/service)

Was the temperature drop caused by external factors (driving into snow pile, ice on O2 sensor)? Thaw sensor, clear all fault memory, continue driving!

1. Check O2 sensor heater: Contact resistance on plugs and in wiring is excessive (DME-wiring harness-sensor)
2. Check wiring
3. Check O2 sensor plug (water or corrosion in the plug? Repeatedly disconnect the plug and then re-insert it FIRMLY)
4. Replace plug and/or wire as indicated
5. Replace the affected downstream (post-cat) O2 sensor

Monitoring criteria

O2 sensor signal check. No fault memories; Mass airflow exceeds 10 kg/h

Fault debouncing

Bank 2 downstream (post-cat) O2 sensor voltage less than 0.02 V; internal resistance in circuit for downstream oxygen sensor less than 10 ohms

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Engine at operating temperature

Time conditions

approximately 2 minutes

System test

none

Signal information

Voltage < 0.2 V

Calculated value Y/N

N

Possible Fault Causes

Short to ground

Repair procedures (plant/service)

1. Check wiring
2. Check plugs
3. Resistance measurement
4. Measure voltage
5. Replace Bank 2 downstream (post-cat) O2 sensor

11388

BMW Fault Code Description VS-Text

Oxygen sensor behind catalytic converter 2, signal

Component

Oxygen Sensor, Rear

Subcomponent

Slow Response

Monitoring criteria

O2 sensor behind catalytic converter voltage too high with overrun injection deactivation active; signal sticks at rich

Fault debouncing

Voltage > 0.2 V

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Engine at operating temperature

Time conditions

Approximately 10s overrun injection deactivation

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Open wire; short to positive, O2 sensor sticking (with aid of a power source) at $U > 0.2 \text{ V}$; sensor too cold in overrun fuel supply deactivation.

Repair procedures (plant/service)

1. Check wiring
2. Check plugs
3. Measure wire resistance against positive and ground
4. Replace Bank 2 downstream (post-cat) O2 sensor

MIL illumination/CC message/emergency program

MIL ON

BMW Fault Code (hex)

0x2CA9

BMW Fault Code (dez)

11433

BMW Fault Code Description VS-Text

Oxygen sensor heating behind catalytic converter 2, function

Component

Oxygen Sensor, Rear

Subcomponent

Heater

Monitoring criteria

Check internal resistance of O2 sensor to check sensor heater => If the heater is too weak, the O2 sensor's internal resistance rises too high (= sensor too cold). No fault memories

Fault debouncing

Internal resistance $R > 12000$ Ohm (US) or 15000 Ohm (ECE)

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Exhaust-gas temperature less than 700°C

Time conditions

approximately 400 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

O2 sensor is too cool; contact resistance at terminals in heater wire too high; heater too weak owing to aging.

Repair procedures (plant/service)

Was the temperature drop caused by external factors (driving into snow pile, ice on O2 sensor)? Thaw sensor, clear all fault memory, continue driving!

1. Check O2 sensor heater: Contact resistance on plugs and in wiring is excessive (DME-wiring harness-sensor)

2. Check wiring
3. Check O2 sensor plug (water or corrosion in the plug? Repeatedly disconnect the plug and then re-insert it FIRMLY)
4. Replace plug and/or wire as indicated
5. Replace the affected downstream (post-cat) O2 sensor

BMW Fault Code Description VS-Text

Fuel injector, cylinder 6, activation

Component

Injector

Subcomponent

Short to Batt

Monitoring criteria

Injector control monitor

Fault debouncing

0.2 sec.

Terminal conditions

Terminal 15, engine on

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

1.5 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Wire is shorted to positive, or a short to positive is present in the component

Repair procedures (plant/service)

Check wiring. Repair if defective. If wiring is OK, proceed to check component

MIL illumination/CC message/emergency program

MIL

Remarks

Problem resolved only after terminal switch

DTC P0300: RANDOM/MULTIPLE CYLINDER MISFIRE DETECTED (MAX)

BMW Fault Code (hex)

0x29CC

BMW Fault Code (dez)

10700

BMW Fault Code Description VS-Text

Combustion misfires, several cylinders

Component

Misfire

Subcomponent

Multiple

Monitoring criteria

Combustion consistency measurement. Starting at engine speed $n > 450$ and $n < 7000$. Ambient pressure > 740 hPa. Combustion miss on at least two cylinders.

Fault debouncing

Combustion miss within 200 crankshaft rotations, weighted according to engine speed and load factor.

Terminal conditions

Terminal 15, engine on

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

Coolant temperature $> - 6.8^{\circ}\text{C}$

Time conditions

6 crankshaft rotations after start

System test

none

Signal information

none

Calculated value Y/N

Y

Possible Fault Causes

Ignition miss or fuel trim fault affecting at least two individual cylinders

Repair procedures (plant/service)

Ignition coils, spark plugs, ignition cables, injectors, DME

MIL illumination/CC message/emergency program

MIL ON

Remarks

Supplementary information always provided when combustion miss is detected on more than two cylinders.

according to the corresponding combustion miss fault

Remarks

Supplementary information always provided when combustion miss of any kind is detected during operation in the fuel reserve range.

DTC P0326: KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1 OR SINGLE SENSOR) (PLAUS)

BMW Fault Code (hex)

0x2E68

BMW Fault Code (dez)

11880

BMW Fault Code Description VS-Text

Knock-sensor signal 1

Component

Knock Sensor

Subcomponent

Sensor 1

Monitoring criteria

Knock sensor signal monitor. Vehicle road operation at > 2800 RPM (current data status, tends toward > 2560 RPM) and air mass > 180 mg/unit. It is not possible to clear fault by switching ignition terminals. Compliance with the activation conditions and absence of malfunction extending over several seconds are required before fault code can be cleared.

Fault debouncing

The debounce time is derived from assessment of statistical diagnosis

Terminal conditions

Terminal 15, engine on

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

min 1 sec., max 3 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Knock sensor signal too low. Threaded sensor connection is loose or wire connecting knock sensor 2 to engine-management ECU is open.

Repair procedures (plant/service)

1. Check knock sensor connection to verify that it is tight.
2. Check wire connecting knock sensor 1 and engine-management control module
3. Check for connection between knock sensor 1 and ground or positive
4. Replace knock sensor

MIL illumination/CC message/emergency program

No warning message. (No closed-loop knock control available. Power loss, as engine reverts to operation in safe range.)

Remarks

none

DTC P0327: KNOCK SENSOR 1 CIRCUIT LOW (BANK 1 OR SINGLE SENSOR) (MIN)**BMW Fault Code (hex)**

0x2E68

BMW Fault Code (dez)

11880

BMW Fault Code Description VS-Text

Knock-sensor signal 1

Component

Knock Sensor

Subcomponent

Sensor 1

Monitoring criteria

Knock sensor signal monitor. Vehicle road operation at > 2800 1 RPM (current data status, tends toward > 2560 RPM) and air mass > 180 mg/unit. It is not possible to clear fault by switching ignition terminals. Compliance with the activation conditions and absence of malfunction extending over several seconds are required before fault code can be cleared.

Fault debouncing

Yes, by event counter. Knock signal sensor must lie below threshold (differential knock signal < 180 mV < 200 mV) for 1...3 sec., then fault code is registered

Terminal conditions

Terminal 15, engine on

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

min 1 sec., max 3 sec.

System test

DTC P0328: KNOCK SENSOR 1 CIRCUIT HIGH (BANK 1 OR SINGLE SENSOR) (MAX)

BMW Fault Code (hex)

0x2E68

BMW Fault Code (dez)

11880

BMW Fault Code Description VS-Text

Knock-sensor signal 1

Component

Knock Sensor

Subcomponent

Sensor 1

Monitoring criteria

Knock sensor signal monitor. Vehicle road operation at > 2800 RPM (current data status, tends toward > 2560

RPM) and air mass > 180 mg/unit. It is not possible to clear fault by switching ignition terminals. Compliance with the activation conditions and absence of malfunction extending over several seconds are required before fault code can be cleared.

Fault debouncing

Yes, by event counter. If knock sensor signal remains below threshold (differential knock signal > 4.8 V) for 1...3 sec. fault code is stored.

Terminal conditions

Terminal 15, engine on

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

min 1 sec., max 3 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Knock sensor signal too high. Threaded sensor connection is loose or wire connecting knock sensor 1 to the engine-management ECU is shorted to positive.

Repair procedures (plant/service)

1. Check knock sensor connection to verify that it is tight.
2. Check wire connecting knock sensor 1 and engine-management control module
3. Check for connection between knock sensor 1 and ground or positive
4. Replace knock sensor

MIL illumination/CC message/emergency program

No warning message. (No closed-loop knock control available. Power loss, as engine reverts to operation in safe range.)

Remarks

none

0x2A1C

BMW Fault Code (dez)

10780

BMW Fault Code Description VS-Text

Tank fill level, plausibility

Component

Fuel Level Sensor

Subcomponent

Plausibility

Monitoring criteria

Excess mechanical resistance in the level sensor causes the level signal to change too slowly relative to engine fuel consumption, leading to generation of a fault memory entry

Fault debouncing

20 liters of fuel consumption required

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

none

Time conditions

Immediately after engine starts

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Mechanical seizure of level sensor in tank

Repair procedures (plant/service)

1. Check level sensor data directly at flange
2. Check variation in sensor data by rocking/knocking on the tank
3. Carefully open the tank flange, check for binding in the float lever
4. Replace the fuel level sensor only if binding is found in the float lever (distorted sensor lever, bearing resists motion)

BMW Fault Code Description VS-Text

DME master relay, activation

Component

ECM/PCM Power Relay

Subcomponent

Electrical

Monitoring criteria

Main relay monitoring. Main relay must have opened.

Fault debouncing

none

Terminal conditions

First Terminal 15 OFF (wait until main relay opens) then Terminal 15 ON (and leave ON)

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

System responds to fault by storing fault code within approximately 1 sec.

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Main relay fails to make owing to mechanical problems. (or contacts close only with lag) Or the connecting wire to the DME has a short circuit to UBatt or is open.

Repair procedures (plant/service)

Check wiring. Repair if defective. If wiring is OK, proceed to check component.

MIL illumination/CC message/emergency program

none

Remarks

When you encounter this fault, note that in all likelihood other diagnostic fault codes will also be entered in the fault memory (throttle plate potentiometer 1 and 2, voltage supply to pedal-position sensor, etc.), as the main relay's response lag or refusal to make will prevent the power supply from reaching these components.

BMW Fault Code (dez)

10823

BMW Fault Code Description VS-Text

Valvetronic, eccentric shaft sensor: plausibility

Component

Valvetronic (VVT)

Subcomponent

Sensors

Monitoring criteria

Sensor signal monitor (cumulative sensor faults). Always active

Fault debouncing

20 ms

Terminal conditions

Terminal 15 ON

Voltage conditions

none

Temperature conditions

none

Time conditions

100 ms

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Open sensor wire; reluctor missing; VVT sensor defective

Repair procedures (plant/service)

1. Examination of sensor plugs, sensor wiring.
2. If Item 1 is OK, inspect the reluctor.
3. If the reluctor is OK, replace VVT sensor.

MIL illumination/CC message/emergency program

ECE: No warning message. Engine reverts to VVT emergency backup mode (throttled operation) US: OPEN

BMW Fault Code Description VS-Text

Valvetronic, position at new start: plausibility

Component

Valvetronic (VVT)

Subcomponent

Value Comparison

Monitoring criteria

When the DME is activated (wake-up) it assesses the current VVT sensor angle based on the last VVT sensor angle prior to shutdown. If there is a substantial difference in the two angles, the operative assumption will that substantial repairs have been carried out on the cylinder head. The VVT travel limit positions must be re-initialized. No VVT sensor faults should be present (#10800, #10801,#10802).

Fault debouncing

Following successful travel limit initialization routine (can be initiated by tester), active only once at moment when system starts (DME wake-up).

0x2A3E

BMW Fault Code (dez)

10814

BMW Fault Code Description VS-Text

Valvetronic, actuator motor: overload

Component

Valvetronic (VVT)

Subcomponent

Overload Protection

Monitoring criteria

Monitoring of servo motor overload; The VVT servo motor temperature is calculated in the DME using a model. The first stage occurs when it heats beyond a warning threshold (fault #10819, fault class 2). This is 190°C (VVT motor temperature) and causes the VVT to revert to operation in its emergency mode. If the VVT motor were to overheat even further, the VVT system would be completely deactivated upon reaching the deactivation threshold (200°C VVT motor temperature).

Fault debouncing

Warning threshold: 190°C VVT Servo motor temperature. Deactivation threshold: 200°C VVT servo motor temperature

Terminal conditions

Terminal 15 ON

Voltage conditions

none

Temperature conditions

none

Time conditions

Fault code is entered immediately as soon as VVT motor reaches the critical level.

System test

none

Signal information

Calculated value Y/N

Y

Possible Fault Causes

A model is employed to calculate the VVT servo motor's temperature in the DME. The first stage occurs when it heats beyond a warning threshold (fault code #10819, fault class 2). This is 190°C (VVT motor temperature)

and causes the VVT to revert to operation in its emergency mode. If the VVT motor were to overheat even further, the VVT system would be completely deactivated upon reaching the deactivation threshold (200°C VVT motor temperature). Overheated VVT motor (based on model calculations, no monitored figures).
Defective VVT motor.

Repair procedures (plant/service)

1. Check VVT servo motor
2. Allow servo motor to cool, Clear fault memory and verify that DME software is the most recent version.
3. DO NOT replace DME!

MIL illumination/CC message/emergency program

ECE: No warning message. Engine reverts to VVT emergency backup mode (throttled operation) US: OPEN

Calculated value Y/N

Y

Possible Fault Causes

1. Loose reductor on VVT sensor
2. Defective VVT servo motor (soft interturn short circuit makes resistance too low in motor winding)
3. Short circuit in wiring harness (wire between VVT servo motor and DME)
4. Abuse of accelerator pedal module. Brief, rapid repeated pressure on the accelerator pedal extending over a period of time increases current flow within the VVT system.

Repair procedures (plant/service)

1. Check for correct reductor attachment at VVT sensor.
2. Defective VVT servo motor (for instance, interturn short circuit) Check servo motor and replace as indicated
3. Check wiring harness from VVT motor to DME for shorts between the two VVT wires and vehicle ground.
4. If abuse is suspected: Clear fault memory from DME

Valvetronic, thermal overload protection: warning threshold

Component

Valvetronic (VVT)

Subcomponent

Overload Protection

Monitoring criteria

The temperature of the VVT driver circuit in the DME is monitored, and the system responds to overheating by reverting to VVT emergency mode operation - the vehicle continues to operate, but in throttled mode. Incorrect use of the pedal-position sensor, consisting of rapid, repeated pressure extending over several minutes heats up the VVT driver circuit in the DME, leading to its deactivation when it reaches a critical level.

Fault debouncing

after Terminal 15 switch and/or always active if DME is awake. VVT driver circuit in the DME: Warning threshold 112°C

Terminal conditions

Terminal 15 ON

Voltage conditions

none

Temperature conditions

none

Time conditions

immediately

System test

Signal information

none

Calculated value Y/N

Y

Possible Fault Causes

1. Loose reductor on VVT sensor. (vibrations in position determination lead to overheating of the VVT driver circuit within the DME)
2. EBOX fan fails owing to loose plug-in connection, open wire, defective EBOX fan.
3. Incorrect installation of DME in the EBOX (EBOX fan must be positioned to ventilate DME).
4. Air openings from vehicle interior to EBOX obstructed.
5. Short in wiring harness between VVT servo motor and DME.
6. Defective DME

Repair procedures (plant/service)

If no tampering/abuse can be detected the following tests should be carried out:

1. Check for correct reductor attachment at VVT sensor.
2. Use tester to manually activate the E-box fan for acoustic check.
3. DME installed according to specification and check to verify installation of spacer plate (to guide airflow in E-Box).

4. Check wiring harness between VVT motor and DME for soft shorts between the two VVT motor wires and vehicle ground
5. Defective VVT servo motor (for instance, interturn short circuit) - Replace servo motor and determine whether malfunction is still present (Clear fault)

N

Possible Fault Causes

Sensor's self-diagnosis reports fault or range violation with period duration exceeding upper limit.

Repair procedures (plant/service)

1. Visual inspection of plug-in contacts (at both component and DME ends)
2. Measure sensor wire, power supply and ground (possible intermittent contact!)
3. Replace sensor

MIL illumination/CC message/emergency program

none

Remarks

If the ""air mass period duration"" displayed in the environmental data is > 4500 us this is a fault generated by the sensor's own self-diagnosis utility (sensor reports active problem). The response should be to replace the sensor. If the ""air mass period duration"" is < 4500 us, this is an upward range violation (period duration too high) that can be caused by defects in both the sensor and the wiring harness.

Activation conditions: - Engine start - Secondary air-injection must be active - Ambient temperature $>3^{\circ}\text{C}$ - $3.8^{\circ}\text{C} < \text{Coolant temperature} < 50.3^{\circ}\text{C}$

Fault debouncing

40 sec.

Terminal conditions

Terminal 15, engine start

Voltage conditions

Vehicle electrical system voltage (battery voltage between 7 & 15 V)

Temperature conditions

Ambient temperature $> 3^{\circ}\text{C}$, coolant start temperature between 3.8°C & 50.3°C

Time conditions

none

System test

EOL test of secondary air-injection system (Do not run more than 5 EOL tests in succession; the SA pump can overheat)

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Potential causes - Hose between SA pump and SA valve disconnected/damaged - Defective secondary air-injection pump - Defective secondary air-injection valve - Obstructed passage between secondary air injection

valve and the exhaust banks (in engine block)

Repair procedures (plant/service)

1. Visual inspection from connecting hose between secondary air injection pump (SAP) and secondary air-injection valve (SAV). Replace the hose if it is damaged.
2. Determine whether hose is connected. - if not - connect hose. A click must be audible when the hose is connected.
3. Conduct EOL test and listen to determine whether SAP is running or not: - if yes - determine whether the pump is producing pressure (hold with hand), it should be possible to feel pressure - of not - check wiring to pump (plug, relay, wiring), conduct EOL test with pump supplied by separate 12 V power source.

0.02 sec.

Terminal conditions

Terminal 15 ON

Voltage conditions

Voltage in onboard electrical system ≥ 10 V

Temperature conditions

none

Time conditions

220 ms

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Short circuit to ground in voltage supply for Channel 2, defective voltage regulator, main relay activation lag

Repair procedures (plant/service)

1. Check fault memory for problem with throttle valve and/or main relay, replace main relay as indicated
2. Check power-supply wire for short to ground (also measure in PWG)
3. Replace DME

MIL illumination/CC message/emergency program

CC status report: Reduced engine power! EML ON restricted PW gradient and PW limit via RPM

Remarks

When relay is defective the fault appears together with throttle valve fault, the symptom being 'short circuit to ground', and fault in voltage supply to pedal-position sensor Channel 2.

Y

Possible Fault Causes

System unable to initialize for lower mechanical travel stop position: Contact resistance in plug-in connection. Throttle valve is contaminated, has electrical problem or mechanical seizure

Repair procedures (plant/service)

1. Check: Sum of throttle valve voltages must equal 5 V
2. Perform electrical check on wires to throttle valve sensors, visual inspection of plug-in terminals (at components, wiring harness and DME)
3. Check to determine whether objects that could physically prevent the throttle valve from closing are present in the intake manifold or throttle valve
4. Replace component

MIL illumination/CC message/emergency program

CC status report: Reduced engine performance!, MIL ON EMB + RPM limit 1300 RPM

Remarks

Lower mechanical travel stop monitor

DTC P164C: PEDAL POSITION SENSOR POTENTIOMETER SUPPLY CHANNEL 1 ELECTRICAL (PLAUS)

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Short circuit to ground in voltage supply for Channel 1, defective voltage regulator, main relay activation lag

Repair procedures (plant/service)

1. Check fault memory for problem with throttle valve and/or main relay, replace main relay as indicated
2. Check power-supply wire for short to ground (also measure in PWG)
3. Replace DME

MIL illumination/CC message/emergency program

CC status report: Reduced engine power! EML ON restricted PW gradient and PW limit via RPM

Remarks

ATTENTION: This fault can produce throttle valve fault and HFM fault with the symptom 'short to ground' as collateral fault. When relay is defective this fault appears together with throttle valve fault, the symptom being 'short circuit to ground', and fault in voltage supply to pedal-position sensor Channel 2.

BMW Fault Code Description VS-Text

DME, internal fault: RAM checksum

Component

ECM/TCM

Subcomponent

NVMY

Monitoring criteria

RAM checksum test. This test is executed once, while the control module is booting.

Fault debouncing

No debounce. Fault can be reset by clearing fault memory.

Terminal conditions

Immediately after wakeup in dormant control module.

Voltage conditions

none

Temperature conditions

none

Time conditions

none

System test

none

Signal information

none

Calculated value Y/N

Y

Possible Fault Causes

Defective data sector in DME's internal EEPROM. Poor or loose ground connections for the ignition coils.

Repair procedures (plant/service)

Start by checking ground connections on the ignition coils. If these are OK, proceed with the following steps. Check to determine whether the diagnostic fault code is stored again after proceeding through the following routine. If yes: Replace DME.

1. Clear fault memory
2. Ignition off, allow vehicle to assume complete dormant status
3. Ignition on
4. Read out stored fault codes from fault memory

MIL illumination/CC message/emergency program

none

Remarks

Possible loss of adaptation data. The following procedure can be used to reprogram the adaptation data:

1. Delete all adaptation data
2. Ignition off and then on
3. Brief drive. Adaptation data are reprogrammed automatically.

Calculated value Y/N

N

Possible Fault Causes

Short circuit on the BSD_BUS. Either to ground or positive, rendering communications impossible. Or no BSD_components connected to the DME.

Repair procedures (plant/service)

1. Disconnect all BSD_components (alternator, battery sensor, water pump) except for the oil sensor. Clear fault memory. Ignition off/on. If fault code is stored again: QLT is defective and must be replaced. Repeat test.
2. If fault code is entered again after QLT replacement: -> Check wiring harness (BSD_BUS) and all plug-in connections for corrosion and shorts to ground/UBatt.
3. If fault code no longer appears after QLT replacement: -> QLT was defective.
4. If no fault code is stored after all components (except QLT, as in 1.) are disconnected: -> The fault lies with one of the

MIL illumination/CC message/emergency program

No oil level display/no oil temperature display available. Service interval calculations for next visit are based on model. Water pump runs at 100% cooling capacity and draws continuous current of approximately 15A. Power management fails to operate correctly because it is not possible to read battery sensor.

Remarks

ATTENTION: Simply switching the ignition on/off is enough for problem diagnosis. Because the water pump may not be connected, and the engine could overheat, you should avoid starting the engine. Fault status can be reset by clearing fault memory.

DTC P2096: POST CATALYST FUEL TRIM SYSTEM TOO LEAN (BANK 1) (MIN)**BMW Fault Code (hex)**

0x2C31

BMW Fault Code (dez)

11313

BMW Fault Code Description VS-Text

Oxygen sensor before catalytic converter, trim control

Component

Fuel System

Subcomponent

Post Catalyst

Monitoring criteria

O2 sensor trim control. No fault memories. Drive at 50 - 80 km/h and at moderate engine speed..

Fault debouncing

Trim controller pegged

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Engine at operating temperature

Time conditions

1 - 2 h steady-state operation; otherwise #11390 may occur

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Defective wiring. Exhaust system leak. Pre-cat or downstream (post-cat) O2 sensor defective.

Repair procedures (plant/service)

This malfunction automatically triggers an active test (collateral fault stored in the control module's fault memory!).

1. Read out results of active test (are other faults still stored in the control module's fault memory)? => Then continue at this point!)
2. Initiate system test for reversed O2 sensors. Follow instructions for system test.
3. If the system test fails to produce a result then
4. Visual inspection of wiring and plugs
5. Electrical check of wiring
6. Replace wiring or plugs as indicated
7. Check exhaust system forward of downstream (post-cat) O2 sensor for leaks
8. Replace upstream (pre-cat) O2 sensor

Engine at operating temperature

Time conditions

roughly 300 s following completion of trim control diagnosis

System test

O2 sensors reversed

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Downstream (post-cat) O2 sensor aged or downstream (post-cat) O2 sensor poisoned or downstream (post-cat) O2 sensor wire defective, pegging trim controller -> Trim controller diagnosis entry -> Activation of active test, entry of fault code #11371

Repair procedures (plant/service)

This malfunction is detected during the active test. The active test is triggered by the trim control diagnosis function (trim controller fault code stored in the control module's fault memory!)

1. Initiate system test for reversed O2 sensors. Follow instructions for system test.
2. If the system test fails to produce a result then
3. Visual inspection of wiring and plugs
4. Electrical check of wiring
5. Replace wires or plugs as indicated
6. Check exhaust system upstream from downstream (post-cat) O2 sensor for leaks
7. Replace downstream (post-cat) O2 sensor

8. Replace upstream (pre-cat) O2 sensor

BMW Fault Code (dez)

11309

BMW Fault Code Description VS-Text

Oxygen sensor before catalytic converter, overrun check

Component

Oxygen Sensor, Front

Subcomponent

Deceleration

Monitoring criteria

Implausible O2 sensor signal in overrun cutoff phase, no fault memories

Fault debouncing

Bank 1 O2 sensor before catalytic converter voltage less than 3.1 V or greater than 2.1 V with overrun injection deactivation active

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Engine warm (exhaust-gas temperature > 380°C)

Time conditions

approximately 9 sec. with overrun cutoff active

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Catalytic converter obstructed (rich exhaust gas on O2 sensor during overrun cutoff); oil or gasoline in exhaust gas during overrun cutoff; defective wiring; Defective pre-cat O2 sensor;

Repair procedures (plant/service)

1. Visual inspection of wiring and plugs (water or corrosion in plug?)
 - a. Repeatedly remove the plug and then FIRMLY insert it again
2. Electrical check of wiring
3. Check catalytic converter (FSD lean fault may be entered for the other bank)
4. Piston rings, injector valves, positive crankcase ventilation OK? FSD fault? Then continue there!
5. Replace wires or plugs on O2 sensors as indicated
6. Replace O2 sensor

(PLAUS)**

BMW Fault Code (hex)

0x2C3D

BMW Fault Code (dez)

11325

BMW Fault Code Description VS-Text

Oxygen sensor before catalytic converter, line fault

Component

Oxygen Sensor, Front

Subcomponent

Pumping Current

Monitoring criteria

O2 sensor wire monitoring. Voltage of O2 sensor signal is too high during overrun cut-off phase, overrun injection deactivation.

Fault debouncing

Voltage >5.8 V during overrun injection deactivation

Terminal conditions

Terminal 15, engine on

Voltage conditions

none

Temperature conditions

Engine at operating temperature.

Time conditions

approximately 9s with overrun injection deactivation active

System test

O2 sensors reversed

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

Sensor inactive. Wire IA is open. Catalyst is plugged (rich exhaust at O2 sensor in overrun cut-off); oil or gasoline in the exhaust gases during operation in overrun cut-off phase.

Repair procedures (plant/service)

1. Visual inspection of wires, DME plug and O2 sensor for damage
2. Inspect wires
3. Check plug-in connections DME <=> Wiring harness <=> Upstream (pre-cat) O2 sensor for Bank 1 (water or corrosion in plug?) => Repeatedly remove the plug and then reconnect it FIRMLY
4. Check catalytic converter (is FSD lean fault entered for the other bank?)
5. Piston rings, injectors, positive crankcase ventilation OK? FSD fault? Then continue there!
6. Replace O2 sensor
7. Replace DME

MIL illumination/CC message/emergency program

MIL ON

Remarks

BMW Fault Code Description VS-Text

Coolant-temperature sensor, measurement range

Component

Engine Coolant

Subcomponent

Temperature

Monitoring criteria

Engine must be running, T_ES > 360 min, UBatt > 11 V, TIA at start between - 10°C and 60°C, TAM_ST > - 10°C, cold start

Fault debouncing

immediately

Terminal conditions

Terminal 15 on and engine running

Voltage conditions

Voltage in onboard electrical system > 11 V

Temperature conditions

Induction air temperature at start between -10 and 60°C, ambient temperature > -10°C

Time conditions

Time parked > 360 min, time after start > 10 sec.

System test

none

Signal information

none

Calculated value Y/N

none

Possible Fault Causes

Temperature sensor sticks at upper end of temperature range, sensor tampering.

Repair procedures (plant/service)

1. Visual inspection of sensor and wiring
2. Determine whether coolant temperature really remains constant while the engine warms up
3. Replace sensor

MIL illumination/CC message/emergency program

MIL ON, electrical water pump and E fan at full power with engine running

Remarks

none

Signal information

none

Calculated value Y/N

Y

Possible Fault Causes

Communications fault on BSD bus while PM is requesting alternator underexcitation.

1. Alternator (BSD-BUS) not connected
2. Open wire (BSD-BUS) between alternator and DME
3. Alternator defect

Repair procedures (plant/service)

1. Check wire (BSD_BUS) connecting alternator and DME.
2. Check plug-in connection at alternator.
3. Replace alternator.

0x2F11

BMW Fault Code (dez)

12049

BMW Fault Code Description VS-Text

Radiator blind, top

Component

No Info

Subcomponent

No Info

Monitoring criteria

1. AKKS must be initialized. Operation of lower flap: 3 x open and 3 x closed. Or conduct the system test.

Fault debouncing

none

Terminal conditions

Terminal 15 ON

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

none

System test

No info.

Signal information

PWM of 5-90 %

Calculated value Y/N

N

Possible Fault Causes

Defective in valve control's electronic circuitry. PVE: Insert a 1K resistor in front of Terminal 87 at DME PIN 1--09.

Repair procedures (plant/service)

1. Check voltage supply to AKKS (focus especially on GND [PIN 2] at the valve)
2. If OK, then replace AKKS

MIL illumination/CC message/emergency program

no external display;

Remarks

There is no danger with the AKKS provided the malfunction did not arise while it was closed.

DTC U1132: LOST COMMUNICATION WITH GENERATOR VIA BSD (BIT SERIAL DATA INTERFACE) (MAX)

BMW Fault Code (hex)

0x2ECC

BMW Fault Code (dez)

11980

BMW Fault Code Description VS-Text

Generator, communication

Component

No Info

Subcomponent

No Info

Monitoring criteria

Commercial vehicle >350 rpm, No communications fault.

Fault debouncing

25 sec.

Terminal conditions

Terminal 15 ON

Voltage conditions

Voltage in onboard electrical system > 10 V

Temperature conditions

none

Time conditions

none

System test

none

Signal information

none

Calculated value Y/N

N

Possible Fault Causes

1. Alternator (BSD-BUS) not connected
2. Open wire (BSD-BUS) between alternator and DME
3. Alternator defect

Repair procedures (plant/service)

1. Check wire (BSD_BUS) connecting alternator and DME.
2. Check plug-in connection at alternator.
3. Replace alternator.

MIL illumination/CC message/emergency program

No warning message. The alternator responds to loss of the BSD_BUS signal by charging at a constant 14.4 V battery.

Remarks

none

ENGINE PERFORMANCE

Fuel System - Repair Instructions - X3

31 FUEL PUMP WITH DRIVE AND LINE

13 31 ... NOTES ON FUEL PRESSURE CHECK (REFERENCE PRESSURE: ENVIRONMENT)

Feature of this version with ambient pressure:

The connection for the vacuum hose of the fuel pressure regulator is located between the throttle and the air cleaner or on the air cleaner.

Test precondition:

The correct fuel pressure regulator is fitted.

- Using the EPC, check whether the fuel pressure regulator suitable for the car is fitted:

Connect test adapter.

Description of operation:

The control function of the fuel pressure regulator must be guaranteed under all operating conditions. The fuel pump must always be able to generate a higher fuel pressure than the pressure regulated by the pressure regulator.

The injection rate is adjusted by means of the injection time; the injection time is controlled by the DME.

Description of operation: fuel return line

When the engine is at a standstill and the ignition key is in position 0, the fuel return line after the pressure regulator is at zero pressure.

Description of operation: pressure retaining function

The pressure regulator closes when the engine is at a standstill and the ignition key is in position 0. The fuel pressure in the delivery line is retained over an extended period. A non-return valve closes in the fuel pump. These measures help to retain the fuel pressure in the fuel system. Extended starting times are thus avoided.

Complaint: drive characteristic faults, lack of power

- Run engine at idle speed and measure fuel pressure.

If the measured value is less than the nominal value - 0.2 bar:

- Line cross-sections in fuel feed are constricted or fuel filter is clogged,

or

- Fuel pump voltage supply is not O.K.: e.g. as a result of high contact resistance (corrosion) in plug connection between wiring harness and fuel pump.

If the measured value is greater than the nominal value + 0.2 bar:

- Turn off engine stop and then observe measured value.
- If measured value drops to nominal value, then line cross-sections in fuel return are constricted or clogged.
- Check the fuel lines for kinks.

If no kinks are visible:

- Replace return lines

If measured value remains too high, then pressure regulator is in all probability faulty.

IMPORTANT: With less likelihood, the return line may be completely blocked. When the pressure regulator is removed, fuel could escape under pressure!

- Have a cleaning cloth ready and catch and dispose of escaping fuel.
- Replace the return line but not the pressure regulator.

Complaint: starting problems

- Run engine briefly at idle speed and switch off.
- Note down measured value while engine is stopped.
- Read off measured value again after approx. 20 to 30 minutes while engine is stopped.

Special tool 13 3 010 (hose clamp) is required for the following test.

If the measured value has dropped by more than 0.5 bar:

- Start engine and wait briefly for a stable pressure increase.
- Switch off the engine and immediately pinch off the delivery line just before the pressure gauge with the special tool 13 3 010.
- Note down measured value
- Read off measured value again after approx. 20 to 30 minutes while engine is stopped

If the measured value has now dropped by less than 0.5 bar, the following faults can be present:

- Fault in delivery lines
- Fault in in-tank delivery hose

- Faulty pressure-holding non-return valve in fuel pump

Check components. Replace faulty components.

If the measured value has dropped by more than 0.5 bar again:

- Replace pressure regulator

NOTE:

- **All the fuel hoses and hose clips which were detached within the framework of the checks must be replaced.**
- **Interrogate fault memory of DME control unit. Check stored fault messages. Rectify faults. Now clear the fault memory.**

13 31 029 CHECKING FUEL PUMP DELIVERY PRESSURE (N52)

Special tools required:

- 13 5 220
- 13 5 221
- 13 5 222

IMPORTANT: The fuel in the fuel lines is under pressure (approx. 5 bar)! Catch and dispose of escaping fuel.

Necessary preliminary tasks:

- Switch off ignition.
- Remove acoustic cover, see **11 00 REMOVING AND INSTALLING/REPLACING IGNITION COIL COVER (N52K)**.

Remove dust cap (1).

Fig. 1: Dust Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Connect special tool kit 13 5 220 (comprising 13 5 221 and 13 5 222) to pressure sensor of DIS Tester.

Connect pressure sensor to DIS Tester.

Fig. 2: Special Tool 13 5 221 And 13 5 222

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not under any circumstances screw in the check valve up to the mechanical stop.

This could damage the valve in the pressure regulator housing.

Mount special tool kit 13 5 220 to injection tube and tighten knurled nut hand-tight.

Screw out check valve (1) so that valve in pressure regulator housing is closed.

Start engine.

Screw in check valve (1) until a pressure reading is indicated on DIS Tester.

Fig. 3: Check Valve And Special Tool Kit 13 5 220
Courtesy of BMW OF NORTH AMERICA, INC.

Measuring fuel pressure.

- Select Measurement.
- Multimeter function appears
- Select Pressure test
- Read off value of fuel pressure.

Compare actual value of test pressure with specified value, see **13 53 INJECTORS AND LINES, FUEL PRESSURE REGULATOR N52 / N52K / N51** .

Switch off engine.

NOTE: Removing special tool kit 13 5 220 :

- Switch off engine
- Screw out check valve fully again.
- Remove special tool kit 13 5 220 from pressure regulator housing.
- Catch and dispose of escaping fuel.

**NOTE: Read out fault memory of DME control unit.
Check stored fault messages.
Now clear the fault memory.**

53 INJECTION NOZZLE AND LINES

13 53 240 REPLACING COMPLETE INJECTION PIPE (N52/ N52K)

Special tools required:

- 13 5 281

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Remove clean air pipe
- Remove ignition coil cover, see **11 00 REMOVING AND INSTALLING/REPLACING IGNITION COIL COVER (N52K)**

Recycling

Fuel escapes when fuel line is detached. Catch and dispose of escaping fuel.

Observe country-specific waste-disposal regulations.

N52K only:

Unclip plug connection (1) from holder (2) and disconnect.

Unclip wiring harnesses from holder (2) and connector strip (3).

Disconnect holder (2) from injection pipe.

Fig. 4: Plug Connection And Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Remove protective cap from compressed air valve.

Fig. 5: Dust Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Connect compressed air line (1) to compressed air valve.

Blow fuel back into tank with a short blast of compressed air (max. 3 bar).

Fig. 6: Compressed Air Line

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock and detach fuel line (1).

Detach connector strip (2) in direction of arrow.

Release screws.

Tightening torque: 1AZ, see **13 53 FUEL INJECTION NOZZLES AND PIPES** .

Remove injection pipe (3).

Fig. 7: Detaching Connector Strip
Courtesy of BMW OF NORTH AMERICA, INC.

Seal fuel hose with special tool 13 5 281 .

Fig. 8: Special Tool 13 5 281
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out retainers (1).

Pull fuel injectors out of injection pipe.

Installation:

Replace sealing rings on fuel injectors and coat with anti - friction rubber coating.

Fig. 9: Retainers

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

13 64 501 REMOVING AND INSTALLING/REPLACING A FUEL INJECTOR (N52, N52K, N51)

This work step is described in the section **13 53 240 Replacing complete injection pipe (N52/ N52K)**.

54 THROTTLE AND OPERATION

13 54 030 REMOVING AND INSTALLING/SEALING THROTTLE VALVE ASSEMBLY (N52 / N52K / N51 / N53)

Read and comply with **61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE)** .

Necessary preliminary tasks:

- Switch off ignition
- Remove air intake hose, see **13 54 250 Removing and installing/replacing intake hose (on air cleaner housing) (N52K)**.

Unlock plug (1) and remove.

Release screws.

Tightening torque: 1AZ, see **13 54 THROTTLE AND ACTUATOR** .

Remove throttle assembly (2).

Fig. 10: Plug And Throttle Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing ring (1) of throttle assembly (2).

Fig. 11: Sealing Ring Of Throttle Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check stored fault messages.

Now clear the fault memory.

13 54 250 REMOVING AND INSTALLING/REPLACING INTAKE HOSE (ON AIR CLEANER HOUSING) (N52K)

Necessary preliminary tasks:

- Switch off ignition
- Remove intake filter housing, see **13 71 000 Removing and installing/replacing intake filter housing (N52K)**

Unfasten clip.

Feed out intake hose (1) and remove.

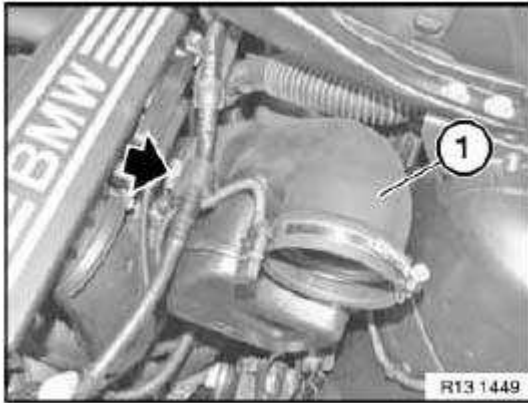

Fig. 12: Intake Hose

Courtesy of BMW OF NORTH AMERICA, INC.

13 54 251 REMOVING AND INSTALLING/REPLACING INTAKE HOSE (ON THROTTLE VALVE ASSEMBLY) (N52K)

Necessary preliminary tasks:

- Remove intake hose

Unfasten clip.

Detach intake hose (1) from throttle valve assembly and remove.

Fig. 13: Intake Hose

Courtesy of BMW OF NORTH AMERICA, INC.

62 SENSOR FOR CONTROL UNIT

13 62 010 REMOVING AND INSTALLING/REPLACING DIFFERENTIAL PRESSURE SENSOR (N52 / N52K / N51)

Necessary preliminary tasks:

- **E90 / E91 / E92 / E93 / E87:**

Remove lower section of microfilter housing, see **31 MICROFILTER** .

- **E85 / E86 E90 / E91 / E92 / E93:**

Remove left tension strut on suspension strut dome

- **E70:**

Remove intake filter housing, see **13 71 000 Removing and installing/replacing intake filter housing (N52K)**.

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Release screws.

Unlock plug (1) and remove.

Pull differential pressure sensor (2) out of intake air manifold.

Fig. 14: Plug And Differential Pressure Sensor

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Read out fault memory of control unit of Digital Engine Electronics (DME).

Check stored fault messages.

Now clear the fault memory.

13 62 531 REPLACING COOLANT TEMPERATURE SENSOR (N52/ N52K/ N53)

WARNING: Danger of scalding!
Only perform these tasks on an engine that has cooled down.

Recycling

Catch and dispose of escaping coolant.

Observe country-specific waste-disposal regulations.

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition
- Remove intake duct

Coolant temperature sensor is mounted on cylinder head at front.

Unlock plug (1) and remove.

Release temperature sensor (2).

Installation:

Tightening torque: 2AZ, see **13 62 SENDERS FOR CONTROL UNIT** .

If necessary, top up coolant.

Check cooling system for leaks, see **17 00 009 CHECKING COOLING SYSTEM FOR LEAKS (M54, N46, N52)** .

Fig. 15: Plug And Temperature Sensor

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Now clear the fault memory.

13 62 560 REMOVING AND INSTALLING/REPLACING AIR - MASS FLOW SENSOR (N52 / N52K / N53)

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition

Release bolts.

Unlock plug (1) and remove.

Pull air-mass flow sensor (2) out of upper section of intake filter housing.

Fig. 16: Plug And Air-Mass Flow Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

13 62 560 REMOVING AND INSTALLING/REPLACING AIR - MASS FLOW SENSOR (N52)

Necessary preliminary tasks:

- Switch off ignition
- Read out fault memory of DME control unit.

Unlock plug (1) and remove.

Release screws.

Pull air-mass flow sensor (2) out of upper section of intake filter housing.

Installation:

Check sealing ring for damage.

Replace if necessary.

Fig. 17: Plug And Air-Mass Flow Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

64 START VALVES

13 64 501 REMOVING AND INSTALLING/REPLACING A FUEL INJECTOR (N52, N52K, N51)

This work step is described in the section **13 53 240 Replacing complete injection pipe (N52/ N52K)**.

13 64 541 REPLACING ALL FUEL INJECTORS

This work step is described in the section **13 53 240 Replacing complete injection pipe (N52/ N52K)**.

71 INTAKE SILENCER

13 71 000 REMOVING AND INSTALLING/REPLACING INTAKE FILTER HOUSING (N52K)

Necessary preliminary tasks:

- Switch off ignition
- Read out fault memory of DME control unit.

Unlock and remove gaiter (1).

Fig. 18: Removing Gaiter

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug (1) and remove.

Release clamp and detach air intake hose.

Detach intake filter housing (2) from bearings pins of rubber mounts in upward direction and remove.

Installation:

Make sure bearing pins are correctly seated in rubber mounts.

Fig. 19: Plug And Intake Filter Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Position holder (1) of intake filter housing on rubber mount (2).

Fig. 20: Holder Of Intake Filter Housing On Rubber Mount
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.

Now clear the fault memory.

72 AIR CLEANER

13 72 001 REPLACING AIR CLEANER ELEMENT (N52K)

Necessary preliminary tasks:

- Read out fault memory of DME control unit
- Switch off ignition

Unlock plug (1) and remove.

Unfasten clip.

Open clips (2).

Remove top section (3) of intake filter housing.

Fig. 21: Plug And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Remove air cleaner element (1).

Installation:

Clean upper and lower sections of intake filter housing from inside.

Install new air cleaner element.

Fig. 22: Air Cleaner Element

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Check stored fault messages.
Now clear the fault memory.

90 CARBON CANISTER VENTILATION

13 90 500 REPLACING TANK VENT VALVE (N52 / N52K / N51 / N53)

Necessary preliminary tasks:

- Check stored fault messages
- Switch off ignition
- Remove throttle valve assembly, see **13 54 030 Removing and installing/sealing throttle valve assembly (N52 / N52K / N51 / N53).**

Installation location:

Tank vent valve is fitted at bottom on intake air manifold.

Unlock plug (1) and remove.

Unlock hose (2) and detach.

Unlock hose (3) on intake manifold and detach.

Detach tank vent valve (4) from bracket and remove.

Fig. 23: Plug, Hose And Tank Vent Valve
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Read out fault memory of DME control unit.
Now clear the fault memory.

CATALYST MONITORING

NOTE: OBD System Description of Siemens VDO ECU MSV80 for following models:

X3 3.0i, X3 3.0Si, 323i (only Canada), 328i, 328xi, 328Ci, 328Cxi, 328i sport wagon, 328xi sport wagon and 328Ci convertible

P0420/0430

DIAGNOSTIC OVERVIEW

The ECM tests the catalyst system during steady state driving by cycling the fueling LEAN and then RICH for a calibrated number of cycles while monitoring the oxygen storage capacity (OSC). Prior to the Catalyst test the canister purge valve is completely closed or completely opened with low canister purge value. This is to eliminate the influence of canister vapors on the downstream sensor during the test.

The first lean to rich cycle of the test is only used to establish an average voltage value of the downstream sensor voltage. During subsequent cycles the OSC is based on the integrated (accumulated) value of the difference between the average value of the previous lean to rich cycle and the measured instantaneous voltage during the current lean to rich cycle.

MONITORING FUNCTION

Catalyst monitoring is based on the monitoring of the oxygen storage capability by comparing the signals of the O2 sensor upstream and downstream the catalyst.

The engine control results in regular lambda oscillations of the exhaust gas. These oscillations are damped by the storage activity of the catalyst. The amplitude of the remaining lambda oscillations downstream the catalyst indicates the oxygen storage capability.

If all monitoring conditions are fulfilled, then a special defined A/F-modulation will be done. The relation of the deviations between the current downstream-sensor-signal to the average value of the downstream-sensor-signal is a sign for catalyst condition. The catalyst system is considered malfunctioning, if after a specified number of monitoring cycles the average of the ratios exceeds a threshold. The corresponding fault code is stored.

MISFIRE MONITORING

P0300, 0301, 0302, 0303, 0304, 0305, 0306

MONITORING FUNCTION

The method of engine misfire detection is based on evaluating the engine speed fluctuations.

The engine torque is a function of engine speed, engine load and the moment of inertia.

In order to detect misfiring at any cylinder, the torque of each cylinder is evaluated by metering the time between two ignition events, which is a measure for the mean value of the speed of this angular segment. This means, a change of the engine torque results in a change of the engine speed.

It is also an influence of the load torque. This means, the influences of different road surface, e. g. pavement, pot holes etc. If the mean engine speed is measured, influences caused by road surfaces have to be eliminated.

This method consists of following main parts:

Data acquisition:

The duration of the crankshaft segments is measured continuously for every combustion cycle.

Sensor wheel adaptation:

Within a defined engine speed range and during fuel cut-off, the adaptation of the sensor wheel tolerances, instead of the misfire detection, is carried out.

With progressing adaptation the sensitivity of the misfire detection is increasing. The adaptation values are stored and taken into consideration for the calculation of the engine roughness.

Calculation of the engine roughness:

The engine roughness is derived from the differences of the segment durations. Different statistical methods are used to distinguish between normal changes of the segment duration and the changes due to misfiring.

Determination of misfiring:

Misfire detection is performed by comparing the engine roughness threshold value with the engine roughness

value. If the threshold is exceeded, single misfire is detected.

STATISTICS, FAULT PROCESSING

Emission Limit: (e) (3.2.2)

If the sum of cylinder(s) misfire counters within 1000 revolutions is 4 times exceeding a predetermined value during a driving cycle, or during the first 1000 revolutions, the fault code for emission relevant misfiring is temporarily stored. If the following driving cycle is also above the emission limits, the MIL will be switched on and a cylinder selective or global fault will be stored.

Catalyst Damage: (e) (3.2.1)

If the weighted sum of cylinder(s) misfire counters within 200 revolutions exceeds a predetermined value the fault code for catalyst damage relevant misfiring is stored and the cylinder with the highest rate will be switched off and the MIL will be switched on immediately. If two cylinders are switched off and the misfire rate is still above the damage limits, MIL is flashed immediately. If one of the cylinder selective counters exceeds the predetermined threshold, the following measures take place:

1. The Lambda closed loop system is switched to open-loop condition.
2. The cylinder individual fault code is stored or if multiple cylinders, then the Global fault code is set.
3. Fuel supply of the misfiring cylinder(s) is not cut-off (per customer request)
4. No downstream fuel trim.

All misfire counters are reset after each interval.

CALIBRATION VARIABLES

CALIBRATION VARIABLES

Siemens VDO Parameter SAM/Specification	J1930 Description	Cal Value
C_MIS_B_MIN_NR	Threshold for CARB B detection	
C_MIS_A_IND_THD	Cylinder individual threshold used for cylinder shut-off during CARB A criterion window	
C_MIS_SUM_A_THD	Cylinder global threshold for misfire status CARB A detection	
THD_ER_AV	Engine speed fluctuation threshold for misfire detection	Table

FUNCTION VARIABLES

FUNCTION VARIABLES

EVAP-SYSTEM LEAK DIAGNOSIS (MODULE DM-TL)

EVAPORATIVE SYSTEM LEAK MEASUREMENT

P0442/0456, 1434, 1447, 1448, 1449

General description of leak measurement

The evaporative system monitoring permits the detection of leaks in the evaporative system with a diameter of 0.02 inches and up.

By means of a Diagnostic Module Tank Leakage (DM-TL), an electrical actuated pump located at the atmospheric connection of the evaporative canister, a pressure test of the evaporative system is performed in the following order:

- During the Reference Leak Measurement, the electrical actuated pump delivers through the reference restriction. The engine-management system measures the pump's electrical current consumption in this section.

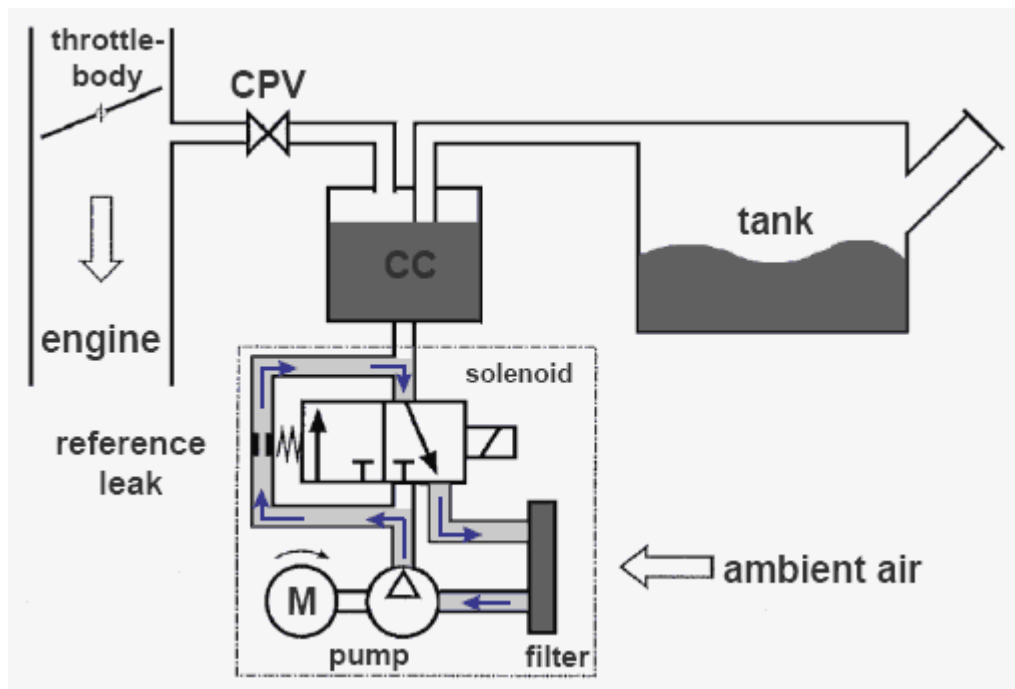

Fig. 1: Evaporative System Diagram (Actuated Pump Delivers Through Reference Restriction)
 Courtesy of BMW OF NORTH AMERICA, INC.

- During the Leak Measurement, the electrically actuated pump delivers through the charcoal canister into the fuel-tank system. The pressure in the evaporative system may be up to 2.5 kPa depending on the fuel level in the tank. The engine-management system measures the pump's electrical current consumption. A

comparison of the currents of the reference leak measurement and the leak measurement is an indication of the leakage in the tank.

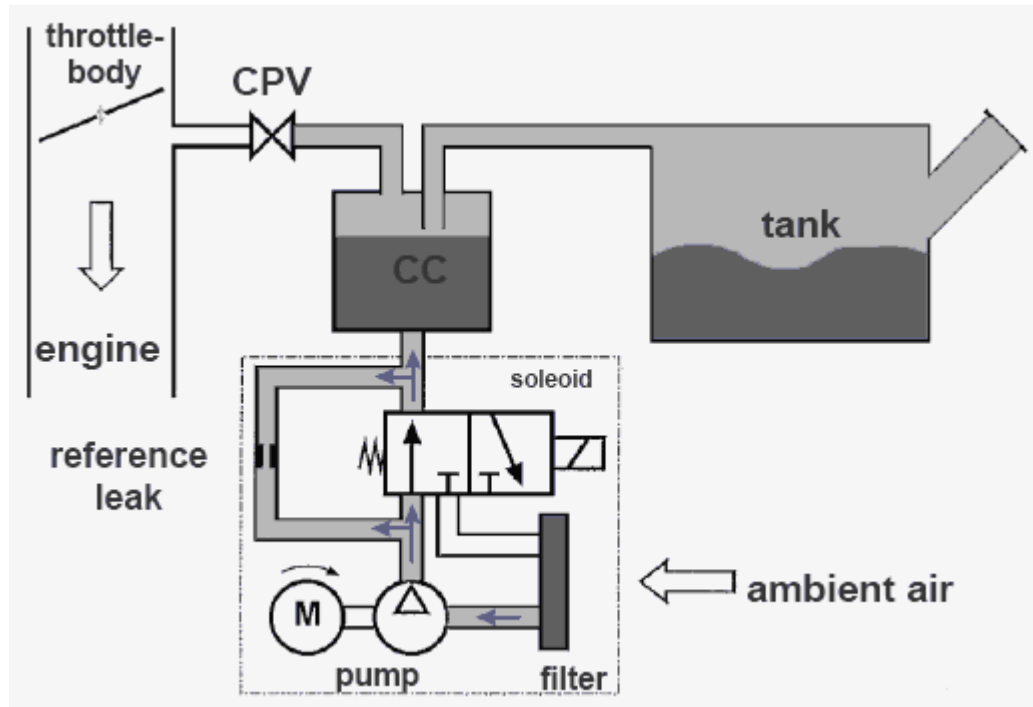

Fig. 2: Evaporative System Diagram (Actuated Pump Delivers Through Charcoal Canister Into Fuel-Tank System)

Courtesy of BMW OF NORTH AMERICA, INC.

0.02 inch diagnosis:

The first step of the diagnosis is the reference measurement, the result of the pump reference current is stored (picture in chapter a). After the solenoid switches, the venting system is pressurized (picture in chapter b). In the rough leak measurement the rough leak threshold is reached, if the leak is smaller than 0.04 inch and then the small leak measurement phase follows. When the DMTL current reaches the reference current within the small leak time, the system is tight (leak smaller than 0.02 inch), otherwise a small leak between 0.02 - 0.04 inches is detected.

0.04 inch diagnosis:

The first step of the diagnosis is also the reference measurement, the result of the pump reference is stored (picture in chapter a). After the solenoid switches, the venting system is pressurized (picture in chapter b). In the rough leak phase (time) the pump current must reach the rough leak threshold 1 (rough leak threshold 1 = idle current pump + K1 x (reference current - idle current)). Factor K1 is between 0.16 and 0.28 depending on the characteristic current value of the pump (reference current - idle current), this value is various in every pump.

If the rough leak threshold 1 is not reached in the rough leak time, the rough leak threshold 2 must be reached in an additional time (rough leak threshold 2 = idle current pump + K2 x (reference current - idle current)). Factor K2 is between 0.60 and 0.80 depending on the characteristic current value of the pump

(reference current - idle current).

If the rough leak threshold 2 is also not reached, a leak > 0.04 inches is detected.

In the diagram below is the typical current of a tight system, a 0.02 inch leak, and a leak > 0.04 inches.

Fig. 3: Tight System Typical Current Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

- c. After the test the remaining pressure in the evaporative system is bled off through the charcoal canister by switching off the pump and solenoid.

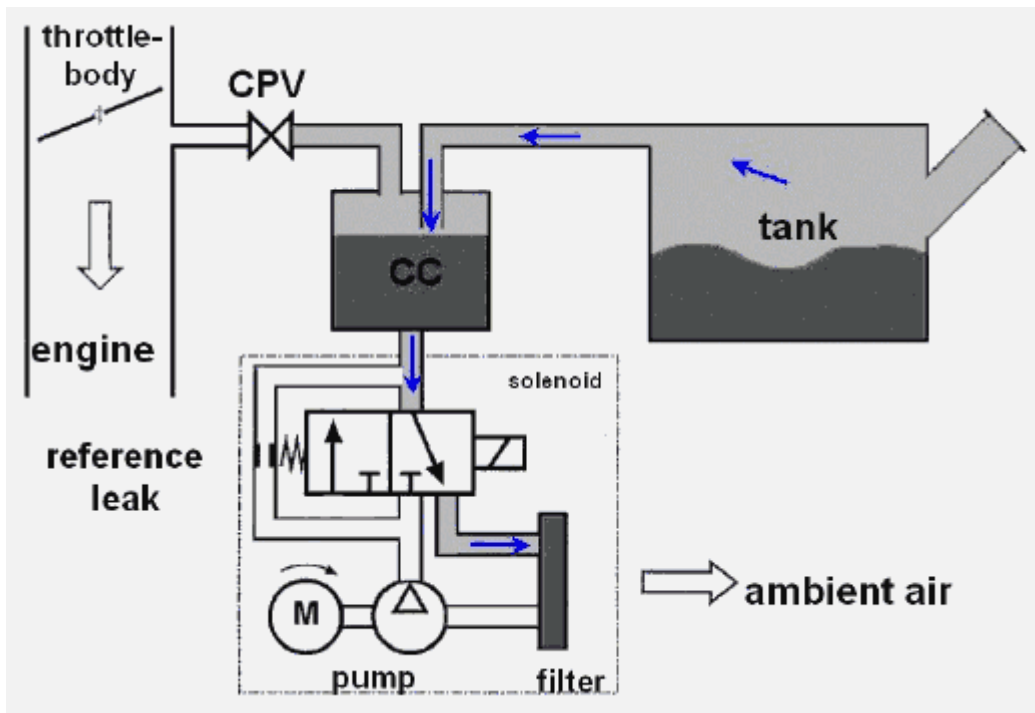

Fig. 4: Evaporative System Diagram

EVAP (FUNCTIONAL CHECK CANISTER PURGE SOLENOID)

P0440, 0441

Monitoring the canister purge solenoid

The diagnosis is used for the functional test of the CP solenoid (CPS).

The test consists of three steps. Step 2 can be triggered separately by an EOL (End Of Line) request by a serial communication tool.

Step 1: based on the activated charcoal filter (ACF) load degree

Step 2: based on ...

- the engine speed change at idle speed
- the deviation of lambda-controller
- manifold air pressure (MAP) change at idle speed

Step 3: based on the difference between the measured air mass flow before and during a CPS opening

Monitoring function

The first check of the CPS is based on the ACF- load degree. The "Canister Load diagnosis" is calculated

permanently until the complete check CPS is finished.

During the next check, the CPS is evaluated based on the engine speed change at idle speed. To this effect, the CPS is opened for a short time and the engine speed monitored for a certain period.

After this check has been enabled for the first time, it is requested during each idle speed phase. This is repeated as long as a result has been reached. This check is not bound to one IS phase, but can be distributed to several IS phases.

During this check the lambda deviation will also be checked.

In step 3 the CPS is considered on the basis of the measured mass air flow before and during a CPS opening phase.

If the CPS is detected to be not OK after all three checks have been passed (end of step 3), then the error is set.

FUEL LEVEL SENSOR

P0461, P0462, P0463, P2067, P2068

The diagnosis of the fuel level sensor signal consists of a circuit continuity check and a rationality check.

FUEL LEVEL SENSOR CIRCUIT CONTINUITY CHECK

The signal of the fuel level sensor is monitored concerning the valid range. This range depends on the used fuel level sensor.

If the left or right fuel level sensor signal is above the upper threshold, a short circuit plus is detected. If the left or right fuel level sensor signal is below the lower threshold, an appropriate fault code for the left or right sensor is set.

FUEL LEVEL SENSOR SIGNAL RATIONALITY CHECK (PLAUSIBILITY ERROR)

The engine management system of every BMW has the capability to calculate fuel consumption. For the fuel level sensor plausibility check, this calculated consumption is compared with the difference of the fuel level signal. When the calculated fuel consumption reaches an appropriate and predetermined amount (for example five gallons), the calculated fuel consumption is compared to the change in fuel level as indicated by the fuel level sensors. If the difference is greater than the applicable threshold value, a stuck fuel level sensor fault is detected and an appropriate fault code is set.

If a fault is present, the OBD II EVAP leak monitor will run using a substitute value of 85% total fuel tank volume.

The 85% substitute value will assure that in every case the required 0.020 inch leak is detected by the OBD II system.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

GENERAL DESCRIPTION OF THE PCV-SYSTEM

There are 3 tubes connected to the engine: The first of them conducts the blow-by gases from the cylinder head cover to the separator, where the oil is separated from the air and lead back by a second tube to the crankcase sump. A third tube directs the cleaned blow-by gases via the intake system to the combustion. The pressure regulator makes sure that the high vacuum level between crankcase and ambient air will be reduced if needed.

DIAGNOSIS OF A LEAKAGE IN THE PCV-SYSTEM

A disconnection or leakage in the PCV-System is indicated by a rough or stalling engine and results in a reaction within the fuel system (fuel trim deviation). In this case a fault code will be stored by the **fuel system monitoring**.

AMBIENT TEMPERATURE MONITORING

CAN BASED AMBIENT TEMPERATURE - SIGNAL DIAGNOSIS

P0072, P0073

General Description

The purpose of this diagnosis is to detect electrical faults as defined in OBDII requirements. The input signal is a CAN message of instrumentation cluster. If an error is present on CAN signal, an error symptom is set and an error counter is de-bounced.

Error Symptoms

- short circuit to vbatt or open line
- short circuit to ground
- signal error

AMBIENT TEMPERATURE SIGNAL PLAUSIBILITY CHECK

P0071

General Description

This diagnosis is performed in order to detect a stuck or not plausible TAM signal which cannot be detected by electrical range diagnosis.

The first part, just after start looks at the change of ambient temperature and compares the start and stop temperature. If the check is positive the diagnosis is finished. In negative case diagnosis runs to next step during warm up phase.

The error detection is only performed if the monitoring conditions for time after start, engine state idle speed, time of engine stop, ECT and ambient temperature are fulfilled. The plausibility error is detected if the absolute value of the temperature-difference between the arithmetic mean of ECT (Engine Coolant Temperature) and TIA (Temperature Intake Air) and the ambient temperature TAM (in formula: $ABS [(ECT+TIA) \times 0,5 - TAM]$) exceeds the threshold for an anti-bounce time.

The error validation is only performed if ECT signal is valid and the vehicle was driven with a certain vehicle speed. If both conditions are true and an error was detected, then the error is set for this driving cycle and the diagnosis is switched off.

For RBM handling the Cold Start Denominator will be considered.

Error Symptoms

- Ambient temperature not plausible

Input parameters for monitoring

- ECT
- engine state
- engine stop time
- ambient temperature after engine stop (last driving cycle)

- ambient temperature at start
- actual ambient temperature
- vehicle speed
- engine run time after start

FUEL SYSTEM MONITORING

LAMBDA ADAPTATION

Diagnostic Overview / Monitoring Function

(P0171, 172, 174, 175)

The ECM monitors the fuel system control continuously during all engine states except PUC (decal fuel cut-off). After the enable conditions are met a counter is started. At this point the ECM evaluates the total percentage of short and long term fuel control. If no condition is present the end diagnostic counter will decrement from a calibrated value to zero and a passing decision is made.

If a lean condition is present and total fuel control is above the calibrated threshold two timers are started. If the lean threshold counter exceeds the calibrated threshold before the reset timer has decremented from a calibrated threshold to zero a lean error is set.

If a rich condition is present and total fuel control is below the calibrated threshold two timers are started. If the rich threshold counter exceeds the calibrated threshold before the reset timer has decremented from a calibrated threshold to zero a rich error is set.

The time counter is increased while "lambda controller + lambda adaptation" exceed minimum or maximum threshold.

The error is detected as soon as the time counter reaches its maximum value.

Fig. 12: Fuel System Monitoring Timing Chart
Courtesy of BMW OF NORTH AMERICA, INC.

Similar Conditions Function

When the engine management system recognizes a failure in the misfire or fuel systems, the engine management system is required to record the conditions present when the fault occurred. These conditions recorded include engine speed, engine load (MAF), and warm up status of the first event that resulted in the storage of a code. These conditions stored are referred to as **similar conditions**

Once the similar conditions are met without a failure in the misfire or fuel system, the flag is set to 1. Once this flag is set the driving cycle counter for that failure can be decremented.

The code and stored freeze frame conditions may be erased if similar conditions are not encountered during the next 80 driving cycles immediately following the initial detection of the malfunction.

The MIL may be extinguished after three sequential driving cycles in which similar conditions have been encountered without an exceeding the thresholds of the fuel system diagnostic.

TRIM CONTROL PLAUSIBILITY MONITORING

P2096/2098, P2097/2099

Monitoring function

The trim control plausibility monitoring detects a high deviation of the l-share of lambda trim control. If it exceeds given thresholds the following malfunction is detected:

Fuel trim above limit

If the above mentioned malfunction is detected, the corresponding fault code is stored.

FAULT CODE CHART

	B1S1	B2S1

OXYGEN SENSOR MONITORING LINEAR UPSTREAM / BINARY DOWNSTREAM

UPSTREAM OXYGEN SENSOR MONITORING (LINEAR)

Upstream Oxygen Sensor - Short Circuit Monitoring

P0131/0151, P0132/0152

Monitoring function

The oxygen sensor circuit monitoring detects the following malfunctions by evaluating the error information received from oxygen sensor microcontroller:

- Short circuit of sensor signal to battery voltage
- Short circuit of sensor signal to ECM ground

If one of the above mentioned malfunctions is detected, the corresponding fault code is stored.

FAULT CODE CHART

	B1S1	B2S1
SC Ground	P0131	P0151
SC Vbatt	P0132	P0152

Upstream Oxygen Sensor - Open Circuit Monitoring

Monitoring function

The oxygen sensor circuit monitoring detects the following malfunctions by evaluating the error information received from oxygen sensor monitoring functions:

FAULT CODE CHART

	B1S1	B2S1
○ Reference voltage Failure - (UN)	P2243	P2247
○ Virtual Ground Failure - (VM)	P112C	P112D
○ Pumping Current Failure - (IP)	P112C	P112D
○ Trim Current Failure - (IA)	P2626	P2629

If one of the above mentioned malfunctions is detected, the corresponding fault code is stored.

Monitoring Description

This function determines, if an open circuit in any of the four electric lines (*Reference Voltage, Virtual Ground, Pumping Current and Trim Current*) is present in the WRAF Sensor.

This function shall be triggered only if one of the following diagnosis is active (to set the readiness bit), which are 'Upstream Oxygen Sensor - Signal Monitoring During Fuel Cut-off and 'Upstream Oxygen Sensor - Heater Monitoring'. The function shall go to the state = "active" only if one of the above diagnosis detected a fault.

(Reference Voltage)

If a heater error exist and sensor voltage is too low, while the internal resistance measurement is turned off, an open circuit in the line 'Reference voltage' occurred.

(Virtual Ground) or (Pumping Current)

An open circuit in line Virtual Ground or in the line Pumping current can be detected if the sensor signal stocks near lambda 1. The sensor non-activity can be detected by the Oxygen Sensor Signal Monitoring During Fuel Cut-off (signal voltage below e.g. 2.1 V *) in fuel cut off).

(Trim Current) If the sensor shows an augmented gain, i.e. the sensor signal is higher than the nominal characteristic line, the plausibility test during the fuel cutoff phase shall detect this symptom (signal voltage above e.g. 5.6 V *) during fuel cut off) and an Open Circuit is assigned to the line Trim Current.

)* For exact values please have a look at the summary table!

Upstream Oxygen Sensor - Signal Controller Monitoring

Diagnostic Overview

Sec (e) (7.2)

This function will detect an error during the initialization and/or operation of a WRAF sensor controller through SPI communication. Information communicated from the Basic Software (BSW) is used for initialization and communication between application software (ASW) and the controller. This is used to determine if the function is working properly.

Monitoring Function

Sec (e) (7.2.1)

After an ECU reset, the WRAF sensor controller is started and the diagnosis determines the time until the initialization, has been performed in the allowed time. If not successful, then a DTC will be stored. If this is successful, then the difference is checked between the present error counter and the stored value of this error counter at ECU reset, (switching from Key "OFF" to Key "ON") or at clearing error memory and after each function call, in case a difference between both counters was found. If there is a difference, another counter is incremented.

If this counter is higher than a threshold, a SPI communication error is stored.

FAULT CODE CHART

	B1S1	B2S1
Communication error	P3022	P3023
Initialization error	P3024	P3025

All of the above checks are performed internal to the ECU. (See)

Upstream Oxygen Sensor - Signal Activity Check

P2414/2415

Monitoring function

The oxygen sensor signal activity check monitors if the sensor is attached to the exhaust pipe and whether the exhaust is sampled correctly (no leakage). A malfunction is detected if the oxygen sensor voltage is above a threshold (shows too lean mixture in part load or full load)

If the above mentioned malfunction is detected, the corresponding fault code is stored.

B1S1 P2414

B2S1 P2415

Upstream Oxygen Sensor - Swapped Sensors Check

P0040

Monitoring Description

This function will detect if the Oxygen Sensor wire harness has been cross connected, i.e., Bank 1 with Bank 2. This is performed by the use of the output of the fuel correction (lambda controller) of each bank. If this control is on opposite limit at bank 1 and bank 2, the sensors are swapped and the corresponding fault code is stored.

Corresponding fault code:

P0040

Upstream Oxygen Sensor - Active Signal Check (Shift to lean / rich)

P2195, 2196, 2197, 2198

Monitoring Function

This monitor is an enhancement of the Downstream Oxygen Sensor - Active Signal Check (Stuck lean / rich) and the Trim Control Plausibility Monitoring. Its purpose is to help determine the root cause of a stocking downstream sensor signal or a implausible high i- share of the fuel trim controller.

The monitor will only be enabled if a fuel correction fault has been detected and a malfunction code has been stored (P2096 - P2097 - P2098 - P2099)

OR

if the rear sensor signal check has detected, that the rear sensor signal is very rich or very lean and the corresponding malfunction fault code has stored (P114A - PI 14B - PP114C-P114C)

If one of the listed fault codes exists, this diagnosis will be enabled to determine if the root cause of the malfunction is due to a stuck signal or characteristic line shift of the upstream O2 sensor or due to a stuck signal of the downstream O2 sensor or a system malfunction, i.e. vacuum leak, injector, etc...

If it has been determined that the upstream O2 signal was the root cause of the fuel correction fault, the appropriate DTC will be stored along with the fuel correction or with the downstream sensor stuck DTC.

Upstream Oxygen Sensor - Signal Dynamic Monitoring (Slow Response)

P0133/0153

Monitoring function

The oxygen sensor signal dynamic monitoring detects greater deviations of the dynamic behavior of the sensor signal compared to the nominal behavior, controlled by the lambda controller

The change of the dynamic behavior is caused by problems of the electrical connection (e.g. open circuit), extreme aging of the sensor or a low sensor temperature which slows down the sensor compared to the nominal behavior.

The monitoring is based on an amplitude criterion, i.e. the relation between the amplification of the oxygen sensor and the model is monitored and detects the following malfunction:

Sensor signal too slow

If the above mentioned malfunction is detected, the corresponding fault code is stored.

B1S1 P0133

B2S1 P0153

Upstream Oxygen Sensor - Signal Monitoring During Fuel Cut-off

P2297/2298

Monitoring function

The oxygen sensor signal monitoring during fuel cut-off detects if the oxygen sensor signal is not plausible during fuel cut-off. A malfunction is detected if the oxygen sensor voltage is outside the normal operating voltage range (3.1 V ... 5.68 V).)*

If the oxygen sensor signal voltage is between 2.1 ... 3.1 V during fuel cut-off, then the signal is not plausible.

If the above mentioned malfunction is detected, the corresponding fault code is stored.

B1S1 P2297

B2S1 P2298

If the oxygen sensor signal voltage is above a threshold during fuel cut-off (e.g. 5.6 V)*) or below a threshold (e.g. 2.1 V)*) then the open circuit diagnostic function is triggered (see chapter '**OXYGEN SENSOR MONITORING - OPEN CIRCUIT**'). The fault processing continues in this function.

)* For exact values please have a look at the summary table!

Upstream Oxygen Sensor - Heater Monitoring

P3026/3027

Diagnostic Overview

Sec (e) (7.2.3)

The purpose of this function is to detect oxygen sensor heater failures that would lead to an increase in emissions beyond the thresholds stated in the appropriate regulations.

The diagnosis shall be carried out by determining whether the measured oxygen sensor ceramic temperature falls below set limits over a number of measurement cycles. The evaluations of the diagnosis cycle are

determined after the completion of a limited number of monitoring cycles.

Deviations in the oxygen sensor ceramic temperature or the oxygen sensor not being operatively ready in a timely manner (because of a too low temperature) can lead to an increase in emissions above the applicable standards or prevent the sensor signal from being used as a diagnostic system monitoring device. Deviations may occur due to, for example, ageing of the heater element, defective wiring, increased heater circuit connector contact resistance, defective heater driver etc.

Monitoring Function

The diagnosis strategy is based on a statistical evaluation of the oxygen sensor ceramic temperature over a pre-defined number of monitoring cycles.

The oxygen sensor ceramic temperature shall be obtained indirectly via the measured internal resistance of the sensor.

If the sensor is not ready after a defined time (e.g. 30s after start))* the sensor is set to forced readiness mode and the Upstream Oxygen Sensor Heater Monitoring is started.

Two cases can appear:

- sensor temperature is invalid (no measurement of sensor temperature possible because of an ECU internal (electrical) failure)
=>P165F/P166F is stored
- sensor temperature is below a threshold
=> normal failure detection

A low sensor temperature can be caused by a weak heater or a open circuit in the temperature measurement line (line UN). After a low sensor temperature has been detected, the open circuit diagnosis is triggered to check, if an open circuit in line UN is present. If there is an open circuit, then open circuit fault code (P2243/P2247) is stored (see chapter 'OXYGEN SENSOR MONITORING - OPEN CIRCUIT' and picture below).

If there is no open circuit present, then the heater fault code is stored (P0135/P0155).

)* For exact values please have a look at the summary table!

SUMMARY

Downstream Oxygen Sensor - Signal Dynamic / Plausibility Check During Fuel Cutoff

P0139/0159

Monitoring function

The following plausibility and activity monitoring is carried out: (e) (7.3.2)

Sensor signal plausibility and signal activity monitoring is performed during coasting conditions during fuel cut-off (slow response / sensor signal range too small).

A malfunction is detected, if the sensor signal is not below a threshold after a short time after entering fuel cut-off. This short time is needed to purge the exhaust pipe. Usually the signal falls from fuel trim correction setpoint (e.g. 680 mV) to a voltage near 0mV.

If one of the above mentioned malfunctions is detected, the corresponding fault code is stored.

FAULT CODE CHART

	B1S2	B2S2
Failure during fuel cut-off	P0139	P0159

Downstream Oxygen Sensor - Dynamic / Transition Time in Sensor Midpoint Range Monitoring

P1130/1131

Monitoring Function

This function monitors the transition Time in sensor midpoint range of the downstream sensor voltage. When a fuel cut-off phase starts, the following steps will be executed:

- sensor voltage must be above a threshold (signal must be rich enough, to measure the switctime)

Remark: Usually the signal starts at fuel trim control setpoint (e.g. 650 mV)

- sensor voltage value is stored (= "start-value")
- switctime measurement is started, when the signal is e.g. at 75 % of start value

Remark: The measurement start and stop- value are relative to the start value, to measure always the switctime around the fuel trim control setpoint.

- switctime measurement is finished, when the signal is e.g. at 40 % of start value
- measured switctime is corrected over mass air flow

The transition time ("switctime") is represented by a cycle counter. This switctime is measured over x)* fuel cut-off phases. The mean value after x fuel cut- off phases is compared with a failure threshold.

If this value is above a threshold, a malfunction is detected and the corresponding fault code is stored.

FAULT CODE CHART

	B1S2	B2S2
Switctime too high	P1130	P1131

Downstream Oxygen Sensor - Active Signal Check (Stuck lean / rich)

Monitoring Function

This monitor consists of two parts.

1. **Part one** monitors the downstream sensor voltage during active fuel trim controller p- share. If the fuel trim control is active, the downstream sensor voltage must be in a band around the trim control setpoint. If the voltage is outside this band)*, a mass air flow integral is incremented. If this integral is over a threshold, a malfunction is detected (see also picture below!). When the downstream sensor voltage will not switch to rich before the integral is over a threshold after a fuel cut-off phase, then this fault will be stored, too.

If the above mentioned malfunctions are detected, the corresponding fault code is stored.

FAULT CODE CHART

	B1S2	B2S2
Downstream sensor voltage too low	P114B	P114D
Downstream sensor voltage too high	P114A	P114C

)* For exact values of thresholds etc. please have a look at the summary table!

2. **Part two - Downstream Active Test:**

This monitor is an enhancement of the Downstream Oxygen Sensor - Active Signal Check (Stuck lean / rich) and the Trim Control Plausibility Monitoring. Its purpose is to help determine the root cause of a stocking downstream sensor signal or a implausible high i- share of the fuel trim controller.

The monitor will only be enabled if a fuel correction fault has been detected and a malfunction code has been stored (P2096 - P2097 - P2098 - P2099)

OR

if the rear sensor signal check has detected, that the rear sensor signal is very rich or very lean and the corresponding malfunction fault code has stored (P114A - PI 14B - PP114C-P114C)

If one of the listed fault codes exists, this diagnosis will be enabled to determine if the root cause of the malfunction is due to a stuck signal or characteristic line shift of the upstream O2 sensor or due to a stuck signal of the downstream O2 sensor or a system malfunction, i.e. vacuum leak, injector, etc...

If it has been determined that the upstream O2 signal was the root cause of the fuel correction fault, the appropriate DTC will be stored along with the fuel correction or with the downstream sensor stuck DTC (see chapter '[UPSTREAM OXYGEN SENSOR - ACTIVE SIGNAL CHECK \(SHIFT TO LEAN / RICH\)](#)').

If it has been determined that the downstream sensor signal was the root cause of the fuel correction fault, the appropriate DTC (see table below) will be stored along with the fuel correction or with the

downstream sensor stuck DTC.

This function will also detect, if the oxygen sensor wire harness has been cross connected, i.e., Bank 1 with Bank 2. When this failure is present, the downstream sensor voltages of bank 1 and 2 are on opposite limits.

If one of the above mentioned malfunctions is detected, the corresponding fault code is stored.

Downstream Oxygen Sensor - Heater Circuit Monitoring

P0141,0161,P0036,0037,0038,0056,0057,0058

Monitoring Function: Circuit

For proper function of the oxygen sensor, the sensor element must be heated.

A non functioning heater delays the sensor readiness for closed loop control and thus influences emissions.

The monitoring strategy is based on the comparison of the O2 sensor heater resistance to an absolute threshold during coasting conditions where the exhaust temperature is sufficiently low as to cause the sensor ceramic temperature to fall outside normal operating levels, in cases where the heating power is insufficient.

The cooling energy of the exhaust gas is calculated and compared to a calibrated threshold.

The heater monitor is active if the calculated energy is equal or exceeds the threshold. Then the O2 sensor heater is compared to a calibrated threshold. If the heater resistance is equal or exceeds the threshold, an O2 sensor heater malfunction is detected and the corresponding fault code is stored.

Corresponding fault code:

B1S2 P0141

B2S2 P0161

Monitoring Function: Power stage

The purpose of this monitor is to detect errors within the O2 Sensor Heater Circuit. The signal for the O2 sensor heater is pulse-width modulated. The signal of the power stage is monitored internally by the driver. The driver can distinguish between three symptoms:

- HO2S Down SCVB

- HO2S Down SCG
- HO2S Down Open Line

If one of the above mentioned symptoms is present, a malfunction is detected and the corresponding fault code is stored.

FAULT CODE CHART

	B1S2	B2S2
SC Ground	P0037	P0057
SC Vbatt	P0038	P0058
Open circuit	P0036	P0056

CLOSED LOOP LAMBDA CONTROL - ENABLE CONDITIONS

Closed loop lambda control is enabled (with a delay) at the start of a driving cycle and can be temporary or permanently deactivated during the driving cycle. The turn-on delay at the start of a driving cycle is described by the following enable conditions:

- the upstream oxygen sensor operability is detected i.e. the upstream HO2'S operating temperature has been reached
- a calibrated delay time, after end of engine start, has elapsed
- the engine coolant temperature must have exceeded a calibrated threshold or the modeled engine coolant temperature (substitute for a faulty temperature sensor minimum) must have exceeded a calibrated threshold after a calibrated period of time
- no secondary air activity

Closed loop lambda operation is disabled during the driving cycle, if the following operating condition, which permits only mixture enrichment by the lambda controller, is fulfilled:

- when Catalyst overheating prevention is active.

Only for linear Lambda Sensor:

- the A/F ratio set-point value lies below oxygen sensor's measurable limit - in this case only A/F mixture enrichment can be executed by the lambda control (no closed loop operation) the moment the set-point value exceeds the measurable threshold.

Closed loop lambda operation is further deactivated during a driving cycle when any of the following conditions are fulfilled:

- during fuel cut-off or cylinder shut-off and immediately afterwards till the oxygen sensor again starts indicating correct values (the waiting time depends on integrated mass airflow or on a calibrated delay time).
- the mass air flow is below a calibrated threshold that leads to the minimum possible injection time.
- Secondary air system active

ENGINE COOLANT TEMPERATURE (ECT) MONITORING

ELECTRICAL COOLANT TEMPERATURE DIAGNOSIS

P0017,0018

General Description

The purpose of this diagnosis is to detect electrical faults of the sensor signal. The input signal is analog from a NTC and has to be in a calibrated range. Short cut to ground can be detected immediately, short cut to voltage battery or open load after a delay time. If an error symptom is detected, the error counter is de-bounced.

Error Symptoms

- Short circuit to voltage battery or open circuit
- Short circuit to ground

COOLANT TEMPERATURE GRADIENT DIAGNOSIS

P3198

General Description

The purpose of this diagnosis is to detect an implausible gradient on the coolant temperature signal. The diagnostic function checks whether the difference between one measured coolant temperature value and the succeeding value is too big.

Error Symptom

- ECT signal gradient error

Input parameters for monitoring

- measured ECT

COOLANT TEMPERATURE STUCK DIAGNOSIS

P3199

General Description

The purpose of this diagnosis is to detect a stuck coolant temperature signal. The diagnostic function checks if after a variation of the calculated coolant temperature also a variation of the measured coolant temperature is detected.

For RBM handling the Cold Start Denominator will be considered.

Error Symptom

- ECT signal stuck error

Input parameters for monitoring

- Measured ECT
- Calculated (modeled) ECT

COOLANT TEMPERATURE SENSOR STUCK IN A RANGE DIAGNOSIS WITH ENGINE OFF TIMER

P316A

General description

The engine off time is calculated by a relative time counter of an instrumentation CAN message. After evaluation of this message the engine off time is compared with the difference of ECT at engine stop and ECT. This is to check if the engine off time is within a certain temperature range.

Error Symptoms

- Coolant temperature signal stuck in range error

Input parameters for monitoring

- ECT (at start)
- IAT (at start)
- ambient temperature (at start)
- engine off timer

ENGINE OFF TIMER MONITORING

P1515,1551

General description

The engine off time is calculated by a relative time counter of an instrumentation CAN message. After evaluation of this message the engine off time is compared with the difference of ECT at engine stop and ECT. This is to check if the engine off time is within a certain temperature range.

Error Symptoms

- No signal from CAN (symptom 2)
- Engine off time not plausible to ECT (symptom 3)

Input parameters for monitoring

- ECT at engine stop
- ECT
- relative time counter via CAN

THERMOSTAT

P0128,0597,0598,0599

DESCRIPTION OF THE ENGINE COOLANT THERMOSTAT MONITORING

The coolant thermostat monitoring is done to detect a slow warm-up due to heat losses through thermostat and radiator. It is based on the comparison of the measured ECT sensor signal and the calculated ECT model (TCO_SUB).

The ECT model calculation is depending on the speed of the water pump, engine load and ambient temperature.

A malfunctioning coolant thermostat is detected, if the calculated ECT model has exceeded the threshold 1 (P0128) and the measured ECT sensor signal remains below threshold 2 (P0128).

Before a malfunctioning coolant thermostat is entered into failure memory, the conditions concerning low load, coasting duration and IAT during the monitoring are checked. If the monitoring conditions are met, the coolant thermostat is entered into failure memory. Otherwise the coolant thermostat monitoring is inhibited for this driving cycle.

THE INPUT PARAMETERS USED FOR MONITORING ARE

- Engine coolant temperature
- Intake air temperature
- Ambient air
- Engine load

EXAMPLE OF MONITORING METHOD

Fig. 16: Monitoring Method (Example)

Courtesy of BMW OF NORTH AMERICA, INC.

A comparison between the measured coolant temperature and the "warmed-up temperature" is done after a specific time interval. The interval itself is based on the coolant temperature model (Function of intake air mass).

As soon as the model temperature exceeds the thermostat opening temperature and all other monitoring conditions are fulfilled at the same time, a valid diagnosis occurs.

At that time, if the measured coolant temperature is higher than warmed-up temperature, the thermostat is concluded as normal thermostat.

On the contrary, if the measured coolant temperature is lower than warmed-up temperature, the thermostat is concluded as opened stuck thermostat.

INTAKE AIR TEMPERATURE (IAT) MONITORING

ELECTRICAL INTAKE AIR TEMPERATURE DIAGNOSIS

P0112,0113

General Description

The purpose of this diagnosis is to detect electrical faults as defined in OBDI requirements. The input signal is analog from a NTC and has to be in a calibrated range. Short cut to ground can be detected immediately, short cut to voltage battery or open load after a delay time. If an error symptom is detected, the error counter is de-bounced.

Error Symptoms

- Short circuit to voltage battery or open load
- Short circuit to ground

INTAKE AIR PLAUSIBILITY CHECK

P0111, 111E, 111F

General Description

This diagnosis checks IAT integrity for a plausible range and / or signal stuck. For the range detection, IAT has to be within coolant temperature and ambient temperature window. If IAT is outside of the range plus an offset, the error symptom is set and the error counter is de-bounced.

If the vehicle was driven with a certain vehicle speed for a calibrated time (cool down of hot IAT) and afterwards the vehicle was in idle for a calibrated time, and the IAT signal has not moved, then a stuck IAT signal is detected and the error is de-bounced.

For RBM handling the Cold Start Denominator will be considered.

Error Symptoms

- Signal too high
- Signal too low
- Signal not plausible

Input parameters for monitoring

- ECT
- Ambient temperature at start and continuously
- IAT
- Vehicle speed
- Engine speed

CAMSHAFT AND CRANKSHAFT SENSOR INCLUDING VALVE TIMING

CAMSHAFT SENSOR

Variable Camshaft Timing (Vanos) (detection of mechanical IVVT error)

P0012/0015

The BMW-Vanos is a combined hydraulic and mechanical camshaft control unit, managed by the ECU. The double Vanos allows the engine to control valve-timing continuously for both intake and exhaust camshafts. The electronically control of the Vanos positions is dependant on engine speed, load and temperature.

The diagnosis is monitoring the correct mechanical function of the variable camshaft timing. The diagnosis carries out a continuous rationality check of the Vanos function. If a malfunction is detected, an error bit will be set and sent to the Error management module. This module produces the final information for setting the corresponding DTC.

The diagnostic strategy for inlet and exhaust camshaft is identical.

Control deviation of the camshaft position controller: ("target + slow response")

Description

In this diagnosis module the difference between the actual and target position of the Vanos units ("control deviation") is checked. If the calculated difference between these two positions exceeds the established threshold, a counter is started. The counter is incremented twice per crank revolution (but not exceeding 10 msec-rates).

If the counter exceeds a limit (also adjustable), a Rationality Fault (DTC) is stored.

The control deviation diagnosis has got an interface to the Rate-Based Monitoring module.

A. In-use monitor performance Ratio:

The incrementing of the numerator, denominator, and the ratio calculation for the Variable Camshaft Timing monitor is executed by the Rate-Based Monitoring module. Like all monitors for which a standardized track and report in-use performance is required, the Variable Camshaft Timing monitor reports to the RBM-module via status flags.

B. Conditions for incrementing the Numerator:

The numerator is incremented if and only if the monitor is not inhibited due to stored faults and the diagnostic has been performed and a fault would have been detected.

C. Conditions for incrementing the Denominator:

The denominator is incremented if the monitor is not inhibited due to stored faults, the general driving conditions have been fulfilled and all additional physical conditions for incrementing have been fulfilled.

Camshaft position sensor (CMP)

P0340/0365/1300/130A/0344/0369/1554/1553/0016/0017

Description

The purpose of the diagnosis is to detect when the camshaft reference position is outside the designed range relative to the engine position from crankshaft and to detect a signal which is not valid.

The diagnostic strategy for inlet and exhaust camshaft is identical.

Monitoring Function

The detection of each camshaft position is done by an active hall sensor and a cam wheel, "3 asymmetric teeth". The camshaft sensor delivers 3 high and 3 low phases of different length per 720°CRK. The high or low pegel of the signal at the reference gap of the crankshaft signal determines the position of the engine within the combustion cycle. With that information, a engine position is calculated from the crankshaft position sensor within a range from [0 to 720[°CRK

The following malfunctions are detected:

MALFUNCTIONS REFERENCE CHART

- CMP sensor signal plausibility	P0340 / P0365
- CMP sensor signal segment period	P1300 / P130A
- CMP sensor signal loss of synchronization	P0344 / P0369
- CMP sensor signal reference to CRK position	P1554 / P1553
- CMP sensor signal jump of chain	P0016 / P0017

Diagnosis of signal plausibility

P0340/0365

The monitor checks once per combustion cycle the edge counter of the camshaft. If the edge counter has not changed during the last cycle, a cycle counter is incremented. When the counter reaches a threshold, the error CAM_plaus is delivered to the error management.

Diagnosis of period length

P1300/130A

The monitor checks at every edge of the CMP signal the length of the last signal period. If the difference to the designed length exceeds a max value, the corresponding debounce counter is incremented. When the counter reaches a threshold the error CAM_period is delivered to the error management.

Diagnosis of synchronization state

P0344/P0369

The monitor checks at every reference gap of the crankshaft sensor signal whether the camshaft is synchronized or not. If the camshaft is not synchronized, a revolution counter for the camshaft is incremented. When the counter reaches a threshold the error CAM_sync is delivered to the error management.

Diagnosis of mechanical reference position

P1554/1553

The monitor checks at least once per driving cycle the position of the camshaft in reference position compared to the crankshaft position. The deviation of all camshaft edges compared to the designed position is averaged. If the average value exceeds a max value, the corresponding debounce counter is incremented. When the counter

reaches a threshold the error CAM_ref_crk_cam is delivered to the error management.

Diagnosis of mechanical chain jump

P0016/0017

The diagnosis is performed after the reference position adaptation and uses the same calculated average value. The average value is stored in the non volatile RAM of the ECU as an adaptation value. Before storing the value, the new adapted value is compared with the stored value. If the deviation exceeds a max value, the error CAM_one_tooth_off is delivered to the error management and the new value is not stored in RAM. With this diagnosis a chain jump of the timing chain is detected.

The diagnosis of the mechanical chain jump has got an interface to the Rate-Based Monitoring module.

A. In-use monitor performance Ratio:

The incrementing of the numerator and denominator for the diagnosis of chain jump is executed by the Rate-Based Monitoring module. Like all monitors for which a standardized track and report in-use performance is required, the diagnosis monitor reports to the RBM-module via status flags.

B. Conditions for incrementing the Numerator:

The numerator is incremented if and only if the monitor is not inhibited due to stored faults and the diagnostic has been performed and a fault would have been detected.

C. Conditions for incrementing the Denominator:

The denominator is incremented with every driving cycle.

Flowchart for diagnosis of chain jump:

see Diagnosis of mechanical reference position

Camshaft Crankshaft synchronization

P0341

Description

The purpose of the diagnosis is to determine whether the inlet (first) camshaft is used for engine synchronization or the exhaust camshaft.

Monitoring Function

The diagnosis is performed at every edge of the selected camshaft signal and at the reference gap of the CKP sensor signal. With the period between current event and the last event, the function eliminates the edges of the camshaft which are not inside the designed window. The window is calculated from the designed position plus / minus a tolerance. The tolerance is expanded by the range of the variable valve timing, when the camshaft is not

in lock position.

The following malfunctions are detected:

MALFUNCTIONS REFERENCE CHART

- CMP sensor signal not valid for synchronization	P0341
---	-------

Diagnosis of camshaft crankshaft synchronization

The monitor eliminates with every event the edges from the list of all 6 cam edges, which are not inside the pattern. If only one edge is left, the edge number is identified and the camshaft is valid for synchronization. If no edge is left in the list, synchronization failed and is started again. If a calibrated number of synchronizations failed, the error is delivered to the error management. Afterwards, an only if synchronization fails with the intake camshaft, the same procedure is started with the exhaust camshaft.

CRANKSHAFT POSITION SENSOR (CRK)

P0335/0370/0373

Description

The purpose of this diagnostic is to check the integrity of the crankshaft sensor signal and/or electrical malfunctions. (Open line, SCG, SCVB)

Monitoring Function

The detection of crankshaft position is done by an active hall sensor and a crank wheel, "e.g. 60 minus 2 teeth". A reference gap, "e.g. of two teeth" allows the detection of the top dead center of cylinder 0. The crankshaft sensor delivers a certain number of high and low phases per 360°CRK. The transition from high to low is a falling edge; from low to high is a rising edge. Only the falling edges are counted. The difference between two falling edges is 6° CRK.

The following malfunctions are detected:

MALFUNCTIONS REFERENCE CHART

- missing CRK sensor signal	P0335
- no plausible CRK signal	P0335
- wrong tooth number	P0370
- wrong tooth period	P0370
- sync error	P0373

A teeth counter is incremented at every falling edge of the CRK sensor signal. If plus or minus one tooth is detected during the last 360° CRK at the reference gap, the tooth number debounce counter will be incremented. If the counter exceeds a limit, a CRK tooth error is delivered to the error management.

If more than one tooth plus or minus is detected the CRK loses synchronization and a CRK sync debounce counter will be incremented. If the counter exceeds a limit, a CRK sync error is delivered to the error

management.

The detection of a tooth period error is done by an acceptance window. The expected tooth period is multiplied and divided with an engine speed dependency factor. The result is a bottom and a top limit of tooth period, in which the transition from high to low of the electrical signal has to occur. If a tooth period is not valid, the tooth period error debounce counter will be incremented. If the counter exceeds a limit, a CRK tooth per error is delivered to the error management.

Detection of implausible crankshaft signal is based on the detection of CAM signals without receiving correct CRK signal. If 12 or more CAM edges are detected (eg. 2 working cycles), without valid synchronization of the crankshaft, then CRK plaus error is detected and delivered to the error management. If no CRK signal at all is received, the symptom is "missing signal", else the symptom is "implausible signal".

VARIABLE VALVE LIFT - ELECTRICAL DIAGNOSIS

P1047,1048,1049,1076,1075,103A, 1078,107A, 107B107C,105B,105A,1055,1056,1019, 1020,1057,1017,1030,1064,101A,1023,1024,1041

DESCRIPTIONS

The electronic control of the Variable Valve Lift positions is dependant on, Voltage Limits, Start & Stop position, Adaptations, current and temperature. The following errors will be detected in this system.

Electrical diagnosis is performed internally to the controller in order to detect the following errors: Short circuit to battery, to ground or short circuit to each other:

SCVB - P1047

SCG-P1048

S together - P1049

System current is monitored through the ECU and the variable valve train relay. This diagnosis checks for over-temperature and overload conditions and performs short term and long term high current monitoring (looks for current spikes over a threshold, and time vs. current table based):

Relay over temp - P1076

Relay overload - P1075

Relay overload - P103A

VVL Bus Conductor Temp - P1078

VVL Power Stage Warning - P107A

VV Train Bus Conductor Temp - P107B

VVL Power Stage Warning - P107C

Powerstage self diagnosis is performed to realize if power stage diagnosis has detected under voltage or overcurrent of high or low side. The diagnosis is a self check realized therefore in the specific hardware (powerstage).

undervoltage of driver - P105B

overcurrent detection on high side / low side of H-bridge - P105A

Power Supply Control Motor is monitored through the main relay and checks over and under voltage conditions. There is also a Power Supply sensor diagnosis which checks short circuit to battery and to ground. If this occurs, the following DTC's will be stored:

Power Supply over voltage - P1055

Power Supply Under Voltage - P1056

Power Supply Sensor SCVB - P1019

Power Supply Sensor SCG - P1020

VVL Relay Diagnosis is performed internally to the ECU and does a comparison of the main relay voltage to the variable valve lift capacitors. If the difference is greater than a threshold then an appropriate DTC will be stored.

Relay Diagnosis - P1057 (Battery Main Relay Voltage - Capacitor Voltage)

Sensor Diagnosis is performed internally to the ECU and checks the sensor supply voltage to tunable boundaries. A sensor signal versus an internal sensor self check will determine the integrity of the sensor. If an error is detected, the appropriate DTC will be stored.

Sensor Signal fault - P1017 (ECU check)

Control Position Diagnosis and the **Value Comparison Diagnosis** are used to monitor the start and stop positions and the current PWM signal movement of the variable valve train system. If the difference between the target and actual angle is determined to be greater than a threshold percentage an error is detected, if a difference in the start and stop positions are greater than a threshold an error is detected. If any of these errors is detected, the appropriate DTC will be stored:

Control Position fault - P1030 (PWM out of range)

Value Comparison fault - P1064 (Difference)

Self Learning / Adaptation Diagnosis is performed internally to the ECU. There are three adaptation diagnoses performed in this function, the top and bottom limit individually out of range and both limits out of range. Furthermore the ECU self check diagnosis is performed, which is basically a check sum error. If any of these

errors is detected, the appropriate DTC will be stored:

Top Limit Fault - P101A (top limit not reached)

Bottom Limit Fault - P1023 (bottom limit not reached)

Both Adaptations Fails - P1024 (both limits not reached)

ECU Check Sum Error - P1041

ELECTRONIC THROTTLE CONTROL MONITOR

ELECTRONIC THROTTLE CONTROL (ETC) MOTOR CONTROL CIRCUIT

Monitoring Descriptions

ETC Driver diagnosis (H-bridge): The ETC - H-Bridge IC continually checks the MTC if there is a short circuit to battery voltage or ground. In addition the IC is able to detect overtemperature. This is performed internally to the ECU.

ETC spring check (start routine)

(P169A, P1694)

This Diagnosis checks if the throttle spring is working correctly and if the throttle limp home position can be

reached.

The diagnosis is performed at the beginning of every driving cycle at ignition "Key ON" position.

ETC adaptation diagnosis

(P1632, P1633, P1634, P1635)

After the initial engine start and / or component change, the characteristic Potentiometer values for the limp home position and the lower mechanical stop are learned within an adaptation routine. The values are stored at the end of the driving cycle in the non-volatile memory.

If the conditions are not fulfilled, the malfunction errors (DTC's) are stored.

Electronic Throttle Control (ETC) Motor Control Performance

(P1637, P1639)

This diagnosis is able to detect a too slow or jammed actuator. The given pulse width modulation signal (MTCPWM) exceeds the position controller permissible maximum value for longer than designated (Max short or Max Long) time.

If either of the times is exceeded, the appropriate DTC will be stored.

Also if a maximum allowed difference between throttle actual value and setpoint value is exceeded, a DTC is stored.

ISC (IDLE SPEED CONTROL) ACTUATOR

90506,0507

IDLE SPEED CONTROL ELECTRICAL DIAGNOSIS

Sec (e) (16.2.2) (B) CCR Title 13, 1968.2

General Description

The purpose of this diagnosis is to detect electrical faults of the idle speed controller circuit. The controller is PWM modulated, inverse output signals are used for continuous activation of the opening and closing of a double-wound coil actuator.

The error detection is activated at Key "ON". The following errors are detected:

- Short to ground
- Short to battery
- Open circuit

If any of the above errors are detected during opening or closing of the controller, the appropriate DTC will be stored.

Idle Speed Control - Rationality Diagnosis

General Description:

This diagnosis detects the stability of the idle speed. If the commanded idle speed and the actual idle speed is not within a calibrated value, above or below commanded, the idle speed is considered to be out of range.

If the above failure conditions are detected, the appropriate DTC will be stored.

AIR MASS FLOW METER - RATIONALITY CHECK

P1415, 1424

DESCRIPTION

Depending on engine speed, valve-lift, inlet camshaft position, outlet camshaft position and manifold pressure an air mass flow into the cylinder is calculated. There is also a correction of the calculated air mass flow depending on intake air temperature, coolant temperature and ambient pressure. The ratio between the measured air mass flow and the calculated air mass flow must be between calibrated MIN/MAX-values. If the MIN/MAX thresholds are exceeded, a time counter is incremented. After this counter reaches the threshold within one diagnosis cycle, an air mass flow meter malfunction is detected.

MANIFOLD DIFFERENTIAL PRESSURE SENSOR - RATIONALITY CHECK

P1124,P1104,1105

DESCRIPTION

For a variable valve lift engine, the main function of the throttle body is to control the pressure in the intake manifold. Therefore the manifold differential pressure plausibility check is testing the plausibility of measured intake manifold pressure in comparison to the measured throttle position. So no throttle position acquisition error must be present.

The setpoint of the differential intake manifold pressure is up to 60-70% of maximum torque request constant 5 kPa beneath ambient pressure. At higher load the differential pressure setpoint becomes Zero.

In case the setpoint of the differential pressure in the intake manifold is > 3 Kpa beneath the ambient pressure, a differential pressure controller is active. The output of the controller is monitored. The output of the manifold pressure controller has to be between calibrated MIN/MAX-thresholds. If the MIN/MAX thresholds are exceeded a time counter is incremented. After this counter reaches the threshold within one diagnosis cycle, a manifold differential pressure sensor malfunction is detected.

COMPREHENSIVE COMPONENT MONITORING OBD II SIEMENS VDO FUNCTION DEFINITION

STRATEGY

Principle:

- **Sensors** that can affect emissions or are used to monitor other component / system are monitored for circuit continuity and short to battery voltage and / or to ground using high and low voltage signal limit.
- **Actuators** that can affect emissions or are used to monitor other component / system are monitored by power stage voltage check for valid signals.
- For some of sensors or actuators, plausibility checks are included to ensure proper operation of the components.

MONITORING STRATEGY FOR SENSORS

- Sensor signals out of a defined range are regarded as circuit malfunctions shorted to BATT, GND or Open circuit.

MONITORING STRATEGY FOR ACTUATORS

- Invalid actuator output signals at power stage are regarded as circuit malfunctions shorted to BATT, GND or Open circuit.

RATIONALITY CHECK

- Components are checked for the integrity of their values. This is accomplished by the use of a model or other sensor inputs. If a component does not function as expected or the integrity is in question (values are not within a threshold) it is considered out of range / plausible.

COMPREHENSIVE MONITORING FOR FOLLOWING SENSORS AND ACTUATORS

- Throttle Position Sensor - Electrical Check
- Mass Air Flow Sensor - Electrical Check
- Coolant Temperature Sensor (ECT) - Electrical Check
- Camshaft Position Sensor
- Vehicle Speed Signal
- Injector Valve Diagnosis
- Idle Speed Plausibility
- Differential Pressure Sensor - Electrical check
- Knock Sensor diagnosis
- TCU error diagnosis
- CAN Communication
- Pedal Position Sensor
- Ambient Pressure Sensor - Electrical check
- Ambient Pressure Sensor - Rationality Check

- EVAP - DMTL Valve, Electrical check
- EVAP - DMTL Heater, Electrical check
- EVAP - DMTL Pump, Electrical check
- EVAP - Purge Control Valve, Electrical check

CALCULATED LOAD AND FUEL TRIM DETERMINATION

The calculated engine load "LOAD_CLC [%]" is based on the measured mass air flow (metered by the hot-film air-mass sensor (HFM)).

Strategy:

A 2-dimensional map is used to interpolate the calculated engine load "LOAD_CLC [%]" depending on metered mass air flow and engine speed. A weighting factor is applied to compensate the altitude influence.

The calculation is performed as follows:

$$\text{LOAD_CLC [\%]} = \text{LOAD_CLC_RAW } f(\text{metered mass air flow, engine speed}) \times (1013\text{hPa} / \text{ambient pressure}) \times 100\%$$

with:

REFERENCE CHART

LOAD_CLC	calculated engine load in % with altitude correction
LOAD_CLC_RAW	calculated engine load in % without altitude correction

In case of a malfunction of the HFM, the metered mass air flow is substituted by a modeled mass air flow value.

START EMISSION REDUCTION STRATEGY MONITORING

P1561,1562

All parameters, that are relevant during the cat heating phase, are monitored by standard monitoring functions:

MONITORING FUNCTION REFERENCE CHART

Relevant Components during Cat Heating Phase						Impact of faulty Component			
Comp./ System	Parameter	needed for	Component Diagnosis	Diagnosis during Cat Heating	Emission Impact > 1,5xGW	Idle Speed	Ignition Angle	Engine Lambda	Tras
Secondary Air	Secondary Air Mass	Enleanment exhaust gas	Secondary Air diagnosis	Yes	Yes, dep. to variant and emission class			X	
Injection Value	Injection time	Enleanment lambda_engine < 1	Output stage diagnosis	Yes	none	X	X	X	
		Enleanment lambda_engine > 1	Misfire detection	Yes					
			Fuel supply diagnosis	no					
Mass Air Flow Sensor	Air Mass - Input for maps	Larger overlap, VANOS End position	Air mass flow sensor diagnosis	Yes	none	X	X	X	
			Air mass model diagnosis	Yes					
			Fuel supply diagnosis	no					
Throttle Position	Angle	Mass Air Flow	Power stage, accelerator pedal diagnosis	Yes	none	X	X	X

			Air mass model diagnosis	Yes					
Phase Sensor (Camshaft)	Valve overlap	Larger overlap	RPM sensor diagnosis	Yes	none				
Camshaft Position Actuator	Valve overlap	Larger overlap	Output stage diagnosis Camshaft position actuator	Yes Yes	none				
RPM Sensor	Engine speed	Idle speed increase	RPM sensor diagnosis	Yes	none	X			
Idle Speed	Engine speed	EVAP, Camshaft Position	Idle speed diagnosis	Yes	none	X			
CAN-Communication with Transmission	CAN-bus	Shifting point	Timeout CAN-message	Yes	none	X			
Coolant Temperature Sensor	Temperature	Input for maps	Electrical plausibility Stuck signal	Yes no	Yes	X	X	X	
ECM	Signals	Calculation	Self Check RAM,ROM,W-dog	Yes	-				
Ignition	Ignition angle	Optimum: retarded ignition	Misfire detection	Yes	Yes, dep. to emission class		X		

Illustration 1 (Standard monitoring functions during Cat Heating - Overview)

To fulfill the legal requirements, the monitoring of the idle speed is now extended to the cold start phase. In case of an error, the specific P-Codes:

- P1561 Cold Start Idle Air Control System RPM lower than expected
- P1562 Cold Start Idle Air Control System RPM higher than expected

are set.

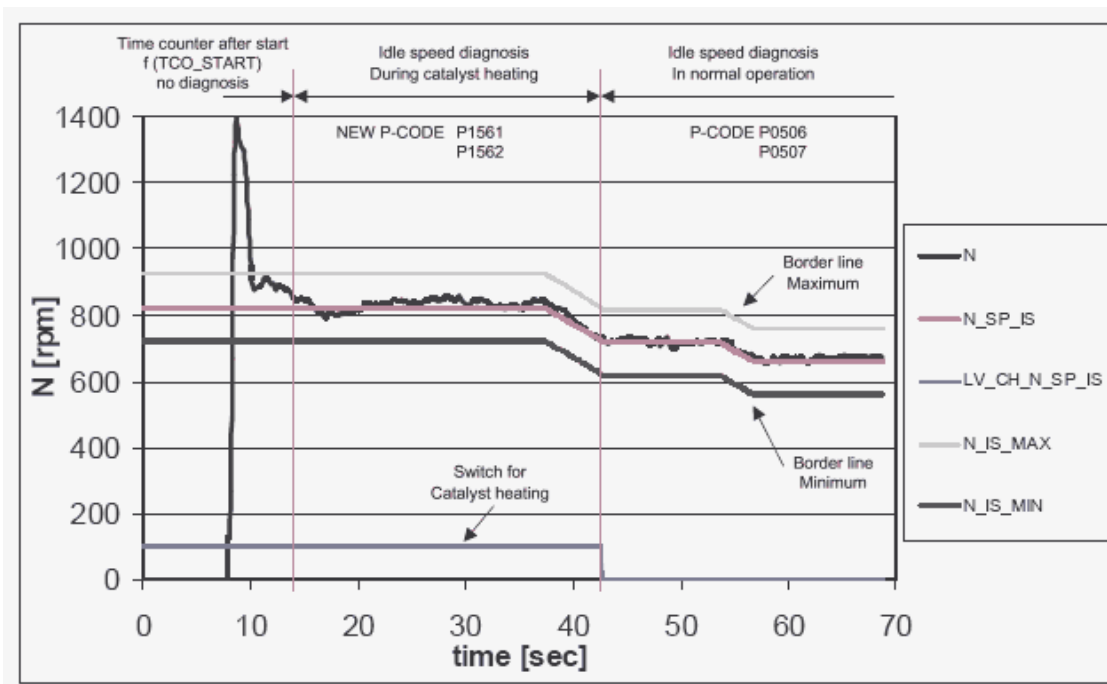

Fig. 26: Idle Speed Control Graph
 Courtesy of BMW OF NORTH AMERICA, INC.

Illustration 2 (Idle speed control)

During cat heating, it is essential to make sure, that enough thermal energy is applied to the catalyst to heat it up as quick as possible.

Therefore it is target to limit the ignition timing to the earliest possible value during the cat heating phase.

If there would be a demand for more torque and therefore for an advanced ignition timing beyond the limits, the engine would be allowed to stall instead of fulfilling the demand.

The torque limits are calibrated the way that the emissions stay below 1.5 times of the limits.

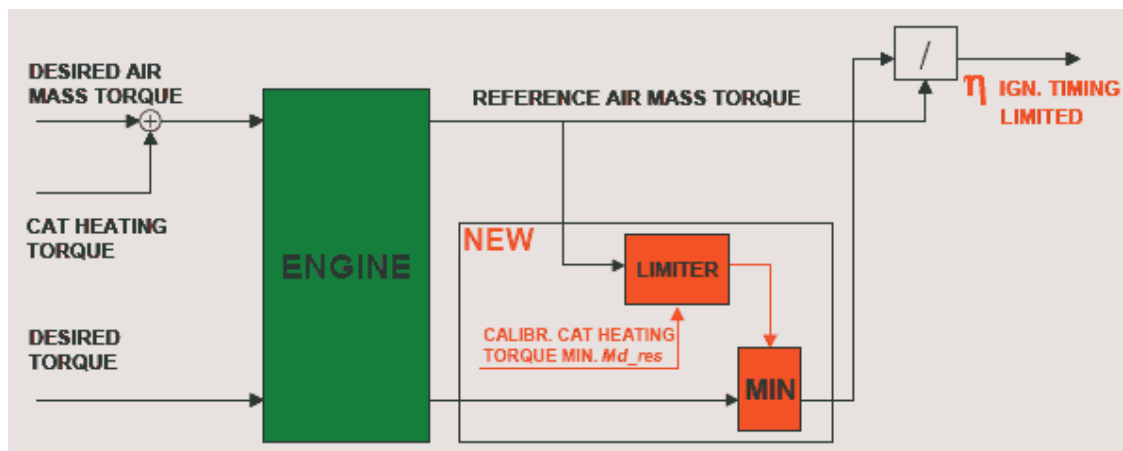

Fig. 27: Start Emission Reduction Strategy - Flow Chart
Courtesy of BMW OF NORTH AMERICA, INC.

Illustration 3 (Flowchart)

Known System:

During normal driving, the ignition timing desired torque corresponds to the air mass desired torque, which determines the ignition timing. During the cat heating phase, the cat heating torque is added to the air mass desired torque, resulting in a higher reference air mass torque.

The efficiency, desired torque divided by the reference torque, determines the ignition timing.

New System (BMW-development):

The earliest possible ignition timing is determined by the limitation of the torque reserve to a minimum value during the cat heating phase. For this, the required minimum cat heating torque is subtracted from the reference air mass torque. The thus reduced efficiency leads to a safe ignition retard and limits the ignition timing during the cat heating measures.

Limitation of ignition timing to the earliest possible ignition timing during the cat heating phase by limitation of torque reserve to the minimum required torque reserve.

Fig. 28: Torque Characteristic Line And Ignition Timing Diagram

HVAC

Air Conditioning & Heating Systems - Repair Instructions - X3

11 HEATER WITH OPERATION

64 11 ... INSTALLING SERVODRIVE

Fig. 1: Servodrive

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, align shaft of flap(s) to be actuated to position of servodrive to be installed.

64 11 077 REMOVING AND INSTALLING/REPLACING BOWDEN CABLE FOR TEMPERABLE VENTILATION

Necessary preliminary tasks:

- Remove center fresh air grille, see **64 22 162 Removing and installing/replacing center fresh-air grill.**
- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING .**

Fig. 2: Bowden Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect Bowden cable (1).

Fig. 3: Bowden Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect Bowden cable from mountings (1) and feed out.

Installation:

Make sure Bowden cable can move freely.

If necessary, perform function test prior to assembly.

64 11 213 REMOVING AND INSTALLING/REPLACING HEATER - A/C UNIT FAN

Special tools required:

- 51 3 057

Necessary preliminary tasks:

E46 and E83:

Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD** .

E46 M43TU only:

Remove cylinder head.

E46 M47, M47TU only:

Remove complete wiper console.

Remove air cleaner element.

E46 M52TU, M54 only:

Remove engine cover.

E46 M57 only:

Remove intake air manifold.

E46 N42 only:

Remove cylinder head.

Fig. 4: Hose And Cover Strip

Courtesy of BMW OF NORTH AMERICA, INC.

Necessary preliminary tasks:

E46 S54 only:

Remove intake air manifold.

Detach hose (1) in direction of arrow from fitting (2).

Remove cover strip (3) in direction of arrow from guide (4).

Pull lock (1) in direction of arrow and feed out flap (2).

Fig. 5: Pulling Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 6: Retainers And Fan Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip retainers (1).

Unscrew bolt (2).

Feed out fan cover (3).

Fig. 7: Screws And Fan Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Pull out fan cover (2).

Installation:

Make sure fan cover (2) is correctly seated.

Fig. 8: Unfastening Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten plug connection and disconnect.

Release retainer with special tool 51 3 057.

Installation:

Bridge (1) must snap into place in opening (2) of fan motor.

Fig. 9: Bridge

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 10: Fan For Heater - A/C Unit

Courtesy of BMW OF NORTH AMERICA, INC.

Remove fan for heater - A/C unit towards front.

Installation:

Make sure fan for heater - A/C unit is correctly seated.

64 11 227 REPLACING OUTPUT STAGE/SWITCH FOR HEATER - A/C SYSTEM BLOWER

Necessary preliminary tasks:

- Remove servodrive of right fresh-air/recirculated-air flap, see **64 11 807 Removing and installing/replacing servodrive for right fresh-air flap.**

Fig. 11: Catch

Courtesy of BMW OF NORTH AMERICA, INC.

Release catch (1) and pull output stage (2) out of heater.

Fig. 12: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) and remove output stage (2).

**64 11 377 REMOVING AND INSTALLING CONTROL PANEL FOR HEATER - A/C SYSTEM
(REPLACING, AUTOMATIC AIR CONDITIONING)**

Special tools required:

- **64 1 020 RELEASE HOOK**

**IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO
STATIC DISCHARGE) .**

Necessary preliminary tasks:

- Remove center fresh air grill, see **64 22 162 Removing and installing/replacing center fresh-air grill.**
- Remove ignition key from ignition switch
- Pull fuse 63 from distribution box in glovebox

Fig. 13: Special Tool And Retaining Points
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Unclip control panel for heater - A/C system (2) with special tool 64 1 020 at retaining points (3) all round and pull back.

Unlock associated plug connections and disconnect.

Remove control panel for heater - A/C system (2).

Replacement:

Carry out programming/coding using appropriate BMW service tool.

64 11 807 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR RIGHT FRESH-AIR FLAP

Necessary preliminary tasks:

- Remove right glovebox with housing, see **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING .**

Fig. 14: Screws And Servomotor
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove servomotor (2) complete with bracket.

Fig. 15: Plug Connection And Actuating Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Disengage actuating lever (2) and remove bracket with servomotor (3).

Fig. 16: Removing Servomotor From Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Release lock (1) and remove servomotor (2) from holder.

Installation:

Fig. 17: Lug
Courtesy of BMW OF NORTH AMERICA, INC.

Lug (1) must be adapted to fit in counterpiece (2) on holder.

64 11 992 REMOVING AND INSTALLING/REPLACING SOLAR SENSOR

Special tools required:

- **64 1 020 RELEASE HOOK**

Necessary preliminary tasks:

- Remove instrument panel trim, see **51 45 030 REMOVING AND INSTALLING INSTRUMENT PANEL TRIM** .

Fig. 18: Special Tool (64 1 020)

Courtesy of BMW OF NORTH AMERICA, INC.

Lever out solar sensor (1) with special tool 64 1 020 in direction of arrow.

Feed wiring harness of solar sensor (1) out of retainers of instrument panel trim (2).

Remove solar sensor (1) from instrument panel trim (2).

64 11 910 REMOVING AND INSTALLING/REPLACING TEMPERATURE SENSOR FOR HEATER CORE

Necessary preliminary tasks:

- Remove switch unit in centre console. See **61 31 057 REMOVING AND INSTALLING/REPLACING SWITCH UNIT IN CENTER CONSOLE** .

Remove temperature sensor (1) and disconnect plug connection (2).

Fig. 19: Remove Temperature Sensor (1) And Disconnect Plug Connection (2)
Courtesy of BMW OF NORTH AMERICA, INC.

64 11 845 REPLACING ACTUATOR DRIVE OF DEFROSTER FLAPS

Necessary preliminary tasks:

- Remove **actuator drive for ventilation flaps.**

Unlock actuator drive (1) and feed out towards side. Disconnect plug connection.

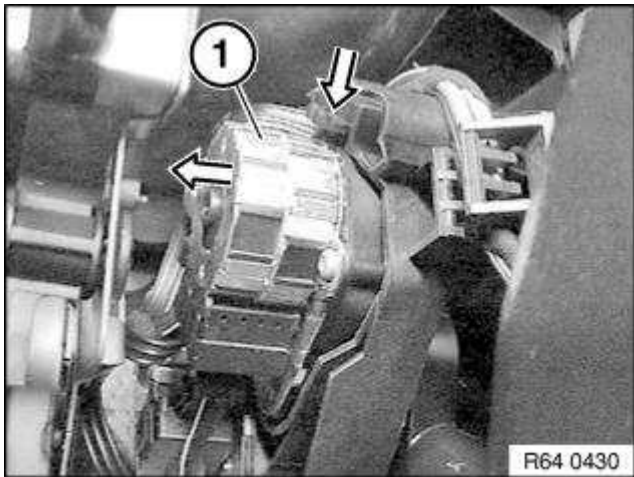

Fig. 20: Unlock Actuator Drive (1) And Feed Out Towards Side
Courtesy of BMW OF NORTH AMERICA, INC.

Installation note: If necessary, align shaft for defroster flaps and drive (see illustration).

Fig. 21: Align Shaft For Defroster Flaps And Drive
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement: Servomotors must be re-addressed in the event of replacement! Addressing can only be carried out with the BMW diagnosis system. Service functions: Body, Heating and air conditioning function, Flap

motors, Re-address flap motors.

64 11 839 REPLACING ACTUATOR DRIVE OF FOOTWELL FLAP

Necessary preliminary tasks:

- Remove **RIGHT GLOVEBOX WITH HOUSING** .

Unhook adjusting lever (1).

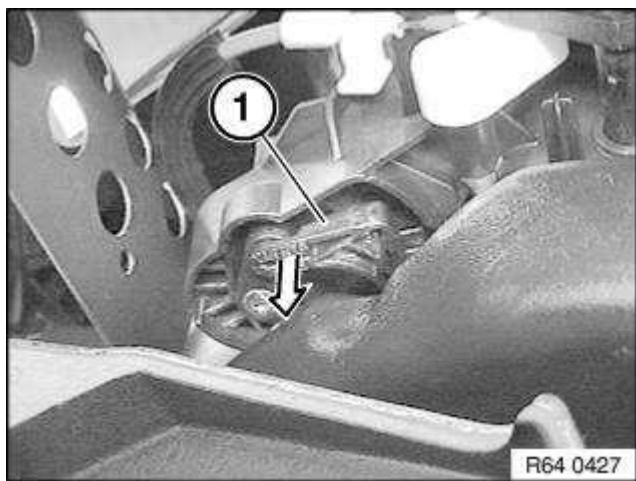

Fig. 22: Unhook Adjusting Lever (1)
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1). Unlock actuator drive (2) and feed out towards rear.

Fig. 23: Unlock Actuator Drive (2) And Feed Out Towards Rear
Courtesy of BMW OF NORTH AMERICA, INC.

Installation note: If necessary, align shaft for footwell flap and drive (see illustration).

Fig. 24: Align Shaft For Footwell Flap And Drive
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement: Servomotors must be re-addressed in the event of replacement! Addressing can only be carried out with the BMW diagnosis system. Service functions: Body, Heating and air conditioning function, Flap motors, Re-address flap motors.

64 11 829 REPLACING ACTUATOR DRIVE OF VENTILATION FLAPS

Necessary preliminary tasks:

- Remove trim panel for pedal mechanism. See **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .
- Remove lower section of steering column trim. See **32 31 020 REMOVING AND INSTALLING / REPLACING LOWER SECTION OF STEERING COLUMN TRIM** .

NOTE: Heater is removed for purposes of clarity.

Release screw (1). Unclip adjusting clasp (2) and feed out servomotor (3).

Fig. 25: Unclip Adjusting Clasp (2) And Feed Out Servomotor (3)
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement: Servomotors must be re-addressed in the event of replacement! Addressing can only be carried out with the BMW diagnosis system. Service functions: Body, Heating and air conditioning function, Flap motors, Re-address flap motors.

64 11 829 REPLACING ACTUATOR DRIVE OF VENTILATION FLAPS

Necessary preliminary tasks:

- Disconnect battery negative lead. See **61 20 900 DISCONNECTING AND CONNECTING BATTERY NEGATIVE LEAD** .
- Remove glovebox. See **51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING** .
- Partially remove fuse box

Disconnect plug connection (1). Unlock actuator drive (2) and remove

Fig. 26: Unlock Actuator Drive (2) And Remove
Courtesy of BMW OF NORTH AMERICA, INC.

Installation: If necessary, align shaft for defrosting flaps and drive (see illustration).

Fig. 27: Align Shaft For Defrosting Flaps And Drive
Courtesy of BMW OF NORTH AMERICA, INC.

64 11 942 REPLACING EVAPORATOR TEMPERATURE SENSOR

Necessary preliminary tasks:

- Remove trim panel for pedal assembly. See 45 INSTRUMENT CLUSTER TRIM PANEL .

NOTE: Left footwell heating duct removed for purposes of clarity.

Pull out evaporator temperature sensor (1) and disconnect plug connection (2).

Fig. 28: Pull Out Evaporator Temperature Sensor (1) And Disconnect Plug Connection (2)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Ensure evaporator temperature sensor (1) is correctly seated.

64 11 208 REPLACING HEATER CORE

WARNING: Scalding hazard! Work on the cooling system may only be carried out when it has cooled down.

Necessary preliminary tasks:

- Remove **microfilter housing**.
- Remove instrument panel trim. See **51 45 030 REMOVING AND INSTALLING INSTRUMENT PANEL TRIM**.

Recycling: Coolant emerges when coolant hoses are detached. Have a suitable collecting container ready. Catch and dispose of escaping coolant. Observe country-specific waste-disposal regulations.

Detach hot water hoses (1) from heater and blow coolant out of heater core.

Fig. 29: Detach Hot Water Hoses (1) From Heater
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, the following operations are shown on the removed heater core.

Pull out temperature sensor (1) and unclip wiring harness (2) from holder.

Fig. 30: Pull Out Temperature Sensor (1) And Unclip Wiring Harness (2) From Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Ensure correct lead routing.

Release screw (1) and remove bracket (2) from double pipe. Unclip retainers (3) and lift off cover for heating element (4).

Fig. 31: Release Screw (1) And Remove Bracket (2) From Double Pipe
Courtesy of BMW OF NORTH AMERICA, INC.

Installation: First insert lugs (5).

Remove retainers (1) and remove double pipe (2) towards top. Raise heater core (3) at front and remove.

Fig. 32: Remove Retainers (1) And Remove Double Pipe (2) Towards Top
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Replace sealing rings, coat with anti-friction agent and make sure sealing rings and lines are correctly seated.

After installation: Venting cooling system and checking for water leaks. See **00 COOLANT, CHECKING COOLING SYSTEM** .

64 11 800 REPLACING SERVODRIVE ON GEAR FOR FLAP CONTROL (A/C CONTROL)

Necessary preliminary tasks:

- Remove **RIGHT GLOVEBOX WITH HOUSING** .

Move rotary knob (1) into position illustrated.

Fig. 33: Move Rotary Knob (1) Into Position Illustrated
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1). Unlock servo-drive (2) and remove towards bottom.

Fig. 34: Disconnect Plug Connection (1)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation: If necessary, align shaft for defrosting flaps and drive (see illustration).

Fig. 35: Align Shaft For Defrosting Flaps And Drive
Courtesy of BMW OF NORTH AMERICA, INC.

22 NOZZLES AND OUTLETS

64 22 135 REMOVING AND INSTALLING/REPLACING LEFT FRESH-AIR GRILL

Special tools required:

- 00 9 341

Fig. 36: Special Tool (00 9 341)
Courtesy of BMW OF NORTH AMERICA, INC.

Fit special tool 00 9 341 at side as illustrated.

Lever out left fresh-air grill (1) all round and remove in direction of arrow.

64 22 136 REMOVING AND INSTALLING/REPLACING RIGHT FRESH-AIR GRILL

Special tools required:

- 00 9 318

Fig. 37: Special Tool (00 9 318)
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip right fresh-air grill (1) with special tool 00 9 318 and remove in direction of arrow.

Fig. 38: Catches On Fresh-Air Grill
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on fresh-air grill (2) must not be damaged or missing.

64 22 162 REMOVING AND INSTALLING/REPLACING CENTER FRESH-AIR GRILL

Special tools required:

- **64 1 020 RELEASE HOOK**

Necessary preliminary tasks:

- Remove switch for hazard warning system/central locking, see **61 31 079 REMOVING AND INSTALLING/REPLACING SWITCH FOR HAZARD WARNING FLASHERS/CENTRAL LOCKING**.

Fig. 39: Special Tool (64 1 020)
Courtesy of BMW OF NORTH AMERICA, INC.

Fit special tool 64 1 020 at lower attachment points (1).

Lever out center fresh-air grill (2) and pull back.

Unclip Bowden cable (3) and remove center fresh-air grill (2).

31 MICROFILTER

64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION

Fig. 40: Toggle And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Turn toggle (1) through approx. 90° and remove cover (2) towards front.

Fig. 41: Microfilter Element

Courtesy of BMW OF NORTH AMERICA, INC.

Remove microfilter element (1).

64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION

Fig. 42: Rotary Catches And Raise Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlock rotary catches (1), raise cover (2) and remove microfilter.

64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION

IMPORTANT: Risk of damage! A/C system must not be operated without the prescribed filter element.

Note on cleaning: Spray microfilter housing from inside with BMW pollen filter housing cleaner. Wipe away excess liquid. This kills off germs, bacteria and fungi that cause smells. The smell that results on the plastic parts of the microfilter housing is eliminated.

Remove sealing lips at marked points. Unclip line and water hose (1) from cover (3). Release retaining lug (2). Feed out cover (3).

Fig. 43: Unclip Line And Water Hose (1) From Cover (3)
 Courtesy of BMW OF NORTH AMERICA, INC.

Cover tabs (1) must snap in correctly under cowl panel.

Fig. 44: Cover Tabs (1) Must Snap In Correctly Under Cowl Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Remove filter cover (1) in direction of arrow.

Fig. 45: Remove Filter Cover (1) In Direction Of Arrow
Courtesy of BMW OF NORTH AMERICA, INC.

Remove upper microfilter (1) in direction of arrow.

Fig. 46: Remove Upper Microfilter (1) In Direction Of Arrow
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip filter frame (1) at the marked points and detach. Remove lower microfilter (2) in direction of arrow.

Fig. 47: Unclip Filter Frame (1) At The Marked Points And Detach
Courtesy of BMW OF NORTH AMERICA, INC.

Installation note: Make sure upper microfilter (1) and lower microfilter (2) are installed in the correct position. The arrows mark the direction of the air intake.

Fig. 48: Make Sure Upper Microfilter (1) And Lower Microfilter (2) Are Installed In The Correct Position

Courtesy of BMW OF NORTH AMERICA, INC.

64 31 080 REMOVING AND INSTALLING/REPLACING MICROFILTER HOUSING

Necessary preliminary tasks:

- Remove microfilter.
- Remove cable duct cover .

Release screws (1). Remove lines from cable duct (2). Feed microfilter housing (3) upwards in direction of arrow.

Fig. 49: Feed Microfilter Housing (3) Upwards In Direction Of Arrow
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Make sure water drain hoses (1) are correctly seated.

Fig. 50: Make Sure Water Drain Hoses (1) Are Correctly Seated
Courtesy of BMW OF NORTH AMERICA, INC.

50 AIR CONDITIONING SYSTEM

64 50 ... AIR CONDITIONER TEST (R 134A)

Before A/C efficiency test, satisfy following conditions:

1. Provide a MoDiC or DIS. Safeguard electrical system integrity by checking the fault memory (no faults in the fault memory).
2. Provide a thermometer with separate gauge.
3. Perform the test in a suitable work bay with an ambient temperature between 20°C and 30°C.

Re 1:

Connect MoDiC or DIS to car and display evaporator temperature.

Re 2:

Position a thermometer with a separate gauge approx. 5 cm below the roof liner at the height of the B-pillar. Lay gauge outwards out of vehicle interior.

Re 3:

Heating up vehicle interior:

- A/C button is not activated during heating up.
- Close all windows and doors.
- Set recirculated air mode.
- Select air distribution mode for footwell and defrosting.
- Maximum temperature setting.

- Maximum fan stage.
- Run engine at approx. 2000 RPM until operating temperature is reached, then idle speed.

A/C efficiency test:

Turn on A/C compressor at a vehicle interior temperature of 50°C.

After 3-4 minutes, the evaporator sensor temperature must be < or = 15°C.

Draw off A/C system if this temperature is not reached, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**. Measure amount of refrigerant drawn off.

If drawn-off quantity does not correspond to specified fill quantity:**64 50 A/C SYSTEM, REFRIGERANT AMOUNTS E83** supplement refrigerant and repeat test.

If fill quantity is correct, continue troubleshooting by pressure measurement .

**NOTE: A/C systems with uncontrolled compressors only:
 If necessary, then continue troubleshooting by pressure measurement .**

64 50 ... INSTRUCTIONS FOR HANDLING REFRIGERANT R 134A

WARNING: Although R 134a at normal temperature is non-toxic, non-flammable and not explosive in air in any mixture ratio, it is still essential to follow various safety precautions.

The filled refrigerant circuit of the A/C system is subject to gauge pressure. When carrying out repairs on the A/C system, it is absolutely essential to draw off the refrigerant.

Do not weld or solder on filled A/C systems or in rooms into which R 134a may have leaked. Exposure to flames or high temperatures (< or = 50°C) may give rise to toxic decomposition products (fluorine gas). For this reason, do not smoke either.

R 134a must be drawn off, cleaned and returned to the A/C system with a service station following the relevant operating instructions.

Avoid all contact with liquid or gaseous R 134a. Wear protective goggles and gloves when working on the refrigerant circuit. R 134a acting on the skin can cause frostbite. Rinse affected body parts thoroughly with cold water. If R 134a gets into your eyes, likewise rinse with plenty of water and, if necessary, remove contact lenses if worn. Then seek immediate medical attention. Likewise seek immediate medical attention if you experience problems after inhaling R 134a fumes.

As a gas, R 134a is colorless, odorless and heavier than air. If it gets into the atmosphere, this may result especially in workshop pits in an imperceptible danger of asphyxiation or in cardiac palpitations. Ventilate rooms adequately; if necessary, turn on installed extractor systems.

For a properly functioning A/C system, it is essential to have the greatest possible levels of cleanliness when working on the A/C system and the best possible evacuation (at least 30 minutes dehumidification from refrigerant circuit) before each filling of the A/C system.

R 134a absorbs moisture very easily. Therefore seal off opened pipes, condenser, evaporator, compressor and drier bottle immediately with plugs.

With replacement parts, the plugs may only be removed immediately before the lines are connected.

In the event of warranty claims, the old parts must be provided with plugs to be able to determine the cause of the damage.

If an A/C system has been completely drained by leakage, accident or repair, the drier element must be replaced as excessive moisture may have entered the system.

Store filled pressurized refrigerant bottles in such a way that they are not exposed to direct sunlight or other heat sources (max. 45°C). Also avoid exposing them to mechanical stress (e.g. by dropping).

In the event of fire, carbon dioxide (CO₂), extinguishing powder and a sprayed water jet are deemed to be suitable extinguishants. Cool reservoirs at risk with a sprayed water jet (risk of bursting!).

IMPORTANT: After each refill of an A/C system, check that protective caps of filling valves are hand-tight. They serve as additional seals.

64 50 ... INSTRUCTIONS FOR HANDLING REFRIGERANT OIL (FOR REFRIGERANT R 134A)

WARNING: Observe the following points when handling refrigerant oil:

- **Wear protective goggles.**
- **Wear gloves made from impermeable plastic.**
- **Do not swallow.**
- **Do not inhale.**

Action to be taken after contact with refrigerant oil:

- **After contact with eyes, rinse thoroughly with plenty of water and take out contact lenses (if worn). Then seek immediate medical attention.**
- **After contact with the skin, wash body parts affected with plenty of soap and water.**
- **Do not induce vomiting if oil is swallowed, seek immediate medical attention.**
- **If inhaled, introduce the person affected to fresh air. Seek medical attention if problems persist.**

WARNING: Refrigerant oil is non-combustible and non-explosive at normal temperatures. In spite of this, the following precautions must be observed:

- Do not store in the vicinity of flames, heat sources or strongly oxidizing materials.
- Suitable extinguishants: carbon dioxide (CO²), dry extinguishing, foam.

IMPORTANT: Refrigerant oil is hygroscopic and must therefore be stored in suitable containers that are sealed airtight!

Recycling:

Dispose of drawn-off refrigerant oil as hazardous waste.

Observe country-specific waste-disposal regulations.

Absorb escaping refrigerant oil with fluid-binding material.

Notify the relevant authorities if larger amounts of refrigerant oil are discharged into above-ground water supplies, drainage systems or subsoil.

64 50 ... LEAK TESTING WITH ULTRAVIOLET ADDITIVES (UV ADDITIVES) (BMW LEAK-TESTING CASE)

IMPORTANT: It is absolutely essential to read and comply with the equipment manufacturer's instructions for use provided in the equipment case!

Read and comply with the instructions for use provided with the special tool particularly with regard to accident prevention, health protection and environmental protection.

Use only BMW-approved UV-additives (e.g. TRACER).

Only the basic procedure is described in the following!

WARNING: Avoid contact with refrigerant.

Follow safety precautions when handling refrigerant, see 64 50 ... Instructions for handling refrigerant R 134a.

IMPORTANT: UV lamp gets very hot in the radiation area!

Do not use the UV lamp without the filter glass.

Eyes and skin will suffer damage if the UV lamp is used without the filter glass.

When using the UV lamp, wear the protective goggles provided in the case.

NOTE:

- Fill the hose system of the hand pump completely with UV additive PRIOR to use

- Use the UV additive exclusively for BMW-approved refrigerant oils
- Do not operate the A/C system while the hand pump is connected or in use
- The A/C system must always be filled with an adequate amount of refrigerant to enable the leak-detecting agent to be properly distributed

Necessary preliminary tasks:

Before actually testing for leaks, check the entire refrigerant circuit using the UV leak-detecting lamp to ensure that no AV additive is already in the area of the refrigerant circuit.

If already illuminated areas are found, carefully clean the area in question with the cleaning agent contained in the case.

On initial use:

Fig. 51: Additive Cartridge And Hose Piece
Courtesy of BMW OF NORTH AMERICA, INC.

Connect hand pump (1) to additive cartridge (2) and hose piece (3).

Fig. 52: Vent Valve And Quick-Connect Coupling
Courtesy of BMW OF NORTH AMERICA, INC.

On Initial use:

Attach vent valve (1) to quick-connect coupling (2).

Turn handle (3) on hand pump to advance the plunger until a small amount of UV additive emerges. This vents the hose system.

IMPORTANT: The entire hand pump with hose system must not be disassembled again once the filling work has been completed.

Fig. 53: Quick-Connect Coupling
Courtesy of BMW OF NORTH AMERICA, INC.

Attach quick-connect coupling (1) to low-pressure connection (2) of A/C system.

Turn handle on hand pump (3) until the required amount of UV additive is added.

The quantity of UV additive to be added is dependent on the amount of refrigerant in the refrigerant circuit, see **64 50 A/C SYSTEM, REFRIGERANT AMOUNTS E83** :

- A/C systems with refrigerant filling up to 900 g: one graduation mark (4) on additive cartridge
- A/C systems with refrigerant filling in excess of 900 g: two graduation marks (4) on additive cartridge

NOTE: After filling, remove quick-connect coupling (1) and if necessary use the cleaning agent contained in the special tool case to clean up the UV additive.

Further tasks:

- Start engine.
- Run A/C system at highest setting for 5-10 minutes in order to ensure adequate distribution of dye in the system
- Switch off engine
- Check all A/C system components for possible leaks
- Possible leaks show up in luminous green

Fig. 54: Accompanying Information Label And Filling Capacity Information Label
Courtesy of BMW OF NORTH AMERICA, INC.

Complete accompanying information label (1) with the relevant data and attach in an easily visible position next to the filling capacity information label (2).

64 50 ... LEAK-TESTING WITH LEAK TESTER DEVICE

WARNING: Avoid contact with refrigerant.

Follow safety precautions when handling refrigerant, see 64 50 ... Instructions for handling refrigerant R 134a.

Carry out leak-testing with a leak tester device from the workshop equipment catalog following the device manufacturer's operating instructions.

If leaks not to be localized are already identified during evacuation, the A/C system must nevertheless be filled, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**. Then test for leaks with leak tester device.

NOTE: Refrigerant is heavier than air.
Therefore always conduct the leak test below the lines and components to be tested.
Shield lines and components against strong blasts of air (wind, drawing off).

Tighten down loose lines, mark leaks.

Then draw off **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)** A/C system and seal off or repair leakage points.

Then refill **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)** A/C system and test for leaks.

64 50 ... SAFETY INSTRUCTIONS FOR HANDLING REFRIGERANT R134A

WARNING: Risk of injury!
Refrigerant circuit is under high pressure! Work on the refrigerant circuit may only be carried out by experts!
Draw off refrigerant without fail BEFORE all repair work on the refrigerant circuit.
The refrigerant circuit is depressurized AFTER drawing off!
It is absolutely essential to read and observe the relevant operating instructions for the A/C service unit used!

Protective measures/rules of conduct:

- Wear protective goggles
- Wear oil-resistant protective gloves
- Do not smoke!
- Observe country-specific safety regulations.

First aid measures:

- Eye contact: In the event of contact with the eyes, rinse immediately with plenty of running water and consult a doctor.
- Skin contact: In the event of contact with skin, remove affected clothing immediately and rinse with plenty of water.
- After inhalation: If refrigerant vapors are inhaled in greater concentrations, remove the person affected to an area of fresh air and keep them under supervision. Consult a doctor. If breathing problems are experienced, breathe additional oxygen. If the person affected is breathing with difficulty or has stopped breathing, incline the person's head at the neck and administer the kiss of life.

64 50 009 DRAWING OFF, EVACUATING AND FILLING A/C SYSTEM (R 134A)

WARNING: Refrigerant circuit is under high pressure!
Repair work may only be carried out on a **DEPRESSURIZED** refrigerant circuit!
Avoid contact with refrigerant and refrigerant oil.
Follow safety instructions for handling refrigerant R 134a, see 64 50 ... Safety instructions for handling refrigerant R134a.
Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).

IMPORTANT: Risk of damage!
Restart engine only when A/C system has been correctly filled.

NOTE: Draw off, evacuate and fill the A/C system in accordance with the operating instructions of the relevant service station.

E60 only:

If necessary, to connect service station, use manufacturer's adapter for high-pressure connection (red).

Instructions for drawing off A/C system:

To help separation of refrigerant and refrigerant oil, run engine at low speed (800-1200 RPM) and with A/C system turned on for a few minutes.

The limits the entrainment of refrigerant oil while it is drawn off.

Drawn-off refrigerant oil must be changed and reintroduced via the service station.

If at the end of the drawing-off procedure the service station moisture indicator shows that the drawn-off refrigerant is excessively moist, clean the refrigerant in accordance with the service station operating instructions.

Recycling:

Dispose of drawn-off refrigerant oil as hazardous waste.

Observe country-specific waste-disposal regulations.

Instructions for evacuating off A/C system:

The evacuation procedure removes all traces of ambient air, water vapor and any other gases present from the A/C system. This enables subsequent system filling with refrigerant.

A decrease in the vacuum level indicates a leak in the refrigerant circuit. 64 50 ... Leak testing with ultraviolet

additives (UV additives) (BMW leak-testing case)

Fig. 55: Instructions For Filling A/C System Screen
Courtesy of BMW OF NORTH AMERICA, INC.

Instructions for filling A/C system:

Before filling with refrigerant, top up the refrigerant oil entrained during drawing off.

Follow instructions for opening and replacing parts in refrigerant circuit!**64 52 ... Instructions for opening and replacing parts in refrigerant circuit.**

Depending on the type of component replaced on the A/C system, it may be necessary to top up the refrigerant oil, even if no measurable losses have occurred during drawing off. Read and comply with the A/C system manufacturer's notes in this regard and the operating instructions of the relevant service station.

Information on the required refrigerant fill quantity for the entire A/C system is contained on the rating plate (1) in the engine compartment.

Installation:

Reseal refrigerant filler necks on vehicle with sealing caps.

64 52 ... INSTRUCTIONS FOR OPENING AND REPLACING PARTS IN REFRIGERANT CIRCUIT

WARNING:

- **Avoid contact with refrigerant and refrigerant oil**
- **Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.**
- **Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).**

CAUTION:

- **Always use new O-rings each time A/C connections are opened.**

- **Moisten O-rings with refrigerant oil prior to fitting**
- **Seal all parts to be returned at openings to prevent ingress of moisture or foreign bodies**

I. Opening refrigerant circuit without part replacement, as preliminary work to further work

(e.g. engine removal):

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out main work
- Replace removed refrigerant oil with new refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

II. Part replacement and part replacement on account of insidious leak

(minor leak, e.g. hairline crack)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement**.
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

III. Part replacement on account of sudden leak

(major leak, e.g. pipe break due to accident)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish 25 ml new refrigerant oil and new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement**.
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

51 A/C HOUSING/EVAPORATOR, SWITCHING ELEMENTS

64 51 522 REMOVING AND INSTALLING OR REPLACING EXPANSION VALVE

Necessary preliminary tasks:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD**.

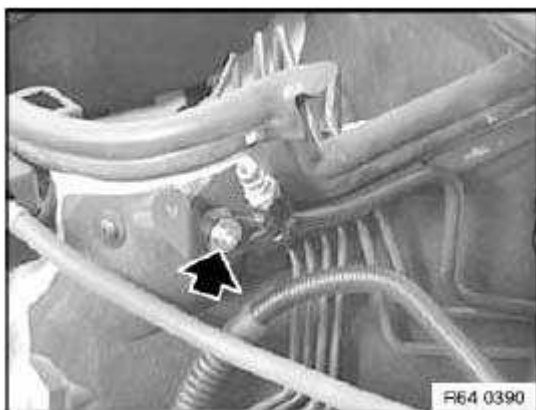

Fig. 56: Locating Nut

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten nut.

Installation:

Tightening torque: 64 53 10AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

Fig. 57: Locating Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws.

Detach refrigerant lines in direction of arrow.

Installation:

Replace sealing rings.

Tightening torque: 64 53 2AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

If necessary, pull lock (1) in direction of arrow and feed out flap (2).

Fig. 58: Pulling Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 59: Double Pipe

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew nut (1).

Installation:

Replace sealing rings.

Tightening torque: 64 53 11AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

Detach double pipe (2) in direction of arrow and lay to one side.

Fig. 60: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws.

Installation:

Replace sealing rings.

Tightening torque: 64 53 9AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

Pull out expansion valve in direction of arrow.

64 52 ... INSTRUCTIONS FOR OPENING AND REPLACING PARTS IN REFRIGERANT CIRCUIT

WARNING:

- **Avoid contact with refrigerant and refrigerant oil**
- **Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.**
- **Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).**

CAUTION:

- **Always use new O-rings each time A/C connections are opened**
- **Moisten O-rings with refrigerant oil prior to fitting**
- **Seal all parts to be returned at openings to prevent ingress of moisture or foreign bodies**

I. Opening refrigerant circuit without part replacement, as preliminary work to further work

(e.g. engine removal):

Work sequence:

- **Draw off A/C system, then determine drawn-off refrigerant oil quantity, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**
- **Carry out main work**
- **Replace removed refrigerant oil with new refrigerant oil**
- **Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**

II. Part replacement and part replacement on account of insidious leak

(minor leak, e.g. hairline crack)

Work sequence:

- **Draw off A/C system, then determine drawn-off refrigerant oil quantity, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**
- **Carry out part replacement**
- **Replace removed refrigerant oil with new refrigerant oil**
- **Additionally replenish new refrigerant oil in accordance with replaced parts:**
 - **Compressor: refer to 64 52 ... Instructions for compressor replacement.**
 - **Evaporator: 10 ml**

- Condenser: 10 ml
- Desiccant insert / desiccant bottle: 30 ml
- Each replaced refrigerant line: 10 ml
- Condenser with integrated dryer: 30 ml
- Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

III. Part replacement on account of sudden leak

(major leak, e.g. pipe break due to accident)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement**.
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

IV. Part replacement on account of sudden leak

(major leak, e.g. pipe break due to accident)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish 25 ml new refrigerant oil and new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement**.
 - Evaporator: 10 ml

- Condenser: 10 ml
- Desiccant insert / desiccant bottle: 30 ml
- Each replaced refrigerant line: 10 ml
- Condenser with integrated dryer: 30 ml
- Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

64 51 ... LEAK-TESTING CONDENSER

Special tools Required

- **00 9 030 (Wedge)**
- **64 5 121 (Connection hose with clamp)**
- **64 5 122 (Climate condenser test adapter)**
- **64 5 123 (Climate condenser seal plug)**

WARNING: Risk of injury!

Refrigerant circuit is under high pressure!

Follow safety instructions for handling refrigerant

Comply with the standard national safety instructions and precautions on handling nitrogen.

Ensure that employees are advised of how to handle pressurized vessels and nitrogen correctly (danger of asphyxiation). For this purpose, follow the notes and instructions in the technical safety specifications available from the gas supplier.

Necessary preliminary tasks:

- Drain off **air conditioner**
- Detach refrigerant lines from condenser

Tightening torque, see 64 53 6AZ in **64 53 REFRIGERANT LINES AND EXPANSION VALVE** .

IMPORTANT: Risk of damage!

Special tool 64 5 122 and special tool 64 5 123 have different diameters (A, B) at the seal plugs!

Ensure correct connection assignment on condenser.

Replace sealing rings (1) prior to each use.

Fig. 61: Identifying Special Tool 64 5 122, 64 5 123 & Sealing Rings
Courtesy of BMW OF NORTH AMERICA, INC.

Fit and secure sealing adapter **64 5 123** to connection of low-pressure line.

Fit and secure test adapter **64 5 122** to connection of low-pressure line.

Tightening torque, see 64 53 6AZ in **64 53 REFRIGERANT LINES AND EXPANSION VALVE** .

Fig. 62: Identifying Special Tool 64 5 122 & 64 5 123
Courtesy of BMW OF NORTH AMERICA, INC.

Connect special tool **64 5 122** to special tool **64 5 121** .

Fig. 63: Identifying Special Tool 64 5 122 & 64 5 121
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage: Use only nitrogen pressure bottles with pressure reducers for leak-testing.

Pressurize condenser to 10 bar slowly only. Excessively fast pressurization and pressures in excess of 20 bar may cause damage to the condenser.

Connect nitrogen pressure bottle with pressure reducer to pressure gauge and then connect to special tool **64 5 121** (connecting hose).

NOTE:

- **Testing apparatus must be leakproof.**
- **Ambient temperature and temperature of vehicle must not change during the test procedure.**
- **Do not move the vehicle during this period**

Apply test pressure of 10 bar **slowly** and close nitrogen pressure bottle.

Check leak-tightness of testing apparatus and of connection to refrigerant line.

Set test pressure of 10 bar is only permitted to drop by 2 bar to 8.5 bar over a test period of 1.5 hours.

If the pressure loss is greater than 1.5 bar, this indicates that there is a leak in the condenser unit.

WARNING: After leak-testing, unscrew special tool 64 5 121 slowly from special tool 64 5 122 to reduce pressure.

After leak-testing:

- Replace all sealing rings and moisten with refrigerant oil
- Assemble A/C system
- Evacuate and fill A/C system

64 51 ... LEAK-TESTING EVAPORATOR

Special tools Required

- 64 5 121
- 64 5 125

WARNING: It is essential, when handling nitrogen, to observe the standard national safety regulations.

Ensure that employees are advised of how to handle pressurized vessels and nitrogen correctly (danger of asphyxiation). For this purpose, follow the notes and instructions in the technical safety specifications available from the gas supplier.

Necessary preliminary tasks:

- Remove expansion valve .

Replace sealing rings (1) and coat with refrigerant oil

Fig. 64: Replace Sealing Rings (1) And Coat With Refrigerant Oil
Courtesy of BMW OF NORTH AMERICA, INC.

Connect special tool **64 5 125** to retainer and screws of expansion valve.

Tightening torque, see 64 53 9AZ in **64 53 REFRIGERANT LINES AND EXPANSION VALVE** .

Connect special tool **64 5 121** to special tool 64 5 125.

Fig. 65: Identifying Special Tool 64 5 121 & 64 5 125
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage: Use only nitrogen pressure bottles with pressure reducers for leak-testing.

Pressurize evaporator to 10 bar slowly only. Excessively fast pressurization and pressures in excess of 20 bar may cause damage to the evaporator.

Connect nitrogen pressure bottle with pressure reducer to pressure gauge and then connect to special tool **64 5 121** (connecting hose).

NOTE:

- **Testing apparatus must be leakproof.**
- **Ambient temperature and temperature of vehicle must not change during the test procedure.**
- **Do not move the vehicle during this period**

Apply test pressure of 10 bar slowly and close nitrogen pressure bottle.

Check leak-tightness of testing apparatus and of connection to refrigerant line.

Set test pressure of 10 bar is only permitted to drop by 2 bar to 8.5 bar over a test period of 1.5 hours.

If the pressure loss is greater than 1.5 bar, this indicates that there is a leak in the evaporator unit.

WARNING: After leak-testing, unscrew special tool 64 5 121 slowly from special tool 64 5 125 to reduce pressure.

After leak-testing:

- Replace all sealing rings and moisten with refrigerant oil

52 COMPRESSOR

64 52 ... INSTRUCTIONS FOR COMPRESSOR REPLACEMENT

IMPORTANT: Compressors with plastic belt pulleys:

- Avoid impacts/knocks to plastic belt pulley (caused by tools, contact with base).
- Return faulty compressors in their original packaging only.

IMPORTANT: When starting up a new compressor for the first time, it is absolutely essential to carry out the following breaking-in procedure:

- Switch on A/C system
- Set all air vents in instrument cluster to "OPEN"
- Start engine and let it stabilize at idle speed
- Set blower output to min. 75 % of max. blower output
- Switch on A/C system and run for at least 2 minutes at idle speed (risk of damage at higher speed!)

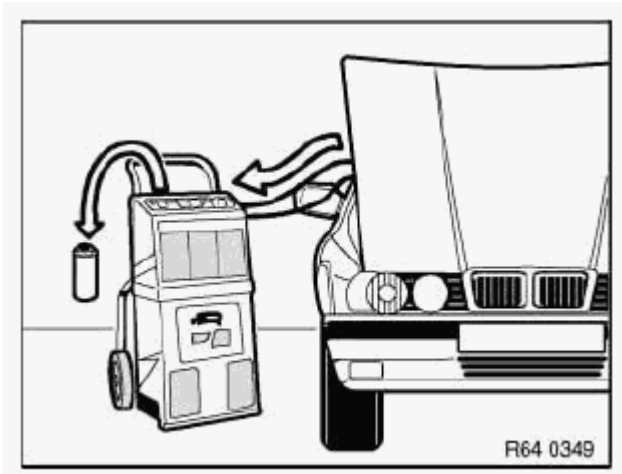

Fig. 66: Evacuating Refrigerant Oil From Air-Conditioning System
Courtesy of BMW OF NORTH AMERICA, INC.

When evacuating the air-conditioning system, refrigerant oil is also extracted and collected in the oil separator of the service station.

After evacuation, the refrigerant must be filtered in the service station as the oil separator could still contain a liquid refrigerant/oil mixture. The filtering process gasifies the refrigerant completely and only the previously bound refrigerant oil remains in the oil separator. Measure and note down this quantity of refrigerant oil, refer to Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**..

Fig. 67: Transferring Refrigerant Oil Into Container
Courtesy of BMW OF NORTH AMERICA, INC.

Transfer the refrigerant oil remaining in the previous compressor via the filler plug completely into a measuring container.

Measure the amount of refrigerant oil collected from the previous compressor.

Fig. 68: Measuring Amount Of Refrigerant Oil
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 69: Removing Refrigerant Oil Into Clean Container
 Courtesy of BMW OF NORTH AMERICA, INC.

The new compressor is filled at the factory with refrigerant oil.

Open filler plug and pour entire contents of compressor into a clean container.

Installation:

Replace sealing ring and moisten with refrigerant oil.

Observe tightening torque: 64 52 2AZ, see **64 52 A/C COMPRESSOR** .

Fig. 70: Pouring Same Amount Of Refrigerant Oil Extra Into Clean Measuring Container
 Courtesy of BMW OF NORTH AMERICA, INC.

From the new compressor, pour the same amount of refrigerant oil (as drained from the previous compressor) + 10 g extra into a clean measuring container and pour again into the new compressor.

Remaining refrigerant oil can be poured into service station tank, refer to Evacuate and fill A/C system, see **64**

50 009 Drawing off, evacuating and filling A/C system (R 134a)..

Otherwise the excess refrigerant oil must be disposed of correctly.

On account of its hygroscopic properties, refrigerant oil must not be stored in open containers.

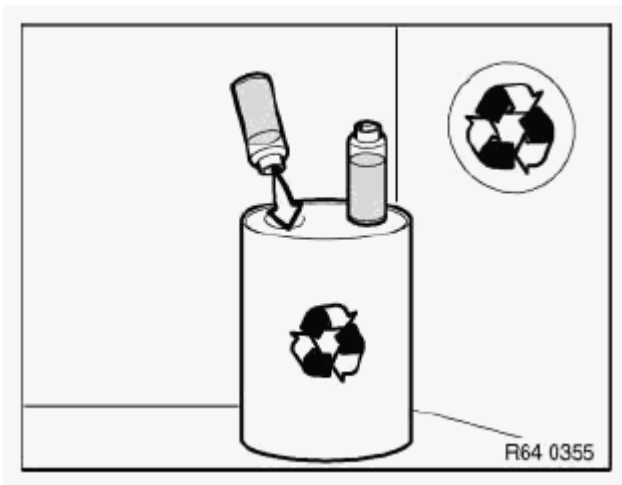

Fig. 71: Draining Refrigerant Oil
Courtesy of BMW OF NORTH AMERICA, INC.

The refrigerant oil drawn off from the oil separator of the service station and from the previous compressor must not be reused and must be correctly disposed of.

After installing the new compressor, it is essential before filling the A/C system to pour the same amount of the previously drawn off refrigerant oil into the system again, refer to Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)..**

Fig. 72: Evacuating Refrigerant Oil Into A/C System
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If A/C system is opened for more than 24 hours: Replace drier bottle/drier insert .

64 52 ... INSTRUCTIONS FOR OPENING AND REPLACING PARTS IN REFRIGERANT CIRCUIT

WARNING: Avoid contact with refrigerant and refrigerant oil

- Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.
- Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).

CAUTION:

- Always use new O-rings each time A/C connections are opened
- Moisten O-rings with refrigerant oil prior to fitting
- Seal all parts to be returned at openings to prevent ingress of moisture or foreign bodies

I. Opening refrigerant circuit without part replacement, as preliminary work to further work

(e.g. engine removal):

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).
- Carry out main work
- Replace removed refrigerant oil with new refrigerant oil
- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).

II. Part replacement and part replacement on account of insidious leak

(minor leak, e.g. hairline crack)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to 64 52 ... Instructions for compressor replacement.
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml

- Each replaced refrigerant line: 10 ml
- Condenser with integrated dryer: 30 ml
- Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

III. Part replacement on account of sudden leak

(major leak, e.g. pipe break due to accident)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement**.
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.

64 52 521 REPLACING A/C SYSTEM COMPRESSOR (N52K)

Special tools required:

- 32 1 270 (Plug)

WARNING: Avoid contact with refrigerant and refrigerant oil.

Follow safety instructions for handling R134a refrigerant, see **64 50 ... Safety instructions for handling refrigerant R134a**.

Follow safety instructions for handling refrigerant oil, see **64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a)**.

IMPORTANT: Risk of damage! Restart engine only when A/C system has been correctly filled. Read and comply with notes on replacing compressor. Follow instructions for opening and replacing parts in refrigerant circuit. If A/C system is opened for more than 24 hours: Replace desiccant insert for A/C system.

Necessary preliminary tasks:

- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**. are not included in the time value given for this work operation
- Remove A/C compressor drive belt
- Remove coolant thermostat. See **11 53 000 REMOVING AND INSTALLING/REPLACING COOLANT THERMOSTAT (N52K)** .

Release screws (1) and disconnect plug connection on compressor. Disconnect pressure and suction lines.
Installation: Replace all sealing rings and moisten with refrigerant oil. Tightening torque, see 64 52 1AZ in **64 52 A/C COMPRESSOR** .

Fig. 73: Release Screws (1) And Disconnect Plug Connection On Compressor
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Seal openings or lines on compressor with special tool 32 1 270 to prevent escape of media and fouling.

NOTE: Secure compressor (3) against falling out. Release screw (1). Release screws (2) and feed out compressor towards front. Tightening torque, see 64 52 3AZ in **64 52 A/C COMPRESSOR** .

Fig. 74: Release Screws (2) And Feed Out Compressor Towards Front
 Courtesy of BMW OF NORTH AMERICA, INC.

After installation: Fill and vent cooling system. Evacuate and fill A/C system.

64 52 521 REPLACING AIR CONDITIONING COMPRESSOR (N54, N55)

Special tools required:

- 00 9 030 (Wedge)
- 32 1 270 (Plug)

WARNING: Avoid contact with refrigerant and refrigerant oil.
 Follow safety instructions for handling R134a refrigerant, see 64 50 ...
 Safety instructions for handling refrigerant R134a.
 Follow safety instructions for handling refrigerant oil, see 64 50 ...
 Instructions for handling refrigerant oil (for refrigerant R 134a).

IMPORTANT: Risk of damage! Restart engine only when A/C system has been correctly filled.
 Read and comply with notes on replacing compressor. Follow instructions for opening and replacing parts in refrigerant circuit. If A/C system is opened for more than 24 hours: Replace desiccant insert for A/C system.

Necessary preliminary tasks:

- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a). are not included in the time value given for this work operation
- Remove A/C compressor drive belt
- Remove left charge air duct

Release screws (1) and (2). Remove refrigerant line. Tightening torque 64 52 1AZ. Installation note: Replace sealing rings. Use special tool 00 9 030 to mount sealing rings without damaging them.

Fig. 75: Release Screws (1) And (2)

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Seal openings or lines on compressor with special tool 32 1 270 to prevent escape of media and dirt contamination.

IMPORTANT: Secure compressor against falling.

Disconnect plug connection (1). Unfasten screws (2). Release screw (3) and feed out compressor in upward direction. Tightening torque 64 52 3AZ.

Fig. 76: Release Screw (3) And Feed Out Compressor In Upward Direction

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement: Read and comply with notes on compressor replacement. If necessary, release screws (1) and modify holder (2).

Fig. 77: Release Screws (1) And Modify Holder (2)
Courtesy of BMW OF NORTH AMERICA, INC.

After installation: Evacuate and fill air conditioning system. Assemble engine.

53 CONDENSER AND DRYER WITH LINES

64 52 ... INSTRUCTIONS FOR OPENING AND REPLACING PARTS IN REFRIGERANT CIRCUIT

WARNING:

- Avoid contact with refrigerant and refrigerant oil
- Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.
- Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).

CAUTION:

- Always use new O-rings each time A/C connections are opened.
- Moisten O-rings with refrigerant oil prior to fitting
- Seal all parts to be returned at openings to prevent ingress of moisture or foreign bodies

I. Opening refrigerant circuit without part replacement, as preliminary work to further work

(e.g. engine removal):

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).
- Carry out main work
- Replace removed refrigerant oil with new refrigerant oil
- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R

134a).

II. Part replacement and part replacement on account of insidious leak

(minor leak, e.g. hairline crack)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement.**
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**

III. Part replacement on account of sudden leak

(major leak, e.g. pipe break due to accident)

Work sequence:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a).**
- Carry out part replacement
- Replace removed refrigerant oil with new refrigerant oil
- Additionally replenish 25 ml new refrigerant oil and new refrigerant oil in accordance with replaced parts:
 - Compressor: refer to **64 52 ... Instructions for compressor replacement.**
 - Evaporator: 10 ml
 - Condenser: 10 ml
 - Desiccant insert / desiccant bottle: 30 ml
 - Each replaced refrigerant line: 10 ml
 - Condenser with integrated dryer: 30 ml
 - Safety pressure switch and seals: no additional refrigerant oil
- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R**

134a).

64 53 ... NOTES ON REPLACING DRIER BOTTLE OR DRIER INSERT

The drier bottle or drier insert does not have to be replaced at regular service intervals in a functioning, leakproof A/C system.

However, the drier bottle or drier insert must be replaced without fail in the event of:

- fouling of the refrigerant by filings/shavings (e.g. when the compressor is clamped)
- a leaking A/C system or loss of refrigerant
- the refrigerant circuit being opened for a period exceeding 24 hours, e.g. during repair work.

64 53 ... REPLACING VALVE INSERT FOR REFRIGERANT LINE

Avoid contact with refrigerant and refrigerant oil.

Follow safety instructions for handling R134a refrigerant, see **64 50 ... Safety instructions for handling refrigerant R134a.**

Follow safety instructions for handling refrigerant oil, see **64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).**

IMPORTANT: Risk of damage!

Restart engine only when A/C system has been correctly filled.

If A/C system is opened for more than 24 hours: Replacing drier insert for A/C system

NOTE: The special tool is available under BMW order number: 81 34 0 427 679 from the BMW workshop equipment catalogue.

Necessary preliminary tasks:

- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a).** are not included in the time value given for this work operation

Twist valve insert out of filler neck (2) with remover (1).

Fig. 78: Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Screw in valve insert hand-tight only.

After installation:

- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).
- Check leak-tightness of valve insert with soapy solution

In event of leakage:

- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).
- Check sealing faces on line and valve insert for damage, replace line or valve insert if necessary

64 53 510 REMOVING AND INSTALLING/REPLACING DRYER BOTTLE FOR AIR CONDITIONER

WARNING: Avoid contact with refrigerant and refrigerant oil.

Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.

Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).

IMPORTANT: Risk of damage!

Restart engine only when A/C system has been correctly filled.

A/C system is opened for more than 24 hours:

Replacing drier insert for A/C system

Necessary preliminary tasks:

- Evacuate and fill A/C system, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**. are not included in the time value given for this work operation
- Release fluid reservoir for windscreen washer system and place to one side
- Partially detach front right wheel arch, see **51 71 040 REMOVING AND INSTALLING/REPLACING FRONT LEFT OR RIGHT WHEEL ARCH COVER** .

Fig. 79: Screws And Refrigerant Lines
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove refrigerant lines (2).

Installation:

Replace all sealing rings.

Tightening torque: 64 53 1AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

Slacken screws (1) and remove dryer bottle (2) towards top.

Fig. 80: Dryer Bottle And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (3).

Installation:

Make sure dryer bottle is securely seated.

After installation:

- Evacuate and fill A/C system, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).

64 53 520 REPLACING SAFETY PRESSURE SWITCH

WARNING: Avoid contact with refrigerant and refrigerant oil.
Follow safety instructions for handling R134a refrigerant, see 64 50 ...
Safety instructions for handling refrigerant R134a.
Follow safety instructions for handling refrigerant oil, see 64 50 ...
Instructions for handling refrigerant oil (for refrigerant R 134a).

NOTE: The time value given for this work operation does not include drawing off, evacuating and filling the A/C system!

- Drain off air conditioner, see 64 50 009 Drawing off, evacuating and filling A/C system (R 134a).

IMPORTANT: Risk of damage!
Restart engine only when A/C system has been correctly filled.

NOTE: If A/C system is opened for more than 24 hours: Replace drier for A/C system, see 64 53 510 Removing and installing/replacing dryer bottle for air conditioner.

Necessary preliminary tasks:

- Release fluid reservoir for windscreen washer system and place to one side

Fig. 81: Safety Pressure Switch

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Release safety pressure switch (2).

Tightening torque: 64 53 13AZ, see **64 11 HOUSING, HEATER/AIR CONDITIONER** .

64 53 550 REMOVING AND INSTALLING OR REPLACING CAPACITOR FOR THE HEATING AND AIR CONDITIONING SYSTEM

WARNING:

- **Avoid contact with refrigerant and refrigerant oil**
- **Follow safety instructions for handling R134a refrigerant, see 64 50 ... Safety instructions for handling refrigerant R134a.**
- **Follow safety instructions for handling refrigerant oil, see 64 50 ... Instructions for handling refrigerant oil (for refrigerant R 134a).**

IMPORTANT: Risk of damage! Restart engine only when heating and air conditioning system has been correctly filled.

NOTE: Follow notes for opening and replacing parts in refrigerant circuit. If Air conditioning system is opened for more than 24 hours: Replacing desiccant insert for air conditioning system

IMPORTANT: The desiccant insert can only be replaced in vehicles up to 12/08! In vehicles after 12/08, the air conditioning capacitor must be replaced!

Necessary preliminary tasks:

- Draw off A/C system, then determine drawn-off refrigerant oil quantity, see **64 50 009 Drawing off, evacuating and filling A/C system (R 134a)**.
- Remove radiator.

Release screws (1) and remove refrigerant lines. Installation note: Tightening torque 64 53 6AZ, see **64 53 REFRIGERANT LINES AND EXPANSION VALVE** . Replace all sealing rings and moisten with refrigerant oil.

Release screw (2) and remove the spacers (3). Release retaining clip (4) and remove capacitor (5).

Fig. 82: Release Screw (2) And Remove The Spacers (3)
Courtesy of BMW OF NORTH AMERICA, INC.

After installation: **Evacuate and fill heating and air conditioning system.** Fill and vent cooling system and check for leaks. See **CHECKING COOLING SYSTEM** .

CABIN AIR FILTER

BMW - X3 (E83)

REMOVAL & INSTALLATION

NOTE: Manufacturer's terminology for this filter is microfilter.

NOTE: Numbers in parenthesis refer to numbers in figures.

CABIN AIR FILTER

Removal & Installation

1. Turn toggle (1) approximately 90 degrees and remove cover (2) towards front. See **Fig. 1**.

G00213245

Fig. 1: Removing Cover
Courtesy of BMW OF NORTH AMERICA, INC.

2. Remove microfilter (1). See **Fig. 2**. To install microfilter, reverse removal procedure.

G00213246

Fig. 2: Removing Microfilter

Courtesy of BMW OF NORTH AMERICA, INC.

HVAC

Heating and Air Conditioning - Operating Fluids

1.0 AIR CONDITIONER REFRIGERANT

FREON®

The refrigerant Freon® R12 is used in most BMW automobiles with an air conditioner up through the 1992 model year. It has a boiling point of -29.8°C (sea level), at which the refrigerant is transformed from a liquid into a gaseous state. This boiling point, however, is not constant. It is displaced in the direction of higher temperatures as pressure increases.

Freon® R12 complies with the requirements expected of a safety refrigerant. Freon® is not combustible and does not turn into an explosive mixture with air. It is also odorless and non-toxic. Conformance with certain safety regulations is essential to the handling of refrigeration systems.

There are currently no BMW-approved alternative refrigerants to R12.

SAFETY WARNING

64 Avoid any contact with liquid refrigerant, since this could cause frostbite. Protect eyes with safety goggles and hands with gloves. Contact a doctor without delay in case of an accident.

64 Freon® R12 is heavier than air, so this refrigerant must not be discharged in closed rooms. There is danger of asphyxiation in a sunken work area (pit). Do not store bottles of refrigerant at temperatures above $113^{\circ}\text{F}/45^{\circ}\text{C}$ or heat them.

64 Never weld on or near a system filled with refrigerant. Heat could cause excessive pressure and an explosion. In addition, Freon® R12 will decompose at high temperature or when subjected to an open flame. The resulting decomposition products would be hazardous to health.

64 Make sure you read the container label instructions completely prior to use.

64 Obtain and use the correct type of refrigerant recovery/recycling machine. Follow the directions included in the machine's instruction manual.

HFC-134A

The refrigerant HFC-134a (also known as R-134a) is used as of the following models with an air conditioner:

64 1992 E32/M30 from March 1992 production

64 1993 E34, E36, 325iC. E31, E32 from August 1992 production

This environmentally friendly refrigerant performs similar functions as Freon® R12, but the refrigerants Freon® R12 and R-134a must NEVER be mixed or combined in any way under any circumstances.

SAFETY WARNING

64 Always wear eye protection and gloves while handling refrigerant or servicing air conditioning systems.

64 Avoid breathing R-134a and lubricant vapor or mist. Exposure may irritate eyes, nose, throat, and lungs. Use only approved service equipment to discharge A/C systems. If accidental system discharge occurs, ventilate work area before resuming service.

64 If refrigerant or compressor oil contacts the skin or eyes, large quantities of cool water should be used to flush the affected area.

64 Never heat a refrigerant container with an open flame. Keep all refrigerants away from open flames, since burning refrigerant can produce poisonous gas.

64 Under no circumstances should R-134a service equipment or vehicle A/C systems be pressure tested with air/R 134a mixtures. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures.

The use of compressed air (shop air) for leak detection in R-134a systems could result in fire or explosion causing injury or property damage. In addition, introducing compressed air into A/C systems or components contaminates the system and/or refrigerant with moisture.

64 Obtain and use the correct type of refrigerant recovery/recycling machine. Follow the directions included in the machine's instruction manual.

2.0 REFRIGERATION OIL

OIL USED IN FREON®-CHARGED SYSTEMS

A mineral-based oil is used. The oil level in the compressor must be checked before filling an air conditioner with refrigerant. It can be checked only if the system is without refrigerant.

Always check the oil level each time a new system is filled with Freon® R12 or after repairs. The oil level is very important for the entire air conditioning system. Part of the oil (approx. 25% depending on amount of refrigerant) is mixed with the refrigerant and is continuously circulated in the system. This oil lubricates the moving parts of the system, such as the expansion valve and compressor.

Oil Used in R-134a-Charged Systems:

A synthetic oil is used, which is totally different than the mineral-based oils used in Freon® R12 systems.

R-134a systems require Polyalkylene Glycol lubricants, often referred to as "PAG" oil. Use of R-12 compressor oil in R-134a systems will cause the compressor to seize and fail. The R-12 mineral oil does not stay in solution in R-134a. In addition, R-134a compressor should not be used in an R-12 system. Long term damage and corrosion will result.

The **GREEN** R-134a system labels, usually located near the top side of the fan shroud in the engine

compartment, will display the refrigerant requirement for R-134a systems. An example is illustrated.

R-12 systems will have a **BLACK** label in a similar location.

Fig. 1: Identifying R-12 Systems - Black Label
Courtesy of BMW OF NORTH AMERICA, INC.

PAG oil should only be stored in its original container, and sealed as tightly as possible. PAG oil is totally devoid of moisture when packaged, and will absorb moisture readily (hygroscopic) if exposed to the atmosphere, rendering it useless. Dispose of all extracted lubricants from A/C systems. Never reuse old compressor oil. Contaminated PAG oil should never be added to the air-conditioning system, and old PAG oil is typically contaminated with moisture. R-134a is even more sensitive to moisture contamination than R-12 systems.

PAG oil may be obtained from BMW of North America.

BMW Part No. 82 11 1 468 042.

3.0 AIR CONDITIONING UNIT DISINFECTANTS

A musty odor may be detected in the vehicle, particularly when the air conditioner is first switched on.

This is caused by microorganisms growing on the evaporator from moisture condensation.

A disinfectant can be applied to the air conditioning system:

"Airguard" by J. J. Products, Inc.; "Airsept" by The Auto Doctor or Air Conditioning and Heating System Treatment by Wurth USA, Inc.

Such disinfectants are not available from BMW of North America.

4.0 AIR CONDITIONER REFRIGERATION/OIL FILL CAPACITIES

Note that some 1993 Model Year early production R-134a equipped vehicles have under-hood labels that

specify higher charge values than those specified in the chart. Testing has confirmed that the values given are the optimum fill capacities. Consult the chart before refilling. Labels with the lower refrigerant charge amount specified on the chart have been phased into production as of 11/92.

When performing repairs to the A/C system that require recharging, only the specifications given in this chart should be used, as well as the label part numbers, as appropriate. However, inadvertent refrigerant charging up to the fill capacity given on an "original" ('93 MY production prior to 11/92) under-hood label will not cause any problems.

See appropriate HVAC article for oil refill capacity for specifications not indicated in **A/C LABEL BMW P/N REFERENCE** table.

Refrigerant, Special Features, Production Range, Fill Capacity g (lbs), Fill Capacity ml (oz), BMW P/N

A/C LABEL BMW P/N REFERENCE

Series/Body, Refrigerant	Model or Type Special Features	Production Range	Fill Capacity g (lbs)	Refrigerant Oil Total Fill Capacity ml (oz)	A/C Label BMW P/N

NOTE:

- 1. The Modine condenser was used in many E36 vehicles over the production range 9/91-3/92. This condenser has a smaller volume, and the A/C system must be charged accordingly.**

- 2. Production start of 1993 MY E34/S38 (M5) 9/92; E32/M70 (750iL) 11/92.**
- 3. R-134a, the environmentally friendly air conditioning refrigerant, was introduced to the U.S. market beginning with 3/92 production E32/M30 (735i/iL) vehicles.**
- 4. Labels reflecting the proper charging volumes given on this chart are available from BMW Parts. These may be used in place of the original equipment labels on '93 model year vehicles produced before 11/92.**
- 5. All vehicles equipped with R-134a refrigerant require special PAG lubricant.**
- 6. Nippon Denso**
- 7. Seiko Seiki**

64 HEATING AND AIR CONDITIONING

64 1 020 RELEASE HOOK

Minimum set: Mechanical tools

Note: For releasing and removing fresh air grille. For removing various trims.

Series: E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

Storage location: C33

SI number: 1 15 99 (483)

Order number: 64 1 020 Release hook

Fig. 1: Release Hook (64 1 020)

64 1 450 SPRAY UNIT

In conjunction with: Pressure vessel spray gun, manufacturer: SATA (81 45 9 429 217)

Note: For cleaning and disinfecting evaporator in A/C system

Series: E39, E46, E53, E83

SI number: 1 22 00(648)

Order number: 64 1 450 Spray unit

Consisting of:

1 = 64 1 451 Spray lance

2 = 64 1 452 Drilling hole template

Note: Model series: E39, E53 IHKA

3 = 64 1 453 Center bit

Note: Model series: E39, E53 IHKA

4 = 64 1 454 Guide

Note: Model series: E39, E53 IHKA

5 = 64 1 455 Positioner

Note: Model series: E39, E53 IHKA

6 = 64 1 456 Retaining screw

Note: Model series: E39, E53 IHKA

7 = 64 1 457 Adapter

Note: Model series: E46 IHKA / R Model series: E39, E53 IHKR

8 = 64 1 458 Seal plug

Note: Model series: E46 IHKA / R Model series: E39, E53 IHKR

Fig. 4: Spray Unit (64 1 450)

64 5 100 SET OF SEALING ADAPTERS

Note: For closing off line flanges of A/C components (evaporator, condenser, compressor) for leak testing. Special tool 64 5 101 replaced by 64 5 105 (from 01/2005).

Series: E32, E34, E36, E38, E39, E46, E53, E60, E61, E63, E64, E70, E81, E83, E87, E90, E91, E92, E93

SI number: 1 17 98 (359)

Order number: 64 5 100 Set of sealing adapters

Consisting of:

1 = 64 5 104 Connecting hose

Note: For connecting pressure cylinder to filler adapter

2 = 64 5 102 Sealing adapter

Note: For closing off intake line

3 = 64 5 103 Sealing adapter

Note: For closing of intake connection on compressor

4 = 64 5 105 Filler adapter

Note: For closing off the pressure line and connection at connecting hose (replacement for special tool SWZ 64 5 101 since 01/2005)

5 = 64 5 106 Sealing adapter

Note: For closing off line during leak test (included in scope of delivery from 01/2005)

6 = 64 5 107 Sealing adapter

Note: For closing off line during leak test for E81, E87, E90, E91, E92, E93 (included in scope of delivery from 02/2007)

7 = 64 5 108 Sealing adapter

Note: For closing off line during evaporator leak test in E70 (included in scope of delivery from 02/2007)

Fig. 7: Set Of Sealing Adapters (64 5 100)

ACCESSORIES AND EQUIPMENT

Lighting - Repair Instructions - X3

10 LAMP SETTINGS

63 10 ... TEST REQUIREMENTS FOR HEADLIGHT VERTICAL AIM ADJUSTMENT

- Car parked on level ground.
- Replace faulty glass and mirrors and blackened light bulbs.
- Check tire pressure and correct if necessary.
- Apply load equivalent to one person on driver's seat (approx. 75 kg).
- Vehicle with full fuel tank or appropriate additional weight in luggage compartment.
- Correct adjustment of headlights in relation to engine hood (gap dimensions).
- Manual headlight vertical aim control: Turn handwheel to 0 position.
- Automatic headlight vertical aim control: Wait approx. 30 seconds after switching on lights.
- Version with xenon headlights: Wait 80 seconds after switching on lights. During this time, do not move the vehicle and avoid vibrations.
- Align headlight aimer with vehicle longitudinal axis and parallel to parking surface. Set marking line (M) on aimer to distance (e). Scale graduations on aimer are equal to a gradient in cm at a distance of 10 meters.

Fig. 1: Headlight Aiming

Courtesy of BMW OF NORTH AMERICA, INC.

Light/dark limit of headlights in headlight aimer

e Adjustment dimension, headlights:

- as per type plate on headlight housing in % (e.g.: 1.0 % = 10 cm / 10 m = 10 on headlight aimer).

Adjustment dimension, fog lights:

- all vehicles 2.0 % = 20 cm / 10 m = 20 on headlight aimer.

H Height of center of headlight above parking surface.

h H - e = height of marking line above parking surface

+ Central mark = center point of high-beam headlight.

M Marking line of headlamp aimer

S Parking surface of vehicle and headlight aimer

Adjustment dimension (e) is only valid for EUR. Observe differing national regulations.

63 10 004 ADJUSTING HEADLIGHTS

NOTE: Comply with test preconditions for headlight adjustment, see 63 10 ... Test requirements for headlight vertical aim adjustment.

Adjust headlights at adjusting screws (1) and (2).

A definite allocation of adjusting screws is not possible.

1. Adjustment screw primarily for vertical adjustment
2. Adjustment screw primarily for lateral adjustment

Fig. 2: Headlight Adjusting Screws
Courtesy of BMW OF NORTH AMERICA, INC.

63 10 014 ADJUSTING FOG LAMPS

Comply with test preconditions for headlight adjustment, see **63 10 ... Test requirements for headlight vertical aim adjustment.**

Unclip fog lamp trim (1) through opening (2) and remove from front bumper trim (3).

Fig. 3: Unclipping Fog Lamp Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of fog lamp trim (2) must not be damaged. Make sure fog lamp trim (2) is correctly seated in front bumper trim.

Fig. 4: Retaining Hooks Of Fog Lamp Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust fog lamp (1) by turning adjusting screw (2).

Fig. 5: Fog Lamp And Adjusting Screw
Courtesy of BMW OF NORTH AMERICA, INC.

12 HEADLIGHTS

51 11 710 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT HEADLIGHT BRACKET (M TECHNIC AERODYNAMIC KIT)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 REMOVING AND INSTALLING FRONT BUMPER TRIM (FROM 09/2006)** .

Version with headlight washer system:

- Remove high-pressure nozzle, see **61 67 083 REMOVING AND INSTALLING/REPLACING HIGH - PRESSURE NOZZLE OF LEFT OR RIGHT HEADLIGHT WASHER SYSTEM (M AERODYNAMIC KIT)** .

Release screws (1) and remove bracket (2).

Fig. 6: Screws And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

63 12 001 REMOVING AND INSTALLING/REPLACING LEFT HEADLIGHT

Operation is described in:

Removing and installing left xenon headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight)**.

63 12 002 REMOVING AND INSTALLING/REPLACING RIGHT HEADLIGHT

Operation is described in:

Removing and installing left headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight)**.

63 12 010 REMOVING AND INSTALLING/REPLACING LEFT HEADLIGHT (XENON HEADLIGHT)

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 REMOVING AND INSTALLING FRONT BUMPER TRIM (FROM 09/2006)** .

Version with M Technic aerodynamic kit:

- Remove headlight bracket, see **51 11 710 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT HEADLIGHT BRACKET (M TECHNIC AERODYNAMIC KIT)** .

Unlock plug connections (1) and disconnect.

Release screws (2) and (3).

Installation:

- Observe gap dimensions, see **00 BODY** .
- Adjust headlight, see **63 10 004 Adjusting headlights**.

Pull out headlight (4) in direction of arrow and remove.

Fig. 7: Unlocking Plug Connections
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Install headlight (1) so that locators (2) fit exactly on guides (3).

Fig. 8: Headlight Locators
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- Remove ignition unit and bulb for xenon headlight, see **63 99 076 Replacing bulb for left xenon headlight.**
- Remove control unit for xenon headlights, see **63 12 860 REPLACING CONTROL UNIT FOR LEFT XENON HEADLIGHT .**

63 12 012 REMOVING AND INSTALLING RIGHT HEADLIGHT (XENON HEADLIGHT)

Operation is described in:

Removing and installing left headlight, see **63 12 010 Removing and installing/replacing left headlight**

(xenon headlight).

63 12 015 REMOVING AND INSTALLING LEFT HEADLIGHT (ADAPTIVE HEADLIGHT)

This operation is described in:

Removing and installing left xenon headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight).**

63 12 016 REPLACING LEFT HEADLIGHT (ADAPTIVE HEADLIGHT)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- Remove left headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight).**
- Remove drive unit for adaptive headlight, see **63 12 895 Replacing drive for left adaptive headlight.**
- Remove control unit for left xenon headlight, see **63 12 860 Replacing control unit for left xenon headlight.**
- Remove bulb for left xenon headlight (ignition unit), see **63 99 076 Replacing bulb for left xenon headlight.**

After installation:

- Carry out programming/coding using appropriate BMW service tool.
- Adjust headlight, see **63 10 004 Adjusting headlights.**

63 12 017 REMOVING AND INSTALLING/REPLACING RIGHT HEADLIGHT (ADAPTIVE HEADLIGHT)

Operation is described in:

Removing and installing left headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight).**

63 12 860 REPLACING CONTROL UNIT FOR LEFT XENON HEADLIGHT

**WARNING: Version with xenon headlights: Danger to life due to high voltage!
Therefore disconnect all components from voltage supply before removal.
Work on the entire xenon lighting system (ignition unit, control unit and**

lamp) may only be carried out by specialist personnel.

Necessary preliminary tasks:

- Remove left headlight, see 63 12 010 Removing and installing/replacing left headlight (xenon headlight).

Release screws (1).

Remove control unit for xenon headlight (2) from headlight (3).

Fig. 9: Screws And Control Unit
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit control unit for xenon headlight (3) exactly on headlight.

Make sure plug housing (1) is correctly seated on pin housing (2).

Fig. 10: Control Unit And Plug Housing
Courtesy of BMW OF NORTH AMERICA, INC.

63 12 861 REPLACING CONTROL UNIT FOR RIGHT XENON HEADLIGHT

Operation is described in:

Remove control unit for left xenon headlight, see [63 12 860 Replacing control unit for left xenon headlight.](#)

63 12 870 REPLACING IGNITION UNIT FOR LEFT XENON HEADLIGHT

**WARNING: Version with xenon headlights: Danger to life due to high voltage!
Therefore disconnect all components from voltage supply before removal.
Work on the entire xenon lighting system (ignition unit, control unit and lamp) may only be carried out by specialist personnel.**

Unlock catch (1) in direction of arrow and fold down cover (2).

Remove cover (2) from headlight (3).

Fig. 11: Removing Cover From Headlight
Courtesy of BMW OF NORTH AMERICA, INC.

Turn ignition unit for xenon headlight (1) approx. 30° counterclockwise and detach from headlight (3).

NOTE: Plug connection (2) is automatically released by turning ignition unit for xenon headlight (1).

Feed out ignition unit for xenon headlight (1) through opening in headlight (4) and remove.

Fig. 12: Xenon Headlight

Courtesy of BMW OF NORTH AMERICA, INC.

63 12 871 REPLACING RIGHT IGNITION UNIT FOR RIGHT XENON HEADLIGHT

Operation is described in:

Remove control unit for left xenon headlight, see **63 12 860 Replacing control unit for left xenon headlight.**

63 12 895 REPLACING DRIVE FOR LEFT ADAPTIVE HEADLIGHT

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

**WARNING: Version with xenon headlights: Danger to life due to high voltage!
Therefore disconnect all components from voltage supply before removal.
Work on the entire xenon lighting system (ignition unit, control unit and lamp) may only be carried out by specialist personnel.**

Necessary preliminary tasks:

- Remove left headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight).**

Release screws (1).

Remove drive for adaptive headlight (2) in direction of arrow from headlight (3).

Fig. 13: Screws And Headlight
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit drive for adaptive headlight (1) exactly on headlight.

Make sure pin housing (2) is correctly seated in plug housing (3).

Fig. 14: Adaptive Headlight And Pin Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Carry out coding/programming using appropriate BMW service tool.

63 12 896 REPLACING DRIVE FOR RIGHT ADAPTIVE HEADLIGHT

Operation is described in:

Replacing drive for left adaptive headlight, see **63 12 895 Replacing drive for left adaptive headlight.**

63 12 950 REPLACING A LOWER HOLDER FOR HEADLIGHT MOUNTING

Necessary preliminary tasks:

- Remove headlight, see **63 12 010 Removing and installing/replacing left headlight (xenon headlight).**

Release screws (1).

Remove holder (2) from headlight (3).

Installation:

Screws (1) are also used for gap adjustment.

Fig. 15: Holder And Headlight
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure metal nuts (1) are correctly seated.

Guides (2) must slide exactly in locators (3).

Fig. 16: Metal Nuts And Guides
Courtesy of BMW OF NORTH AMERICA, INC.

13 TURN SIGNAL INDICATOR LIGHTS

63 13 200 REMOVING AND INSTALLING/REPLACING FRONT LEFT OR RIGHT AUXILIARY TURN SIGNAL LAMP

Slide front auxiliary turn signal lamp (1) towards front and fold in direction of arrow out of front side wall (2).

Unlock associated plug connection and disconnect.

Remove front auxiliary turn signal lamp (1).

Fig. 17: Removing Front Auxiliary Turn Signal Lamp
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, convert bulb.

WARNING: Follow instructions for handling light bulbs (exterior lights), see [63 99 ...](#)
Instructions for handling light bulbs (exterior lights).

Installation:

Note type of bulb, see [63 13 TURN SIGNALS E83](#) .

14 CLEARANCE AND SIDE MARKER LAMPS

63 14 120 REMOVING AND INSTALLING OR REPLACING REAR REFLECTOR

Unclip reflector (1) from bumper panel (2) in area (3).

Pull reflector (1) out of guide and detach towards rear from bumper panel.

Fig. 18: Reflector And Bumper Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on rear reflector must not be damaged.

Fig. 19: Catches
Courtesy of BMW OF NORTH AMERICA, INC.

17 FOG LIGHTS, AUXILIARY LIGHTS

63 17 060 REMOVING AND INSTALLING (REPLACING) LEFT OR RIGHT FRONT FOG LAMP

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Unclip fog lamp trim (1) through opening (2) and remove from front bumper trim (3).

Fig. 20: Unclipping Fog Lamp Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of fog lamp trim (2) must not be damaged.

Make sure fog lamp trim (2) is correctly seated in front bumper trim (2).

Fig. 21: Retaining Hooks Of Fog Lamp Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Feed fog lamp (2) in direction of arrow out of front bumper trim (3).

Unlock associated plug connection and disconnect.

Remove fog lamp (2).

Fig. 22: Fog Lamp And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Adjust front fog lamps, see **63 10 014 Adjusting fog lamps.**

If necessary, convert bulb.

Installation:

Note bulb type, see **63 17 FRONT FOG LAMPS, ADDITIONAL LAMPS E83 .**

63 17 060 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT FRONT FOG LAMP (M AERODYNAMIC KIT)

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- Remove front fog lamp trim

Release screws (1).

Feed fog lamp (2) in direction of arrow out of front bumper trim.

Unlock associated plug connection and disconnect.

Remove fog lamp (2).

Fig. 23: Screws And Fog Lamp

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Adjust front fog lamps, see **63 10 014 Adjusting fog lamps.**

If necessary, convert bulb.

Installation:

Note type of bulb, see **63 13 TURN SIGNALS E83 .**

21 REAR LIGHT CLUSTER

63 21 055 REPLACING A SOCKET HOUSING FOR LEFT OR RIGHT TAIL LIGHT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Side panel:

Unfasten plug connection (1) and disconnect.

Fold back side panel (2) in direction of arrow.

Fig. 24: Folding Back Side Panel

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock catch (1) and remove socket housing for rear light (2) in direction of arrow from rear light (3).

NOTE: If necessary, remove bulbs from socket housing for rear light (2).

Fig. 25: Catch And Socket Housing

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert socket housing for rear light (1) in rear light (2) in such a way that retaining hook (3) engages associated locator (4).

Fig. 26: Socket Housing And Rear Light
 Courtesy of BMW OF NORTH AMERICA, INC.

Rear lid:

Necessary preliminary tasks:

- Remove panel for rear lid, see **51 49 008 REMOVING AND INSTALLING/REPLACING PANEL FOR REAR LID** .

Turn socket housing for rear light to be replaced counterclockwise and remove.

- NOTE:**
- 1. Socket housing for fog warning lamp**
 - 2. Socket housing for reversing light**

Fig. 27: Socket Housing For Fog Warning Lamp
 Courtesy of BMW OF NORTH AMERICA, INC.

- NOTE:** Convert bulbs, replace if necessary, see **63 99 312 REPLACING BULB(S) FOR LEFT OR RIGHT REAR LIGHT (REAR LID)** .

63 21 101 REPLACING SEALING FRAME FOR LEFT OR RIGHT REAR LIGHT (ON SIDE PANEL)

Necessary preliminary tasks:

- Remove rear light, see **63 21 180 Removing and installing/replacing left or right rear light (on side panel)**.

Detach sealing frame for rear light (1) in upwards direction from rear light (2).

Installation:

Sealing frame for rear light (1) is centered via openings for threaded pins (3).

Make sure sealing frame for rear light (1) is correctly bonded all round on rear light (2).

Fig. 28: Threaded Pins And Rear Light
Courtesy of BMW OF NORTH AMERICA, INC.

63 21 104 REPLACING SEALING FRAME FOR LEFT OR RIGHT REAR LIGHT (ON REAR LID)

Necessary preliminary tasks:

- Remove rear light, see **63 21 180 Removing and installing/replacing left or right rear light (on side panel)**.

Detach sealing frame for rear light (1) in direction of arrow from rear light (2).

Installation:

Make sure sealing frame for rear light (1) is correctly bonded all round on rear light (2).

Fig. 29: Sealing Frame

Courtesy of BMW OF NORTH AMERICA, INC.

63 21 180 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT REAR LIGHT (ON SIDE PANEL)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove socket housing for rear light, see **63 21 055 REPLACING A SOCKET HOUSING FOR LEFT OR RIGHT TAIL LIGHT** .

Unscrew nuts (1).

Tightening torque: 63 21 1AZ, see **63 21 REAR LIGHT UNIT** .

Remove rear light (2) in outwards direction from side panel (3).

Installation:

Make sure gap (outer) is uniform all round between rear light (2) and side panel (3).

Fig. 30: Nuts And Side Panel

Courtesy of BMW OF NORTH AMERICA, INC.

63 21 183 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT TAIL LIGHT (ON REAR LID)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove panel for rear lid, see **51 49 008 REMOVING AND INSTALLING/REPLACING PANEL FOR REAR LID .**

Disconnect plug connection (1).

Slacken nut (2).

Tightening torque: 63 21 1AZ, see **63 21 REAR LIGHT UNIT .**

Feed out rear light (3) in direction of arrow and remove in outward direction from rear lid.

Installation:

Make sure guide (4) is correctly seated in cutout for rear lid (5).

Fig. 31: Plug Connection And Rear Light
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Position lugs (1) of rear light (2) exactly over side edge of rear lid (3).

Fig. 32: Lugs Of Rear Light
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, remove bulbs, see **63 99 312 Replacing bulb(s) for left or right rear light (rear lid)**.

25 BRAKE LIGHTS

63 25 000 REMOVING AND INSTALLING/REPLACING AUXILIARY BRAKE LIGHT

Necessary preliminary tasks:

- Remove rear spoiler, see **51 71 412 REMOVING AND INSTALLING REAR SPOILER** .

Release screws (1).

Installation:

Make sure hose (2) is correctly seated.

Slide additional stop light (3) slightly towards rear out of rear spoiler.

Fig. 33: Additional Stop Light And Hose
Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten plug connection (1) and disconnect.

Pull additional stop light (2) in direction of arrow out of rear spoiler (3) and remove.

Fig. 34: Plug Connection And Additional Stop Light
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) must be exactly seated in locators (2).

Make sure electrical leads (3) are correctly routed.

Fig. 35: Guides And Electrical Leads

Courtesy of BMW OF NORTH AMERICA, INC.

26 LICENCE PLATE LIGHTS

63 26 000 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT NUMBER/LICENSE PLATE LIGHT

Operation is described in:

Replacing handle strip (on rear lid), see **51 13 402 REMOVING AND INSTALLING/REPLACING HANDLE STRIP (ON REAR LID)** .

31 INTERIOR LIGHTS

63 31 .. OVERVIEW OF INTERIOR LIGHTS

H63 0943

- | | | | |
|---|---------------------------------------|---|--|
| 1 | Footwell light | 5 | Interior light |
| 2 | Glovebox light | 6 | Luggage compartment light (D-pillar) |
| 3 | Ceiling light (front) | 7 | Luggage compartment light (rear lid) |
| 4 | Mirror lights | | |

Fig. 36: Overview Of Interior Lights

Courtesy of BMW OF NORTH AMERICA, INC.

63 31 000 REMOVING AND INSTALLING/REPLACING COMPLETE CEILING LIGHT (FRONT)

Special tools required:

See **00 MAINTENANCE AND GENERAL INFORMATION**

- 00 9 317

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Lever out ceiling light (1) with special tool 00 9 317 as illustrated.

Disconnect associated plug connection and remove ceiling light (1).

Fig. 37: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- If necessary, convert bulbs.
- Note bulb type, see **63 31 INTERIOR LIGHTS E83** .

63 31 015 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT INTERIOR LIGHT (SIDE ROOFLINER)

Special tools required:

- **64 1 020 RELEASE HOOK**

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Lever out lens cover (1) with special tool 64 1 020 at retaining points (2).

Feed out lens cover (1) in direction of arrow and remove.

Fig. 38: Lens Cover With Special Tool (64 1 020)
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out interior light (1) with special tool 64 1 020 as illustrated.

Disconnect associated plug connection and remove interior light (1).

Fig. 39: Special Tool (64 1 020)
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- If necessary, convert bulbs.
- Note bulb type, see **63 31 INTERIOR LIGHTS E83** .

63 31 020 REMOVING AND INSTALLING/REPLACING FOOTWELL LIGHT

Special tools required:

- **64 1 020 RELEASE HOOK**

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Replacement:

If necessary, remove bulb.

Lever footwell light (1) with special tool 64 1 020 out of trim for pedal assembly (2).

Disconnect associated plug connection and remove footwell light (1).

Replacement:

Note bulb type, see **63 31 INTERIOR LIGHTS E83** .

Fig. 40: Special Tool (64 1 020)

Courtesy of BMW OF NORTH AMERICA, INC.

63 31 050 REMOVING AND INSTALLING/REPLACING MIRROR LIGHT

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Replacement:

If necessary, convert bulb.

Lever front mirror light (1) in direction of arrow.

Disconnect plug connection underneath and remove mirror plate light (1).

Replacement:

Note bulb type, see 63 31 INTERIOR LIGHTS E83 .

Fig. 41: Removing Front Mirror Light

Courtesy of BMW OF NORTH AMERICA, INC.

63 31 080 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT LIGHT (D-

PILLAR)

Special tools required:

- **64 1 020 RELEASE HOOK**

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Lever out luggage compartment light (1) with special tool 64 1 020 as illustrated.

Disconnect associated plug connection and remove luggage compartment light (1).

Fig. 42: Luggage Compartment Light With Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- If necessary, convert bulbs.
- Note bulb type.

63 31 085 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT LAMP (ON REAR LID)

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Lever out luggage compartment lamp (1) at openings (2) in direction of arrow.

Disconnect plug connection underneath and remove luggage compartment lamp (1).

Fig. 43: Luggage Compartment Lamp
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- If necessary, convert bulbs.
- Note bulb type, see 63 31 INTERIOR LIGHTS E83 .

63 31 150 REMOVING AND INSTALLING/REPLACING GLOVEBOX LIGHT

IMPORTANT: Follow instructions for handling light bulbs (interior lights), see 63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .

Lever out glovebox light (1) in direction of arrow.

Disconnect plug connection and remove glovebox light (1).

Replacement:

If necessary, remove bulb.

Note bulb type, see 63 31 INTERIOR LIGHTS E83 .

Fig. 44: Glovebox Light

Courtesy of BMW OF NORTH AMERICA, INC.

99 LIGHT BULBS

63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS)

WARNING: Xenon headlights: Danger to life due to high voltage!
Work on the entire xenon lighting system (ignition unit, control unit and lamp) may only be carried out by specialist personnel.

WARNING: Halogen lamps are under pressure:
To avoid injury, wear protective goggles and gloves.

IMPORTANT: To prevent short-circuiting, disconnect light bulbs from voltage supply prior to replacement.

Do not touch the glass bulbs in new lights bulbs as even the slightest contamination will burn in and reduce bulb service life.

Only touch light bulbs with clean gloves or a clean cloth.

Do not expose light bulbs to mechanical vibrations.

Use only recommended light bulbs.

Follow the light bulb manufacturer's instructions without fail.

63 99 ... INSTRUCTIONS FOR REPLACING LIGHT BULBS (INTERIOR LIGHTS)

CAUTION: To prevent short-circuiting, disconnect light bulbs from voltage supply prior to replacement.

Do not touch the glass bulbs in new lights bulbs as even the slightest contamination will burn in and reduce bulb service life.

Only touch light bulbs with clean gloves or a clean cloth.

Do not expose light bulbs to mechanical vibrations.

Use only recommended light bulbs.

Follow the light bulb manufacturer's instructions without fail.

63 99 002 REPLACING HALOGEN BULB FOR HIGH-BEAM HEADLIGHT ON LEFT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- M54 only:

Remove suction filter housing

NOTE: **Headlight (3) removed for purposes of clarity.
Unlock clip (1) in direction of arrow.
Remove cover (2) from headlight (3).**

Fig. 45: Removing Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip bulb (1) by pressing on plug (2).

Remove bulb (1) from headlight (3) slightly, disconnect plug connection and remove bulb (1).

Installation:

Insert bulb (1) in headlight (3) at bottom at first and then tilt upwards until bulb (1) snaps audibly into place.

Make sure bulb (1) is correctly seated in catches (4).

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

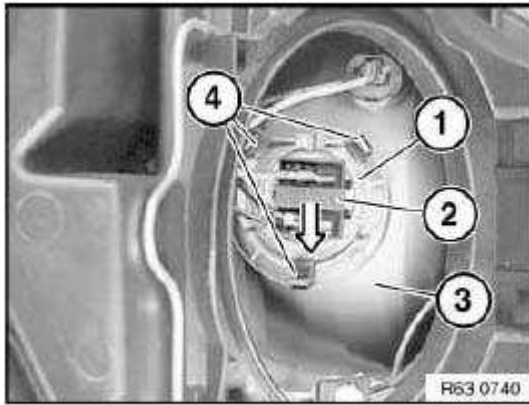

Fig. 46: Bulb And Catches

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 003 REPLACING HALOGEN BULB FOR HIGH-BEAM HEADLAMP ON RIGHT

Operation is described in:

Replacing halogen bulb for high-beam headlight on left, see **63 99 002 Replacing halogen bulb for high-beam headlight on left.**

63 99 072 REPLACING HALOGEN BULB FOR LEFT (OR RIGHT) HEADLIGHT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

NOTE: Headlight (2) removed for purposes of clarity.
Unlock cover (1) in direction of arrow.
Remove cover (1) from headlight (2).

Installation:

Make sure cover is correctly seated on headlight (2).

Guides must be exactly seated in associated mounts.

Fig. 47: Removing Cover From Headlight
Courtesy of BMW OF NORTH AMERICA, INC.

Remove bulb (1) towards rear from headlight.

Disconnect plug connection (2).

Installation:

Make sure bulb (1) is exactly seated in headlight.

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 48: Bulb And Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

63 99 076 REPLACING BULB FOR LEFT XENON HEADLIGHT

WARNING: Follow instructions for handling light bulbs (exterior lights), see **63 99 ... Instructions for handling light bulbs (exterior lights)**.

Necessary preliminary tasks:

- Removing ignition unit for left xenon headlight, see **63 12 870 Replacing ignition unit for left xenon headlight.**

Unlock retaining ring (1) in counterclockwise direction and remove.

Remove bulb for xenon headlight (2) in direction of arrow from headlight (3).

Fig. 49: Retaining Ring And Bulb
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert bulb for xenon headlight (1) exactly in headlight (2).

Observe "Top marking" (3).

Fit retaining ring (4) on headlight in such a way that apertures (5) slide over fixtures for ignition unit.

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83 .**

Fig. 50: Retaining Ring And Bulb

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 077 REPLACING BULB FOR RIGHT XENON HEADLIGHT

Operation is described in:

Remove bulb for left xenon headlight (ignition unit), see **63 99 076 Replacing bulb for left xenon headlight.**

63 99 140 REPLACING BULB FOR SIDE MARKER LAMP, FRONT LEFT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- M54 only:

Remove suction filter housing

NOTE: Headlight (3) removed for purposes of clarity.

Unlock clip (1) in direction of arrow.

Remove cover (2) from headlight (3).

Fig. 51: Removing Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Grip bulb holder (1) on both sides and pull towards rear out of headlight (2).

Fig. 52: Bulb Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Pull bulb for side marker lamp (1) in direction of arrow out of bulb holder (2) and remove.

Installation:

Make sure guides (3) are exactly seated in mountings (4).

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 53: Side Marker Lamp And Bulb Holder

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 141 REPLACING BULB FOR SIDE MARKER LAMP, FRONT RIGHT

Operation is described in:

Replacing bulb for side marker lamp, front left, see **63 99 140 Replacing bulb for side marker lamp, front left**.

63 99 201 REPLACING HALOGEN BULB FOR LEFT OR RIGHT FRONT FOG LAMP

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

Necessary preliminary tasks:

- Remove fog lamp, see **63 17 060 Removing and installing (replacing) left or right front fog lamp.**

Turn bulb holder (1) in direction of arrow and remove from fog lamp (2).

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 54: Turning Bulb Holder

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 273 REPLACING BULB FOR TURN INDICATOR, FRONT LEFT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ... Instructions for handling light bulbs (exterior lights).

NOTE: Headlight removed for purposes of clarity.

Turn bulb holder (1) counterclockwise and pull towards rear out of headlight (2).

Remove bulb from bulb holder (1).

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 55: Turning Bulb Holder

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 275 REPLACING BULB FOR TURN INDICATOR, FRONT RIGHT

Operation is described in:

Replacing bulb for turn indicator, front left, see **63 99 273 Replacing bulb for turn indicator, front left.**

63 99 295 REPLACING BULB FOR AUXILIARY TURN SIGNAL LIGHT, FRONT LEFT OR RIGHT

**WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ...
Instructions for handling light bulbs (exterior lights).**

Necessary preliminary tasks:

- Remove front auxiliary turn signal light, see **63 13 200 Removing and installing/replacing front left or right auxiliary turn signal lamp.**

Turn bulb holder (1) approx. 45° and remove from front auxiliary turn signal light (2).

Pull bulb out of holder (1).

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83 .**

Fig. 56: Front Auxiliary Turn Signal Light
Courtesy of BMW OF NORTH AMERICA, INC.

63 99 312 REPLACING BULB(S) FOR LEFT OR RIGHT REAR LIGHT (REAR LID)

This operation is described in:

"Replacing a socket housing for left or right rear light", see [63 21 055 Replacing a socket housing for left or right tail light](#).

Installation:

Note type of bulb, see [63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83](#) .

63 99 315 REPLACING LIGHT BULB(S) FOR LEFT OR RIGHT REAR LIGHT

WARNING: Follow instructions for handling light bulbs (exterior lights), see [63 99 ... Instructions for handling light bulbs \(exterior lights\)](#).

Rear light in side panel:

Necessary preliminary tasks:

- Remove socket housing for rear light, see [63 21 055 REPLACING A SOCKET HOUSING FOR LEFT OR RIGHT TAIL LIGHT](#) .

Turn faulty bulb and pull out of socket housing for rear light.

NOTE:

- 1. Bulb, turn indicator light**
- 2. Bulb, rear light/brake light**
- 3. Bulb, rear light**

Fig. 57: Bulb, Turn Indicator Light
Courtesy of BMW OF NORTH AMERICA, INC.

Rear light in rear lid:

Necessary preliminary tasks:

- Remove socket housing for rear light, see **63 21 055 REPLACING A SOCKET HOUSING FOR LEFT OR RIGHT TAIL LIGHT** .

Remove faulty bulb (1) in direction of arrow from socket housing (2).

Fig. 58: Removing Bulb
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

63 99 401 REPLACING BULB FOR LEFT OR RIGHT LICENSE PLATE LIGHT

WARNING: Follow instructions for handling light bulbs (exterior lights), see 63 99 ...

Instructions for handling light bulbs (exterior lights).

Lever out lens (1) on left or right from opening (2) and remove.

Lever out bulb (3).

NOTE: Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

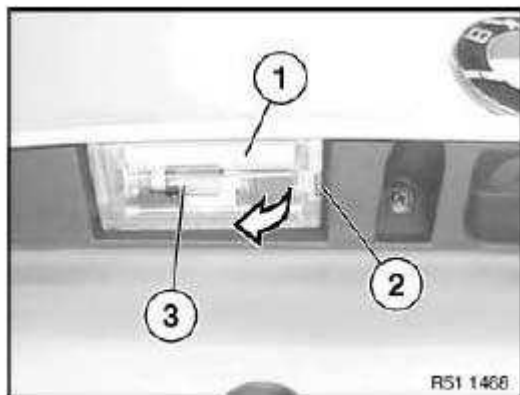

Fig. 59: Removing Lens

Courtesy of BMW OF NORTH AMERICA, INC.

63 99 431 REPLACING BULB FOR FRONT CEILING LIGHT

WARNING: Follow instructions for handling light bulbs (interior lights), see **63 99 ... INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS)** .

Necessary preliminary tasks:

- Remove front ceiling light

Turn bulb holder in direction of arrow and remove.

Fig. 60: Turning Bulb Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Pull bulb (1) out of bulb holder (2).

Fig. 61: Bulb Holder And Bulb

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Make sure bulb holder is correctly seated and engaged in ceiling light
- Note bulb type

63 99 431 REPLACING BULB FOR FRONT CEILING LIGHT

**WARNING: Follow instructions for handling light bulbs (interior lights), see 63 99 ...
INSTRUCTIONS FOR HANDLING LIGHT BULBS (EXTERIOR LIGHTS) .**

Necessary preliminary tasks:

- Remove front ceiling light

Version without inside reading lamp:

Release screws (1) and remove lens.

Fig. 62: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Remove festoons (1) from lens (2).

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 63: Festoons And Lens

Courtesy of BMW OF NORTH AMERICA, INC.

Version with inside reading lamp:

Turn bulb in direction of arrow and remove.

Installation:

Note type of bulb, see **63 12 HEADLIGHTS, HEADLIGHT ASSEMBLY E83** .

Fig. 64: Turning Bulb

GLOSSARY OF ELECTRICAL COMPONENTS

All models from E38 and MINI

Fig. 1: Glossary Of Electrical Components
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

This glossary contains electrical components from the circuit diagrams found in diagnosis, together with the respective abbreviated designations for the components.

Abbreviated designations are the descriptions of the components found in the circuit diagrams. Example: "A210" for the control unit "door module, rear passenger side".

This glossary contains approx. 2,000 abbreviated designations.

This glossary contains the following information:

- Abbreviated designation (alphanumerically sorted)
- Component
- Information: Reference to a component description in an SI Technology bulletin (SBT).

If there is not a more detailed description of the component available, a short description of the component will be given in column headed "Information".

- KoGr.: Main group for the component

Each abbreviated designation with component is assigned to a main group.

An overview of the main groups can be found in the SI Technology bulletin (SBT) "Abbreviations".

- Model series: Overview of model series in whose circuit diagrams the abbreviated designation is found.

This glossary contains the abbreviated designations for the following circuit diagrams:

- Circuit diagram-DVD "BMW V 5.0", status 03/2005 (WDS: Wiring Diagram System):

This DVD contains the circuit diagrams needed for diagnosis on BMW vehicles.

- Circuit diagram-DVD "MINI V 3.0", status 03/2005 (WDS: Wiring Diagram System):

This DVD contains the circuit diagrams needed for diagnosis on MINI vehicles.

This glossary contains the abbreviated designations used in both these DVDs. Abbreviated designations that are **only** found in the overviews "Component- and signal information" are **not** contained in this glossary.

NOTE: Assignment of abbreviated designation to model series

For technical reasons associated with the system, some model series are listed together, as follows:

- E60 and E61
- E63 and E64
- E65 and E66
- E83 and E85
- E87 and E90
- R50, R52 and R53

For this reason, it is possible that an abbreviated designation is assigned to a model series even though the component concerned is not found in that model series.

ALPHANUMERICAL OVERVIEW OF ABBREVIATED DESIGNATIONS

The WDS-DVD (Wiring Diagram System) alphanumerically lists the abbreviated designations from the

overview "Component- and signal information".

Abbreviated designations are alphabetically sorted in the following groups:

- A Control units, modules
- B Sensors, electric converters
- D Diagnosis interfaces
- E Lights, electric heating equipment
- F Fuses
- G Power supply, gas generators
- H Acoustic and visual warning systems
- I Components from BMW suppliers
- K Relays
- L Coils
- M Electric motors, drives
- N Amplifiers, regulators, control units
- P Display instruments
- R Resistors, potentiometers
- S Switches, buttons
- T Ignition coils
- U Radio systems, suppressor filters
- V Semiconductors, diodes
- W Aerials, screening
- X Connectors

Connectors are **not** listed in this glossary.

- Y Electromechanical components
- Z Blocking circuits, suppressor filters

ADAPTIVE HEADLIGHTS

E46/2, E46/C, E53, E83

Fig. 2: Adaptive Headlights Aiming Angle
Courtesy of BMW OF NORTH AMERICA, INC.

Launch dates for option 524 "Adaptive headlights":

- E46 Coupe (E46/2) and E46 Convertible (E46/C) model revision: 03/2003
- E53: 04/2004 onwards
- E83: From 10/2003

NOTE: **Option 524 is only available in conjunction with option 522.**

Option 524 "Adaptive headlights" is only available in conjunction with option 522 "Xenon dipped and main - beam headlights".

NOTE: **ALC = AHL**
The development code for the adaptive headlights was "ALC".
ALC stood for "Adaptive Light Control".
The marketing and sales designation for option 524 in English-language markets is "adaptive headlights", abbreviated to "AHL".
This is why the abbreviation "AHL" is used even in diagnosis and technical vehicle documentation.
However, some control units may still bear the abbreviation "ALC", which may also be the abbreviation used in the EPC (Electronic Parts Catalogue).

INTRODUCTION

The adaptive headlights turn the bi-xenon headlights towards the inside of a bend when cornering. This improves illumination of the curve of the road.

Visibility is therefore improved.

When cornering, the driver is not looking into a "black hole" - instead, the adaptive headlights allow the driver to see the curve of the road.

- > E46/2, E46/C, E53 and E83 until 09/2006
- > E83 from 09/2006

NOTE: AHL control unit discontinued from 09/2006.

On the E83 from 09/2006, the software for the AHL control unit is integrated into the light module (LM). The AHL control unit is no longer fitted.

The turning lights function is new on the E83 from 09/2006.

The turning lights give the area next to the carriageway additional illumination when you are turning or cornering (driving in tight bends). The function is also active when you are parking.

The turning lights are realized using the front foglights. The front foglights have a specially shaped reflector to illuminate the areas to the sides better.

**NOTE: Turning lights only in conjunction with option 524.
Turning lights are a subfunction of option 524 "Adaptive headlights".**

BRIEF DESCRIPTION OF COMPONENTS

The following components and control units provide input signals for the adaptive headlights system:

○ **Light switch**

The rotary switch for the side lights and dipped headlights differs depending on the vehicle equipment level (adaptive headlights, automatic driving lights control, automatic or manual headlight-range adjustment). For the adaptive headlights function to operate, the light switch must be set to position "A" ("A" = "automatic driving lights control" or "adaptive headlights").

○ **Turn-signal/main-beam switch**

The main-beam headlights are switched on and off with the direction indicator / main-beam switch (by pressing or pulling the switch). The adaptive headlights function operates with both dipped and main-

beam headlights.

○ **Ride-height sensors**

If the special equipment "Adaptive headlights" is fitted, the adaptive headlights control unit evaluates the signals from the ride-height sensors.

This is because: the adaptive headlights control unit also controls the automatic headlight-range adjustment.

The automatic headlight-range adjustment feature adjusts the vertical aim of the headlights to compensate for variations in the vehicle tilt angle (e.g. when the vehicle is laden, and under braking and acceleration in dynamic driving situations).

○ **Brake light switch**

If the vehicle is equipped with the "adaptive headlights" option, the signals from the brake light switch are read by the control unit for the adaptive headlights.

The signal sent by the brake light switch is an input signal for the automatic headlight-range adjustment; see above: Ride-height sensors.

○ **Zero-position sensor**

- > E46/2, E46/C
- > E83

The zero-position sensor in the AHL headlight sends a signal for calculating the zero position of the AHL headlight. This regulates the horizontal movement of the AHL headlight.

○ **Position sensor**

- > E53

The position sensor in the positioner module for the bi-xenon headlights supplies a signal for the horizontal movement of the headlights.

○ **General module**

The basic module supplies input signals with regard to the terminal management (terminal 15 ON).

The adaptive headlights control unit is activated when terminal 15 is switched ON.

○ **EGS control unit or reversing light switch**

When reverse gear is engaged, the headlights are moved to the straight-ahead position.

On vehicles with automatic transmission, the EGS control unit (electronic transmission control) provides the "Reverse gear engaged" signal.

On vehicles with manual transmission, the signal is supplied by the reversing light switch.

○ **KOMBI: Instrument cluster**

The instrument cluster is the gateway, i.e. the data interface) between the PT-CAN data bus and the K-bus.

○ **RLS: Rain-light sensor for automatic driving lights control**

The rain-light sensor measures the ambient brightness outside the vehicle.

- In twilight conditions, the rain-light sensor transmits the message "Twilight" so that the automatic headlight-range adjustment can activate dipped headlights. The headlights are tilted up and down as required, but they are not swivelled towards the bend in the road.
- In darkness, the rain-light sensor sends the message "Darkness". The adaptive headlights are then activated when the vehicle is cornering. The headlights are moved to the left or the right:

○ **Steering-angle sensor and DSC sensor**

The steering angle sensor and DSC sensor (DSC = Dynamic Stability Control) supply signals for the adaptive headlights to the adaptive headlights control unit. These signals are evaluated as follows, depending on the vehicle's speed:

- Vehicle speeds up to **30 km/h:**

The adaptive headlights function is controlled using the information from the **steering angle sensor** (in the steering column switch cluster).

- Vehicle speeds between **30 km/h and 50 km/h:**

In the 30 to 50 km/h speed range, there is a **continuous transition** in signal evaluation: from the evaluation of signals sent by the steering angle sensor to evaluation of the signals sent by the yaw-rate sensor (in the DSC sensor).

- **In extreme dynamic driving situations**, e.g. if the vehicle starts to skid or fishtail, even at speeds less than **50 km/h**, the signals from the yaw-rate-sensor are considered.

If the vehicle starts to skid or fishtail, the headlights will move to the straight-ahead position. The headlights are not moved until the vehicle has stabilized.

- Vehicle speeds over **50 km/h:**

At speeds upwards of 50 km/h, the signals from the **yaw-rate sensor** (in the DSC sensor) form the primary basis for control of the adaptive headlights function.

Reason: For a constant cornering radius, the steering angle required increases disproportionately with speed. In addition, the steering angle required also depends on the coefficient of friction of the road surface.

The yaw rate is directly proportional to speed. For this reason, the yaw rate is always the most suitable measure for controlling the adaptive headlights at high speeds.

Even at high speeds, however, the steering angle sensor signal is used to detect (predict) the driver's commands **in advance**. This prediction is important: The yaw rate signal is not supplied until the vehicle has **responded** to the steering wheel movement.

The steering-angle sensor signal is disabled so that rapid, momentary steering adjustments do not affect the adaptive headlights function.

A number of control units are involved in the adaptive headlights system.

Depending on the series and model concerned, the adaptive headlights are actuated by the following control units:

- **AHL control unit**

- > E46/2, E46/C, E53 and E83 until 09/2006

The AHL control unit controls the adaptive headlights.

For safety reasons, the AHL control unit is also responsible for the automatic headlight-range adjustment. This is because: Oncoming traffic must not be dazzled by the adaptive headlights. If a headlight sticks in an unfavorable position, the AHL control unit will attempt to move this headlight down (using the stepper motors in the automatic headlight-range adjustment).

The AHL control unit is connected to the K-bus and the PT-CAN.

- **LM: Light module**

- > E83 from 09/2006

The AHL control unit is integrated in the light module.

The light module controls and monitors all vehicle lights. Information is received and transmitted over the data buses PT-CAN, LIN bus and K-bus.

- **Stepper motor controllers**

The stepper motor controllers (SMC) control the stepper motors in the headlights (for the automatic headlight-range adjustment and for the adaptive headlights).

- **LSZ: Light switch cluster**

- > E46/2, E46/C, E53 and E83 until 09/2006 (E53: light module)

The light switch cluster forwards the prompts from the light switch and from the turn-signal/main-beam switch to the AHL control unit (via the K-bus).

- **Xenon-headlight control unit**

The xenon-headlight control unit actuates the bulb in the bi-xenon headlights.

The following components are controlled:

○ **Stepper motors for the adaptive headlights**

The stepper motors turn the positioner modules in the bi-xenon headlights.

The stepper motors swivel the headlights along the vertical and horizontal axes. (vertical = up and down for the automatic headlight-range adjustment;

horizontal = to the left and right for the adaptive headlights).

The positioner modules execute the movement.

○ **Indicator light on the light switch**

The indicator light (green LED) next to the "A" (= "automatic driving lights control") is actuated by the adaptive headlights and has 2 display functions:

- The indicator light **lights up permanently** when the automatic driving lights control or adaptive headlights function is switched on (= light switch in position "A").
- The indicator light **flashes** if a fault develops in the adaptive headlight system.

The indicator light thus supports diagnosis of the adaptive headlights.

The indicator light is actuated by the light switch cluster or by the light module.

SYSTEM FUNCTIONS

The adaptive headlights system moves headlights horizontal (i.e. from left to right) in order to illuminate the inside of a bend when cornering.

The following functions of the adaptive headlights system are described below:

- System activation and automatic calibration
- Activation of stepper motor controllers
- Speed-dependent analysis of signals
- Adjustment of headlight horizontal aim
- Deactivation of adaptive headlights function under extreme handling conditions
- Deactivation of adaptive headlights function in response to system faults
- Setting headlights to parked position
- Automatic headlight-range adjustment
- Adaptive headlights for automatic driving lights control
- Turning light

NOTE: Different control units for adaptive headlights.

- > E46/2, E46/C, E53 and E83 until 09/2006: AHL control unit
- > E83 from 09/2006: The adaptive headlights are actuated by the light module.

For this reason, the following text refers to the general "control unit for adaptive headlights".

System activation and automatic calibration

When terminal 15 is switched ON, the headlights always perform a calibration sequence, even if the dipped headlights are not switched on. The control unit for adaptive headlights (AHL control unit or light module) sends the "perform calibration sequence" prompt to the stepper motor controllers (SMCs, control unit for the headlight stepper motors). The stepper motor controllers actuate the stepper motors in the headlights. The calibration sequence is performed.

In the calibration sequence, the headlights move as follows:

- The headlights move to the right and the left (= calibration sequence for adaptive headlights).
- The headlights move up and down (= calibration sequence for automatic headlight-range adjustment).
- At the end of the calibration sequence, the headlights are in the straight-ahead position.

Following the calibration sequence, the system is ready for operation.

When reverse gear is engaged, the headlights are moved to the straight-ahead position.

NOTE: The calibration sequence is performed only after terminal 15 has been switched OFF for at least 15 seconds.

If terminal 15 is repeatedly switched on and off (e.g. for demonstration purposes), the calibration sequence will not be executed every time terminal 15 is switched on. Terminal 15 must have been switched off for at least 15 seconds before it is switched on again. Only then is a calibration sequence performed when terminal 15 is switched on.

Activation of stepper motor controllers

The control unit for adaptive headlights (AHL control unit or light module) sends the stepper motor controllers (SMC) the nominal values for the positioner modules (position of positioner modules and speed of movement).

The control unit for adaptive headlights calculates the nominal values using the following signals:

- Vehicle road speed
- Steering angle (at speeds up to 50 km/h, dependent on encoding)
- Yaw rate (50 km/h upwards, see Steering-angle sensor and DSC sensor above)

Speed-dependent analysis of signals

The adaptive headlights are controlled by the following signals depending on the road speed: signals from the steering angle sensor or signals from yaw-rate sensor (in the DSC sensor). The encoding (at the end of the production line) determines the priority assigned to sensor signals above which speed threshold (see above).

Adjustment of headlight horizontal aim

The stepper motor controllers move the headlights to the right or left when the vehicle corners.

Horizontal range of movement of headlights:

- Inwards, i.e. towards center of vehicle: up to max. 8 °
 - > E46/2, E46/C, E83:7 °
 - > E53:8°
- Outwards: up to max. 15°

Example: Right-hand bend:

The right-hand headlight turns by up to 15° (the right-hand headlight is the "inside" headlight on a right-hand bend).

It therefore swivels outwards away from the vehicle center.

The left-hand headlight swivels through a maximum of 8 ° (the left-hand headlight swivels towards the vehicle center, i.e. inwards).

The headlight on the outside of the bend reaches its end position at the same time as the headlight on the inside of the bend, ensuring that the road is evenly illuminated.

On a right-hand bend, the left-hand headlight is on the outside of the bend. The right-hand headlight is on the inside of the bend.

Deactivation of adaptive headlights function under extreme handling conditions

If the vehicle drifts, skids and loses sideways grip, the adaptive headlights function is deactivated as follows:

- The headlights are returned to the straight-ahead position. The headlights are no longer turned.
- The dipped headlights remain on.

Deactivation of adaptive headlights function in response to system faults

In the event of a system error, the indicator light on the light switch will flash.

Dazzling of oncoming traffic must be prevented in the event of a system fault.

For this reason, the adaptive headlights function is deactivated as follows:

- If the stepper motors are still functional, the headlights are returned to the straight-ahead position. The

headlights are no longer moved towards bends in the road.

- If it is no longer possible for a headlight to be moved back to the straight-ahead position, the headlight is tilted downwards (by the stepped motors for automatic headlight-range adjustment). This prevents dazzling of oncoming traffic.
- If the headlight cannot be tilted downwards, the bi-xenon bulb in this headlight is disabled as follows:

When the vehicle is parked up, the control unit registers sleep mode for the adaptive headlights, as follows: Standstill and terminal R OFF for several minutes.

The next time the vehicle is restarted, the bi-xenon light of the defective headlight is not switched on.

The front foglights are switched on in order to ensure a minimum level of illumination.

The dipped headlight is **not** switched off while the vehicle is in motion.

Setting headlights to parked position

When terminal R is switched off, the headlights move to the parked position. The parked position is important for the headlights' next calibration sequence. From the parked position, the headlights are run through a calibration sequence in the pre-drive-check. During the calibration sequence, the control unit for adaptive headlights relearns the straight-ahead position for the headlights.

When the headlights have reached the parked position, the stepper motor controllers SMCs inform the control unit for adaptive headlights ("verification").

The control unit for adaptive headlights deactivates the stepper motor controllers. The run-down period lasts approx. 10 seconds.

Automatic headlight-range adjustment

If the special equipment "Adaptive headlights" is fitted, the control unit for adaptive headlights also controls the automatic headlight-range adjustment.

The automatic headlight-range adjustment adapts the headlight range for different operating conditions.

Variations in the vehicle tilt angle are produced by vehicle loads and braking or acceleration in extreme driving situations. The automatic headlight-range adjustment moves the headlights up and down as required.

The control unit for adaptive headlights also controls the automatic headlight-range adjustment as follows.

1. The ride-height sensors and the brake light switch supply the signals for the automatic headlight-range adjustment.
2. The control unit for adaptive headlights computes the vehicle inclination (longitudinally to the roadway) from the signals.
3. The stepper motors for the automatic headlight-range adjustment automatically and dynamically control the headlight range.

The headlight range is adjusted so that the actual headlight range conforms to the legally required headlight range as follows:

- If vehicle rear is lower than front:

The actual headlight range will be longer than the legally stipulated range. The headlight beam height is lowered to reduce the headlight range to match the legal requirement.

- If the vehicle is horizontal:

The actual headlight range will be the same as the legally stipulated range.

- If vehicle front is lower than rear:

The actual headlight range will be shorter than the legally stipulated range. The headlight beam height is raised to increase the headlight range to match the legal requirement.

Adaptive headlights for automatic driving lights control

The automatic driving lights control feature (option in conjunction with the rain-light sensor) switches the side lights and dipped headlights on and off automatically.

Switch-on conditions:

- The automatic driving lights control must be encoded in the light switch cluster or light module.
- The light switch must be in position "A" ("A" stands for automatic driving lights control and for adaptive headlights).
- The rain-light sensor must be installed and operational.

The rain-light sensor detects the brightness of the ambient light.

The rain-light sensor sends the following prompts to the light switch cluster or the light module:

- Ambient brightness low: In twilight, darkness, in an underground garage or tunnel.

"Switch on dipped headlights" request

- Ambient brightness sufficient.

"Switch off dipped headlights" request

If only the side lights are to be switched on, the light switch must be set to side lights (switch position 1).

When the light switch is set to position "A", the control unit for adaptive headlights is also activated:

- When the automatic driving lights control function switches on the dipped headlights (e.g. at twilight), the adaptive headlights function is notified at the same time.

The control unit for adaptive headlights then assumes control of the automatic headlight-range adjustment.

- In addition, the signals from the rain-light sensor are also evaluated. The headlights are not turned when the vehicle is cornering until total darkness sets in.

The message "dipped headlights on" is given individually for each headlight.

If a headlight fails, the adaptive headlights are switched off.

The front foglights are switched on in order to ensure a minimum level of illumination.

Turning lights

- > E83 from 09/2006

The turning lights are coupled to the adaptive headlights (option 524).

Depending on actuation, the right-hand and/or left-hand front foglight is switched on. The turning lights are actuated by the light module (LM). The turning light are not switched on suddenly but rather faded according to special time parameters.

Depending on the country concerned, the turning lights are switched on when cornering.

The following conditions must be satisfied for the turning lights to be **switched on**:

- Terminal 15 ON
- Light switch in position "A" ("A" stands for automatic driving lights control)
- Rain-light sensor detects twilight or darkness (threshold exceeded)

and

- Turn signal indicator ON (not one-touch turn signal)
- Speed range (forward):
 - Europe and Japan version from 0 km/h to 35 km/h
 - US version from 0 km/h to 65 km/h
- Swivel angle (theoretical):
 - when stationary $\leq 77^\circ$
 - when driving $\leq 10^\circ$

Alternatively

- Speed range (reverse):
 - 0 km/h to 35 km/h
- Swivel angle (theoretical):

- when stationary or driving $\geq 70^\circ$

If the vehicle is stationary, the turning lights will automatically be deactivated after a certain time, e.g. when waiting at traffic lights. However, the turning lights can be activated again with the turn-signal/main-beam switch.

The light module (LM) uses the following signals to actuate the turning lights:

- Steering angle
- Yaw rate
- Status of reverse gear

The following conditions must be satisfied for the turning lights to be **switched off**:

- Light switch not in position "A" ("A" stands for automatic driving lights control)
- Rain-light sensor does not detect twilight or darkness (lower threshold exceeded)

Alternatively

- Turn signal indicator OFF
- Speed range (forward):
 - Europe and Japan versions ≥ 40 km/h
 - US version ≥ 70 km/h
- Swivel angle (theoretical):
 - when stationary 77°
 - when driving 10°

Alternatively

- Speed range (reverse): ≥ 40 km/h
- Swivel angle (theoretical): when stationary and when driving below a certain value

Alternatively

- Vehicle skids and swings out.

Alternatively

- Front foglights are switched on with the front foglights switch.

PRECONDITIONS FOR ACTIVATION

The control unit for adaptive headlights is "awake" from terminal 15 ON.

The movement of the lights is subject to the following conditions:

- Reverse gear must **not** be engaged.
- No system faults must be present. The indicator light must **not** be flashing.
- The bulbs for the bi-xenon lights are OK in both headlights.
- The vehicle must not be skidding or fishtailing.
- The rain-light sensor must detect darkness.
- Additional precondition for activation: automatic driving lights control is active (light switch in position "A", see above).

National versions

The options "Daytime driving lights" and "Manual headlight-range adjustment" are available in certain countries.

Vehicles with manual headlight-range adjustment do not have adaptive headlights.

This is because vehicles with manual headlight-range adjustment have halogen dipped headlights; adaptive headlights are only available in conjunction with option 522 "Xenon dipped and main-beam headlights".

Switching on adaptive headlights in conjunction with daytime driving lights function

The "Daytime lights" option (Northern Europe and Canada) means that

The dipped headlights and the side lights are **always** switched on under the following conditions:

- Light switch in position "2"
- Terminal 15 ON

The automatic headlight-range adjustment is active (actuated by the control unit for adaptive headlights).

If terminal 15 is switched off, the dipped headlights and the side lights are automatically switched off as well.

The light switch must also be set to position "A" with the "Daytime driving lights" option. The control unit for adaptive headlights is then in standby.

System functions for "Daytime lights" option when the light switch is set to position "A":

- If the vehicle is encoded with the "Daytime driving lights" option (end of production line), the light switch can remain in position "A" at all times.

When terminal R is switched on, side lights, parking lights and licence plate lights are switched on.

As soon as terminal 15 is switched on, the dipped headlights are also switched on.

- When the dipped headlights are switched on, the adaptive headlights control unit is activated (for automatic headlight-range adjustment).

- The indicator lamp on the light switch lights up and indicates that the system is functional.
- The adaptive headlights turn when the vehicle is stationary if the steering wheel is turned (to the right only).
- The headlights are moved when the vehicle corners if the rain-light sensor registers darkness.

The switch-on conditions for the adaptive headlights in conjunction with special equipment "Daytime driving lights" are as follows:

- The vehicle must be encoded with the "Daytime driving lights" option (end of production line)
- The light switch must be in position "A"
- Terminal 15 must be switched on and reverse gear must not be engaged
- Rain-light sensor must detect darkness

Subject to change.

Vehicle Lighting - Product Information

ADAPTIVE HEADLIGHTS E60, E61, E63, E64, E65, E66, E70, E81, E87, E90, E91, E92, E93

Fig. 1: Identifying Headlights Focusing Angle

Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

Adaptive headlights turn the bi-xenon headlights towards the inside of a bend when cornering. This improves illumination of the curve of the road. Visibility is therefore improved.

When cornering, the driver is not looking into a "black hole" - instead, the adaptive headlights allow the driver to see the curve of the road.

This service information describes the adaptive headlights for the following model series:

> E60, E61, E63, E64 up to 03/2005:

See **SYSTEM OVERVIEW OF ADAPTIVE HEADLIGHTS (E60, E61, E63, E64, E65, E66 UP TO 03/2005)**

The system overview applies accordingly for the E65 and E66 up to 03/2005.

> E60, E61, E63, E64 from 03/2005 until 09/2005

See **SYSTEM OVERVIEW OF ADAPTIVE HEADLIGHTS (E60, E61, E63, E64, E65, E66 FROM 03/2005)**

The system overview applies accordingly for the E65 and E66 from 03/2005.

NOTE: *AHL control unit discontinued from 03/2005.*

From 03/2005, the AHL control unit software is integrated into the light module on the E60, E61, E63, E64, E65 and E66. The AHL control unit is no longer fitted.

> E60, E61, E63, E64 from 09/2005

The vehicle electrical system was changed from 09/2005.

As a result of the change, several control units were discontinued and some control unit functions were integrated into new control units.

> E70

The turning lights function is new on the E70 from the start of series production.

The turning lights give the area next to the carriage way additional illumination when you are turning or cornering (driving in tight bends). They are also active when you park the vehicle.

Depending on the country concerned, the turning lights are activated when cornering.

> E81, E87, E90, E91, E92, E93

For the E81, E92, E93 from start of series production and for the E87 from 03/2007, the turning light function is new.

NOTE: *Turning lights on E70, E81, E87, E92, E93 only in conjunction with option 524*

Turning lights are a subfunction of option 524 "Adaptive headlights".

Bi-xenon headlights are standard equipment on the E92, E93.

Option 524 is standard on the US version.

NOTE: *AHL components on E46, E53 and E83*

There is a separate system description for the adaptive headlights on the E46,

E53, E83.

NOTE: *AHL components on the E63, E64*

- The E63, E64 has a zero-position sensor.
- Otherwise, the E63 and E64 are the same as the other 5-Series models.

NOTE: *Components for adaptive headlight on E70, E81, E87, E90, E91, E92, E93*

On the E81, E87, E90, E91, E92, E93, the adaptive headlights largely correspond to those on the E60, E61, E63, E64, E65 and E66:

- E70, E81, E87, E90, E91, E92, E93 vehicles are equipped with a zero-position sensor.
- On the E70, E81, E87, E90, E91, E92, E93, the FRM (footwell module) acts as control unit for exterior lighting. The footwell module contains the functions of the light module, AHL control unit and the general module (or body general module).

BRIEF DESCRIPTION OF COMPONENTS

The following components and control units provide signals for the adaptive headlight system:

CAS: Car Access System

The Car Access System supplies signals for the terminal management (e.g. terminal 15 ON).

The adaptive headlights control unit is activated when terminal 15 is switched ON.

Light Switch

The rotary switch for the side lights and dipped headlights differs depending on the vehicle equipment level (adaptive headlights, automatic driving lights control, automatic or manual headlight-range adjustment). For the adaptive headlights function to operate, the light switch must be set to position "A" ("A" = "automatic driving lights control" and "adaptive headlights").

See **LIGHT SWITCH**

Turn-Signal/Main-Beam Switch

The main-beam headlights are switched on and off with the turn-signal/main-beam switch (by pressing or pulling the switch). The adaptive headlights function operates with both dipped and main-beam headlights.

See **DIRECTION INDICATOR/MAIN-BEAM SWITCH**

SZL: Steering Column Switch

The SZL control unit forwards the signals from the turn-signal/main-beam switch to the adaptive headlights control unit.

E60, E61, E63, E64, E65 and E66

See **SZL: STEERING COLUMN SWITCH CLUSTER**

E70, E81, E87, E90, E91, E92, E93

The steering column switch cluster forwards the signals from the turn-signal/main-beam switch to the footwell module (FRM).

Ride-Height Sensors

If the special equipment "Adaptive headlights" is fitted, the adaptive headlights control unit evaluates the signals from the ride-height sensors. This is because: the adaptive headlights control unit also controls the automatic headlight-range adjustment.

The automatic headlight - range adjustment feature adjusts the vertical aim of the headlights to compensate for variations in the vehicle tilt angle (e.g. when the vehicle is laden, and under braking and acceleration in dynamic driving situations).

See **E60, E61, E63, E64, E65, E66, E90 - RIDE-HEIGHT SENSORS**

Brake Light Switch

If the special equipment "Adaptive headlights" is fitted, the signals from the brake light switch are read by the adaptive headlights control unit.

In addition, the brake light switch signal is also a signal for automatic headlight-range adjustment, see **RIDE-HEIGHT SENSORS** above.

Position Sensor

E60, E61

E65, E66

Hella headlights have a position sensor.

The position sensor in the positioner module for the bi-xenon headlights supplies a signal for the horizontal movement of the headlights.

See **POSITION SENSOR**

Zero-Position Sensor

> E63, E64

> E70, E81, E87, E90, E91, E92, E93

Automotive Lighting headlights, previously Bosch, have a zero-position sensor.

The zero-position sensor registers the horizontal movement of the headlight.

See **ZERO-POSITION SENSOR**

EGS Control Unit or Reversing Light Switch

When reverse gear is engaged, the headlights are moved to the straight - ahead position.

- On vehicles with automatic transmission, the EGS control unit provides the "Reverse gear engaged" signal. (EGS: electronic transmission control).
- On vehicles with manual transmission, the signal is supplied by the reversing light switch.

Rain-Light Sensor For Automatic Driving Lights Control

The rain - light sensor measures the ambient brightness outside the vehicle.

- In twilight conditions, the rain - light sensor transmits the message "Twilight" so that the automatic headlight - range adjustment can activate dipped headlights. The headlights are tilted up and down as required, but they are not yet moved towards the bend in the road.
- In darkness, the rain-light sensor sends the message "Darkness". The adaptive headlights are then activated when the vehicle is cornering. The headlights are moved to the left or right:

See **RAIN-LIGHT SENSOR FOR AUTOMATIC DRIVING LIGHTS CONTROL**

Steering-Angle Sensor and DSC Sensor

The steering angle sensor and DSC sensor (DSC = Dynamic Stability Control) supply signals for the adaptive headlights to the adaptive headlights control unit. These signals are evaluated as follows, depending on the vehicle's speed:

- Vehicle speeds up to **30 km/h:**

The adaptive headlights function is controlled using the information from the steering angle sensor (in the steering column switch cluster).

- Vehicle speeds between **30 km/h and 50 km/h:**

In the 30 to 50 km/h speed range, there is a continuous transition in signal evaluation: from the evaluation of signals sent by the steering angle sensor to evaluation of the signals sent by the yaw-rate sensor (in the DSC sensor).

- **In extreme dynamic driving situations** , e.g. if the vehicle starts to skid or fishtail, even at speeds less than **50 km/h** , the signals from the yaw-rate-sensor are considered.

If the vehicle starts to skid or fishtail, the headlights will move to the straight - ahead position. The headlights are not moved until the vehicle has stabilized.

- Vehicle speeds over **50 km/h**:

At speeds upwards of 50 km/h, the signals from the **yaw-rate sensor** (in the DSC sensor) form the primary basis for control of the adaptive headlights function.

Reason: For a constant cornering radius, the steering angle required increases disproportionately with speed. In addition, the steering angle required also depends on the coefficient of friction of the road surface.

Yaw rate is directly proportional to speed. For this reason, the yaw rate is always the most suitable measure for controlling the adaptive headlights at high speeds.

Even at high speeds, however, the steering angle sensor signal is used to detect (predict) the driver's commands **in advance**. This prediction is important: The yaw rate signal is not supplied until the vehicle has **responded** to the steering wheel movement.

The steering-angle sensor signal is disabled so that rapid, momentary steering adjustments do not affect the adaptive headlights function.

A number of control units are involved in the adaptive headlights system (see above: **CAS: CAR ACCESS SYSTEM, EGS CONTROL UNIT OR REVERSING LIGHT SWITCH** and **SZL: STEERING COLUMN SWITCH**). Depending on the model series and model version concerned, the adaptive headlights are actuated by the following control units:

AHL: Adaptive Headlights

> E60, E61, E63, E64, E65, E66 up to 03/2005

The AHL control unit actuates the adaptive headlights.

For safety reasons, the AHL control unit is also responsible for the automatic headlight-range adjustment. This is because: Oncoming traffic must not be dazzled by the adaptive headlights. If a headlight sticks in an unfavorable position, the AHL control unit will attempt to move this headlight down (using the stepper motors in the automatic headlight-range adjustment).

The AHL control unit is connected to the PT-CAN.

See **AHL: ADAPTIVE HEADLIGHTS**

LM: Light Module

E60, E61, E63, E64, E65, E66 from 03/2005

From 03/2005, the AHL control unit is integrated in the light module.

The light module (LM) controls and monitors all vehicle lights. Information is transmitted and received via the K-CAN data bus.

The light module actuates the indicator light for the adaptive headlights (on the light switch).

See **E60, E61, E63, E64 FROM 03/2005** and/or **E65, E66 (FROM 03/2005)**

FRM: Footwell Module

> E70, E81, E87, E90, E91, E92, E93

The footwell module controls the exterior lighting and the adaptive headlights.

The footwell module thus takes the place of the light module and the AHL control unit.

The footwell module actuates the indicator light for the adaptive headlights (on the light switch).

See **FRM: FOOTWELL MODULE**

The footwell module has its own system description.

SMC: Stepper Motor Controllers

The stepper motor controllers control the stepper motors in the headlights (for the automatic headlight - range adjustment and for the adaptive headlights). The stepper motor controllers are not capable of self - diagnosis. The stepper motor controllers are diagnosed and encoded via the control unit for adaptive headlights.

See **SMC: STEPPER MOTOR CONTROLLERS**

SGM: Safety and Gateway Module

E60, E61, E63, E64 until 09/2005 and E65, E66

The safety and gateway module (SGM) is the interface between the two data buses K-CAN and PT-CAN. Thus, all information exchanged between the light module and the AHL control unit passes through the SGM. Information from the yaw-rate sensor (in the DSC sensor) is also fed through the SGM to the AHL control unit.

KGM: Body Gateway Module

E60, E61, E63, E64 from 09/2005

The vehicle electrical system was changed from 09/2005.

As a result of the change, several control units were discontinued and some control unit functions were integrated into new control units.

The new body gateway module (KGM) supersedes the safety and gateway module (SGM) previously fitted, the door modules and the micro - power module.

Xenon-Headlight Control Unit

The xenon-headlight control unit actuates the bulb in the bi-xenon headlights.

The xenon-headlight control unit is not capable of self-diagnosis. The xenon control unit is monitored by the light module (E70, E81, E87, E90, E91, E92, E93: footwell module).

See **E60, E61, E63, E64, E65, E66, E90 - BI-XENON HEADLIGHTS**

Headlights

Option 524 "Adaptive headlights" is only available in conjunction with option 522 "Xenon dipped and main-beam headlights". This means that bi-xenon headlights are employed.

See **E60, E61, E63, E64, E65, E66, E90 - BI-XENON HEADLIGHTS**

Stepper Motors For the Adaptive Headlights

The stepper motors turn the positioner modules in the bi-xenon headlights.

The stepper motors move the headlights vertically and horizontally (vertically = up and down for automatic headlight range adjustment;

horizontally = left and right for the adaptive headlights function).

The positioner modules execute the movement.

See **POSITIONER MODULES**

Indicator Light On the Light Switch

The indicator light (green LED) next to the "A" (= "automatic driving lights control" and "adaptive headlights") has 2 display functions:

- The indicator light **lights up permanently** when the automatic driving lights control or adaptive headlights function is switched on (= light switch in position "A").
- The indicator light **flashes** if a fault develops in the adaptive headlight system.

E60, E61, E63, E64, E65 and E66:

The indicator light is actuated by the light module.

E70, E81, E87, E90, E91, E92, E93:

The indicator light is actuated by the footwell module.

SYSTEM FUNCTIONS

The adaptive headlights system moves headlights horizontal (i.e. from left to right) in order to illuminate the inside of a bend when cornering.

The following functions of the adaptive headlights system are described below:

- System activation and automatic calibration
- Activation of stepper motor controllers
- Speed-dependent analysis of signals
- Adjustment of headlight horizontal aim
- Deactivation of adaptive headlights function under extreme handling conditions
- Deactivation of adaptive headlights function in response to system faults
- Setting headlights to parked position
- Automatic headlight-range adjustment
- Adaptive headlights for automatic driving lights control
- Turning light

NOTE: ***Different control units for adaptive headlights.***

E60, E61, E63, E64, E65, E66 up to 03/2005: The adaptive headlights are actuated by the AHL control unit.

E60, E61, E63, E64, E65, E66 from 03/2005: The adaptive headlights are actuated by the light module (LM).

E70, E81, E87, E90, E91, E92, E93: The adaptive headlights are actuated by the footwell module (FRM).

System Activation and Automatic Calibration

When terminal 15 is switched ON, the headlights always perform a calibration sequence, even if the dipped headlights are not switched on. The control unit for adaptive headlights sends the "perform calibration sequence" request to the stepper motor controllers (SMCs, control units for the headlight stepper motors). The stepper motor controllers actuate the stepper motors in the headlights. The calibration sequence is performed. In the calibration sequence, the headlights move as follows:

1. The headlights move to the right and left (= calibration sequence for adaptive headlights).
2. The headlights move up and down (= calibration sequence for automatic headlight - range adjustment).
3. At the end of the calibration sequence, the headlights are in the straight-ahead position.

Following the calibration sequence, the system is ready for operation.

When reverse gear is engaged, the headlights are moved to the straight-ahead position.

NOTE: ***The calibration sequence is performed only after terminal 15 has been switched OFF for at least 15 seconds.***

- > E66, E61, E63, E64, E65, E66 until 09/2006
- > E87, E90, E91, E92, E93 until 03/2007

If terminal 15 is repeatedly switched on and off (e.g. for demonstration purposes), the calibration sequence will not be executed every time terminal 15 is switched on.

Terminal 15 must have been switched off for at least 15 seconds before it is switched on again. Only then is a calibration sequence performed when terminal 15 is switched on.

NOTE: *Calibration sequence always after terminal 15 ON and dipped - beam headlights ON.*

- > E66, E61, E63, E64, E65, E66 from 09/2006
- > E70 from start of series production
- > E81, E87, E90, E91, E92, E93 from 03/2007

If terminal 15 is repeatedly switched on and off (e.g. for demonstration purposes), the calibration sequence will not be executed every time terminal 15 and the dipped-bead headlights are switched ON.

NOTE: *Calibration sequence with enlarged range of movement.*

- > not E65, E66

From 09/2007, starting with the E60, E61, E63, E64, a calibration sequence with larger range of movement will be introduced.

The calibration sequence with larger range of movement will then gradually be introduced on other model series.

Activation of Stepper Motor Controllers

The control unit for adaptive headlights sends the stepper motor controllers (SMC) the nominal values for the positioner modules (position of positioner modules and speed of movement).

The control unit for adaptive headlights calculates the nominal values using the following signals:

- Vehicle road speed
- Steering angle (at speeds up to 50 km/h, dependent on encoding)
- Yaw rate (50 km/h upwards, see **STEERING-ANGLE SENSOR AND DSC SENSOR** above)

Speed-Dependent Analysis of Signals

Depending on the road speed, the adaptive headlights are controlled using the following signals: Signals from the steering angle sensor and signals from yaw - rate sensor (in the DSC sensor).

The encoding (at the end of the production line) determines the priority assigned to sensor signals above which speed threshold.

Adjustment of Headlight Horizontal Aim

The stepper motor controllers move the headlights to the right or left when the vehicle corners.

Horizontal range of movement of headlights:

- Inwards, i.e. towards center of vehicle: up to max. 8°
- Outwards: up to max. 15°

Example: Right - hand bend:

The right-hand headlight turns by up to 15° (the right-hand headlight is the "inside" headlight on a right-hand bend).

Viewed from the vehicle, the right-hand headlight moves "outwards".

The left-hand headlight moves up to 8° (the left-hand headlight moves towards the middle of the vehicle, i.e. "inwards" as viewed from the vehicle).

The headlight on the outside of the bend has to reach its end position at the same time as the headlight on the inside of the bend so that the carriage way remains smoothly and evenly illuminated.

On a right-hand bend, the left-hand headlight is on the outside of the bend. The right-hand headlight is on the inside of the bend.

Deactivation of Adaptive Headlights Function Under Extreme Handling Conditions

If the vehicle drifts, skids and loses sideways grip, the adaptive headlights function is deactivated as follows:

- The headlights are returned to the straight-ahead position. The headlights are no longer turned.
- The dipped headlights remain on.

Deactivation of Adaptive Headlights Function In Response To System Faults

Until 09/2007, a system fault will be indicated by the indicator lamp on the light switch flashing.

From 09/2007 system fault will be indicated by a Check-Control message in the instrument cluster.

Dazzling of oncoming traffic must be prevented in the event of a system fault.

For this reason, the adaptive headlights function is deactivated as follows:

- If the stepper motors are still functional, the headlights are returned to the straight-ahead position. The headlights are no longer moved towards bends in the road.
- If it is no longer possible for a headlight to be moved back to the straight-ahead position, the headlight is tilted downwards (by the stepped motors for automatic headlight-range adjustment). This prevents dazzling of oncoming traffic.
- Vehicles **up to 09/2007**

If the headlight cannot be tilted downwards, the bi-xenon bulb in this headlight is disabled as follows:

When the vehicle is parked up, the control unit registers sleep mode for the adaptive headlights, as follows: Vehicle standstill and terminal R OFF for several minutes.

The next time the vehicle is restarted, the bi-xenon light of the defective headlight is not switched on.

The front foglights are switched on in order to ensure a minimum level of illumination.

The dipped beam headlights are **not** switched off while the vehicle is in motion.

NOTE: ***From 09/2007, the dipped - beam headlights will not be switched off in the event of a system fault.***

If a system fault develops in the adaptive headlights, the dipped-beam headlights for the affected headlight will *not* be switched off.

Setting Headlights To Parked Position

When terminal R is switched off, the headlights move to the parked position. The parked position is important for the headlights' next calibration sequence: From the parked position, the headlights are run through a calibration sequence in the pre-drive-check. During each calibration sequence, the control unit for adaptive headlights relearns the straight - ahead position for the headlights.

When the headlights have reached the parked position, the stepper motor controllers SMCs inform the control unit for adaptive headlights ("verification").

The control unit for adaptive headlights deactivates the stepper motor controllers.

The run-down period lasts approx. 10 seconds.

Automatic Headlight-Range Adjustment

If the special equipment "Adaptive headlights" is fitted, the control unit for adaptive headlights also controls the automatic headlight-range adjustment.

The automatic headlight - range adjustment adapts the headlight range for different operating conditions. Variations in the vehicle tilt angle are produced by vehicle loads and braking or acceleration in extreme driving situations. The automatic headlight-range adjustment moves the headlights up and down as required.

The control unit for adaptive headlights also controls the automatic headlight-range adjustment as follows:

1. The ride-height sensors and the brake light switch supply the signals for the automatic headlight-range adjustment.
2. The control unit for adaptive headlights computes the vehicle inclination (longitudinally to the roadway) from the signals.
3. The stepper motors for the automatic headlight-range adjustment automatically and dynamically control the headlight range.

The headlight range is adjusted so that the actual headlight range conforms to the legally required headlight range as follows:

- If vehicle rear is lower than front:

The actual headlight range will be longer than the legally stipulated range. The headlight beam height is lowered to reduce the headlight range to match the legal requirement.

- If the vehicle is horizontal:

The actual headlight range will be the same as the legally stipulated range.

- If vehicle front is lower than rear:

The actual headlight range will be shorter than the legally stipulated range. The headlight beam height is raised to increase the headlight range to match the legal requirement.

Adaptive Headlights For Automatic Driving Lights Control

The automatic driving lights control feature (option in conjunction with the rain-light sensor) automatically switches the side lights and dipped headlights on or off.

Switch-on conditions:

- The automatic driving lights control must be encoded (in the light module on the E60, E61, E63, E64, E65, E66, in the footwell module on the E70, E81, E87, E90, E91, E92, E93).
- The light switch must be in position "A" ("A" for automatic driving lights control and adaptive headlights).
- The rain-light sensor must be installed and operational.

The rain-light sensor detects the brightness of the ambient light.

The rain-light sensor sends the following prompts to the light module (on the E70, E81, E87, E90, E91, E92, E93: footwell module):

- Ambient brightness low: In twilight, darkness, in an underground garage or tunnel.

"Switch on dipped headlights" request

- Ambient brightness sufficient.

"Switch off dipped headlights" request

If only the side lights are to be switched on, the light switch must be set to side lights (switch position 1).

When the light switch is set to position "A", the control unit for adaptive headlights is also activated:

- When the automatic driving lights control function switches on the dipped headlights (e.g. at dawn/dusk), the adaptive headlights function is notified at the same time.

The control unit for adaptive headlights thus assumes control of the automatic headlight - range adjustment.

- In addition, signals from the rain - light sensor are evaluated (E60, E61, E63, E64, E65, E66: by the light module; E90, E91, E92, E93: by the footwell module).

The headlights are not turned when the vehicle is cornering until total darkness sets in.

The message "dipped headlights on" is given individually for each headlight.

If a headlight fails, the adaptive headlights are switched off.

The front foglights are switched on in order to ensure a minimum level of illumination.

Turning Lights

The turning lights are coupled to the adaptive headlights (option 524).

The footwell module (FRM) uses the following signals to adjust the turning lights:

- Steering angle
- Yaw rate
- Status of reverse gear

> E81, E92, E93 with start of series production and E87 from 03/2007

Instead of the main-beam headlight (H7), the main headlight with turning light has a fixed additional reflector with an H3 bulb. The special shape of the lens prevents dazzle to the front.

The **Fig. 2** shows the main headlight with turning light on the E81, E87, E92, E93

1. Bi-xenon light
2. H8 bulb for side lights and daytime driving lights

3. H3 bulb for turning lights
4. Reflector for turning lights

Fig. 2: Identifying Headlight Reflector For Turning Lights
Courtesy of BMW OF NORTH AMERICA, INC.

The **Fig. 3** shows the turning light on the E81, E87, E92, E93

1. Left turn
2. Right turn

Fig. 3: Identifying Turning Light Turn
Courtesy of BMW OF NORTH AMERICA, INC.

The following conditions must be satisfied for the turning lights to be switched on:

- Terminal 15 ON
- Light switch in position "A" ("A" stands for automatic driving lights control)
- Rain-light sensor detects twilight or darkness (threshold exceeded)

The turning lights are not activated at speeds greater than 70 km/h.

> Europe version:

For legal reasons, the turning lights on the Europe version can only be activated via the turn signal indicator at speeds up to 40 km/h.

When reversing, the footwell module (FRM) activates the turning lights as follows in the speed range 0 km/h to 35 km/h:

- US version: both sides
- Other countries: outside of turn only

When the turn signal indicator is switched on:

If the vehicle is stationary, the turning lights will automatically be deactivated after approx. 4 seconds, e.g. when waiting at traffic lights. However, the turning lights can be activated again with the turn-signal/mainbeam switch (up to 3 times) until the reflector has reached a certain temperature.

A temperature model protects the headlights from excessive thermal stress.

The switching-off conditions for the turning light depend on the country concerned.

NOTE: *Temperature monitoring by temperature model*

A temperature model in the footwell module calculates the temperature of the reflector. The temperature of the reflector must not exceed a certain value. If a critical temperature is reached, the footwell module (FRM) will deactivate the turning lights. The turning lights can be activated again after a cooling-off phase.

> E70 with start of series production

The turning lights are realized using the front foglights. (Reason: The installation location of the headlights is too high for the turning lights. This prevents legal stipulations from being adhered to.)

Depending on actuation, the right - hand and/or left-hand front foglight is switched on. The turning lights are actuated by the light module (LM).

The front foglights have an additional reflector to illuminate the areas to the sides better.

When turning, the front foglight on the inside of the turn is automatically activated. The additional reflector for the turning light reflects the light beam towards the turning area.

The turning light are not switched on suddenly but rather faded according to special time parameters.

Depending on the country concerned, the turning lights are switched on when cornering.

The **Fig. 4** shows the front foglight on the E70

1. Additional reflector for the turning light

2. Reflector for the front foglights
3. Bulb

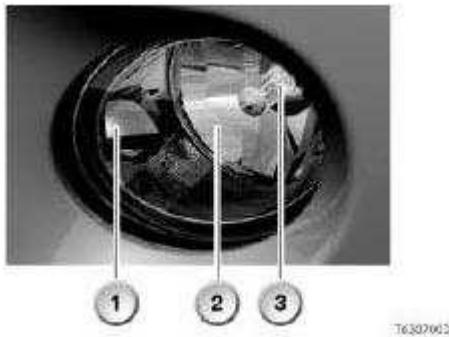

Fig. 4: Identifying Turning Light Reflector
Courtesy of BMW OF NORTH AMERICA, INC.

The following conditions must be satisfied for the turning lights to be **switched on**:

- Terminal 15 ON
- Light switch in position "A" ("A" stands for automatic driving lights control)
- Rain-light sensor detects twilight or darkness (threshold exceeded)

and

- Turn signal indicator ON (not one-touch turn signal)
- Speed range (forwards):
 - Europe and Japan version from 0 km/h to 35 km/h
 - US version from 0 km/h to 65 km/h
- Swivel angle (theoretical):
 - when stationary $\geq 77^\circ$
 - when driving $\geq 10^\circ$

Alternatively

- Speed range (reverse):
 - 0 km/h to 35 km/h
- Swivel angle (theoretical):
 - when stationary or driving $\geq 70^\circ$

If the vehicle is stationary, the turning lights will automatically be deactivated after a certain time, e.g. when waiting at traffic lights. However, the turning lights can be activated again with the turn-signal/main-beam switch.

The following conditions must be satisfied for the turning lights to be **switched off**:

- Light switch not in position "A" ("A" stands for automatic driving lights control)
- Rain-light sensor does not detect twilight or darkness (lower threshold exceeded)

Alternatively

- Turn signal indicator OFF
- Speed range (forwards):
 - Europe and Japan versions > or = 40 km/h
 - US version > or = 70 km/h
- Swivel angle (theoretical):
 - when stationary 77°
 - when driving 10°

Alternatively

- Speed range (reverse): > or = 40 km/h
- Swivel angle (theoretical): when stationary and when driving below a certain value

Alternatively

- Vehicle skids and swings out.

Alternatively

- Front foglights are switched on with the front foglights switch.

PRECONDITIONS FOR ACTIVATION

The control unit for adaptive headlights is "awake" from terminal 15 ON.

The movement of the lights is subject to the following conditions:

- Reverse gear must **not** be engaged.
- The system is free of faults (indicator lamp **not** flashing and no Check-Control message)
- The bulbs for the bi-xenon lights are OK in both headlights.
- The vehicle must not be skidding or fishtailing.
- The rain - light sensor must detect darkness.
- Additional precondition for activation: automatic driving lights control is active (light switch in position "A", see above).

Notes for service staff

CAUTION: Exercise caution when working on bi-xenon headlights

Whenever inspecting or working on the headlights, always observe the safety precautions and accident prevention rules. The headlight system has dangerously high voltage.

- General note: See **E60, E61, E63, E64, E65, E66, E90 - ADAPTIVE HEADLIGHTS, GENERAL INFORMATION FOR SERVICE STAFF**
- Diagnosis: See **E60, E61, E63, E64, E65, E66, E90 - ADAPTIVE HEADLIGHTS DIAGNOSIS**
- Encoding/programming: See **E60, E61, E63, E64, E65, E66, E90 - ENCODING/PROGRAMMING ADAPTIVE HEADLIGHTS**
- Car and Key Memory:
 - > E60, E61, E63, E64, E65, E66

The sensitivity of the driving light sensor can be set to one of 2 settings with the Car and Key Memory.

> E70, E81, E87, E90, E91, E92, E93

All Car and Key Memory functions are programmed inside the vehicle itself.

(Please refer to the "Personal profile" section of the Owner's Handbook: Personal settings for a maximum of 3 remote control units via the display in the instrument cluster or via the Central Information Display.)

NATIONAL VERSIONS

The options "Daytime driving lights" and "Manual headlight - range adjustment" are available in certain countries. Vehicles with manual headlight-range adjustment do not have adaptive headlights. This is because vehicles with manual headlight - range adjustment have halogen dipped headlights. Adaptive headlights (option 524) are only available in conjunction with option 522 "Xenon dipped and main - beam headlights".

Switching on adaptive headlights in conjunction with daytime driving lights function

The "Daytime lights" option (Northern Europe and Canada) means that dipped-beam headlights and side lights (E70, E92, E93: daytime driving lights) are always switched on:

- Light switch in position "2"
- Terminal 15 ON

The automatic headlight - range adjustment is active (actuated by the control unit for adaptive headlights).

If terminal 15 is switched off, the dipped headlights and the side lights are automatically switched off as well.

The light switch must also be set to position "A" with the "Daytime driving lights" option. The control unit for adaptive headlights is then in standby.

System functions for "Daytime lights" option when the light switch is set to position "A":

- If the vehicle is encoded with the "Daytime driving lights" option (end of production line), the light switch can remain in position "A" at all times.

When terminal R is switched on, the side lights, parking lights and licence plate lighting are switched on.

As soon as terminal 15 is switched on, the dipped headlights are also switched on.

- When the dipped headlights are switched on, the control unit for adaptive headlights is activated (for automatic headlight-range adjustment).
- The indicator lamp on the light switch lights up and indicates that the system is functional.
- The adaptive headlights turn when the vehicle is stationary if the steering wheel is turned (to the right only).
- The headlights are moved when the vehicle corners if the rain - light sensor registers darkness.

The switch-on conditions for the adaptive headlights in conjunction with special equipment "Daytime driving lights" are as follows:

- The vehicle must be encoded with the "Daytime driving lights" option (end of production line)
- The light switch must be in position "A"
- Terminal 15 must be switched on and reverse gear must not be engaged
- Rain-light sensor must detect darkness

Subject to change.

MAIN-BEAM ASSISTANT E60, E61, E63, E64, E65, E66, E70, E90, E91, E92, E93

Fig. 5: Identifying Main-Beam Assistant
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

The main-beam assistant assists the driver to operate the main-beam headlights. The main-beam assistant automatically switches the main-beam headlights on and off as the traffic situation changes.

The main-beam assistant detects vehicles travelling ahead of the car and oncoming traffic, and it also detects lighted stretches of roadway. By automatically switching off the main-beam headlights in good time, the main-beam assistant ensures that the occupants of oncoming vehicles, for example, are not dazzled by the headlights.

Advantages:

Drivers do not have to concern themselves with the job of operating the main - beam headlights. This enhances the level of convenience for drivers. The main - beam headlights are switched on more frequently by the main-beam assistant than is the case with manually operated main-beam headlights. The driver's field of vision is optimally illuminated. Driving in the dark, therefore, is rendered safer.

IMPORTANT: *The driver retains full responsibility for all his/her actions, despite the assistance of the main - beam assistant.*

The main-beam assistant merely assists the driver in the task of operating the main-beam headlights.

Responsibility for switching the main-beam headlights on and off in accordance with the dictates of the traffic situation rests with the drivers.

The main-beam assistant can be deactivated at any time with the turn-signal/main-beam switch.

Option 5AC "Main-beam assistant" is available for the BMW 3, 5, 6 and 7-Series.

> E60, E61, E63, E64, E65, E66 - See **SYSTEM OVERVIEW FOR THE MAIN-BEAM ASSISTANT: E60, E61, E63, E64, E65, E66**

NOTE: ***Only the main beam of the bi-xenon headlights are switched on.***

If a main-beam assistant is fitted, only the main beam of the bi-xenon headlights are switched on.

The halogen headlights are switched on only when the headlight flasher is actuated. In countries in which daytime driving lights are required by law, the halogen headlights are used for the daytime driving lights.

BRIEF DESCRIPTION OF COMPONENTS

The following components and control units provide input signals for the main - beam assistant:

- **Light switch**

The main-beam assistant can be activated only when the light switch is in position "A".

"A" stands for "automatic headlight control".

- **Turn-signal/main-beam switch**

The main-beam assistant is activated and deactivated by mans of the turn-signal/main-beam switch.

See the section entitled **OPERATION** below.

- **Rain-light sensor**

The rain - light sensor measures the brightness of the ambient light. The light module switches the dipped headlights on when daylight fails.

The main-beam assistant can be activated only when the dipped headlights are on. The precondition is that the light switch must be in the "A" position.

- **Wheel-speed sensors**

Each of the wheel-speed sensors measures the circumferential speed of an individual wheel. The DSC control unit (DSC: Dynamic Stability Control) uses these input signals to calculate the car's road speed.

The main-beam headlights are switched on when the car's road speed is above 50 km/h.

The main-beam headlights are switched off when the car's road speed is below 38 km/h.

- **DSC sensor**

The DSC sensor registers lateral acceleration and calculates the yaw rate.

("Yaw" is the movement of the vehicle about the vertical axis, e.g. when the car is cornering).

The main-beam assistant uses the yaw rate to improve evaluation when the car corners. The DSC sensor is underneath the driver's seat. For safety reasons, cars with active front steering have a second DSC sensor underneath the front passenger's seat.

- **Image sensor**

The image sensor is a special camera for detecting light sources.

The image sensor transmits images to the control unit for the main - beam assistant.

The images are carried by an LVDS data line (LVDS: Low Voltage Differential Signalling).

The control unit for the main-beam assistant analyses the images.

The image sensor and the control unit are installed in a **common** housing and can only be supplied as a unit.

See **IMAGE SENSOR FOR THE MAIN-BEAM ASSISTANT: E60, E61, E63, E64, E65, E66**

- **Reverse gear switch**

The main-beam headlights are **not** switched on if reverse gear is engaged.

In a manual-shift car, the reverse gear switch supplies the "reverse gear engaged" information.

The reverse gear switch sends this information to the light module.

- **Selector lever position switch**

The main-beam headlights are **not** switched on if reverse gear is engaged.

In a car fitted with electronic transmission control (EGS), the selector lever position switch supplies the "reverse gear engaged" information. The selector lever position switch sends this information to the EGS control unit.

The EGS control unit sends this information to the light module or footwell module.

- **Selector angle sensor and shift travel sensor**

> E60, E61, E63, E64, E65, E66

The main-beam headlights are **not** switched on if reverse gear is engaged.

In a car fitted with sequential manual transmission (SMG), the selector angle sensor and the shift travel sensor supply the "reverse gear engaged" information. The selector angle sensor and the shift travel sensor send the information to the SMG control unit. The SMG control unit sends the information to the light module.

The following control units are involved in the main-beam assistant system:

- **FLA: Main-beam assistant**

The FLA control unit analyses the images from the image sensor. The FLA control unit receives information on road speed and yaw rate from the DSC control unit.

The FLA control unit sends a switch-on recommendation or a switch-off recommendation for the main-beam headlights to the light module. The recommendation depends on the traffic situation, the ambient light, and the car's road speed.

The FLA control unit is connected to the K-CAN.

See **FLA CONTROL UNIT FOR THE MAIN-BEAM ASSISTANT: E60, E61, E63, E64, E65, E66**

- **LM: Light module**

> E60, E61, E63, E64, E65, E66

The light module receives various input variables for the main-beam headlights:

- Switch-on or switch-off recommendation from the FLA control unit
- Switch position of the light switch
- Switch position of the direction indicator/mean - beam switch
- Information from the reverse gear switch or the selector lever position switch or the selection angle and shift travel sensor
- Information from the rain-light sensor, as to whether the dipped headlights have to be switched on

On the basis of the input variables, the light module decides whether the main-beam headlights should be switched on or off.

- The light module actuates the bi-xenon headlights.
- The light module actuates the FLA indicator light in the instrument cluster.

A Check-Control symbol appears if the main - beam assistant fails.

The light module is connected to the K-CAN.

○ **FRM: Footwell module**

> E90, E91, E92, E93, E70

The footwell module receives various input variables for the main - beam headlights:

- Switch-on or switch-off recommendation from the FLA control unit
- Switch position of the light switch
- Switch position of the direction indicator/main-beam switch
- Information from the reverse gear switch or selector lever position switch
- Information from the rain-light sensor, as to whether the dipped headlights have to be switched on

On the basis of the input variables, the footwell module decides whether the main-beam headlights should be switched on or off.

- The footwell module actuates the bi-xenon headlights.
- The footwell module actuates the FLA indicator light in the instrument cluster.

A Check-Control symbol appears if the main-beam assistant fails.

The footwell module is connected to the K-CAN.

○ **DSC: Dynamic Stability Control**

The DSC control unit calculates the car's road speed using the signals from the wheel-speed sensors. The DSC control unit sends the information on road speed to the main - beam assistant.

The DSC control unit also sends the information from the yaw-rate sensor in the DSC sensor to the main-beam assistant.

○ **EGS or SMG: Electronic gearbox control or sequential manual transmission**

The EGS control unit receives the "Reverse gear engaged" information from the selector lever position switch.

The EGS control unit is connected to the PT-CAN.

The SMG control unit receives the "Reverse gear engaged" information from the selector angle sensor and the shift travel sensor. The SMG control unit is connected to the PT-CAN.

○ **SZL: Steering Column Switch**

The switch signals from the turn - signal/main-beam switch are picked up and evaluated by the SZL

control unit.

The SZL control unit sends the position of the turn-signal/main-beam switch to the light module (E60, E61, E63, E64, E65, E66) or footwell module (E90, E91, E92, E93, E70)

The following components are controlled:

- **Bi-xenon headlights**

The bi-xenon headlights are actuated by the light module.

NOTE: *Only the main beam of the bi-xenon headlights are switched on.*

If a main-beam assistant is fitted, only the main beam of the bi-xenon headlights are switched on. The halogen headlights are switched on only when the headlight flasher is actuated. In countries in which daytime driving lights are required by law, the halogen headlights are used for the daytime driving lights.

- **Instrument cluster**

The indicators in the instrument cluster are as follows:

- Main-beam indicator lamp (legally stipulated, blue)
- FLA indicator light
 - Orange on BMW 3, 5 and 6-Series and on X5
 - Blue on BMW 7-Series
- Check-Control symbol for failure of the main-beam assistant (yellow)

See the section entitled **SYSTEM FUNCTIONS** below.

The following components provide the power supply for the main - beam assistant:

- **PM: Power module**

> E65, E66

In the BMW 7-Series, the power module supplies power to the main - beam assistant.

- **Rear power distributor**

> E60, E61, E63, E64

In the BMW 5-Series and 6-Series, the rear power distributor supplies power to the main-beam assistant.

- **Power distributor in junction box**

> E90, E91, E92, E93

On the BMW 3-Series, the power distributor in the junction box supplies voltage to the main - beam assistant.

- **Rear power distributor**
> E70

On the BMW X5, the rear power distributor provides power to the main - beam assistant.

SYSTEM FUNCTIONS

In accordance with the traffic situation, the FLA control unit sends a switch - on recommendation or a switch - off recommendation for the main - beam headlights to the light module or footwell module. On the basis of this recommendation and various other the input variables, the light module or footwell module decides whether the main-beam headlights should be switched on or off.

The following system functions of the main - beam assistant are described:

- Automatic main-beam headlight switch - off when oncoming traffic is detected
- Automatic main-beam headlight switch - off when vehicle detected ahead of the car
- Automatic main-beam headlight switch - off when adequate ambient lighting is detected
- Automatic main-beam headlight switch - on
- Indicators in the instrument cluster
- Function limitations of the main - beam assistant
- Automatic alignment of the main - beam assistant

Automatic Main - Beam Headlight Switch-Off When Oncoming Traffic Is Detected

The light cone of the main - beam headlights has a range of about 400 m. The image sensor can detect other light sources within a range of about 1000 m. This ensures that the image sensor detects oncoming vehicles before their drivers can be dazzled by the light cone of the main - beam headlights.

When the image sensor detects an oncoming vehicle, the FLA control unit sends a switch - off recommendation to the light module or footwell module. The light module or footwell module switches the main - beam headlights off.

Automatic Main - Beam Headlight Switch-Off When Vehicle Detected Ahead Of The Car

When the image sensor detects a vehicle ahead, the FLA control unit sends a switch - off recommendation to the light module or footwell module. The light module or footwell module switches the main - beam headlights off.

Automatic Main - Beam Headlight Switch-Off When Adequate Ambient Lighting Is Detected

When the image sensor detects an environment in which ambient lighting is adequate, the FLA control unit sends a switch-off recommendation to the light module or footwell module. The light module or footwell module switches the main-beam headlights off.

Adequate ambient lighting means:

- Daylight
- Twilight
- Street lighting (e. g. in illuminated towns)

Automatic Main-Beam Headlight Switch-On

If there is no reason for the lights to be dipped, the light module or footwell module switches the main-beam headlights on. The bi-xenon headlights are switched to full beam.

Displays In The Instrument Cluster

The FLA indicator light lights up in the instrument cluster as soon as the main-beam assistant is activated (blue on the BMW 7-Series, orange on the BMW 3, 5, and 6-Series and on the X5).

The main-beam indicator light also lights up (blue) in the usual way as soon as the main-beam headlights are switched on.

A Check-Control symbol appears (yellow) if the FLA control unit detects a system failure.

See **INDICATORS FOR THE MAIN-BEAM ASSISTANT AND THE MAIN-BEAM HEADLIGHTS: E60, E61, E63, E64, E65, E66**

Function Limitations Of The Main-Beam Assistant

The main-beam assistant can be subject to function limitations under the following circumstances:

- Inclement weather conditions (e.g. fog)
- Poorly lighted road users (e.g. cyclists, pedestrians)
- Certain road signs (e.g. the warning sign for a tight bend): Reflections from traffic signs may be incorrectly interpreted by the main - beam assistant as a vehicle driving ahead or as oncoming traffic.

See **FUNCTION LIMITATIONS OF THE MAIN-BEAM ASSISTANT**

- Driving over crests and through dips

See **FUNCTION LIMITATIONS OF THE MAIN-BEAM ASSISTANT**

- Certain traffic situations (e.g. tight bends, vehicles approaching from the side)
- Image sensor's field of view obstructed (e.g. by snow)

Automatic Alignment Of The Main-Beam Assistant

In order to operate correctly, the image sensor must be aligned parallel with the vehicle's centerline. When the car is driven at night, the main - beam assistant can automatically correct alignment up to 3° to the left or 3° to

the right. This correction compensates for minor deviations from the centerline.

Driving conditions for automatic directional orientation of the main - beam assistant are:

- Straight ahead for a distance of approx. 50 km: A relatively straight stretch accelerates the directional orientation.
- Road marking must be clearly visible.

See **IMAGE SENSOR FOR THE MAIN-BEAM ASSISTANT: E60, E61, E63, E64, E65, E66**

OPERATION

Operation of the main-beam assistant is described in a separate section.

The following controls of the main - beam assistant are described:

- Switching on automatic headlight control
- Activating the main - beam assistant
- Deactivating the main-beam assistant
- Reactivating the main-beam assistant
- Switching on the headlight flasher

See **OPERATION**

PRECONDITIONS FOR ACTIVATION

For technical reasons, distinctions are drawn between the following conditions required for switch - on:

- Conditions required for switch-on for the FLA control unit
- Conditions required for switch-on for the main-beam assistant
- Conditions required for switch-on for the main-beam headlights

Conditions Required For Switch - On For The FLA Control Unit

The FLA control unit is active as of terminal 15 ON.

Conditions Required For Switch - On For The Main-Beam Assistant

- Light switch set to position "A"
- Dipped headlights switched on.

When the switch is in position "A", the dipped headlights are switched on by the automatic headlight control.

- Turn-signal/main-beam switch pressed forward (in forward direction of travel).

Conditions Required For Switch - On For The Main-Beam Headlights

- Road speed greater than 50 km/h.
- Reverse gear must **not** be engaged.
- Image sensor does **not** detect an oncoming vehicle or a vehicle ahead.
- Image sensor detects adequate darkness.

Notes for service staff

The following information is available for service staff:

- General note: See **MAIN-BEAM ASSISTANT, GENERAL INFORMATION FOR SERVICE STAFF: E60, E61, E63, E64, E65, E66**
- Diagnosis: See **MAIN-BEAM ASSISTANT DIAGNOSIS: E60, E61, E63, E64, E65, E66**
- Encoding/programming: -

MAINTENANCE

Maintenance & OE General Information - X3

00 MAINTENANCE AND GENERAL INFORMATION

00 DANGER OF POISONING IF OIL IS INGESTED/ABSORBED THROUGH THE SKIN

Danger of poisoning!

Ingesting oil or absorbing through the skin may cause poisoning!

Possible symptoms are:

- Headaches
- Dizziness
- Stomach aches
- Vomiting
- Diarrhoea
- Cramps/fits
- Unconsciousness

Protective measures/rules of conduct:

- Pour oil only into appropriately marked containers
- Do not pour oil into drinking vessels (drinks bottles, glasses, cups or mugs)
- Observe country-specific safety regulations

First aid measures:

- Do not induce vomiting.

If the person affected is still conscious, he/she must rinse out their mouth with water, drink plenty of water and consult a doctor immediately.

If the person affected is unconscious, do not administer anything by mouth, place the person in the recovery position and seek immediate medical attention.

00 RISK OF INJURY IF OIL COMES INTO CONTACT WITH EYES AND SKIN

Danger of injury!

Contact with eyes or skin may result in injury!

Possible symptoms are:

- Impaired sight
- Irritation of the eyes
- Reddening of the skin
- Rough and cracked skin

Protective measures/rules of conduct:

- Wear protective goggles
- Wear oil-resistant protective gloves
- Observe country-specific safety regulations

First aid measures:

- Eye contact: Rinse eyes immediately with plenty of water for at least 15 minutes; if available, use an eye-rinsing bottle. If irritation of the eyes persists, consult a doctor.
- Skin contact: Wash off with soap and water immediately. If irritation persists, consult a doctor.

NOTE: Do not use solvents/thinners.

00 SAFETY INSTRUCTIONS FOR HANDLING OIL

WARNING: Danger of poisoning if oil is ingested/absorbed through the skin! See 00 Danger of poisoning if oil is ingested/absorbed through the skin
Risk of injury if oil comes into contact with eyes and skin! See 00 Risk of injury if oil comes into contact with eyes and skin

Recycling:

Observe country-specific waste-disposal regulations.

Measures if oil is unintentionally released:

- Personal precautionary measures: Danger of slipping! Keep non-involved persons away from the work area. Wear personal protective clothing/equipment.
- Environmental protection measures: Prevent oil from draining into drain channels, sewerage systems, pits, cellars, water and the ground.
- Limiting spread: Use oil blocks to prevent the surface spread of oil.
- Cleaning procedure: Bind and dispose of escaped oil with nonflammable absorbents.

NOTE: Do not flush oil away with water or aqueous cleaning agents.

00 ... BMW SERVICE-INSPECTION (PETROL/GASOLINE VEHICLES)

IMPORTANT: The operations set out below always refer to the maximum possible scope of a service-inspection.

The exact scope of the vehicle in question must be printed out with the vehicle identification number from the KSD CD.

Body / electrical system

- Check lighting system: instrument and indication field lighting, heater fan, signal horn, headlight flasher and hazard warning lights, see **00 00 ... Checking lighting system**
- Seat belts: check condition of belt strap, function of inertia reel mechanism, locking reel, belt buckle, see **00 00 ... Seat belts: checking condition of belt strap, function of inertia reel mechanism, locking reel, belt buckle**
- Battery:
 - Check acid level, charge state (magic eye)
 - If necessary: Charge battery, see **00 00 ... Battery: checking acid level, topping up with distilled water if necessary. If necessary, recharge battery.**
- Heating/air conditioning: change microfilter / carbon canister, see **00 00 ... Heating/air conditioning: replacing microfilter/carbon canister (shorten replacement interval accordingly in event of larger buildup of dust)**
- Body and underbody: check for corrosion and damage-except cavities, see **00 00 ... Body and underbody: checking for corrosion and damage - except cavities**

Engine compartment

- Diagnostic brief test , see **00 00 ... Diagnostic brief test**
- In event of fault memory entry "54C6" change transfer case oil , see **00 00 ... Oil change in transfer case**
- Change engine oil and oil filter , see **00 00 ... Changing engine oil and oil filter**
- Replace spark plugs , see **00 00 ... Replacing spark plugs**
- Coolant hoses: visually inspect for leaks, check coolant level and concentration, top up if necessary
Caution! Replace coolant at least every 3 years, see **00 00 ... Coolant hoses: visual inspection for leaks. Checking coolant level and concentration, topping up if necessary**
- Reset service interval indicator according to factory specifications, see **00 00 ... Resetting service interval indicator according to factory specifications**
- Windscreen washer system and intensive cleaning system: check fluid level, top up if necessary, see **00 00 ... Windscreen washer system and intensive cleaning system: checking fluid level, topping up if necessary**
- Power steering/ride-height control: visual inspection for leaks, check fluid level, top up fluid if necessary, see **00 00 ... Power steering/ride-height control: visual inspection for leaks, checking fluid level, topping up fluid if necessary**
- caution Change brake fluid in accordance with service interval indicator , no later than every 2 years, see **00 00 ... Changing brake fluid**
- Air cleaner: Replace air cleaner element, see **00 00 ... Air cleaner: replacing air cleaner element (shorten replacement interval accordingly in event of larger buildup of dust)**

Chassis / suspension area

- Front and rear disc brake pads:
 - check pad thickness with measuring gauge **00 00 ... Front and rear brake linings: checking lining thickness with measuring gauge. If linings are replaced: cleaning brake shafts, checking brake disk thickness and surface, applying grease to wheel centering on alloy wheels. If rear linings are replaced: checking parking brake linings**
 - If pads are replaced: Clean brake ducts. Brake discs: Check surface and thickness. If replacing at rear: check parking brake linings. Grease wheel centering on light alloy wheels.
- Check steering for play . Steering tie rods and axle joints, steering gear, sleeves and flexible disc: check condition, see **00 00 ... Steering components: checking for zero clearance, leaks, damage and wear**
- Underbody incl. all visible components : check for damage, leaks, corrosion, see **00 00 ... Underbody incl. all visible components: checking for damage, leaks, corrosion**
- Brake lines and connections: visual inspection for leaks, damage and correct position, see **00 00 ... Brake lines and connections: visual inspection for leaks, damage and correct position**
- Check handbrake lever travel , adjust according to setting specifications if necessary, see **00 00 ... Checking handbrake lever travel, adjusting according to setting specifications if necessary**
- Tires:
 - Check pressure, correct if necessary (including spare wheel). Check external condition (left/right), check tread depth and pattern
 - If level of wear is not uniform, measure and correct wheel alignment after consulting with customer, see **00 00 ... Tires: checking inflation pressure, correcting if necessary (incl. spare wheel), checking external condition, tread depth, pattern. In event of nonuniform wear, carry out measurement and correction of wheel alignment**

Final check

- Check roadworthiness: See **00 00 ... Checking roadworthiness**
 - check brakes (with rear disc brakes: brake in handbrake)
 - Steering/power steering
 - Clutch
 - Shock absorbers (visual inspection)
 - Indicator and warning lamps
 - Check Control

00 PRE-DELIVERY CHECK

Quality assurance by BMW Service

Model:

Vehicle identification number:

Included with the vehicle:

- Owner's Handbook(s)
- Service Booklet
- Master key/remote control
- Spare key

I hereby confirm that I have received the vehicle in perfect condition.

.....
Place and date

.....
Signature of vehicle owner

Fig. 1: BMW Service Quality Assurance Sheet
Courtesy of BMW OF NORTH AMERICA, INC.

Pre-delivery check by BMW Service**Scopes of inspection:** To be kept with the workshop documents

The following work must be carried out on the vehicle by BMW Service prior to delivery.

* Denotes optional extra or national-market specification. Observe possible changes in this regard.

Model:

Vehicle identification number:

	Not OK	OK
Battery main switch*		
Removal and connection, carry out following scopes if necessary	0	0
Power windows*: Initialize system	0	0
Glass sunroof*: Initialize system	0	0
Steering angle adjustment or initialize active front steering*	0	0
Equipment pack scopes		
Fit	0	0
<hr/>		
	Not OK	OK
Carry out "CBS pre-delivery check" in the Service Function path under Maintenance	0	0
Deactivate transportation mode	0	0
Reset average mileage, enter service telephone number	0	0
Enter first registration	0	0
Set on-board date	0	0
Set statutory inspection dates*	0	0
Enter service telephone numbers	0	0
Check battery, observe notes/information in Tester	0	0
Clear fault memory	0	0
Carry out brief diagnosis test, eliminate faults if necessary	0	0
Engine compartment		
Check for cleanliness	0	0
Washer fluid reservoir		
Check fill level and top up if necessary, where required with antifreeze additive	0	0
<hr/>		
	Not OK	OK
Sticker		
Attach sticker for BMW Group Mobile Service	0	0
Body, interior equipment, floor plate		
Check for transportation damage	0	0
Spring blocker*		
Remove	0	0
Tyres		
Check tyre pressures; if provided, also compact or spare wheel	0	0
Initialise Run Flat Indicator	0	0
Winter tyres*		
Attach V-max sticker	0	0
Service Booklet		
Stamp pre-delivery check	0	0
	Not OK	OK
Enclose documents or hand over with vehicle		
Owner's Handbook	0	0
Service Booklet	0	0
Contact brochure	0	0
Care/Upkeep brochure	0	0
BMW Group Mobile Service brochure	0	0
Include BMW key or remote control (make note of number)	0	0

00 LIFTING VEHICLE WITH A LIFTING PLATFORM

WARNING: Danger to life!
 Read and follow operating instructions for lifting platform.
 Do not exceed carrying capacity of lifting platform.

NOTE: The lifting platform must comply with the relevant statutory accident prevention regulations and be serviced according to the manufacturer's instructions.

IMPORTANT: Risk of damage!
 Before driving onto a lifting platform, make sure there is sufficient ground clearance between the lifting platform and the car.
 The vehicle may only be raised with the lifting platform at the four jacking points.

Necessary preliminary tasks:

- If necessary, remove jacking points from equipment pack and insert from below into openings in front and rear sill areas

IMPORTANT: Risk of damage!
 Align support plates (2) of lifting platform arms to jacking points (1) in such a

way that no adjoining components are touched and thereby damaged.

Fig. 4: Lifting Platform Support Plates And Jacking Points
Courtesy of BMW OF NORTH AMERICA, INC.

00 NOTES ON USING REPAIR INSTRUCTIONS, TECHNICAL DATA, TIGHTENING TORQUES

These repair instructions are intended to help expertly carry out maintenance and repair work.

They thus supplement the practical and theoretical training of master mechanics and fitters in BMW's Service Training Centers.

The Repair Instructions describes the removal, installation and replacement of subassemblies in the vehicle.

The Repair Instructions describe tasks which can be carried out on series-production BMW Group vehicles and vehicles which have not been subsequently converted.

Cross-references to "Technical Data" and "Tightening Torques" must be complied with.

If there are no cross-references to tightening torques in the repair instructions, the excerpts from the company standard BMW N 600 02.0 must be observed.

Cross-references to other flat rate units are intended as an aid and can refer to a complete work operation or merely to individual work steps contained therein.

Cross-references to other flat rate units must not be considered as an extension of the labor performance standard.

The structure of the Repair Instructions corresponds to the numbering system of the flat rate manuals (flat rate units).

NOTE: **With the exception of inspection operations, no flat rates are published for the**

E52 (Z8) model series. However, the numbering system (flat rate units) is retained.

Furthermore, the corresponding microfiches of the repair instructions are valid for the E12, E21, E24, E28, E30, E31 and E34 model series.

The microfiche is also valid for the E32 model series with the following exception: For the 750i, 750Li models and the job description 31 31 000 Replacing front left or right spring strut, the TIS CD must be used!

In general, the individual work steps of the Repair Instructions describe only the removal of subassemblies. All removed subassemblies are reinstalled in reverse sequence. If particular features need to be observed during installation, they are identified as notes on installation. In contrast, complicated removal and installation procedures are described separately.

Further information on repair operations can be found on the "Commercial Service Data CD (KSD CD)". For the E39, E46 and E53 model series and the following model series, it is possible after selecting the FRU items to activate the corresponding information via the Text and Inclusive Items buttons.

Improvements and modifications are published regularly in service information bulletins.

00 RAISING VEHICLE WITH TROLLEY JACK

IMPORTANT: Observe the following trolley-jack-related instructions:

1. Use only BMW-distributed/approved trolley jacks which have rubber plate contact points.
2. Trolley jacks must be regularly serviced and always checked for functional reliability before they are used!
3. Check the rubber plate on the trolley jack prior to each use, replacing if necessary.

Fig. 5: BMW Trolley Jack

Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: The vehicle may be raised with a trolley jack only at the following jacking points!

Fig. 6: Jacking Points And Rear Differential
Courtesy of BMW OF NORTH AMERICA, INC.

Risk of damage: It is not permitted to raise the vehicle at the rear differential cover!

00 ... SYMBOLS USED AND INFORMATION IN REPAIR INSTRUCTIONS

WARNING: Precautionary rules and measures which protect mechanics and other personnel against injury (including life-threatening injuries).

Example:

WARNING: Danger of scalding!
Only perform this work after engine has cooled down.

IMPORTANT: Specific instructions and precautionary measures which prevent damage to the vehicle or to vehicle parts. Failure to comply with the above will invalidate any warranty claims.

The caution symbol is used in all repair instructions.

However, use of the warning word "Caution!" is not binding in every case.

The notes, instructions and precautionary measures mentioned above retain their validity.

NOTE: Particular information on improved procedures for operation, testing, adjustment and upkeep.
Also indicates the end of a repair section.

Recycling:

Observe country-specific waste-disposal regulations

General information:

Refers to other instructions: such as e.g.:

Necessary preliminary tasks;

Further instructions: refer to operating instructions for balancing machine.

Replacement:

Carry out programming/coding.

NOTE: Many electronic control units must be programmed/coded (e.g. when replaced).

NOTE: • Connect BMW diagnosis system

IMPORTANT: Read and comply with notes on protection against electrostatic damage (ESD protection).

NOTE: Electronic control units and other electronic components - if handled incorrectly - can be damaged or destroyed by electrostatic discharge.

00 00 ... AIR CLEANER: REPLACING AIR CLEANER ELEMENT (SHORTEN REPLACEMENT INTERVAL ACCORDINGLY IN EVENT OF LARGER BUILDUP OF DUST)

- Replace air cleaner (filter) in accordance with repair instructions

00 00 ... BATTERY: CHECKING DISPLAY. IF NECESSARY, RECHARGE BATTERY.

IMPORTANT: Observe safety instructions for handling vehicle battery, see 61 00 ... SAFETY INSTRUCTIONS FOR HANDLING VEHICLE BATTERY .

Vehicles with low-maintenance battery:

Check acid level, top up with distilled water if necessary

If level drops below Max. marking, top up distilled water to Max. marking.

Vehicles with maintenance-free battery:

IMPORTANT: For information on how to proceed, refer to BATTERY CHARGING

Issue a separate invoice if the battery is recharged.

00 00 ... BATTERY: CHECKING ACID LEVEL, TOPPING UP WITH DISTILLED WATER IF

NECESSARY. IF NECESSARY, RECHARGE BATTERY.

IMPORTANT: Observe safety instructions for handling vehicle battery, see 61 00 ... SAFETY INSTRUCTIONS FOR HANDLING VEHICLE BATTERY .

Vehicles with low-maintenance battery:

Check acid level, top up with distilled water if necessary

If level drops below Max. marking, top up distilled water to Max. marking.

Vehicles with maintenance-free battery:

**IMPORTANT: For information on how to proceed, refer to BATTERY CHARGING .
Issue a separate invoice if the battery is recharged.**

00 00 ... BODY AND UNDERBODY: CHECKING FOR CORROSION AND DAMAGE

Inspect chassis, underbody and wheel arches and check for corrosion and damage.

NOTE: It is absolutely essential to rectify any identified faults after consulting the customer and to issue a separate invoice.

00 00 ... BODY AND UNDERBODY: CHECKING FOR CORROSION AND DAMAGE - EXCEPT CAVITIES

Visually inspect the underbody, wheel arches and frame members for rust and damage.

IMPORTANT: If damage to the underbody is identified:

- If necessary, remove panels from underbody.
- Check mountings and fixtures and brake and fuel lines for damage and correct installation position.

Rectify identified faults after consulting with customer and issue a separate invoice.

00 00 ... BODY: CHECK FOR CORROSION (EXCEPT CAVITIES)

Visually inspect the underbody, wheel arches and frame members for rust and damage.

IMPORTANT: If damage to the underbody is identified:

- If necessary, remove panels from underbody.

- **Check mountings and fixtures and brake and fuel lines for damage, corrosion and correct installation position.**

Rectify identified faults after consulting with customer and issue a separate invoice.

00 00 ... BRAKE LINES AND CONNECTIONS: VISUAL INSPECTION FOR LEAKS, DAMAGE AND CORRECT POSITION

Check brake lines and connections

- Visual inspection in visible area for:
 - leaks; if necessary, check brake fluid level in expansion tank
 - traces of fluid
 - damage
 - crushing/flattening
 - correct routing of brake lines
 - correct seating of brake lines in holders

NOTE: Detected faults must urgently be repaired after consultation with the customer!

00 00 ... CHANGING BRAKE FLUID

- Change brake fluid in accordance with repair instructions, see **34 00 025 REPLACING FLUID IN ABS/ASC+T BRAKE SYSTEM**
- Read and comply with general notes and information on brakes, see **34 00 ... GENERAL INFORMATION**

NOTE: Issue a separate invoice for changing the brake fluid.

00 00 ... CHANGING ENGINE OIL AND OIL FILTER

NOTE: Change engine oil and oil filter in accordance with repair instructions

00 00 ... CHECK WINDSCREEN WASH/WIPE SYSTEM

- Check wipe pattern for smearing; if necessary, replace wiper blades after consulting with customer
- The spray jet must emerge uniformly from the spray nozzle, replace nozzle if necessary and issue a separate invoice.
- The spray nozzles are preset at the factory and cannot be adjusted later

IMPORTANT: Do not under any circumstances use a needle or similar to adjust the spray

nozzles as such an implement would damage the water channels in the nozzle!

00 00 ... CHECKING CLUTCH DRIVE PLATE FOR WEAR

- Check clutch drive plate for wear during a test drive (see **FINAL CHECK**)

00 00 ... CHECKING COOLANT LEVEL AND CONCENTRATION, CORRECTING IF NECESSARY

- Check connections, hose clamps and hoses for coolant residues and damage such as e.g. cracks.
- Check coolant level in expansion tank. Coolant level must be between Min. and Max. markings. If necessary, top up coolant to max. fill level.
- In event of topping up: Check concentration with antifreeze tester (special tool) in coolant expansion tank.

If necessary, drain off the difference quantity at the coolant drain plug and top up with recommended coolant (issue a separate invoice).

00 00 ... CHECKING HANDBRAKE LEVER TRAVEL, ADJUSTING ACCORDING TO SETTING SPECIFICATIONS IF NECESSARY

- **Checking parking brake**

Check handbrake lever travel and adjust in accordance with repair instructions, see **34 10 014**
ADJUSTING HANDBRAKE

00 00 ... CHECKING LIGHTING SYSTEM

- Check lighting system for correct operation:
 - Check headlights, rear lights and associated telltale/indicator lamps
 - Check sidelamps, parking lights, dipped-beam and main-beam headlights for correct operation
 - Check headlight flasher for correct operation
 - Check signal horn
 - Check left/right direction indicators and hazard warning system for correct operation
 - Check brake lights for correct operation
 - Check reversing lights and license plate lights for correct operation
 - Check front and rear fog lights for correct operation
 - Check inside light on interior rearview mirror for correct operation
 - Check instrument and indication field lighting

NOTE: Perform a check of headlight adjustment only at the customer's request and issue a separate invoice.

00 00 ... CHECKING ROADWORTHINESS

○ **Checking roadworthiness**

- Take vehicle for a test drive, checking service and parking brakes in the process
- For vehicles with rear disc brakes, brake in parking brake as instructed, see **34 10 014**
ADJUSTING HANDBRAKE
- Check steering for play, ease of movement and directional stability
- Check clutch for problem-free disengagement and non-spasmodic driving off at normal operating temperature
- Check function of all drive positions and driving programs in cars with automatic transmissions.
- Visually inspect shock absorbers for leaks
- Check indicator/warning lamps and Check Control system for correct operation
- Check due date for statutory roadworthiness and exhaust emission tests and advise customer of test dates

00 00 ... COOLANT HOSES: VISUAL INSPECTION FOR LEAKS. CHECKING COOLANT LEVEL AND CONCENTRATION, TOPPING UP IF NECESSARY

- Check connections, hose clamps and hoses for coolant residues and damage such as e.g. cracks.
- Check coolant level in expansion tank. Coolant level must be between Min. and Max. markings. If necessary, top up coolant to max. fill level.
- Check concentration with antifreeze tester (special tool) in coolant expansion tank.

If necessary, drain off the difference quantity at the coolant drain plug and top up with recommended coolant (issue a separate invoice).

00 00 ... DIAGNOSTIC BRIEF TEST

- Connect BMW diagnosis system (DIS) to diagnosis socket or OBD socket
- Switch ignition on
- Carry out vehicle identification
- Start brief test

NOTE: **For diagnostics, the brief test is essential for evaluating possible stored diagnostic trouble codes. In the brief test, the control units are physically identified in succession and their fault memories read out. Check identified faults and if necessary rectify these faults after consulting with customer.**

00 00 ... DIAGNOSTIC BRIEF TEST

Connect diagnostic system to OBD socket.

Switch on ignition.

Carry out vehicle identification.

Click on Brief test.

The brief test is carried out.

NOTE: For motor vehicle diagnostics, the brief test is essential for evaluating possible stored diagnostic trouble codes.
In the brief test, the control units are physically identified in succession and their fault memories read out.
If the fault memory has been read out, the faults appear in the "Fault pattern selection" mask in the "Fault memory contents" field.
Check identified faults and if necessary rectify these faults after consulting with customer.

00 00 ... EXHAUST SYSTEM: CHECKING CONDITION, MOUNTING AND INSPECTING FOR LEAKS

- **Condition**
 - Check exhaust system for corrosion and cracks
 - Check screw connections on flanged joints and clamping sleeves for damage
- **Routing**
 - Check that exhaust system is correctly routed and free of obstructions on the underbody
 - Check that heat shields are fitted and securely seated
- **Mounting**
 - Check rubber mounts and rubber rings for cracks and whether any are missing
- **Leaks**
 - Check exhaust system at flanged joints and clamping sleeves for black combustion residues.

NOTE: After consultation with the customer, rectify faults and issue a separate invoice.

00 00 ... FRONT AND REAR BRAKE LININGS: CHECKING LINING THICKNESS WITH MEASURING GAUGE. IF LININGS ARE REPLACED: CLEANING BRAKE SHAFTS, CHECKING BRAKE DISK THICKNESS AND SURFACE, APPLYING GREASE TO WHEEL CENTERING ON ALLOY WHEELS. IF REAR LININGS ARE REPLACED: CHECKING PARKING BRAKE LININGS

- Check brake lining thicknesses with measuring gauge at front and rear, see **34 00 010 CHECKING THICKNESS OF BRAKE PAD**
- Clean brake shafts
- Replace brake linings if they drop below minimum thickness (refer to Technical Data)
- Replace brake discs if they drop below minimum thickness (refer to Technical Data) and in event of scoring, heat cracks, lateral runout or thickness difference
- Clean wheel centering on alloy wheels and apply a thin coating of grease

- Remove front and (if necessary) rear disc brake pads
 - Remove and install front disc brake pads, see **34 11 000 REMOVING AND INSTALLING/REPLACING BRAKE LININGS OF BOTH FRONT DISC BRAKES**
 - Remove and install rear disc brake pads, see **34 21 200 REMOVING AND INSTALLING/REPLACING BOTH REAR DISC BRAKES**

Additional tasks when changing rear linings

- Remove rear brake discs, see **34 21 320 REMOVING AND INSTALLING/REPLACING BOTH BRAKE DISKS**
- Check parking brake lining for porosity and wear
- Check ease of movement of expander lock

NOTE: Defective brake pads/linings/brake discs must be repaired after consultation with customer and a separate invoice issued

00 00 ... FUEL LINES, FUEL TANK AND FUEL HOSES: VISUAL INSPECTION FOR ROUTING, CONDITION AND LEAKS

- Check fuel lines and hoses and fuel system connections for traces of fluid and for leaks
- Check fuel tank(s) and hoses for damage such as cracks, flattening etc.
- Check that fuel lines are routed correctly
- Check that fuel lines are correctly seated in holders

NOTE: Detected faults must urgently be repaired after consultation with the customer!

00 00 ... HEATING/AIR CONDITIONING: REPLACING MICROFILTER/CARBON CANISTER (SHORTEN REPLACEMENT INTERVAL ACCORDINGLY IN EVENT OF LARGER BUILDUP OF DUST)

- Changing microfilter, refer to repair instructions:
 - Microfilter E39
 - Microfilter E46
 - Microfilter E53
 - Microfilter E85
 - Microfilter E83, see **64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION**

IMPORTANT: In the E39 the water drain under the brake booster must be checked for contamination and if necessary cleaned when the microfilter is changed.

NOTE: In the case of older model years, issue a separate invoice for replacing the microfilter.

00 00 ... INFORMATION/WARNING LABELS

Fig. 7: Information/Warning Labels Location
 Courtesy of BMW OF NORTH AMERICA, INC.

INFORMATION/WARNING LABELS SPECIFICATION

Location:	Information/warning label:	Country:
Various components	Replacement identification-spare parts-	US, CDN
Various components	Anti-theft protection	US, CDN
Engine compartment (1):		
Battery	Battery sticker	Gulf States
Headlights/engine compartment	Mercury (xenon headlights)	Worldwide
Engine compartment/raw air snorkel	Aluminium screws/bolts	Worldwide
Cylinder head cover	Ignition coil	Worldwide
Engine compartment/end panel	BMW High Performance Oil	US, not CDN
Engine compartment/end panel	Premair	US
Engine compartment	ICES CDN	CDN
Engine compartment	EC nameplate	Worldwide, not US, CDN, Japan, Australia, Gulf States
Engine compartment/hood/bonnet	Refrigerant	Worldwide
Engine compartment/hood/bonnet	Production date	Australia, Great Britain
Engine compartment/hood/bonnet	Exhaust gas	Australia, US, CDN
Engine compartment/brake booster	Brake fluid	CDN
Engine compartment/hood/bonnet	Exterior paint	Worldwide

Engine compartment/hood/bonnet	BMW genuine spare parts	Worldwide
Interior (2):		
Windscreen, top right	Airbag-windscreen	Europe
Windscreen	CCC	China
Windscreen	Vehicle identification number	US, CDN, Gulf States, Great Britain & South Africa
I Drive	A/C menu	US, CDN
Passenger compartment/instrument panel	Airbag, instrument panel	US, CDN
Interior/sun visor	Airbag-sun visor	US, CDN
Steering wheel/speedometer	Top speed-210 km/h-Only with optional extra and for car rental	Germany
Complete vehicle, bodyshell:		
B-pillar	Airbag symbol (front passenger)	Worldwide (not US and CDN)
B-pillar	Vehicle identification number	Brazil
B-pillar	Manufacturer's certificate	US, CDN, Gulf States
B-pillar	Tyre inflation pressure	Europe, US, CDN, Australia
B-pillar	Runflat indicator	Worldwide
B-pillar	Side airbag	Worldwide
Door, driver's side	Towing	Worldwide
Rear end (3):		
Fuel cap/hood/bonnet	Independent heating	Europe

Underfloor (4):		
Vehicle jack	Vehicle jack	Australia
Front axle carrier	Airbag (basic setting)	Worldwide
Tension strut with hydro - mount	Do not lash down	Worldwide
Key: US = United States CDN = Canada CCC = Car Communication Computer OBD = On-Board Diagnosis		

NECESSARY

Lock car and check that locks and central locking (incl. tank cap) work properly.

Depending on equipment specification, check comfort locking function of windows and sliding sunroof.

Check function and ease of movement at:

- Door/luggage compartment/bonnet/hood locks
- Door brakes
- Door/engine hood/bonnet/fuel filler cap/rear lid hinges
- Arrester hooks on engine bonnet/hood

and apply oil or grease if necessary.

00 00 ... MICROENCAPSULATED SCREWS

Screw locking is a means to preventing a screwed connection from being loosened by external influences.

After the screw has been coated with the adhesive, the adhesive remains inactive until it is activated by capsule breakage when the screw is inserted and then cures at room temperature.

Installation:

- Microencapsulated screws (Loctite) must be replaced and may not be reused
- Screw connection must be completed within 20 mins. (start of curing)
- Microencapsulated screws must not be retightened
- Thread of nut must be cleaned beforehand in event of repeated use

00 00 ... OIL CHANGE IN MANUAL TRANSMISSION

- Carry out oil change in manual transmission in accordance with repair instructions, see **00 11.. ... Draining/topping up gear oil in manual transmission**

00 00 ... OIL CHANGE IN REAR DIFFERENTIAL

- Carry out oil change in rear differential in accordance with repair instructions, see **00 11 259 Oil change in rear differential incl. used oil disposal**

00 00 ... OIL CHANGE IN TRANSFER CASE

- Change oil in transfer case in accordance with repair instructions

00 00 ... OUTPUT SHAFTS: CHECKING GAITERS FOR LEAKS

- Rotate rear left and right wheels by hand; in so doing, check inner and outer gaiters for damage such as

holes, cracks or porosity

- Check gaiters for leaks (emerging grease)
- Check that strap retainers are securely attached to gaiters and whether any straps are missing
- On all-wheel drive vehicles the same procedure applies to the output shafts on the front axle

00 00 ... POWER STEERING/RIDE-HEIGHT CONTROL: VISUAL INSPECTION FOR LEAKS, CHECKING FLUID LEVEL, TOPPING UP FLUID IF NECESSARY

Visual inspection and leak test

Check connections, hoses and steering gear for traces of fluid.

Checking fluid level

Check fluid level with engine switched off at expansion tank of power steering/ride-height control system.

If necessary, add hydraulic fluid (refer to Service Information Operating Fluids) up to Max. marking (1).

**IMPORTANT: If the fluid level has dropped to the Min. marking (2), you must check the power steering and ride-height control for leaks and issue a separate invoice for this work.
It is not enough merely to top up the fluid.**

Fig. 8: Fluid Level

Courtesy of BMW OF NORTH AMERICA, INC.

00 00 ... RAISING BMW MULTI-TRAILER

**CAUTION: Twin-strut underfloor platforms and twin-pillar lifting platforms are suitable for raising the BMW multi-trailer.
Lifting platforms with drive-on surfaces are not suitable for raising in order to carry out maintenance and repair work.**

The lifting platform must comply with the relevant statutory accident prevention regulations and be serviced according to the manufacturer's instructions. It is essential to follow the lifting platform operating instructions, in particular the safety instructions and carrying capacity!

Make sure you adhere to the BMW-recommended work area of 5 x 7 m and to an escape route of 0.6 m between two lifting platforms.

Before raising the BMW multi-trailer, please observe the following points:

- Raise the trailer only when it is unloaded
- Remove a supplied loading ramp from the loading ramp frame so that all chassis areas of the BMW multi-trailer are freely accessible
- There must be sufficient clearance between the carrier arms/flat girder bridges and the GFK aprons or the front guard of the BMW multi-trailer
- The BMW multi-trailer must always be positioned in the middle of the lifting platform.

CAUTION: You will need special additional supports for the lifting platform in order to bridge the difference in height between longitudinal member and lower edge of GFK side apron or front guard of the BMW multi-trailer. The minimum height of the additional supports is 145 mm. Use only the additional supports approved by the platform manufacturer or specified in these repair instructions.

You will find appropriate examples in the repair instructions for the majority of lifting platforms present in BMW workshops. For lifting platforms that are not named, the relevant manufacturers will offer you appropriate additional supports. Please contact directly the manufacturer of the lifting platform used in your dealership.

CAUTION: The BMW multi-trailer may only be raised by its longitudinal members. Do not under any circumstances raise the BMW multi-trailer by the GFK aprons. Make sure the additional supports bear the longitudinal members over their entire width and no attachments or wiring harnesses are touched or jammed. Check the securing equipment of the additional supports for correct seating. Under no circumstances should any work be carried out underneath the BMW multi-trailer if it is not adequately secured against slipping off the lifting platform.

The areas (2) on the longitudinal members (1) marked in the adjacent diagram are the best areas for attaching the additional supports.

Fig. 9: Longitudinal Member Additional Support Areas
 Courtesy of BMW OF NORTH AMERICA, INC.

General notes on using twin-pillar lifting platforms

For the twin-pillar lifting platforms described, the BMW multi - trailer is positioned in the direction of travel on the platform. For lifting platforms which do not create sufficient clearance between disk wheel and carrier arms, move the BMW multi trailer against the direction of travel onto the platform.

Becker & Soumlhne twin-strut underfloor platform

The BMW multi-trailer can only be raised if it is supported at right angles to the direction of travel. For raising, use the high additional supports (1) of Becker & Soumlhne.

Fig. 10: High Additional Supports
 Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Also lash the BMW multi-trailer to the flat girder bridges of the lifting platform. Flag the protruding tow hitch and the drawbar member of the BMW multi-trailer conspicuously so as to prevent injury, e.g. with a red cloth.

MAHA twin-pillar lifting platform

The BMW multi-trailer can only be raised if you use the support plate attachment sleeves for transporters (1). Position the axle of the BMW multi-trailer in the direction of travel in front of the pillars of the platform in order to obtain the specified lifting ranges and to establish sufficient clearance between disk wheel and carrier arms. The long carrier arms raise the front and the short carrier arms raise the rear of the BMW multi-trailer.

Fig. 11: MAHA Twin-Pillar Lifting Platform Transporters
Courtesy of BMW OF NORTH AMERICA, INC.

Romaico-Lift twin-pillar lifting platform

The BMW multi-trailer can only be raised if you use the 146 mm high attachments (1). Position the axle of the BMW multi-trailer in the direction of travel in front of the pillars of the platform in order to obtain the specified lifting ranges and to establish sufficient clearance between disk wheel and carrier arms. The long carrier arms raise the front and the short carrier arms raise the rear of the BMW multi-trailer.

Fig. 12: Romaico-Lift Twin-Pillar Lifting Platform High Attachments
Courtesy of BMW OF NORTH AMERICA, INC.

Working pit

The BMW multi-trailer can be serviced or repaired in conjunction with a working pit if the following measures are taken into consideration. The BMW multi-trailer must be secured against slipping/tilting sideways. The drawbar jockey wheel must be firmly secured against rolling.

00 00 ... REPLACING SPARK PLUGS

- Replace spark plugs in accordance with repair instructions, see **12 12 011 REPLACING ALL SPARK PLUGS (N42, N40, N46, N45, N52, N52K, N51)**

00 00 ... RESETTING SERVICE INTERVAL INDICATOR ACCORDING TO FACTORY SPECIFICATIONS

Special tools required:

- 61 1 110

For vehicles with diagnosis socket in engine compartment:

Necessary preliminary tasks:

- Switch ignition on.
- Attach resetter (special tool 61 1 110) to diagnosis socket in engine compartment

Resetting engine oil service

Press yellow button (1) for engine oil service.

Green lamp (2) lights up.

Wait until yellow lamp (3) lights up and then goes out again.

Check that oil service indicator has been reset.

Fig. 13: Oil Service Indicator Green Lamp, Yellow Button And Lamp
Courtesy of BMW OF NORTH AMERICA, INC.

Reset service

Press red button (1) for inspection.

Green lamp (2) lights up.

Wait until red lamp (3) lights up and then goes out again.

Turn off ignition, wait 20 seconds and repeat procedure in order to adapt interval of annual inspection to inspection.

Check that service interval indicator has been reset.

Fig. 14: Oil Service Indicator Green Lamp, Red Button And Lamp
Courtesy of BMW OF NORTH AMERICA, INC.

For vehicles without diagnosis socket in engine compartment:

For vehicles which do not have a diagnosis socket in the engine compartment, the service interval indicator is reset via the instrument cluster or the Diagnosis and Information System (DIS).

For details of the exact procedure, please refer to the Owner's Handbook for the vehicle in question or the Diagnosis and Information System (DIS).

00 00 ... SEAT BELTS: CHECKING CONDITION OF BELT STRAP, FUNCTION OF INERTIA REEL MECHANISM, LOCKING REEL, BELT BUCKLE

Belt strap, retractor mechanism, belt interlock

Pull out strap and make sure it emerges without jerking.

Check belt strap for

- folding
- unraveling

- pinches
- cracks and tears
- traces of melting

Retract belt strap; here the inertia reel mechanism must retract the strap automatically and without squeaking noises, the last section of the strap may have to be fed in.

Pull out belt strap in short tugs - locking reel must lock.

Belt buckle

The tongue on the belt strap must easily snap into place with an audible click.

When the "Press" button is pressed, the tongue must be ejected from the buckle under spring pressure.

NOTE: If the seat belt is damaged, you must replace the seat belt completely after consulting the customer; issue a separate invoice for this work. Instructions on how to proceed, refer to 72 11 ... CHECKING AUTOMATIC SAFETY BELT .

00 00 ... STEERING COMPONENTS: CHECKING FOR ZERO CLEARANCE, LEAKS, DAMAGE AND WEAR

Checking play:

- Steering wheel:

Move steering wheel back and forth and check for play

- Tie rod joint:

There must no clearance between tie rod arm (2) and tie rod joint (1).

Fig. 15: Tie Rod Arm And Joint
 Courtesy of BMW OF NORTH AMERICA, INC.

Checking for leaks:

The following illustration shows the arrangement of the power steering components and lines.

Fig. 16: Power Steering Components
 Courtesy of BMW OF NORTH AMERICA, INC.

Check all visible connections, hoses, lines and steering gear for traces of fluid.

Checking for damage and wear:

Check gaiters, flexible disc and axle and tie rod sleeves for damage (e.g. cracks, holes), for leaks or missing clamping bands on gaiters.

00 00 ... STEERING COMPONENTS: CHECKING FOR ZERO CLEARANCE, LEAKS, DAMAGE AND WEAR

Checking play:

- For hydraulically assisted steering systems, the engine must be running

- For electrically assisted steering systems, the ignition must be on

- Steering wheel:

Move steering wheel back and forth and check for play

- Tie rod joint:

There must no clearance between tie rod arm (2) and tie rod joint (1).

Fig. 17: Tie Rod Arm And Joint

Courtesy of BMW OF NORTH AMERICA, INC.

Checking for leaks:

The following illustration shows the arrangement of the power steering components and lines.

Fig. 18: Power Steering Components
 Courtesy of BMW OF NORTH AMERICA, INC.

Check all visible connections, hoses, lines and steering gear for traces of fluid.

Checking for damage and wear:

Check gaiters, flexible disc and axle and tie rod sleeves for damage (e.g. cracks, holes), for leaks or missing clamping bands on gaiters.

00 00 ... STEERING FLUID RESERVOIR: CHECK OIL LEVEL.

IMPORTANT: Adhere to the utmost cleanliness. Do not allow any dirt to enter the hydraulic system.

Using contaminated equipment to add fluid may introduce dirt particles into the fluid reservoir and significantly reduce the service life of the power steering system. Do not use any filler funnels or similar!

Visual inspection and leak test

Check connections, hoses and steering gear for traces of fluid.

Checking fluid level

Check fluid level with engine switched off at expansion tank of power steering/ride-height control system. The fluid temperature should be approx. 20°C here.

Ensure that the cap is fully screwed in prior to the fill level check.

If necessary, add hydraulic fluid up to Max. marking (1).

IMPORTANT: If the fluid level has dropped to the Min. marking (2), you must check the power steering and ride-height control for leaks and issue a separate invoice for this work.

It is not enough merely to top up the fluid.

Fig. 19: Fluid Level

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: To avoid mix-ups when filling with hydraulic fluid, mark the fluid reservoirs or their caps with identification marks.

ATF Automatic transmission fluid

CHF Pentosin CHF11S

Fig. 20: Fluid Reservoir Caps With Identification Marks
 Courtesy of BMW OF NORTH AMERICA, INC.

00 00 ... TRANSMISSION (ALL GEARS): VISUAL INSPECTION FOR LEAKS.

- Inspect visible area of all transmissions for traces of fluid, remove underbody protection if necessary

Rectify identified faults after consulting with customer and issue a separate invoice

00 00 ... TIRES: CHECKING INFLATION PRESSURE, CORRECTING IF NECESSARY (INCL. SPARE WHEEL), CHECKING EXTERNAL CONDITION, TREAD DEPTH, PATTERN. IN EVENT OF NONUNIFORM WEAR, CARRY OUT MEASUREMENT AND CORRECTION OF WHEEL ALIGNMENT

○ **Checking tire inflation pressure:**

- Check tire inflation pressure in accordance with information plate on B-pillar
- The inflation pressure in the spare wheel must be 0.5 bar higher than the maximum specified value on the information plate
- If necessary, initialize Run Flat Indicator, see **36 11 500 INITIALIZING RUN FLAT INDICATOR (RPA)**

○ **Checking tire condition:**

- Check tread depth of all tires with tire tread gauge
- Check tire tread surfaces and side walls for incisions and foreign particles such as nails or screws
- Check tire tread pattern for localized flattening and wear on one side; if necessary, carry out wheel/chassis alignment after consulting with customer and issue a separate invoice for this work

NOTE:

- **For details of approved wheel/tire combinations, refer to KSD CD**
- **For reasons of driving safety, only use tires of the same type and tread pattern on a single vehicle**
- **Inform customer of any incorrect or worn tires**

00 00 ... TIRES: CHECKING INFLATION PRESSURE, CORRECTING IF NECESSARY (INCL. SPARE WHEEL), CHECKING EXTERNAL CONDITION, TREAD DEPTH, PATTERN

- **Checking tire inflation pressure:**
 - Check tire inflation pressure in accordance with information plate on B-pillar
 - The inflation pressure in the spare wheel must be 0.5 bar higher than the maximum specified value on the information plate
 - Initialize Run Flat Indicator, see **36 11 500 INITIALIZING RUN FLAT INDICATOR (RPA)**
- **Checking tire condition:**
 - Check tread depth of all tires with tire tread gauge
 - Check tire tread surfaces and side walls for incisions and foreign particles such as nails or screws
 - Check tire tread pattern for localized flattening and wear on one side; if necessary, carry out wheel/chassis alignment after consulting with customer and issue a separate invoice for this work

NOTE:

- **For details of approved wheel-tyre combinations, refer to KSD CD**
- **For reasons of driving safety, only use tires of the same type and tread pattern on a single vehicle**
- **Inform customer of any incorrect or worn tires**

00 00 ... UNDERBODY INCL. ALL VISIBLE COMPONENTS: CHECKING FOR DAMAGE, LEAKS, CORROSION

- Visually inspect underbody:
 - For leaks (transmission, brake components, steering)
 - Damage to underbody
 - Corrosion on underbody

IMPORTANT: If damage to the underbody is identified:

- **If necessary, remove panels from underbody.**
- **Check mountings and fixtures and brake and fuel lines for damage and correct installation position.**

Rectify identified faults after consulting with customer and issue a separate invoice.

00 00 ... UPKEEP MEASURES FOR STORED VEHICLES (NEW AND USED CARS) AND VEHICLES TO BE LAID UP AT CUSTOMER'S PREMISES

VEHICLES AND IMPLEMENTATION CHART

Measure	Vehicles	Implementation
---------	----------	----------------

Renew outer skin preservation (new cars must always be stored in preserved condition; preservation/depreservation instructions)	New cars	every 6 months; Tropical countries every 4 months
Release parking brake	New cars	in general
	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
Engage gear or selector lever position "P" for automatic	New cars	in general
	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
Check covering of interior equipment	New cars	in general
Increase tire inflation pressure to 3.5 bar	New cars	in general
	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
If battery master switch is fitted, switch off	New cars	in general
Charge battery	New cars	every 6 weeks batteries disconnected from vehicle electrical system every 12 weeks in general before handover to customer
	Used cars	every 6 weeks batteries disconnected from vehicle electrical system every 12 weeks
	Customer cars to be laid up (instructions to customer)	every 6 weeks batteries disconnected from vehicle electrical system every 12 weeks
Change brake fluid and reset service interval indicator (clock symbol only)	New cars	lay-up periods > 6 months, change before handover of vehicle to customer
	Used cars	lay-up periods > 6 months, change before handover of

		vehicle to customer
Check convertible top for possible damage	New cars	in general before handover to customer
	Used cars	in general before handover to customer
Park convertibles, if possible, under a roof	New cars	in general
	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
Check for damage to paintwork and exterior/interior equipment	New cars	in general before handover to customer
	Used cars	in general before handover to customer
Change engine oil and oil filter when engine is at normal operating temperature	New cars	from 12 months lay-up period before handover of vehicle to customer
	Used cars	from 12 months lay-up period before handover of vehicle to customer
	Customer cars to be laid up (instructions to customer)	from 12 months lay-up period before handover of vehicle to customer
Check coolant concentrate	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
Apply hand and foot brakes when dry	New cars	in general
	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general
Perform surface protection: Vehicle washing with inside cleaning and subsequent preservation of paintwork and chrome. Clean rubber seals on hoods/bonnets, rear lids and doors and apply talc or glycerine. Perform cleaning, preservation and subsequent treatment of engine, engine	Used cars	in general
	Customer cars to be laid up (instructions to customer)	in general

compartment, underbody, axles and assemblies with BMW-approved materials.		
Switch on A/C system once a month for 10 minutes	Used cars	necessary in order to retain full operational capability of gaskets and expansion valve (omitted in case of R134a refrigerant, identified by rating plate in engine compartment)
	Customer cars to be laid up (instructions to customer)	necessary in order to retain full operational capability of gaskets and expansion valve (omitted in case of R134a refrigerant, identified by rating plate in engine compartment)

00 00 ... WINDSCREEN WASH/WIPE SYSTEM: CHECKING WASHER FLUID RESERVOIR AND SPRAY NOZZLE ADJUSTMENT

- Check wiper blades for cracks; if necessary, replace wiper blades after consulting with customer
- Check wipe pattern for smearing; if necessary, replace wiper blades after consulting with customer
- The spray jet must emerge uniformly from the spray nozzle, replace nozzle if necessary and issue a separate invoice.
- Check spray nozzle adjustment of windscreen washer system, adjust if necessary

(On the E85 and E83 the spray nozzles are preset at the factory and cannot be adjusted later)

- Check spray nozzle adjustment of headlight washer system, adjust if necessary, refer to (On the E85 and E83 the spray nozzles are preset at the factory and cannot be adjusted later)

IMPORTANT: Do not under any circumstances use a needle or similar to adjust the spray nozzles as such an implement would damage the water channels in the nozzle!

00 00 ... WINDSCREEN WASHER SYSTEM AND INTENSIVE CLEANING SYSTEM: CHECKING FLUID LEVEL, TOPPING UP IF NECESSARY

- Top up windscreen washer fluid reservoir, if necessary rear window washer fluid reservoir and (depending on equipment specification) intensive cleaning reservoir up to edge or mark.

IMPORTANT: A ph-neutral BMW window cleaning agent (antifreeze in winter) must always be added to the water.

00 00 ... WINDSCREEN WASHER SYSTEM: CHECKING FLUID LEVEL, TOPPING UP IF NECESSARY

- Top up windscreen washer fluid reservoir, if necessary rear window washer fluid reservoir and (depending on equipment specification) intensive cleaning reservoir up to edge or mark.

IMPORTANT: A ph-neutral BMW window cleaning agent (antifreeze in winter) must always be added to the water.

00 00 005 INTERROGATE FAULT MEMORIES IN DIAGNOSIS SYSTEM

Connect diagnostic system to OBD socket.

Switch on ignition.

Carry out vehicle identification.

Click on Brief test.

The brief test is carried out.

NOTE: For motor vehicle diagnostics, the brief test is essential for evaluating possible stored diagnostic trouble codes. In the brief test, the control units are physically identified in succession and their fault memories read out. If the fault memory has been read out, the faults appear in the "Fault pattern selection" mask in the "Fault memory contents" field.

00 00 250 BMW ENGINE OIL SERVICE INCL. SUPPLEMENTARY SERVICE (N52K)

Special tools required:

- 11 9 240

The FRU item 00 00 250 comprises the BMW engine oil service incl. supplementary service.

Only the engine oil service will be described in these repair instructions.

The supplementary service is made up of the following operations which must be taken from the relevant repair instructions:

- Reset service interval indicator according to factory specification, see **00 00 ... Resetting service interval indicator according to factory specifications**
- Replace microfilter for interior ventilation
- Check brake lining thickness, see **34 00 010 CHECKING THICKNESS OF BRAKE PAD**
- Adjust handbrake/parking brake, see **34 10 014 ADJUSTING HANDBRAKE**
- Parking brake function check

IMPORTANT: Adhere to exact filling quantities.

**Overfilling the engine with engine oil will result in engine damage .
Checking and drip-off times must be observed.**

**IMPORTANT: When working on the engine oil, coolant or fuel circuit, you must always protect the alternator against contamination.
Risk of damage!
The alternator must therefore be covered with suitable apparatus.**

Recycling:

Catch and dispose of drained engine oil in a suitable container.

Observe country-specific waste-disposal regulations.

NOTE: Adhere to the following work steps in sequence:

- 1. Open oil filter cap.**
- 2. Release screw plug in oil sump.**

NOTE: Picture shows the E93 by way of example. Other model series may differ in certain details.

Release oil filter cap with special tool 11 9 240 .

Engine oil flows out of the oil filter housing and back into the oil sump.

Fig. 21: Special Tool (11 9 240)
Courtesy of BMW OF NORTH AMERICA, INC.

Remove and insert oil filter element (1) in direction of arrow.

Installation:

Replace oil filter element (1) and sealing rings (2).

Installation:

Moisten sealing rings (2) with engine oil.

Tightening torque: 11 42 1AZ, see **11 42 OIL FILTER ELEMENT WITH CONNECTIONS** .

Fig. 22: Sealing Rings

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, the picture shows the assembly underside protection and reinforcement plate removed.

Unclip service opening on reinforcement plate.

Open screw plug (1) in oil sump.

Drain engine oil.

Installation:

Replace sealing ring.

Tightening torque: 11 13 1AZ, see **11 13 OIL PAN** .

Pour in engine oil.

Fig. 23: Screw Plug

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Start engine and run at idle until oil pressure warning lamp goes out.

Turn off engine.

Check oil filter cap and screw plug (1) on oil sump for leaks.

Assemble engine.

Checking engine oil level:

- Park vehicle on a horizontal surface
- Allow engine at normal operating temperature to run for three minutes with increased revs (approx. 1100 rpm)
- Read off engine oil level in instrument cluster or on Control Display
- Top up engine oil if necessary

00 11 ... CHECKING/TOPPING UP OIL LEVEL IN REAR DIFFERENTIAL

IMPORTANT: Risk of damage!

To avoid serious damage to the rear differential, it is essential to use only approved gear oils in the differential.

Undo oil filler plug (1).

Check oil level.

If necessary, pour in rear differential oil up to lower edge of opening for oil filler plug (1).

Fig. 24: Oil Filler Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- A. A) Oil filler plug with sealing ring:

Replace sealing ring (1).

Tightening torque: 33 11 3AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

- B. B) Oil filler plug with O-ring:

Replace oil filler plug (2).

Tightening torque: 33 11 9AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

Fig. 25: Sealing Ring And Oil Filler Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Draining gear oil:

- Release oil drain plug (1) and filler plug (2).
- Clean oil drain plug (1) and screw in.

Tightening torque: 23 00 4AZ, see **23 00 TRANSMISSION IN GENERAL** .

Fill transmission with ATF.

- Pour in gear oil until overflowing.
- Tighten in filler screw (2).

Tightening torque: 23 00 4AZ, see **23 00 TRANSMISSION IN GENERAL** .

Fig. 26: Oil Drain And Filler Plug

Courtesy of BMW OF NORTH AMERICA, INC.

00 11 237 CHECKING/TOPPING UP FLUID LEVEL IN AUTOMATIC TRANSMISSION (GA6L45R)

IMPORTANT: Use only the approved transmission fluid.

Failure to comply with this requirement will result in serious damage to the automatic transmission!

Remove exhaust system bracket (1).

Fig. 27: Exhaust System Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

Topping up transmission fluid after a repair:

Stand vehicle on a level surface and secure against rolling off.

Undo filler plug (1).

Installation:

Replace sealing ring.

Top up transmission fluid until it emerges from filling orifice.

Start engine.

Replenish transmission fluid until it emerges from filling orifice.

Screw in filler plug (1).

Tightening torque: 24 11 7AZ, see **24 11 TRANSMISSION CASE, OIL SUMP** .

Press brake pedal to floor and shift through all gears several times at idle speed. Then shift to "P" position (Park).

Then check fluid level.

Fig. 28: Transmission Filler Plug

Courtesy of BMW OF NORTH AMERICA, INC.

Checking fluid level:

- Connect BMW Diagnosis and Information System (DIS) to vehicle.
- Call up Service functions (drive).
- Carry out fluid level check in accordance with instructions.

00 11 259 OIL CHANGE IN REAR DIFFERENTIAL INCL. USED OIL DISPOSAL

IMPORTANT: Risk of damage!

To avoid serious damage to the rear differential, it is essential to use only approved transmission oils in the differential.

NOTE: The oil does not need to be changed in rear differentials carrying the "Life-Time-Oil" sticker.

Only change oil when rear differential is at normal operating temperature.

Recycling:

Catch and dispose of emerging differential oil.

Observe country-specific waste-disposal regulations

Oil drain plug present:

Place oil collecting apparatus underneath.

Remove oil drain plug (1).

Drain and dispose of differential oil.

Undo oil filler plug (2).

Add differential oil up to lower edge of opening for oil filler plug (2).

Fig. 29: Oil Drain And Filler Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

A. Oil drain or oil filler plug with sealing ring:

Replace sealing ring (1).

Tightening torque: 33 11 3AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

B. Oil drain or oil filler plug with O-ring:

Replace oil drain or oil filler plug (2).

Tightening torque: 33 11 9AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

Fig. 30: Sealing Ring And Oil Filler Plug
Courtesy of BMW OF NORTH AMERICA, INC.

No oil drain plug:

Undo oil filler plug (1).

Drain and dispose of differential oil.

Add differential oil up to lower edge of opening for oil filler plug (1); if necessary, refer to Technical Data for necessary fill quantity.

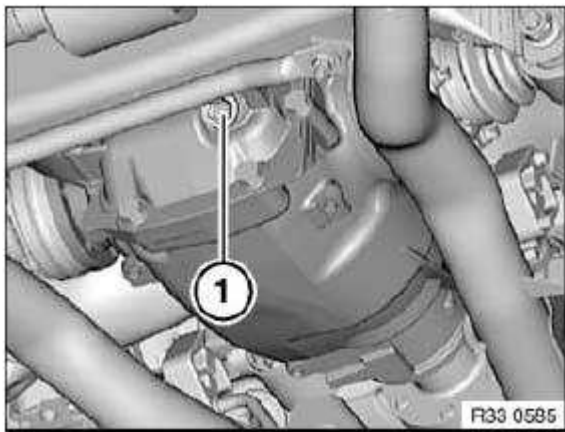

Fig. 31: Oil Filler Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- A. Oil filler plug with sealing ring:

Replace sealing ring (1).

Tightening torque: 33 11 3AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

- B. Oil filler plug with O-ring:

Replace oil filler plug (2).

Tightening torque: 33 11 9AZ, see **33 11 REAR DIFFERENTIAL CASE WITH COVER** .

Fig. 32: Sealing Ring And Oil Filler Plug
 Courtesy of BMW OF NORTH AMERICA, INC.

00 11 572 CHANGING OIL IN TRANSFER BOX (ATC 400/500)

**IMPORTANT: When changing the gear oil, it is necessary to delete the self-adapting wear values in the transfer box control unit.
 Use only the approved transmission fluid.**

Failure to comply with this requirement will result in serious damage to the transfer box!

Catch and dispose of escaping transmission fluid.

Observe country-specific waste-disposal regulations

**NOTE: ATC 500 transfer box:
 Undo oil filler plug (1).
 Tightening torque: 27 00 11AZ, see 27 00 TRANSFER BOX IN GENERAL .**

Fig. 33: Oil Filler Plug
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **ATC 500 transfer box:**
Remove oil drain plug (2).
Tightening torque: 27 00 11AZ, see 27 00 TRANSFER BOX IN GENERAL .

Fig. 34: Oil Drain Plug
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **ATC 400 transfer box:**

Release oil filler plug (1) and oil drain plug (2).

Tightening torque: 27 00 11AZ, see 27 00 TRANSFER BOX IN GENERAL .

Fig. 35: Oil Filler And Drain Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace sealing rings.

Clean oil drain plug (2) and screw in.

Pour in gear oil up to lower edge of filler plug (1).

Tighten in filler screw (1).

Tightening torque: 27 00 11AZ, see 27 00 TRANSFER BOX IN GENERAL .

11 00 REMOVING AND INSTALLING/REPLACING IGNITION COIL COVER (N52K)

Release screws.

Tightening torque: 11 12 6AZ, see 11 12 CYLINDER HEAD WITH CYLINDER HEAD COVER .

Remove ignition coil cover (1).

Fig. 36: Ignition Coil Cover

Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... POSITIONING OF MULTITRAILER HOOD FOR MAINTENANCE AND REPAIR WORK

IMPORTANT: At least two persons are needed to install and remove the hood from the platform.

Before installing and removing the hood, secure the BMW multitrailer and the entire combination against rolling. For this purpose, use the parking brake and the chocks of the BMW multitrailer.

The hood can also be set up and lowered with the aid of the universal lift available from BMW in conjunction with the roof racks and the hood adapter. Under no circumstances should work of any kind be carried out below the suspended hood.

For maintenance and repair work, raise the hood using a lifting platform. Twin-column lifting platforms, body lifting platforms and twin-stamp underfloor platforms are suitable. The seating plates and areas of the lifting platform must be adjustable according to the dimensions of **Fig. 37**.

Fig. 37: Lifting Platform Adjustable Dimensions
Courtesy of BMW OF NORTH AMERICA, INC.

The lifting platform must conform to the relevant legal provisions of the accident prevention regulations and be serviced as specified. Comply with the lifting platform operating instructions, in particular the safety instructions and the carrying capacity.

Make sure you adhere to the BMW-recommended work area of 5 x 7 m and to an escape route of 0.6 m between two lifting platforms.

Please comply with the following instructions before raising the hood:

- Raise only when it is unloaded;
- Ensure sufficient clearance between the seating plates/seating areas and the GFP edge of the hood;
- The hood must always be positioned in the middle of the lifting platform.

IMPORTANT: The hood may only be raised at the pin (1). Under no circumstances may the hood be raised at the GFP edge of the hood (2). See Fig. 38. Exclusively for removal of pin (1), raise the hood in the GFP area.

Also refer to:

86 21 ... REMOVING CENTERING PIN FROM MOUNTING BRACKET .

Fig. 38: Pin And Hood

Courtesy of BMW OF NORTH AMERICA, INC.

MAINTENANCE

Maintenance and General Information - Operating Fluids

1.0 INTRODUCTION

These operating fluids specifications describe the standards which are necessary for approval and application for BMW automobiles. Operating fluids are arranged in vehicle group category and are approved for all assemblies. Before applying operating fluids, it is important to make sure that the specifications and manufacturing codes on the container conform with those on the enclosed specification list.

BMW of North America has also approved various fluids for use which are not available through the Parts Department, but may be obtained locally.

2.0 CORROSION PROTECTION FOR VEHICLE IN LONG-TERM STORAGE

Location-inside of a building whenever possible or covered parking lot (especially convertibles).

Replace engine oil and filter after engine reaches operating temperature. Run engine several minutes after replacing oil. Engine oil must be replaced every 12 months. Factory engine oil (in new cars) can remain in the engine up to 12 months.

Check/correct electrolyte level in battery cells.

Disconnect battery ground lead to avoid discharging battery through current draw of electrical equipment. Or, switch off battery main disconnect switch (if equipped).

Recharge battery.

Inspect undercoating for damage and repair as necessary.

Inspect wax coating in engine compartment, on engine, underbody and axles. Repair as necessary.

Operate air conditioner monthly for 10 minutes in order to lubricate the seals and the expansion valve. Note: The air conditioner will only work at temperatures above 37°F/3°C.

PRE-DELIVERY CARS

Replace brake fluid if car has been parked outdoors longer than six (6) months.

Fill the vehicle fuel tank with fresh fuel in order to prevent condensation inside the tank (applies only to metal fuel tanks).

Check, and if needed, correct the coolant level and concentration of long-term antifreeze and corrosion inhibitor.

Apply brakes to dry the brake discs of any moisture and spray them with a corrosion inhibitor. Spray the

complete brake assemblies after parking the car at its final storage location.

Do not apply the parking brake. Brake linings could seize when the parking brake is applied for an extended period of time. Rather, engage first gear (manual transmissions) or "park" position (automatic transmissions) to hold vehicle stationary.

Increase inflation pressure on all road tires to 50 psi.

Thoroughly clean the entire car, including underside, engine and engine compartment.

4.0 ALTERNATE UNIVERSAL LUBRICANTS AND WORKSHOP SUPPLIES

ALTERNATE UNIVERSAL LUBRICANTS AND WORKSHOP SUPPLIES REFERENCE

BMW P/N	Description/Application	3M P/N	Wurth P/N	Loctite P/N
81 22 9 400 208 ⁽¹⁾	Lubricant/Contact Cleaner Spray Stops electrical and mechanical faults due to water, moisture, rust, dirt and friction. Colorless, neutral, free of grease and silicone, suitable for		89360/1	24379

all applications.
Examples: Stops
moisture on distributor,
generator, ignition coil,
starter, spark plugs, coils,
relays, contacts, etc.
Prevents metal parts
from corroding. Stops
rubber and plastic parts
from aging prematurely.
Applications: from -50oC
to +150oC.

81 22 9 400 229 ⁽¹⁾	Hand Cleaner Removes stubborn stains and grit without attacking skin. Contains special skin protectant. Does not clog pipes.	893900	25108
81 22 9 400 720 ⁽¹⁾	Molybdenum Disulfide (MOS2) Spray 8876 Loosens rust, eliminates squeaking and similar noises, prevent rust seizure. Displaces water on ignition components to allow quick starting. Insulates electrical systems against moisture and stops corrosion.		24378
81 22 9 407 138 ⁽¹⁾	Stain Remover Removes tar, oil and grease stains from seat covers, leather upholstery and painted plastic components.	89024	
81 22 9 407 174 ⁽¹⁾	Bearing Grease A water repellent high- pressure grease for lubricating flywheel gear rings, starter motor pinions, etc., and also as an acid-proof grease for battery terminal posts.	893530	
81 22 9 407 301 ⁽¹⁾	Loctite 574 Anaerobic, silicone sealant for aluminum flange surfaces. Provides	893574	24018

	instant sealing when flanges are assembled.			
81 22 9 407 388 ⁽¹⁾	Adhesive Remover Removes all residual or excess adhesive, sealing and coating compounds, wax, grease or oil films from painted and plastic surfaces, i.e. before installing front or rear spoilers and decor strips.	8984

Films/hook set

00 0 359 SUPPLEMENTARY FOILS + HOOKS FOR 24 2 354 & 24 4 166

Order number: 00 0 359

Supplementary foils + hooks for 24 2 354 & 24 4 166

00 0 361 SUPPLEMENTARY FILMS/HOOKS FOR N43, N47

Order number: 00 0 361

Supplementary films/hooks for N43, N47

00 0 415 FILM SET 1 + 2 FOR E87

Order number: 00 0 415

Film set 1 + 2 for E87

00 0 416 FILM SET CABLE CABINET 1 FOR E90

Order number: 00 0 416

Film set cable cabinet 1 for E90

00 0 418 FILM SET CABLE CABINET 2

Order number: 00 0 418

Film set cable cabinet 2

00 0 450 CROSS-MEMBER / SUB-NO.

Note: Reserved for consecutive sub-no. crossmember 00 0 200

SI number: 1 10 02 (907)

Order number: 00 0 450

Cross-member / sub-no.

00 1 000 SPECIAL TOOL CABINET, LENGTH 6 M, COMPLETE CURRENT RANGE OF EQUIPMENT.

Note: Range of equipment comprises: - Base frame - Films - Hooks - 5 large special tool boards - 4 small special tool boards Accessories such as storage shelves (00 0 250), drawer blocks (00 0 260) and rear panels (00 0 270) must be ordered separately.

SI number: 1 10 04 (092)

Order number: 00 1 000

Special tool cabinet, length 6 m, complete current range of equipment.

Fig. 32: Special Tool Cabinet (00 1000)
Courtesy of BMW OF NORTH AMERICA, INC.

00 1 010 SPECIAL TOOL CABINET, LENGTH 4 M AND 2 M, COMPLETE CURRENT RANGE OF EQUIPMENT.

Note: Consisting of tool cabinet 4 m and 2 m. All boards covered with film, hook set and folding index with list. Accessories such as storage shelves (00 0 250), drawer blocks (00 0 260) and rear panels (00 0 270) must be ordered separately.

Order number: 00 1 010

Special tool cabinet, length 4 m and 2 m, complete current range of equipment.

00 1 140 E87 FILM AND HOOK SET

Note: E87

Order number: 00 1 140

E87 film and hook set

Consisting of:

1 = 00 1 141 Film sheet

2 = 00 1 142 Hook set

00 1 150 N 52 FILM AND HOOK SET

Note: N52

Order number: 00 1 150

N 52 film and hook set

Consisting of:

1 = 00 1 151 Film sheet

2 = 00 1 152 Hook set

00 1 160 FILM AND HOOK SET FOR S85

Note: (for action tools)

SI number: 1 12 05 (196)

Order number: 00 1 160

Film and hook set for S85

00 1 161 FILM S85

Order number: 00 1 161

Film S85

00 1 162 HOOK SET S85

Order number: 00 1 162

Hook set S85

00 1 170 FILM AND HOOK SET FOR S85

Note: (for store tools)

SI number: 1 12 05 (196)

Order number: 00 1 170

Film and hook set for S85

00 1 171 FILM S85

Order number: 00 1 171

Film S85

00 1 172 HOOK SET S85

Order number: 00 1 172

Hook set S85

00 1 300 TOOL CABINET, USA VERSION, COMPLETE

Note: Consisting of: - Tool cabinet 4 m - All boards covered with film, USA version - including hook set - including lighting

Order number: 00 1 300

Tool cabinet, USA version, complete

Consisting of:

1 = 00 1 301 2 m tool cabinet USA basic version

Note: Consisting of: - Tool cabinet 2 m - Large bright-finish board - including lighting

2 = 00 1 302 2 m tool cabinet USA add-on version

Note: Consisting of: - Tool cabinet 2 m - Large bright-finish board - including lighting

00 1 310 TOOL BOARDS, COMPLETE, USA VERSION

Note: Consisting of: - 3 large tool boards, covered with film - including hook set - including wall mounting

Order number: 00 1 310

Tool boards, complete, USA version

00 1 320 FILM SET, COMPLETE USA VERSION

Order number: 00 1 320

Film set, complete, USA version

Consisting of:

1 = 00 1 321 Film no. 1 USA version

2 = 00 1 322 Film no. 2 USA version

3 = 00 1 323 Film no. 3 USA version

4 = 00 1 324 Film no. 4 USA version

5 = 00 1 325 Film no. 5 USA version

6 = 00 1 326 Film no. 6 USA version

7 = 00 1 327 Film no. 7 USA version

8 = 00 1 328 Film no. 8 USA version

9 = 00 1 329 Film no. 9 USA version

00 1 331 FILM NO. 10 USA VERSION

Order number: 00 1 331

Film no. 10 USA version

00 1 332 FILM NO. 11 USA VERSION

Order number: 00 1 332

Film no. 11 USA version

Order number: 00 1 333

Film no. 12 USA version

00 1 340 HOOK SET, COMPLETE, FOR 00 1 300, USA VERSION

Order number: 00 1 340

Hook set, complete, for 00 1 300, USA version

Consisting of:

1 = 00 1 341 Hook set for film no. 1 USA-Version

2 = 00 1 342 Hook set for film no. 2 USA version

3 = 00 1 343 Hook set for film no. 3 USA version

4 = 00 1 344 Hook set for film no. 4 USA version

5 = 00 1 345 Hook set for film no. 5 USA version

6 = 00 1 346 Hook set for film no. 6 USA version

7 = 00 1 347 Hook set for film no. 7 USA version

8 = 00 1 348 Hook set for film no. 8 USA version

9 = 00 1 349 Hook set for film no. 9 USA version

00 1 351 HOOK SET FOR FILM NO. 10 USA VERSION

Order number: 00 1 351

Hook set for film no. 10 USA version

00 1 352 HOOK SET FOR FILM NO. 11 USA VERSION

Order number: 00 1 352

Hook set for film no. 11 USA version

00 2 030 UNIVERSAL HYDRO-LIFTER BASIC UNIT

In conjunction with: 00 2 040, 23 0 040, 23 0 130, 24 0 170, 24 5 300, 25 5 350, 27 1 030, 33 4 420, 51 3 280

Note: Chassis and hydraulic jack - For removing and installing rear axle carriers and transmissions Also for convertible top take-up supports E85 and E64.

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

SI number: 1 05 90 (207)

Order number: 00 2 030

Universal hydro-lifter basic unit

Consisting of:

1 = 00 2 031 Adapter for transmission brackets

Note: Model series: E30, E31, E32, E34, E36

In conjunction with: 23 0 000, 24 0 130

Fig. 33: Universal Hydro-Lifter Basic Unit (00 2 030)
Courtesy of BMW OF NORTH AMERICA, INC.

00 2 040 BASIC TAKE-UP FIXTURE

In conjunction with: 00 2 030, 33 3 270, 33 3 290, 33 3 300, 33 4 220, 33 4 230

Note: For removing and installing rear axle carriers, without pillar guide and lift hoist.

Series: E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E81, E83, E85, E87, E90, E91, E92, E93, R56, RR1, RR2

Storage location: Single

SI number: 1 05 90 (207)

Order number: 00 2 040

Basic take-up fixture

Consisting of:

1 = 00 2 041 Base frame

2 = 00 2 042 Take-up fixtures, side

Fig. 34: Basic Take-Up Fixture (00 2 040)

00 2 050 TORQUE WRENCH, ADJUSTABLE FROM 1 TO 36 NM

Note: For tightening ZF selector units and for adjusting brake bands BW65

Transmission: BW 65

Order number: 00 2 050

Torque wrench, adjustable from 1 to 36 Nm

Consisting of:

1 = 00 2 051 Torque wrench without socket ratchet

2 = 00 2 052 Socket ratchet

Fig. 35: Torque Wrench (00 2050)

Courtesy of BMW OF NORTH AMERICA, INC.

00 2 080 HAND PUMP

Note: For Lifetime oil filling

SI number: 1 01 98(294)

Order number: 00 2 080

Hand pump

Fig. 36: Hand Pump (00 2080)

Courtesy of BMW OF NORTH AMERICA, INC.

00 2 210 EXHAUST PIPE CUTTER

Note: For V2a pipe

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1

Storage location: A9, B9

SI number: 1 03 95 (900)

Order number: 00 2 210

Exhaust pipe cutter

Consisting of:

2 = 00 2 212 Chain

Fig. 37: Exhaust Pipe Cutter (00 2 210)
Courtesy of BMW OF NORTH AMERICA, INC.

00 2 250 SPECIAL PLIERS FOR CABLE RECONDITIONING

Note: With the market introduction of engines (N46, N52 and S85), cable 12 7 420/421 can be used for diagnosis after conditioning

SI number: 02 03 04 (106)

Order number: 00 2 250

Special pliers for cable reconditioning

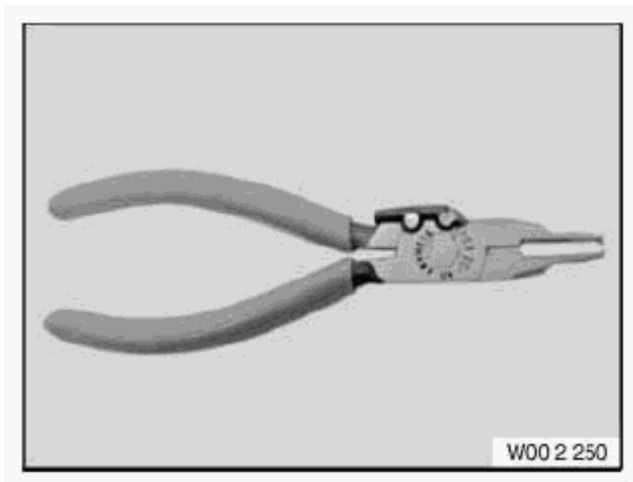

Fig. 38: Special Pliers For Cable Reconditioning (00 2 250)
Courtesy of BMW OF NORTH AMERICA, INC.

00 2 261 ADAPTER (2 X)

SI number: 01 22 06 (307)

Order number: 00 2 261

Adapter (2 x)

Fig. 39: Adapter (2 X) (00 2 261)

Courtesy of BMW OF NORTH AMERICA, INC.

00 2 262 TENSIONING STRAP (2 X)

SI number: 01 22 06 (307)

Order number: 00 2 262

Tensioning strap (2 x)

Fig. 40: Adapter (2 X) (00 2 261)

00 2 520 TORX SOCKETS E10, E12, E14

Note: Replaced by Torx tool kit.

Order number: 00 2 520

Torx sockets E10, E12, E14

Consisting of:

1 = 00 2 521 Torx socket E10

2 = 00 2 522 Torx socket E12

3 = 00 2 523 Torx socket E14

00 2 550 DEPTH GAUGE

Note: E.g. for determining axial play of transmission shaft and basic adjustment dimension for installing bevel pinion in rear differentials

Transmission: 240/5, 242/4, 245/5, 245/5Sport, 260/5, 262/4, 265/5, 265/5Sport, 280/5Sport, A4S 200R, A5S 360R, A5S 390R, GS5-39DZ, diff. 188kom, diff. 220kom, diff. 225kom, diff. type G, diff. type K, diff. type M, S5D 200G, S5D 250G, S5D 260Z, S5D 280Z, S5D 310Z, S5D 320Z, S5D 390Z, S6S 420G, S6S 560G

Storage location: A12, B12

Order number: 00 2 550

Depth gauge

Fig. 41: Depth Gauge (00 2 550)

00 5 010 UNIVERSAL PULLER

Minimum set: Mechanical tools

Note: For withdrawing radial seals 00 5 011 for E90

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, RR1, RR2

Storage location: B26

Order number: 00 5 010

Universal puller

Consisting of:

1 = 00 5 011 Extractor claw (3 pieces required)

2 = 00 5 012 Guide spindle

3 = 00 5 013 Pressure spindle

4 = 00 5 014 Take-up star

Note: For taking up extractor claw

5 = 00 5 015 Thrust member

Fig. 43: Universal Puller (00 5 010)

00 7 500 UNIVERSAL PULLER KUKKO 17/K

Note: For removing bearing inner race from drive flange at rear wheel bearing

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1

Order number: 00 7 500

Universal puller Kukko 17/K

Consisting of:

1 = 00 7 501 Pressure spindle with bridge

2 = 00 7 502 Adjusting spindle (2 x) with knurled nuts (4 x)

3 = 00 7 503 Pressure spindle, side

4 = 00 7 504 Adjusting jaws (2 x)

5 = 00 7 505 Adjusting screws (2 x) with nuts

Note: For adjusting jaw (2 x)

6 = 00 7 506 Extension (2 x)

7 = 00 7 507 Bridge

Fig. 47: Universal Puller Kukko 17/K (00 7 500)

00 8 000 HYDRAULIC PULLER TOOL

In conjunction with: With all previous removal/installation tools for rubber mounts

Note: For removing and installing rubber mount in rear axle carrier

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E83, E85, E87, R50, R52, R53, RR1

Storage location: Single

SI number: 1 02 99(417)

Order number: 00 8 000

Hydraulic puller tool

Consisting of:

1 = 00 8 001 Hydraulic pump

2 = 00 8 002 Hydraulic hose

3 = 00 8 003 Hydraulic cylinder

00 8 004 Threaded spindle

Note: M14 x 520

00 8 005 Threaded spindle

Note: M12 x 496

00 8 006 Threaded spindle (optional)

Note: M14 x 465

00 8 007 Nut M18

00 8 008 Securing line

00 8 009 Spindle with nut

00 8 690 WASHERS AND SCREWS

Order number: 00 8 690

Washers and screws

Consisting of:

1 = 00 8 691 Washers, 100 x

2 = 00 8 692 Screws, 100 x

3 = 00 8 693 Screws, 100 x

Note: For USA

4 = 00 8 694 Box 40 mm

5 = 00 8 695 Box 100 mm

6 = 00 8 696 Box 150 mm

00 9 010 TORX E18 SOCKET

Minimum set: Mechanical tools

Note: For releasing and tightening down transmission bolt connection on engine (aluminium bolts).

Series: E60, E61, E63, E64, E65, E83, E85, E87, E90, E91, E92

SI number: 1 17 04 (130)

Order number: 00 9 010

Torx E18 socket

Fig. 50: E18 Socket (00 9 010 Torx)

Courtesy of BMW OF NORTH AMERICA, INC.

00 9 110 CIRCLIP PLIERS

Note: External circlip-With long legs, 90° angle

Series: All models

Order number: 00 9 110

Circlip pliers

Fig. 51: Circlip Pliers (00 9 110)

Courtesy of BMW OF NORTH AMERICA, INC.

00 9 120 TORQUE ANGLE MEASURING DIAL

Minimum set: Mechanical tools

Note: For torsion angle tightening of cylinder head bolts (all engines) And reinforcement plate front axle carrier E46

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

Storage location: A12

Order number: 00 9 120

Torque angle measuring dial

Fig. 52: Torque Angle Measuring Dial (00 9120)

00 9 130 MAGNET WITH 1/2" CONNECTION

Minimum set: Mechanical tools

In conjunction with: 00 9 120

Note: For securing angle-of-rotation disk 00 9 120 to body.

Series: E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E81, E83, E85, E86, E87, E90, E91, E92

SI number: 1 17 04 (130)

Order number: 00 9 130

Magnet with 1/2" connection

Fig. 53: Magnet With 1/2" Connection (00 9 130)

00 9 220 BENDING LEVER (2 X)

Minimum set: Mechanical tools

In conjunction with: 00 9 230

Note: For adjusting windshield wiper arms

Series: E12, E21, E23, E24, E28, E30, E31, E32, E34, E36, E36/7, E38, E52, E53, E81, E82, E83, E85, E86, E87, R50, R52, R53

Storage location: A14

SI number: 1 10 92 (579)

Order number: 00 9 220

Bending lever (2 x)

Consisting of:

1 = 00 9 221 Bending lever (wide)

2 = 00 9 222 Counterholder (narrow)

Fig. 54: Bending Lever (2 X) (00 9 220)

00 9 290 RIVETING TOOL

Note: Is replaced by 00 2 240!

Series: All models

Order number: 00 9 290

Riveting tool

00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Minimum set: Mechanical tools

Note: For straightening and assembly jobs on vehicle bodies, e.g. fitting trim panels, removing window weatherstrips, repairing small-scale dents, removing residual adhesive materials, measuring gap widths, levering out trim panel parts

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R55, R56, RR1, RR2

SI number: 1 25 05 230

Order number: 00 9 310

Assembly wedges (set in plastic case)

Consisting of:

1 = 00 9 311 Trim remover

2 = 00 9 312 Striking wedge, square

3 = 00 9 313 Striking wedge, large

4 = 00 9 314 Adjusting wedges (2 x)

5 = 00 9 315 Gap wedge

6 = 00 9 316 Sealing lip wedge

7 = 00 9 317 Trim panel wedge

8 = 00 9 318 Universal wedge

9 = 00 9 319 Striking wedge, small

10 = 00 9 321 Fishbone

11 = 00 9 322 Plastic wedge

12 = 00 9 323 Cleaning wedge (scraper)

13 = 00 9 324 Trim remover (metal plate)

Note: For removing stem trims from E60

14 = 00 9 329 Case with inlay for assembly wedges

In conjunction with: 009310

Fig. 55: Assembly Wedges (Set In Plastic Case) (00 9 310)
Courtesy of BMW OF NORTH AMERICA, INC.

00 9 330 WINDSCREEN WIPER SETTING TOOL

Minimum set: Mechanical tools

Note: For adjusting windscreen wiper arms

Series: E46, E52, E53, E60, E61, E63, E64, E65, E66, E81, E83, E85, E86, E87, RR1

Storage location: A40

SI number: 1 09 99 (432)

Order number: 00 9 330

Windscreen wiper setting tool

Consisting of:

1 = 00 9 331 Feeler gauge

2 = 00 9 332 Counter-holder

3 = 00 9 333 Bending lever

Fig. 56: Windscreen Wiper Setting Tool (00 9 330)

00 9 340 DISASSEMBLY AID (2)

Minimum set: Mechanical tools

Note: For levering out switch block on driver's door.

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C,

E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E82, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R55, R56, RR1, RR2

SI number: 1 15 99 (483)

Order number: 00 9 340

Disassembly aid (2)

Fig. 57: Disassembly Aid (2) (00 9340)

GENERAL INFORMATION

Maintenance and General Information - Tightening Torques - X3

00 MAINTENANCE AND GENERAL INFORMATION

00 00 EXCERPT FROM COMPANY STANDARD BMW GS 90003-2

00 00 EXCERPT FROM COMPANY STANDARD BMW GS 90003-2 TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
If there are no cross-references to tightening torques in the repair instructions, the excerpts from the company standard BMW GS 90003-2 must be observed.				
There are different screws / nuts with surface color / (surface coating) - yellow (ZN) and silver (ZNS) The maximum tightening torques are: Surface color yellow (ZN):				
Surface color silver (ZNS): The values specified in this table apply to all screw connections conforming to the aforementioned conditions. Not applicable when using a different surface or lubricant condition on the thread, or if the height of the nut differs.				
Not applicable to necked-down bolts, self-tapping screw connections or to connections between parts made of different				

materials.
Attention!
 To be able to carry out competent repairs, it is essential to comply with the specified tightening torques. This presupposes that the required torque wrenches are subjected to regular testing. Permitted tolerance of torque wrenches +/- 4 % of scale value. Approved torque wrenches and torque testers are contained in the catalogue Workshop Equipment Planning documentation.

GENERAL INFORMATION

BMW - Gasoline - 1982-2012

BRAKE PAD WARNING LIGHT

- NOTE:** Most vehicles are equipped with a Malfunction Indicator Light (MIL) or check engine light. If light comes on and remains on while driving, the vehicle requires some type of repair. See appropriate service and repair information. After repairing fault(s) and clearing fault code(s), the Malfunction Indicator Light (MIL) or check engine light should go out. Some models may use a dual-function indicator light, which is also used to indicate emission component service is due. After performing required service, reset indicator light.
- NOTE:** Brake pad warning light should go out after replacement of brake pad thickness sensor. If warning light does not go out, turn ignition on, engine off, for 30-45 seconds. Warning light should go out. If the above procedure is not successful, connect vehicle to DIS tester, access Instrument Cluster/IKE, then "clear fault memory".
- NOTE:** The base instrument cluster OIL SERVICE INSPECTION display is located on the bottom of the cluster, to the right of center. The base cluster is also equipped with a graphic display of the car that shows if a door or the trunk lid is open. The high instrument cluster OIL SERVICE INSPECTION display is located on the bottom of the cluster, to the left of center.
- NOTE:** To determine the appropriate reset procedure, refer to BRAKE PAD WARNING LIGHT RESET INDEX. Only vehicles listed in this index have a specific brake pad warning light reset procedure. For other vehicles, perform PROCEDURE 1 first. If light does not reset, perform PROCEDURE 2. If the above procedures are not successful, connect vehicle to DIS tester, access Instrument Cluster/IKE, then "clear fault memory".

BRAKE PAD WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
5-Series	
1997-00 (w/High Instrument Cluster)	<u>Brake Pad Warning Light Reset - Procedure 1</u>
1997-00 (w/Base Instrument Cluster)	<u>Brake Pad Warning Light Reset - Procedure 2</u>
7-Series	
1997-00	<u>Brake Pad Warning Light Reset - Procedure 1</u>

BRAKE PAD WARNING LIGHT RESET - PROCEDURE 1

To reset light after replacing brake pads, turn ignition on with engine off. Wait 30 seconds. Brake pad warning indicator light will switch off.

BRAKE PAD WARNING LIGHT RESET - PROCEDURE 2

Start engine. Brake pad warning indicator will switch off.

OXYGEN SENSOR WARNING LIGHT

NOTE: To determine the appropriate reset procedure, refer to **OXYGEN SENSOR WARNING LIGHT RESET INDEX**. Only vehicles listed in this index have an oxygen sensor warning light.

OXYGEN SENSOR WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
All Models	
1983 & Earlier	<u>Oxygen Sensor Warning Light Reset - Procedure 1</u>
1984 & Later	<u>Oxygen Sensor Warning Light Reset - Procedure 2</u>

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 1

1. Every 30,000 miles (25,000 miles on 528i) the OXYGEN light in dash will come on as a reminder to replace the oxygen sensor.

NOTE: On 528e models, pull the protective metal plate off before removing oxygen sensor.

2. On 528e models, no interval reset switch is provided. After replacing sensor, remove instrument panel. Remove and discard bulb for OXYGEN sensor light.
3. On all other models, trace speedometer cable to interval switch (in-line with cable, mounted on frame rail left of transmission). Press White reset button. See **Fig. 1**. Ensure warning light is out.

Fig. 1: Locating Oxygen Sensor Warning Light Reset Switch (All BMW Models Before 1983)
Courtesy of BMW OF NORTH AMERICA, INC.

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 2

NOTE: Some late production (February 1985 and later) BMW models have a reset button on rear of the light control assembly located near pedal assembly. Press button to reset light after servicing oxygen sensor.

No reset switch is provided. When oxygen sensor light comes on, service oxygen sensor. Remove and discard bulb from indicator.

SERVICE INTERVAL REMINDER LIGHTS

NOTE: This is sometimes referred to as the "Oil Change Light" or "Oil Service Light".

NOTE: The service indicator can only be reset using the reset mode in the instrument cluster or by using BMW hardware. This procedure applies to 3-Series from production date 9/99, and 5-Series and 7-Series from production date 9/00 (except 2002-05 7-Series and 2004-05 5-Series) without an engine compartment diagnostic connector.

- On models that still use the round diagnostic connector in engine compartment, use SIA reset tool to reset service lights. See SERVICE

INTERVAL LIGHT RESET - PROCEDURE 1.

- On models without the round diagnostic connector in the engine compartment, the use of the SIA reset tool is not possible. See SERVICE INTERVAL LIGHT RESET - PROCEDURE 2.
- For 2002-up models with condition based service (CBS) interval system reset procedure, see SERVICE INTERVAL LIGHT RESET - PROCEDURE 3.

NOTE: To determine the appropriate reset procedure, refer to SERVICE INTERVAL REMINDER LIGHT RESET INDEX. Only vehicles listed in this index have a service interval reminder.

SERVICE INTERVAL REMINDER LIGHT RESET INDEX

Model & Year	Reset Procedure
Models With Engine Compartment Diagnostic Connector	
1983-05	<u>Service Interval Light Reset - Procedure</u> 1
Models Without Engine Compartment Diagnostic Connector	
2001-05	<u>Service Interval Light Reset - Procedure</u> 2
Models With Condition Based Service (CBS) Interval System	
2002-12	<u>Service Interval Light Reset - Procedure</u> 3
Models Without Condition Based Service (CBS) Interval System	
2004-05	<u>Service Interval Light Reset - Procedure</u> 4

DESCRIPTION & OPERATION

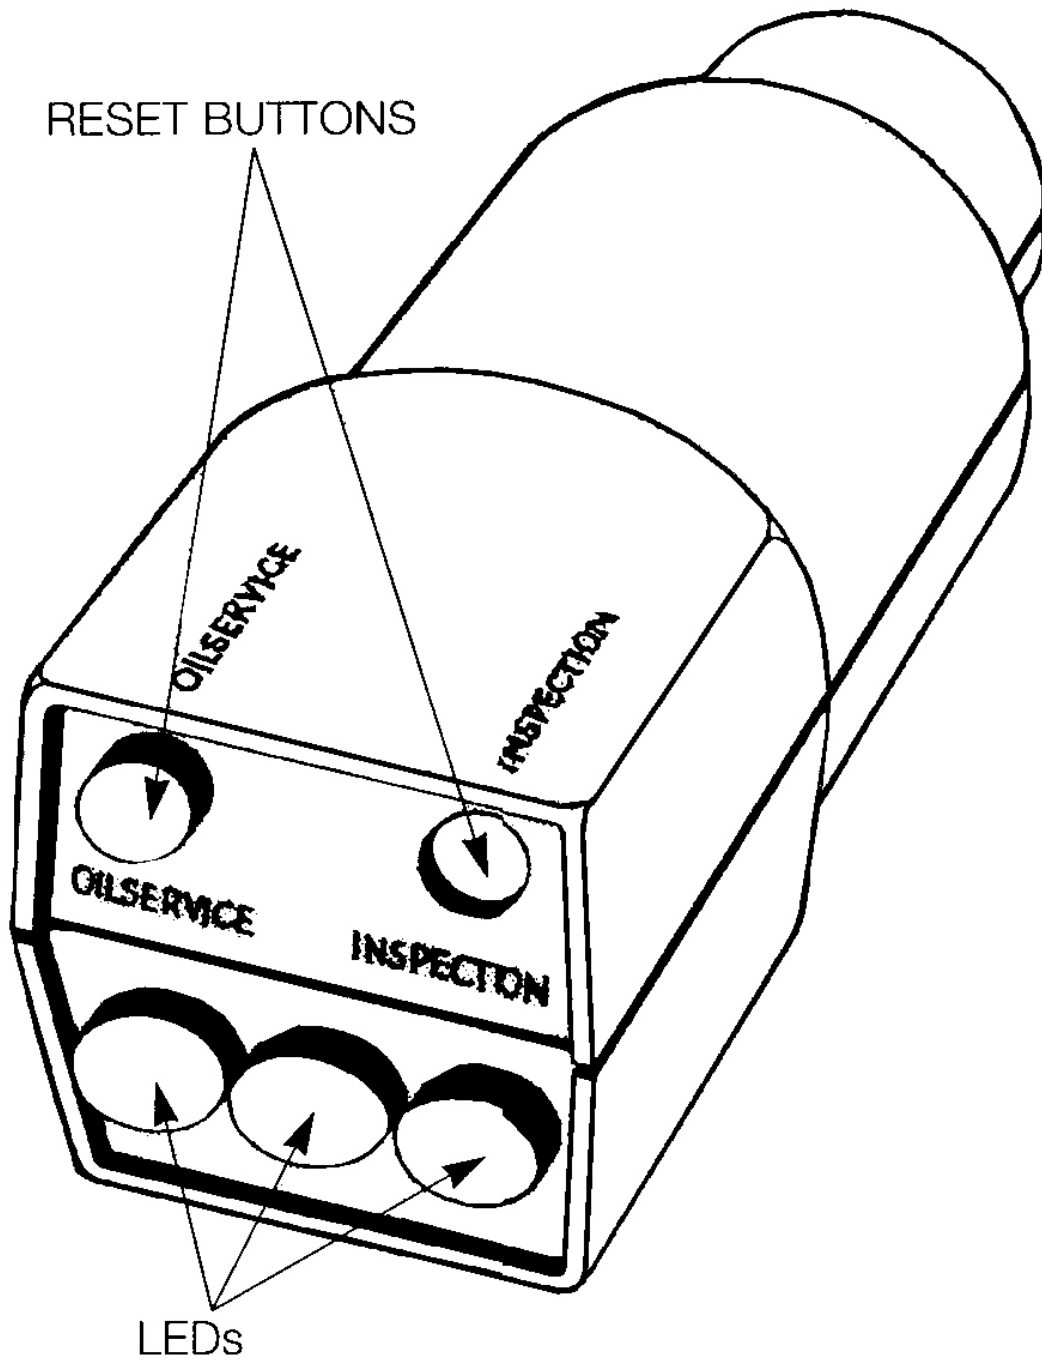

Starting in 1983 and ending on some models in 1999, service indicator on instrument panel consists of 5 Green, 3 Red and one Yellow Light Emitting Diodes (LED) and the inscriptions OIL SERVICE and INSPECTION. When ignition is on, as many as 5 Green LEDs will light up. The Green LEDs go out when the engine is started. If the Yellow LED glows and one of the inscriptions comes on and remains on when the engine is started, maintenance service is due immediately. When maintenance interval has been exceeded (after approximately 1000 miles) the Red LED's will come on in addition to the Yellow LED as a reminder for servicing.

Beginning on some models in 1999, a new method for displaying the service interval is used. Colored LEDs are no longer used to display the amount of time until the next service or inspection is due. The actual mileage remaining until the next service will be displayed for five seconds when the ignition is first switched on. The text OIL SERVICE or INSPECTION will also illuminate to show which service is due. A minus symbol (-) before the mileage display indicates that a service is past due.

The 2002-05 models with condition based service (CBS) interval system uses an entirely different service interval system. See SERVICE INTERVAL LIGHT RESET - PROCEDURE 3.

SERVICE INTERVAL LIGHT RESET - PROCEDURE 1

1. To reset instrument cluster SIA OIL SERVICE indicator, turn ignition switch to ON position. Connect Service Indicator Resetter (62 1 110) to diagnosis connector in engine compartment. See **Fig. 2**.
2. Press Yellow OIL SERVICE button. Green LED will illuminate. Wait until Yellow LED illuminates and then goes out again. Ensure that OIL SERVICE indicator has been reset.
3. To reset SERVICE INTERVAL indicator, press Red INSPECTION service button for inspection. Green LED illuminates. Wait until Red LED illuminates and then goes out again. Turn ignition switch to OFF position, wait 20 seconds and repeat procedure in order to adapt interval of annual inspection to inspection. Ensure that SERVICE INTERVAL indicator has been reset.

SERVICE INTERVAL LIGHT RESET - PROCEDURE 2

Reset service light by performing the following:

1. Ignition key must be in OFF position.
2. Press and hold trip odometer reset button in the instrument cluster (left button), and turn ignition key to first position.
3. Keep the button pressed for approximately 5 seconds until one of the following words appear in the display: "OIL SERVICE", or "INSPECTION", with "RESET".
4. Release reset button and press it again until "RESET" begins to flash in the display. See **Fig. 3** and **Fig. 4**.
5. Service due is shown with "RESET" if coded minimum consumption limit has been reached and resetting is possible. If "RESET" is not shown, minimum limit has not been reached and resetting is not possible.
6. While "RESET" is flashing, press left button briefly to reset service interval. After display has shown new interval, following will appear: "END SIA".
7. System can only be reset again after 2.5 gallons of fuel have been consumed.

SERVICE INTERVAL LIGHT RESET - PROCEDURE 3

Models use a Condition Based Service (CBS) service interval system, which displays a Service Need Display (SND). When ignition is on, Service Need Display appears under the speedometer in the instrument cluster for 10 seconds in the place where the fuel tank level is normally displayed. The first line corresponds to the mileage dependent service items. It specifies the mileage when the next service is due.

If the mileage is exceeded (service overdue), it appears with a minus sign. The second line corresponds to the time dependent service items and is displayed by a clock symbol. It specifies the weeks/months/years when the next service is due. If the service is overdue, it appears with a minus sign. The actual service item (with additional information) can be viewed in the control display.

NOTE: On some models an appropriate scan tool may be used to reset CBS service schedules. By using suitable diagnostic equipment connected to the vehicle diagnostic connector it is possible to reset CBS service schedules at any time.

By selecting the `CBS' option, the diagnostic equipment will gather information regarding the current state of CBS items from their relevant modules on the CAN network.

Service reset is accomplished using instrument cluster:

1. Insert key into ignition.
2. Press start/stop button without depressing the clutch or brake, and wait for the service reminder to disappear.
3. Immediately after the service reminder indicator goes out, press and hold the odometer reset button. After 3 secs a warning triangle will appear, keep the odometer button pressed and after another 2-3 secs an oil can will appear.

NOTE: If the odometer button is pressed too long (10 secs in total), German writing will appear (giving the software level/ can bus etc. of the vehicle). This indicates that you've overshoot the reset procedure and you need to re-start from the beginning.

4. The service menu should now be displayed. Use the toggle switch on indicator stalk (twisting the stalk) to scroll up/down through the various service items.
5. When the item to be reset is showing, press the BC button on end of indicator stalk. "Reset" should now appear in the display. Press in and hold the BC button for 2-3 secs and a whirling clock icon will be displayed. The reset procedure for the selected service item is done.
6. Scroll up/down to select another item (as in step 4), or press the start/stop button to exit.

NOTE: Residual wear or remaining time are specified (possibly with a minus sign). The "1" symbol means that you can reset service operation (early production vehicles may show an "F"), while a "0" indicates it is not resettable (the first 20 percent of the service interval is also protected against accidental reset). For additional information about Condition Based Service (CBS), see RESETTING AND CORRECTING CONDITION BASED SERVICE under PROGRAMMING in SELF-DIAGNOSIS - 7-SERIES article.

Reset Button

Press and hold for 10 seconds.

SERVICE INTERVAL LIGHT RESET - PROCEDURE 4

The BMW maintenance system SIA IV (service interval indicator) is used on X3 models (E83). The service interval indicator is a system subject to constant development which in its development stages has been integrated in various model series such as E85 (Z4) and E46 (3 and M3-Series).

The service indicator appears in the LC display in the instrument cluster's speedometer. The indicator is shown for 5 seconds in the LC display after terminal R is "ON". See **Fig. 7**.

Resetting Service Interval Indicator

Resetting the service interval indicator for the oil service and inspection procedures can only be done by pressing the left button in the instrument cluster. See **Fig. 8**.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: If a tire pressure has been adjusted, or a wheel or tire has been changed or replaced, or repairs have been made to air spring suspension, the TPM system must be reinitialized. System must be reinitialized both before and after pulling a trailer.

CAUTION: When driving with snow chains or a space-saver spare tire, DO NOT initialize the system.

NOTE: To determine the appropriate reset procedure, refer to TPMS RESET INDEX. Only vehicles listed in this index have a TPMS reset.
