

GENERAL INFORMATION

Basic Engine Measuring Techniques - Overview

BASIC MEASURING TECHNIQUES

BASIC ENGINE MEASUREMENTS

During the course of engine repairs some basic engine measurements are required to verify engine diagnosis as well as to complete proper repairs. These measurements are made by precision measuring tools such as micrometers, Vernier calipers, cylinder bore gauges and dial indicators.

G03395197

Fig. 1: Sectional View Of Engine

Courtesy of BMW OF NORTH AMERICA, INC.

Also, a working knowledge of the metric system is also a vital skill that is needed by the technician. All BMW engine measurements consist of metric specifications. Some of the routine engine measurements performed include:

- Valve Guide Wear (Tilt Angle K)

- Cylinder Bore Measurements (Taper and Out-of-Round)
- Cylinder Head Warpage and Thickness
- Axial and Radial Endplay Measurements (Crankshaft/Camshaft etc).

Among all of the skills possessed by a modern technician, basic measuring techniques are perhaps the most overlooked and least used. This is why it is important to review these skills from time to time as a refresher.

Also, it is necessary to access technical data to obtain the proper specifications for these measurements. This course is designed to review measuring techniques to assist in engine diagnosis.

Vernier Measurement

The Vernier scale is used on various measuring tools such as the Vernier caliper and the Depth Gauge. The Vernier scale can be used with Fractional (US) and Metric systems. For the purposes of this training module we will always refer to the Metric Vernier scale.

The Vernier scale consists of a fixed scale and a sliding scale. The fixed scale is divided with graduations in 1 millimeter increments. The sliding scale has 10 graduations in increments of .5.

Fig. 2: Identifying Depth Gauge
 Courtesy of BMW OF NORTH AMERICA, INC.

In order to read a measurement, use the zero mark on the left end of the vernier scale to use as a guide to read a measurement on the fixed scale.

In the example shown at the right, the zero mark is resting between 26 and 27 mm. Therefore the base measurement is 26 mm.

Next, the decimal measurement must be taken. For this, find a line on the Vernier that most closely matches any line on the fixed scale.

Using the example drawing, the "4" on the Vernier scale is lining up directly with a line on the fixed scale.

Combining the previous reading with this reading, the result would be 26.4 mm.

G03395199

Fig. 3: Locating Vernier Scale Reading
Courtesy of BMW OF NORTH AMERICA, INC.

The designations on the Vernier scale are in increments of .5. For example, if a reading on the Vernier scale falls on the .5 (i.e. 2.5, 3.5 etc) designation this would indicate 5/100th's of a millimeter.

Classroom Exercise - Vernier Readings

Fill in the correct Vernier scale readings in the spaces provided below.

Courtesy of BMW OF NORTH AMERICA, INC.

Micrometer Measurements

Another valuable measuring tool is the micrometer, which can be used for measurements such as bearing journal diameter, cylinder head thickness, valve shim thickness and brake rotor thickness etc. Micrometers also come in configurations for inside measurements as well.

The micrometer scale comes in both fractional and metric varieties. We will cover only the metric micrometer scale in this course.

First you must familiarize yourself with the construction of the micrometer in order to understand how measurements are made.

Metric Micrometer Construction

The micrometer is constructed of a few basic parts. The actual item to be measured is placed between the anvil and the spindle. The micrometer can be adjusted to the approximate size using the thimble. The thimble should only be used for the coarse adjustment. In order to make the actual measurement, the micrometer should only be turned using the ratchet (a.k.a. the friction stop). Do not attempt to make a measurement using the thimble. This will give an inaccurate measurement and ultimately damage the micrometer.

Fig. 5: Identifying Micrometer
Courtesy of BMW OF NORTH AMERICA, INC.

Micrometers are available in various sizes for outside as well as inside measurements. The more common variation is the outside micrometer. They are usually available in 25 millimeter increments such as 0-25 mm, 25-50 mm, 50-75 mm etc..

The metric micrometer can measure in increments of one hundredth of a millimeter (.01mm). One hundredth of a millimeter is equal to 0.0003937 inch which is less than one thousandth of an inch.

The measurement area of the micrometer consists of the sleeve scale and the thimble scale. The sleeve scale is used to read whole and half millimeters. The thimble scale (which rotates) reads in hundredths (.01) of a

millimeter from zero to fifty. Two complete revolutions of the thimble equals one millimeter.

On the sleeve scale, each scale mark above the center line indicates whole millimeters. Below the center line, half of a millimeter (or .5mm) increments are indicated.

G03395202

Fig. 6: Identifying Micrometer Reading
Courtesy of BMW OF NORTH AMERICA, INC.

Using the example shown above, the micrometer is a 125-150mm micrometer. To read this micrometer, first take the basic reading from the sleeve scale. The thimble is past the 139 mm mark. Therefore the reading is a least 139 mm. Next, look at the thimble scale and note the reading on the centerline. The "10" on the thimble scale is lined up with the centerline. This indicates a reading of .10 mm. If you add the two readings; $139 + .10 = 139.10$ mm.

Classroom Exercises - Micrometer Measurements

Fill in the correct micrometer readings in the spaces provided below.

Dial Indicator Measurements

The dial indicator is used to measure the travel or movement of a specific item. It can also be used to measure axial and radial runout. In engine measurement applications, the dial indicator can be used to measure valve guide wear, axial movement of the crankshaft (thrust), and runout of flywheels and harmonic balancers.

First, it is important to familiarize yourself with Dial Indicator construction. The face of the dial indicator consists of a moveable bezel which is also attached to the large measuring scale. This allows the tool to be brought to the "zero point" when needed.

The main measuring device is the contact point. The contact point (1) is placed against the object to be measured. Usually, the contact point is rounded or has a ball bearing. This allows for a more accurate measurement.

The measuring face of the dial indicator consists of 2 scales. The smaller scale is for the "coarse" measurement which is in graduations of 1 millimeter. One revolution of the small scale is 10 millimeters.

G03395204

Fig. 8: Identifying Dial Indicator

Courtesy of BMW OF NORTH AMERICA, INC.

The large scale is in graduations of .01 millimeter and the scale goes from zero to one hundred. Therefore, one revolution of the large scale is one millimeter.

The dial indicator also needs to be held in place when taking a measurement. This requires a stand or base. Depending upon the application, these stands can be a clamp type, magnetic or a threaded base.

When taking a measurement, place the contact point on the object to be measured. The dial indicator must be pre-loaded slightly to prevent the measurement from bottoming out.

When reading the scale, be sure to "zero" the dial indicator first. If the readings to be taken are less than 1 millimeter, you do not need to use the small scale. If the readings are larger than 1 millimeter, be sure to factor the small scale into your measurement.

ADDITIONAL ENGINE MEASUREMENTS

During engine repair procedures it is sometimes necessary to assess engine wear to make determinations on

parts replacement. Also, some engine measurements are needed to verify a previous diagnosis.

For example, a cylinder leakdown test could indicate a cylinder sealing concern. Once the engine is disassembled, it would be necessary to verify this condition by checking the piston and piston ring condition. If OK, the next step would be to determine the condition of the cylinder bore. At this point, the cylinders should be checked for taper (conicity) and for out-of-round. The correct measurements could mean the difference between just replacing the rings and/or pistons or replacing the engine block. This is why it is necessary to make accurate measurements when needed.

Some of the other routine engine measurements include:

- Cylinder head warpage
- Cylinder head thickness (on some applications)
- Piston rings - end gap and axial clearance
- Cylinder bore - including out-of-round and taper

Cylinder Head Measurement

If a repair requires removal of the cylinder head, a few basic measurements can be performed to save time and unnecessary machine shop costs. If an engine has been overheated or has an internal or external fluid leakage (coolant/oil), it is a good idea to check the cylinder head for warpage.

This can be done by using a commercially available machinists straight edge and a feeler gauge. by sliding the feeler gauge under the straight edge in various locations, it can determine if there are any low spots or warpage. Usually, the specification is about .05 mm.

G03395211

Fig. 15: Identifying Cylinder Head
Courtesy of BMW OF NORTH AMERICA, INC.

Also, check to see if the cylinder head has a specification for machining limit. If so, it may be possible to have the cylinder head re-surfaced. Depending on the amount of material removed during the machining process, it may be necessary to install a thicker head gasket. There are some "service" head gaskets available through the parts department.

The cylinder head can be checked for minimum thickness. This is done using a micrometer or a vernier caliper. This is not possible on all engines, the example shown is a 6-cylinder (M52TU/M54).

If the minimum thickness is not met, the head will need to be replaced.

G03395212

Fig. 16: Measuring Thickness Of Cylinder Head
Courtesy of BMW OF NORTH AMERICA, INC.

Piston Measurements

When replacing pistons and/or piston rings, there are some basic measurements that need to be made. When fitting a piston to a cylinder bore, the piston diameter should be checked to ensure a proper fit.

The piston diameter is measured using a micrometer. The measurement is taken at a specified point (A) which is 90 degrees from the piston pin axis. Each engine has a specific location to measure piston diameter. For example, the illustration below shows measuring Point A. The specification for this engine (N62) is 18 mm. So the piston diameter is measured 18 mm from the bottom of the piston skirt.

G03395213

Fig. 17: Measuring Piston Diameter Using Micrometer
Courtesy of BMW OF NORTH AMERICA, INC.

The piston diameter, when subtracted from the cylinder bore equals the cylinder wall to piston clearance. If the clearance measurement obtained is not correct, re-check your readings.

Piston Ring Measurements

There are some important specifications to check when installing piston rings. One of the measurements is axial clearance. Axial clearance is the distance between the piston ring and ring land. This prevents the rings from binding in the ring land at operating temperature. Axial clearance is measured using a feeler gauge.

Also the piston ring end gap has to be checked. This measurement is checked using a feeler gauge.

This clearance is critical in order to prevent the end gaps from contacting each other when the engine is at operating temp.

When installing the piston rings, always stagger the end gaps as per the repair instructions.

G03395214

Fig. 18: Measuring Piston Ring Gap Using Feeler Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

G03395215

Fig. 19: Measuring Piston Ring End Gap Using Feeler Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

Cylinder Bore

In order for the cylinder bore to be considered acceptable, it must not be excessively tapered or out-of-round. Once the cylinder has been checked for obvious damage and the surface finish is OK, the integrity of the bores must be verified. If cylinder wear is suspected, it must be checked using the proper cylinder bore gauge.

Each cylinder must be checked at three position in the bore - top, middle and bottom. Also there must be two opposing dimensions that should be checked. The difference between the top and bottom measurements will indicate the taper of the bore. The opposing dimensions will indicate the out-of-round specification.

If these measurements are out of specification, the cylinder bore must be re-finished or overbored. New pistons and rings must be fitted as well.

G03395216

Fig. 20: Checking Cylinder Bore Using Cylinder Bore Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

METRIC SYSTEM

The unit of length, and the basis for all other metric units of measurement is the meter. The meter (1 meter), as a point of reference, is slightly longer than a yard (39.37 inches).

The divisions of a meter are hundredths and thousandths. One hundredth of a meter is called a centimeter, and is equal to .3937 inch or about half the diameter of a nickel.

One thousandth of a meter is called a millimeter. The small marks between the centimeter increments are each one millimeter, or one tenth of a centimeter. And as a point of reference, a standard paper clip is about one millimeter thick.

Metric System Denominations

Throughout the metric system, common to all units of measurement, are prefixes which designate multiples or fractions of the unit.

For automotive applications, the most common prefixes are centi; designating one-hundredth; milli; for one thousandth and kilo- for one thousand.

There are letters uniformly used throughout the system to label the divisions or multiples of each unit of measurement. The letter "m" represents milli, "c" is for centi and "k" is for kilo. These are then combined with the letter representing the unit of measurement.

For example, mm is millimeter, cm is centimeter and km is kilometer. The same applies to liter which is the unit of volume and gram which is the unit of weight.

One kilogram is equal to one thousand grams which is equal to 2.2 pounds. All metric measurements are directly related. For example, one thousand cubic centimeters, or 10cm x 10cm x 10cm of water weighs one kilogram. The volume of those one thousand cc's is one liter.

GENERAL INFORMATION

BMW Universal Bluetooth - Overview - All Models

BMW UNIVERSAL BLUETOOTH™

INTRODUCTION

The BMW Universal Bluetooth™ HandsFree System (ULF) utilizes Bluetooth™ wireless technology to enable a wireless connection to be established between a Bluetooth™ enabled mobile phone and the ULF Control Module installed in the vehicle. The combination of these components results in a new generation of in-vehicle phone system.

The ULF Control Module forms an interface that allows a mobile phone with the embedded Bluetooth™ wireless technology feature to be wirelessly integrated into the vehicle. For the first time BMW is introducing a new generation hands-free telephone system kit that provides the customer with the option of using various Bluetooth™ enabled mobile phones (a list of recommended phones is available from your BMW Center).

G03399806

Fig. 1: Identifying Oddment Tray Button

Courtesy of BMW OF NORTH AMERICA, INC.

WHAT IS BLUETOOTH™

The name Bluetooth™ is derived from the Danish King Harald Bluetooth who lived in the 10th century. He was well known for his ability to unify his kingdom and today lends his name to a wireless technology standard that can connect/unify various electronic devices that are Bluetooth™ enabled and located within a short range (approx. 10 m or 32.8 ft) of each other.

Bluetooth™ wireless technology is a short-range radio frequency technology standard that allows several devices to communicate with each other simultaneously. The standard indicates that up to seven simultaneous connections can be established and maintained at one time, as long as the connected devices are within a range of 10 m (32.8 ft).

NOTE: The ULF system will allow four phones to be paired to the system at a time and only allow one phone to be connected at a time.

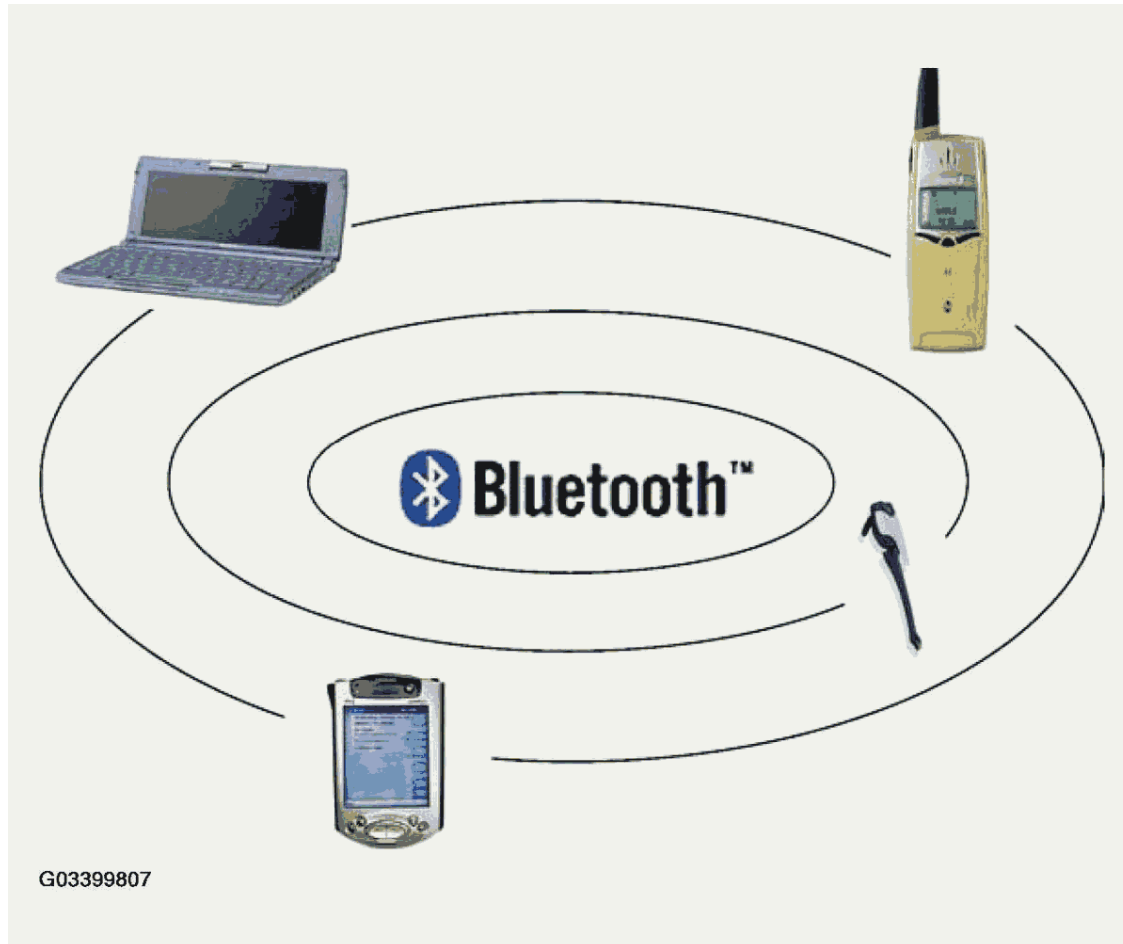

Fig. 2: Bluetooth Network Area Description
Courtesy of BMW OF NORTH AMERICA, INC.

The system uses the license-free, global Industrial Scientific Medical band (ISM) at 2.45 GHz. This frequency range from 2.402 GHz to 2.480 GHz is subdivided into 79 channels with a 1 MHz bandwidth.

Signals transmitted through the airways can be scrambled and unscrambled to enhance communication security. With Bluetooth™ technology, communication frequencies are changed 1600 times per second to reduce the risk of interference or interception of the transmitted signal. The relatively small operating range of approx. 10 m (32.8 ft) also enhances the security of this technology, since tampering with the transmitted data is only possible when inside the 10 m (32.8 ft) wireless "network".

To further enhance the security of this short-range wireless network the ULF system requires a pairing procedure to be carried out for each device that will be introduced into the network. As part of this procedure a required passkey must be entered once (during the initial pairing procedure) to establish a secure connection between the phone and the ULF Control Module.

Data and Voice

Bluetooth™ was developed for the transmission of both voice as well as data. A bandwidth of approx. 1 MB/s is available for this purpose.

Bluetooth™ Enabled Phones

Ideally all phones that are Bluetooth™ enabled should work with the ULF system, however not all phones utilize the same profiles and therefore may not be recognized by the ULF System. A list of recommended Bluetooth™ enabled phones is available from your BMW Center.

ADVANTAGES OF THE ULF SYSTEM

- Once a phone is paired to the system it will be able to automatically connect to the Bluetooth™ wireless network of the vehicle, the next time it is introduced into the vehicle and the vehicle ignition is on.
- Up to four different Bluetooth™ phones can be paired to the system at one time, although only one phone can be wirelessly connected at any time.
- The phone does not need to be inserted into a phone specific cradle in order to be integrated into the vehicle.
- The phone can remain in a briefcase, purse, glove box, etc.; as long as it is turned on and located within the interior of the vehicle.
- The MFL buttons on the steering wheel can be utilized to place or receive a call, to scroll the phone book and select a number or activate voice recognition in order to dial a number via voice command.
- A voice recognition system is integrated into the ULF control module and can be activated by depressing the send/receive™ button.
- The communications protocol of Bluetooth™ wireless technology is standardized irrespective of the manufacturer, this therefore allows various mobile telephones that utilize Bluetooth™ wireless technology and a recognized profile to be connected to the ULF System.

System Overview

A ULF system consists of a control module, microphone, Bluetooth™ antenna, a standalone pairing

(send/receive) button, or eject box with a coin tray insert.

ULF System Overview

G03399808

Fig. 3: ULF Control Module System Components
Courtesy of BMW OF NORTH AMERICA, INC.

ULF Control Module

The ULF module forms the interface between the Bluetooth™ mobile phone and the electronic system in the vehicle. The mobile phone with the embedded Bluetooth™ wireless technology is the transceiver, this requires that the phone be activated, paired and present within the vehicle network in order to place or receive a call in the vehicle.

Oddment Tray

The oddment tray, which is connected to the ULF control module via the vehicles wiring harness, serves the purpose of:

Housing the send/receive™ or pairing button, which must be depressed to activate the pairing procedure between the phone and the control module.

G03399809

Fig. 4: Identifying Oddment Tray Button
Courtesy of BMW OF NORTH AMERICA, INC.

Pairing Button

A stand-alone send/receive™ or pairing button is supplied for the 3 Series in order to retain the cup holders. The button provides the same function as the send/receive™ button on the steering wheel, plus is the button that must be depressed to activate the pairing procedure between the phone and the control module.

Fig. 5: Identifying Pairing Button

Courtesy of BMW OF NORTH AMERICA, INC.

Bluetooth™ Antenna

The Bluetooth™ antenna operates on a frequency of 2.45 GHz and is installed in the interior compartment of the vehicle. This antenna provides the wireless interface between the Bluetooth™ enabled phone and the ULF Control Module.

SYSTEM OPERATION

Initial Operation

Prior to using the system for the first time, the Bluetooth™ mobile phone that is to be used must be paired with the ULF control module. This pairing procedure is necessary in order to assign the digital code of the mobile phone to the ULF control module installed in the vehicle. The pairing procedure is only required when a new phone is introduced to the ULF system for the very first time or the list of paired devices is cleared from the memory of the ULF module, it does not need to be performed every time the phone is used with the system.

After pairing, the mobile phone is recognized automatically by the ULF control module within 45 seconds after it is introduced into the vehicle and the ignition is turned on.

NOTE: Depending on the mobile phone manufacturer, particular care must be taken prior to initial operation to ensure that no headset is coupled with the mobile phone. Various devices may interpret the ULF control module as a headset and

request deactivation of the headset. Please refer to the operating instructions of the mobile phone for detailed information.

Pairing Procedure

The pairing procedure that must be initiated through the phone will differ corresponding to the different menu configurations of the various Bluetooth™ mobile phones on the market. The user's manual of the phone manufacturer should always be referenced for specific steps on how to activate the Bluetooth™ feature and to pair/link devices.

The following steps are generalized steps that should help in activating the Bluetooth™ function of most phones:

In Vehicle:

1. Depress the send /receive (pairing) button located in the center console, for at least 1 second prior to switching on the ignition and continue to hold the button down for approximately 2-3 seconds after the ignition is turned on.
2. Release the button.

NOTE: The send/receive (pairing) button in 5 Series and X5 SAV is located on the oddment tray assembly in the center console.

G03399811

Courtesy of BMW OF NORTH AMERICA, INC.

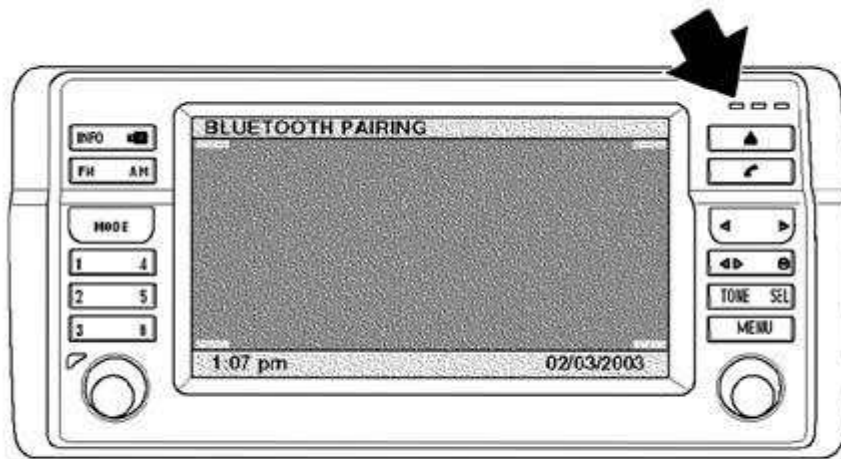

G03399812

Fig. 7: Identifying Send /Receive (Pairing) Button Location (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

3. Shortly after releasing the button on the Radio or Display Screen, the following message should be displayed:
 - a. Display Screen:

"Bluetooth Pairing" displayed.

Green, Yellow and Red LEDs on the right side of the unit are flashing which indicates that the ULF is waiting for a signal from the Bluetooth™ device to be paired.

b. Radio Display (5 Series and X5 SAV):

"Bluetooth Pairing" Display Which Indicates That The Ulf Is Searching For Available Bluetooth™ Devices. Green, Yellow And Red Leds On The Right Side Of The Unit Are Flashing Which Indicates That The Ulf Is Waiting For A Signal From The Bluetooth™ Device To Be Paired.

Fig. 9: Bluetooth Pairing Display
Courtesy of BMW OF NORTH AMERICA, INC.

c. Radio Display (3 Series with CD or Cassette):

"BT Pairing" display which indicates that the ULF is searching for available Bluetooth™ devices.

Fig. 10: BT Pairing Display

Courtesy of BMW OF NORTH AMERICA, INC.

4. Activate the search function of the phone as indicated below.

ON PHONE:

1. Locate the connection/settings menu and select Bluetooth™.
2. Select the response that will activate the Bluetooth™ feature of the phone.
3. Next select a menu option that will allow you to "Discover" or "Search" for active Bluetooth™ devices.
4. If the phone identifies/finds a device (named "BMW" followed by 5 digits) select it and follow the indicated steps to complete the pairing process.
5. Once the phone is successfully paired to the device cycle the vehicle ignition switch off and back on and the devices should wirelessly connect within 30 seconds. When the connection is established the phone will display a connection symbol.

The following steps are an example of the pairing procedure that must be initiated to pair the Sony Ericsson T68i phone to the ULF Control Module.

1. Press the menu button.
2. Select "Connect".
3. Select option 3: "Bluetooth".
4. Select option 4: "Options".
5. Select option 1: "Operation mode" and set to "On" or "Automatic".
6. Go back one step by pressing the red phone button several times.

7. Select option 3: "Discover".
8. Mobile phone display shows 'Searching'
9. Select "BMW" in upcoming list.
10. Select option 1: "Add to paired".
11. Enter the password (= ULF passkey) located on ULF Control Module that is in the rear of the vehicle or on the Passkey Reference Card.
 - Mobile phone display shows 'BMW Pairing'
 - Mobile phone display shows 'Pairing Successful'
 - Display screen shows 'Pairing succeeded' for 3 seconds
12. Enter device name or accept the name that is automatically displayed.
13. Mobile phone display shows "Added to paired devices".
14. Exit menu by pressing the red phone/NO button.
15. Once the phone is successfully paired to the device cycle the ignition switch off and back on.
16. The devices should wirelessly connect within 30 seconds. The connection is established when the phone displays the symbols indicated, on the right side of the screen.

NOTE: Shortly after turning on the ignition and the Bluetooth™ connection is identified, the phone may display a message asking if the connection should be established/accepted. The connection authorization request will always occur unless the setting on the phone is modified to allow automatic connection every time, please refer to the user's manual of the phone to determine how to change this setting.

G03399816

Fig. 11: Locating Connection/Settings Menu On Phone
Courtesy of BMW OF NORTH AMERICA, INC.

System Functions

The mobile phone must always be activated, paired and present within the Bluetooth™ network in order to place or receive a call through the vehicle.

Indicator Lamps

The indicator lamps show the following:

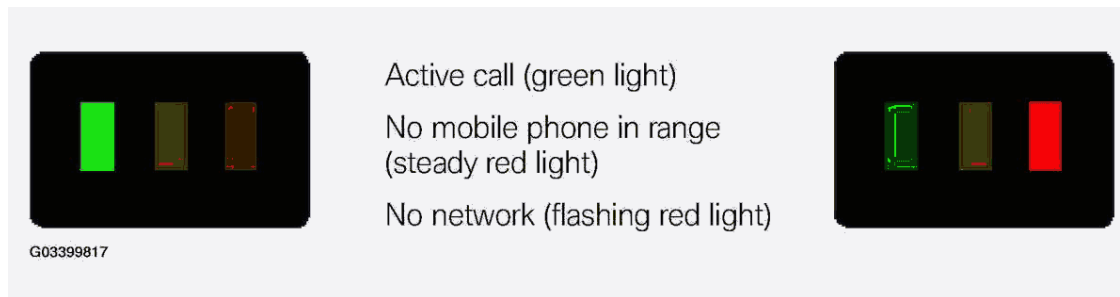

Fig. 12: Identifying Indicator Lamps

Courtesy of BMW OF NORTH AMERICA, INC.

Active call (green light).

No mobile phone in range (steady red light).

No network (flashing red light).

Adopting Telephone Book

Depending on the type of Bluetooth™ mobile phone, the telephone book is either transferred automatically (ex. Nokia 6310, Sony Ericsson T68i) or manually (depending on software version of phone) by the user to the ULF control module. The address book is stored temporarily for the purpose of accessing/displaying stored phonebook information using the steering wheel controls or telephone menu selections available on the display screen or some radio displays.

If a manual transfer of the address book must be made, the ULF must be in setup mode for manual transfer. The corresponding data can then be transferred. If phonebook data is modified while the phone is wirelessly connected to the vehicle the changes will not be displayed in the vehicle if the phonebook is scrolled via the steering wheel or display screen, changes will only be transferred the next time the ignition is cycled.

Placing a Call

A call can be placed in several different ways:

1. Using the keypad or address book of the mobile phone and depressing the send button on the phone.

NOTE: Some phones may ask if the call is to remain within the phone. Refer to the users manual of the phone for specific instructions on disabling this feature.

2. Depressing the R/T button on the steering wheel, then scrolling (using the TM or TM buttons) through the address book of the phone that is linked to the ULF, until the desired number is displayed on the radio or display screen and then depressing the send/receive TM button on the steering wheel or center console to

place the call.

3. Depressing the TM button on the steering wheel until an audible "beep" is heard through the vehicle speakers, at this point a call can be placed by using the following voice commands:
 - "Dial number" or "Dial phone":
 - After the system asks for a number say the number.

Example: "123 456 7890"; the system will repeat the number requested once you stop speaking momentarily, the number may also be displayed depending on the vehicle and equipment/accessories installed.

- "Dial":

NOTE: Once the dial command is given the number will be displayed on the display screen or radio; plus it will always be displayed on the mobile phone after a call is placed.

4. Briefly depressing the TM button on the steering wheel will redial the last number dialed.

For more information on using voice commands refer to the " Owner's Manual for Voice Input System. The Convenient Alternative to Manual Control" (P/N 84 11 027 942)

Receiving/Accepting a Call

The call ringer in the BluetoothTM mobile phone is audible when an incoming call signal is received. At the same time, the signal is sent via the BluetoothTM interface in the mobile phone to the BluetoothTM antenna in the vehicle. The ULF receives the incoming ring/call signal via the BluetoothTM antenna and mutes the radio. The incoming ring/tone signal is then also transmitted to the vehicle speakers.

The following options are available for accepting a call:

3 Series without Display Screen:

- Press send/receive TM button on MFL (Steering Wheel).
- Press send/receive TM button in the center console.
- Press send/receive key on mobile phone.

5 Series and X5 SAV without Display Screen:

- Press send/receive TM button on MFL (Steering Wheel).
- Press send/receive key on radio.
- Press send/receive TM button on the oddment tray (Center Console).
- Press send/receive key on mobile phone.

Vehicles with Display Screen:

- Press send/receive™ button on MFL (Steering Wheel).
- Press send/receive™ button on the oddment tray (Center Console).
- Select the green phone symbol on the Display Screen.
- Press send/receive key on mobile phone.

Conducting a Call

If the call is accepted by pressing the send/receive key™ on the Radio (5 series and X5 SAV), Display Screen, steering wheel or center console, it will be conducted via the hands free microphone and vehicle speakers.

If a call is accepted by pressing the send/receive key on the mobile phone, the reaction will depend on the type of handset. In the majority of cases, however, the question appears:

"Do you wish to use the mobile phone?"

Please refer to the operating instructions of the mobile phone for a detailed description of the operating procedure of the phone.

The hands-free function is activated after pressing the send/receive key. The incoming call is encoded (scrambled) via the Bluetooth™ interface in the mobile phone and sent to the Bluetooth™ antenna in the vehicle. The call is received by the ULF control module and output via the radio to the audio speakers.

Fig. 13: Identifying Call Components (1 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

Since the ULF system provides a digital full-duplex hands-free operation, it is possible to simultaneously speak and listen to calls. An echo cancellation function prevents feedback when speaking into the microphone. The microphone audio signal is sent via a hardwire connection to the ULF control module. In the ULF module the received audio signal is scrambled via the Bluetooth™ module and transferred via the Bluetooth™ antenna to the mobile phone. The mobile phone then transmits the call via the phone antenna.

Fig. 14: Identifying Call Components (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Ending a Call

The following options are available for ending a call:

3 Series without Display Screen:

- Press send/receive TM button on MFL (Steering Wheel).
- Press send/receive TM button in the center console.
- Press send/receive key on mobile phone.

5 Series and X5 SAV without Display Screen:

- Press send/receive TM button on MFL (Steering Wheel).
- Press send/receive key on radio.
- Press send/receive TM button on the oddment tray (Center Console).
- Press send/receive key on mobile phone.

Vehicles with Display Screen:

- Press send/receive TM button on MFL (Steering Wheel).
- Press send/receive TM button on the oddment tray (Center Console).
- Select the green phone symbol on the Display Screen.
- Press send/receive key on mobile phone.

Transfer Active Call From Phone to ULF

If a call is received or placed via the handset, it can be transferred into the vehicle once the phone is within the active BluetoothTM network of the vehicle.

Call transfer procedure:

1. Ignition must be on.

2. Bluetooth™ connection must be established.
3. Briefly depress the send/receive™ button located in the center console.

NOTE: Some phones may automatically display a statement asking the user if the active call should be transferred to the ULF system shortly after the Bluetooth™ connection is established. If the request is acknowledged the call is automatically transferred into the vehicle/ULF system without having to depress the send/receive button.

Transfer Active Call from ULF to Phone

If you are currently in an active call and you need to leave the vehicle the call can be transferred into the handset in several ways.

1. Ignition is turned off and you walk away from the vehicle. Once outside the 10 m (32.8 ft) range a message may be displayed on the phone asking if the current call should be maintained or ended, by maintaining the call it will be transferred to the handset.
2. Depending on the model of phone being used the call can be transferred to the handset by manually disconnecting from the Bluetooth™ network via the connections menu or selecting a transfer function in the settings menu of the phone (refer to the user's manual of the phone for more information).

Linking Several Bluetooth™ Mobile Phones

Up to four Bluetooth™ mobile phones can be paired one after the other to the ULF control module. The pairing operation corresponds to the procedure described above.

The handset paired last has the highest priority. The telephone paired first will drop out of the list if a fifth Bluetooth™ mobile phone is paired.

NOTE: For incoming and outgoing calls, only the user connected first to the system can speak via the hands-free facility.

If two users enter the network or connection range simultaneously, only the user with the highest priority (the user last paired during the initial pairing procedure) will be able to use the hands-free function for incoming & outgoing calls. If the highest priority phone is turned off the phone with the next highest priority will be connected.

Deleting Devices

The paired Bluetooth™ mobile phones can only be deleted as a single group from the ULF control module.

The pairing procedure must first be activated, and then the send/receive™ button on the installed eject-box or the pairing button located at the rear of the center console must again be depressed for an additional 10 seconds after the "Bluetooth Pairing" message is displayed on the radio in order to clear the list of paired devices from the control module and the message "paired devices deleted" is displayed.

TECHNICAL INFORMATION

Not only does the Universal Bluetooth™ Hands-Free System offer a means to wirelessly integrate a mobile phone into the vehicle, it also can be diagnosed using the DISplus or GT1.

The control module should always be coded to the specific vehicle that it is installed into to ensure optimum system performance. Coding of the module can be done using the DISplus or GT1 with CD33 or higher installed.

The ULF control module contains several controllers that provide the following functions:

1. Bluetooth™ Control Circuit:

The Bluetooth™ control circuit is physically connected to the Bluetooth™ antenna. It establishes the connection between the Bluetooth™ mobile phone and the vehicle, de-scrambles the incoming call/signal from the phone, scrambles the outgoing signal from the microphone for transmission to the phone, plus controls all communication to paired Bluetooth™ devices.

2. Hands-free Control Circuit:

The hands-free control circuit in the ULF controls the input/output of audio frequency signals in hands-free mode. The hands-free mode is designed for full-duplex transmission. This means the user can listen and speak simultaneously. Voice transmission takes place via a microphone located in the interior of the vehicle.

Pressing and holding the send/receive™ button until an audible beep is heard will activate the integrated voice recognition system and place the system into a hands-free mode.

3. Audio Output Control:

The incoming signal from the Bluetooth™ phone is processed, sent through the radio and to the speakers.

4. Audio Input Control:

The outgoing audio received from the vehicle microphone is processed and transmitted to the Bluetooth™ phone.

5. I/K-Bus Interface:

The interface in the ULF control module for the I/K-bus controls the procedure for transmitting and receiving data telegrams via the I/K-bus in connection with other components on the bus.

6. Power Module:

The power module in the ULF control module regulates the voltage supply and monitors system shutdown in the event of an under voltage situation in the vehicle.

SYSTEM OVERVIEW

Fig. 15: Identifying Power Module System Components
Courtesy of BMW OF NORTH AMERICA, INC.

Voice Recognition

The voice recognition for this system is integrated into the ULF Control Module and utilizes the same voice commands as those used with the TEMIC Voice Recognition Module used with the CPT8000 phone system. The "Owner's Manual for the Voice Input System" P/N 84 11 0 027 942 should be referenced for more detailed information regarding voice command features.

Coding ULF Control Module to Vehicle

After installing the ULF Kit, the vehicle should be re-coded with DISPlus/GT1 SW 33 or higher, using the "Retrofit" path to ensure that the system works properly with the systems currently installed in the vehicle. The recoding is done automatically when using the following "retrofit" procedure:

Example for coding E46 with ULF installed:

- Connect DIS or GT1 to vehicle (with SW 33 or higher installed).
- Turn on ignition.
- Select "Coding ZCS".

- Series: "E46 Series".
- Path: "2 Retrofit".
- System: "ULF Universal charging and Handsfree facility".
- Follow the on screen requests to activate the coding procedure.

Function Test

Upon completion of the recoding, verify that the BMW Universal Bluetooth™ HandsFree System is working correctly by going through the following action steps. After completing each step ensure that the desired result is obtained:

FUNCTION TEST

Action	Response
Pair phone to vehicle (refer to section for pairing instructions).	Phone and or Radio/MID/Board Computer should display statement indicating Pairing succeeded.
Turn on radio and initiate a call using voice recognition commands by depressing/holding the Voice recognition button on steering wheel until an audible beep is heard.	Radio should mute and an audible beep is heard through vehicle speakers.
Say "Dial number".	System states "Please speak the number".
Say phone number to be dialed ex"1234567890".	System states "1234567890".
If number is correct say "Dial"	Call is placed and number being dialed is displayed on phone as well as on Radio/MID/Board Computer.

TROUBLESHOOTING

TROUBLESHOOTING

Situation	Correction
No audio output through vehicle speakers.	Check SES module jumper plug.
Radio does not mute after placing a call.	Check connections at rear of radio for Tel On and Tel Mute signal. Verify that connectors and pins are properly seated.
Audio quality in vehicle may not sound very good.	Recode ULF Control Module.™ NOTE: Audio quality in vehicle or at person being contacted, is dependent on the quality and signal strength of the wireless service provider in the area traveled.
Customer complains that the person being contacted hears a "Buzzing" noise, at times during their conversation or on voice mail message that he/she has left.	Intermittently a "Buzzing" noise is noticeable to the person being called from the vehicle. The "Buzzing" noise is a result of the GSM signal being feedback through the microphone, this usually occurs if the GSM phone is located too close to the microphone.

	The customer should change the location of where the phone is placed/stored.
Driver is told that the person being contacted complains that there is an echo/reverberation in the audio; person can hear his/her voice back through the phone.	Audio volume in vehicle during a call may be a bit too loud, causing the other person to hear his/her voice coming back through the phone.
A second call is received while in a call, and call cannot be accepted using MFL controls.	Use handset to expect second call and place previous called on hold. Call waiting is functional only via the handset.
The radio audio does not come back immediately if the "other" person hangs up first.	It takes approximately 15 seconds for the ULF system to recognize that the call was terminated from outside the vehicle. If the call is terminated from outside the vehicle first, the driver can depress the button on the steering wheel to terminate the call from the vehicle and un-mute the radio quicker.
Customer is not able to pair phone to system, not able to locate ULF passkey/password reference card.	The "Bluetooth™ Passkey" is identified on the label of the ULF Control Module located in the rear of the vehicle.™ The "Bluetooth™ Passkey" for the installed control module can be obtained by connecting the DISPlus or GT1 and accessing the diagnostics for the ULF system:- select "Diagnostic requests" - select "Bluetooth code".
Intermittently a popping noise is audible through the vehicles speaker and there is no Bluetooth™ wireless communication established between the ULF module and the phone.	Vehicle and /or ULF Control Module are not correctly coded.™ Recode module and vehicle (refer to <u>CODING ULF CONTROL MODULE TO VEHICLE</u>).
E46 Only: After installation of ULF system the speedometer and odometer do not work.	Remove pin 7 & 8 from the 54-pin connector going to the ULF Control Module. .

CONNECTOR PIN ASSIGNMENTS

The 54-pin connector of the ULF Control Module utilizes the following pins on X01185

PINS DESCRIPTION

PIN	Description
1	Microphone +
11	Cradle On/Enable
15	I-Bus
17	KL 30
19	Microphone -
21	Microphone Shield
22	Hook
27	Programming
28	Programming
32	Cradle Key +

33	Telephone On
34	Telephone On (pin 33)
35	KL R (Ignition)
36	KL 31 (Ground)
43	Programming
44	Programming
45	Programming
51	Telephone Mute
52	KL 58g (illumination)

The following pins on X4545 are utilized when the eject box is connected

PINS DESCRIPTION

PIN	Description
1	Cradle Key +
2	KL 31
3	58G
5	KL 30
13	Cradle On/Enable

NOTE: The pairing button used on the E46 only utilizes pin 1, 2 & 3 of X4545

GENERAL INFORMATION

Breakout Boxes & Connectors - Overview

BREAKOUT BOXES AND CONNECTORS

Model: All

Production Date: All

CONNECTOR CONTACT KIT

Connector Contact Removal Kit

The connector contact removal kit provides tools for the disassembly of connectors. Proper use of these tools enable the technician to access wiring connectors for repairs equal to factory quality.

Always refer to the latest appropriate articles for up to date information regarding new tools.

G03388933

Fig. 1: Identifying Connector Contact Removal Kit
Courtesy of BMW OF NORTH AMERICA, INC.

Current P/N 88 88 6 611 150.

The Connector Contact Removal Kit is used for:

- Releasing round plug housings.
- Releasing relay carriers.
- Pressing out contacts.
- Pulling out indicator lamps.

Socket and Spring Contacts

G03388934

Fig. 2: Identifying Spring Contacts
Courtesy of BMW OF NORTH AMERICA, INC.

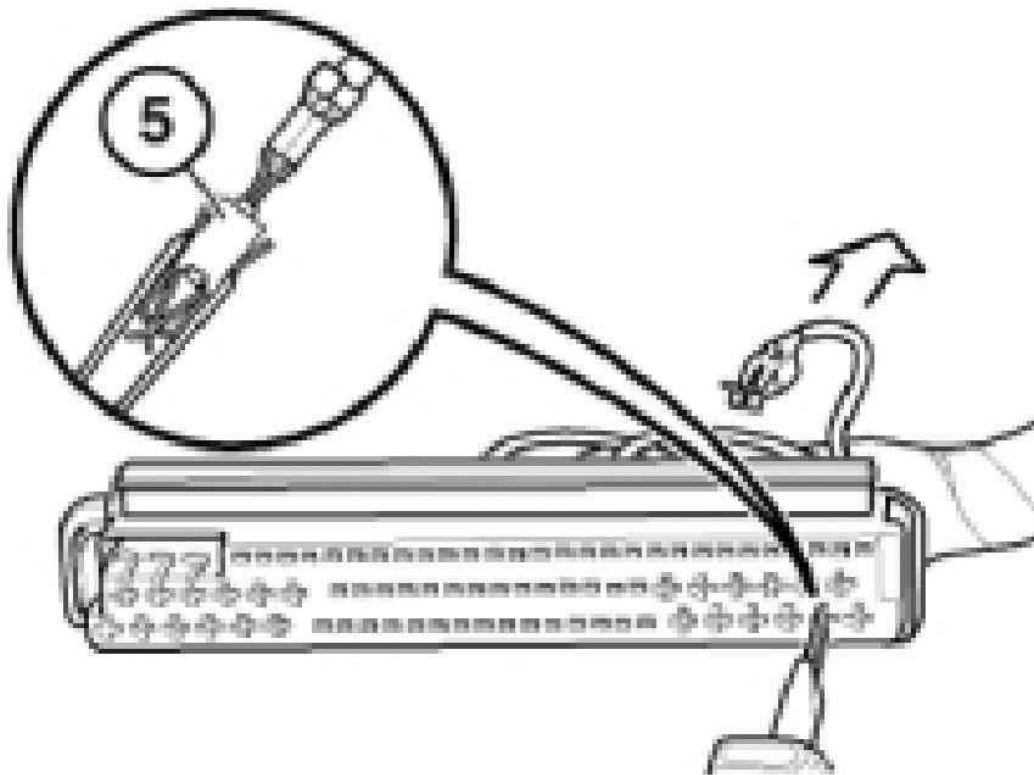

G03388935

Fig. 3: View Of Socket Types

Courtesy of BMW OF NORTH AMERICA, INC.

Socket and Spring contacts compress the springs while the connector is pushed from the housing.

G03388936

Fig. 4: Identifying Different Sockets
Courtesy of BMW OF NORTH AMERICA, INC.

G03388937

Fig. 5: View Of Socket And Spring Contacts

Courtesy of BMW OF NORTH AMERICA, INC.

Flat spring contacts depress the spring allowing the connector to be pushed or gently pulled from the connector housing.

Instrument Cluster Illumination Bulb Holder Removal Socket

The backlighting illumination bulbs are removed from the cluster by placing square head of the socket on the bulb holder and turning 90° counter clockwise.

The bulb removal socket is used on all instrument clusters.

G03388938

Fig. 6: Identifying Instrument Cluster Illumination Bulb Holder Removal Socket
Courtesy of BMW OF NORTH AMERICA, INC.

Relay Holder Disengaging Tool

This tool allows the relay holder (2) to disengage the relay connector (1).

G03388939

Fig. 7: Identifying Relay Holder Disengaging Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Circular Connector Lock Disengager

These tools unlock the circular connector housings allowing the individual connectors to be removed.

The various sizes are reflected in the part numbers:

4 pin = 61 1 141.

7 pin = 61 1 142.

10 pin = 61 1 145.

12 pin = 61 1 143.

25 Pin = 61 1 144.

G03388945

Fig. 13: Locating Recessed Notch In Inner Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Circular plug 13 Pin System D2.5

- Carefully pull off the rubber grommet (1).
- Pull the lock retainers (2) outward (direction of arrows) to allow the lock notch to disengage.
- Pull the inner section (3) upward as shown in the illustration until the lock notches (4) are in the released position of the lock retainers (5) and use the appropriate size spring contact and remove the connector from the housing.

G03388946

Fig. 14: Locating Circular Plug Lock Retainers
Courtesy of BMW OF NORTH AMERICA, INC.

G03388947

Fig. 15: View Of Lock Notch In Circular Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Circular Plug 20 Pin System D2.5

- With the boot pulled back, press the lock tabs (1) of the inner connector section (2) inward.
- Simultaneously, rotate the inner connection section (2) counter clockwise to allow the lock tabs (1) to engage in the unlocked position and use the appropriate sized spring contact and remove connector from the housing.

G03388948

In-line Plug 6-,50 Pin System Elo

- Unlock lock (**Fig. 41**).
- Unfasten cable clip (**Fig. 42**).
- Slide connector lock (1) off of main connector body (2) (**Fig. 43**).
- Push the connector plate (3) out of connector shell using a small screwdriver through hole on end of connector body (**Fig. 44**).
- Push the lock tab of the connector being removed down (6) with pin or small screw driver in the primary lock slot (7) and pull the wire out to the secondary lock position (8) (**Fig. 45**).
- Push the lock tab down again in the secondary lock position and remove wire completely (**Fig. 46**).

PLUG SYSTEM MQS/MPQ

In-line Plug 6-,8 Pin System MQS

- Press lock (1) in direction of arrow and slide plug forward.
- Press locking hook (2) downward and slide lock (1) out.
- Press down arrester hook (3) with screwdriver and pull out cable with contact towards rear.

G03388979

Fig. 47: View Of In-Line Plug Lock
Courtesy of BMW OF NORTH AMERICA, INC.

G03388980

G03388983

Fig. 51: Removing Cable And Contact From In-Line Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Control Unit Plug 25-, 35-, 55-,83-,88 Pin

- Remove phillips head screws (1) from connector. Gently pivot the connector plate (2) with seal (3) out of the connector shell.
- Remove seal (3) and pull connector plate lock (4) out of locked position.
- Using the appropriate sized spring contact and remove connector (5) from housing.

In-line Plug 24 Pin Hybrid System MQS/MPQ

Manufactured by AMP : The following contact types without strand sealing can be fitted in the plug housings:

MQS (Micro Quadlock System).

MPQ, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

Socket Housing

- Press locks (1) on cap (2) upwards on both sides.
- Detach cap from contact carrier (3).

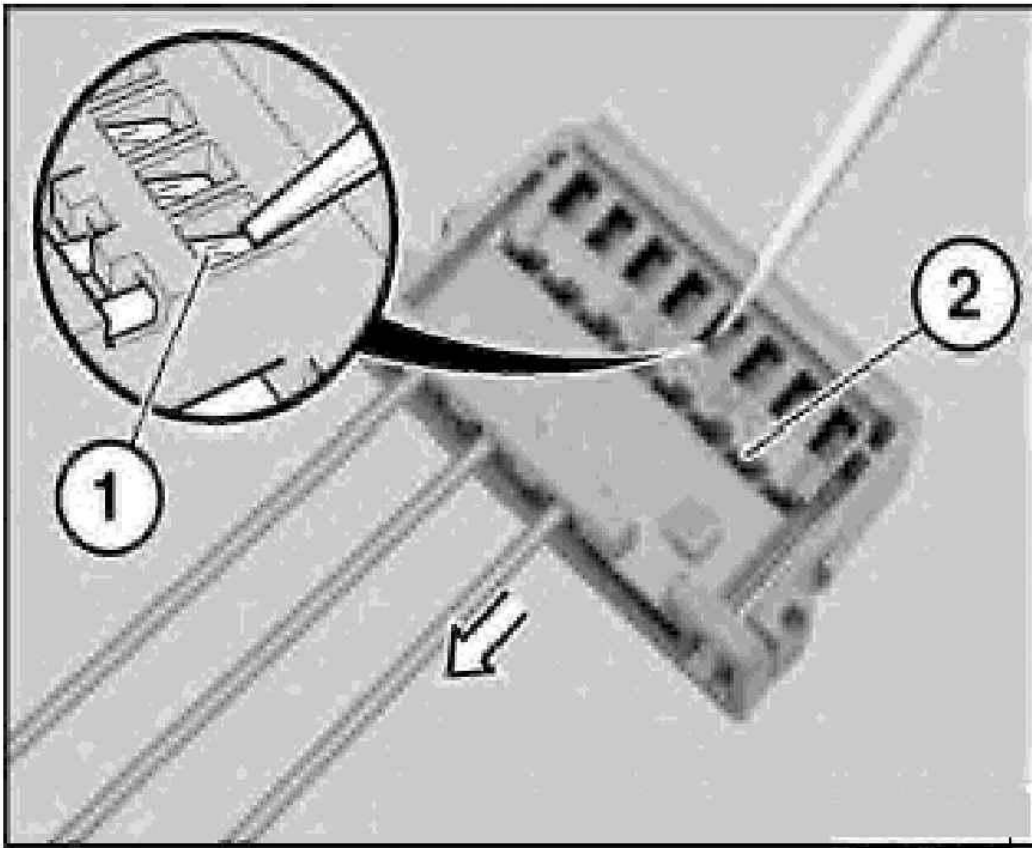

NOTE: Detaching the cap releases the secondary lock of the socket contacts.

G03388987

Fig. 55: Removing Cap From Contact Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

- Hold down retaining hook (1) of socket contact carrier with a small screwdriver.
- Pull wire with socket contact in direction of arrow as far as secondary lock (2). (**Fig. 56**)
- Hold down retaining hook in secondary lock (1) again and pull cable with socket contact (2) completely out of contact carrier (3). (**Fig. 57**)

G03388988

Fig. 56: View Of Retaining Hook In Secondary Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Pin Housing

- Press locks (1) on cap (2) upwards on both sides.
- Detach cap from housing carrier (3)(Fig. 58).

NOTE: **Detaching the cap releases the secondary locks of the pin contacts in the contact carriers.**

- Pull contact carrier (1) out of housing carrier (2) (Fig. 59).
- The pin contacts are pulled of a contact carrier as described under "Socket Housing".

G03388989

Fig. 57: Identifying Pin Housing Locks
Courtesy of BMW OF NORTH AMERICA, INC.

G03388990

Fig. 58: Removing Cap From Pin Housing

Socket Housing 42-,43 Pin Hybrid Systems MQS/MPQ

Manufactured by AMP: The following contact types without strand sealing can be fitted in the socket housings:

MQS (Micro Quadlock System).

MPQ, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

- Open secondary locks (1) on socket housing.
- Press back retaining hook of MQS contacts (2) with special tool 61 1 134 and pull out cable with contact.
- Press back retaining hook of MPQ contacts (3) with screwdriver or similar tool and pull out cable with

contact.

Installation:

- Bend open retaining hook of contacts gently before inserting into plug housing.
- To install contacts, observe cavity numbers on reverse side of socket housing.

G03388992

Fig. 60: Identifying MOS Contact Retaining Hook
Courtesy of BMW OF NORTH AMERICA, INC.

G03388993

Fig. 61: Identifying Cavity Numbers On Socket Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Socket Housing 2x27-, 2x27 Pin Hybrid System MQS/MPQ, Elo/Elo Power

Manufactured by Amp: The following contact types without strand sealing can be fitted in the socket housings:

MQS (Micro Quadlock System).

MQS, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

Manufactured by Siemens: The following contact types without strand sealing can be fitted in the socket housings:

Elo (electronic contact).

Elo-Power 2.8 mm wide (electronic contact for heavy loads).

Elo-Power 5.2 mm wide (electronic contact for heavy loads).

- Raise lock (1) on housing (2).
- Push contact carrier (3) from rear out of housing.

NOTE: The second carrier is pushed out in the same way.

Pushing out the contact carrier releases the secondary locks of the secondary contacts.

Procedure for removing contacts are same as for other Elo/Elo-Power Systems, refer to the appropriate article.

G03388994

Fig. 62: Removing Contact Carrier From Rear Housing
Courtesy of BMW OF NORTH AMERICA, INC.

In-line Plug 30 Pin Hybrid System MQS/MPQ

Manufactured by AMP: The following contact types without strand sealing can be fitted in the plug housings:

MQS (Micro Quadlock System).

MPQ, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

Socket Housing

- Raise lock (1) on housing (2).

- Push contact carrier (3) from rear out of housing (2).

NOTE: Pushing out the contact carrier releases the secondary locks of the socket contacts. Procedure for removing contacts are same as for other Elo/Elo-Power Systems, refer to the appropriate article.

G03388995

Fig. 63: Removing Contact Carrier From Rear Out Of Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Pin Housing

- Contact 1-13 and 19-27.
- Raise locking slide (1) on both sides (2) of housing and detach.

NOTE: Detaching the locking slide releases the secondary locks of the pin

contacts.

- Contacts 14-18 and 28-30.
- Pull slide (1) outward completely.
- Raise lock (2) on housing.
- Pull contact carrier out of housing.

NOTE: Pulling out the contact carrier releases the secondary locks of the pin contacts.

G03388996

Fig. 64: Identifying Pin Housing Slide
Courtesy of BMW OF NORTH AMERICA, INC.

G03388997

Fig. 65: Removing Pin Housing Contact Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Socket Housing 5-, 8 Pin System MQS/MPQ

Manufactured by AMP: The following contact types without strand sealing can be fitted in the socket housings:

MQS (Micro Quadlock System).

MPQ, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

Socket housing 5 pin (Hybrid System MQS/MPQ)

- Raise fastener (1) (slide) by way of retaining lug (2) and detach from contact carrier (3).

G03388998

Fig. 66: Identifying Socket Housing Fastener
Courtesy of BMW OF NORTH AMERICA, INC.

Socket Housing 8 Pin (MQS)

- Raise fastener (1) (slide) by way of retaining lug (2) and detach from contact carrier (3).

Procedure for removing contacts are same as for other Elo/Elo-Power Systems, refer to the appropriate article.

G03388999

Fig. 67: Identifying Socket Housing 8 Pin (MQS)
Courtesy of BMW OF NORTH AMERICA, INC.

Socket Housing (Radio Plug) Hybrid system MQS/MPS

Manufactured by AMP: The following contact types without strand sealing can be fitted in the plug housings:

MQS (Micro Quadlock System).

MPQ, width 2.8 mm (Micro Power Quadlock).

MPQ, width 5.2 mm (Micro Power Quadlock).

Removing MPQ contacts from radio plug:

- Press lock (1) in direction of arrow, detach secondary lock (2) from radio plug.

- Feed special tool 61 1 135 past side of contact.
- Press special tool 61 1 135 in direction of arrow.
- Pull wire (1) with socket contact out of radio plug (2).

G03389000

Fig. 68: Locating Radio Plug Lock
Courtesy of BMW OF NORTH AMERICA, INC.

G03389001

Fig. 69: Identifying Special Tool In Radio Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Removing MQS contacts from carrier

- Press lock (1) in direction of arrow and pull housing (2) out of radio plug (**Fig. 70**).
- Press lock (1) in direction of arrow. Pull contact carrier (2) out of housing (**Fig. 71**).

NOTE: When the contact carrier is pulled out, the secondary locks of the socket contacts are raised. Procedure for removing contacts are same as for other Elo/Elo-Power Systems, refer to the appropriate article.

G03389002

Fig. 70: Removing Housing From Radio Plug
Courtesy of BMW OF NORTH AMERICA, INC.

G03389003

Fig. 71: Removing Contact Carrier Out Of Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Removing MPQ contacts from contact carrier

- Remove contact carrier (1) with MQS contacts from radio plug. Raise lock (2) on radio plug. Pull contact carrier (3) out of radio plug (**Fig. 72**).
- Press lock (1) in direction of arrow. Pull secondary lock (2) in direction of arrow completely out of contact carrier (3) (**Fig. 73**).
- Press special tool 61 1 135 on inside of contact into contact carrier (2). Pull wire with socket contact (1) out of contact carrier (2) (**Fig. 74**).

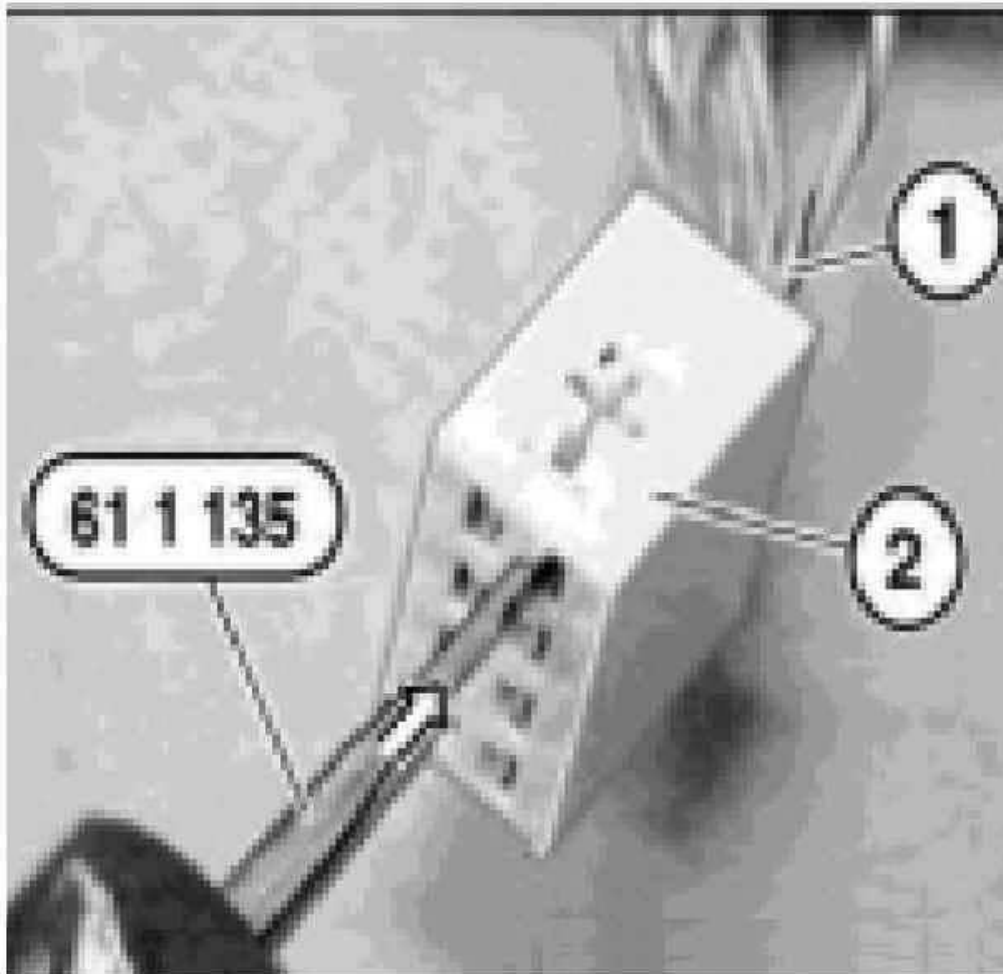

G03389004

Fig. 72: Removing MPQ Contacts From Contact Carrier

MISCELLANEOUS CONNECTORS

Fuse Strip

- Pull appropriate fuse from fuse strip (1). **Note: Mark fuse rating and position for reinstallation.**
- Pull locking slide (2) out of fuse strip until stop is felt.
- Using special tool **61 1 136** or **61 1 137** press the spring latch down (3) and pull the connector from the housing.

G03389007

Fig. 75: Removing Locking Slide From Fuse Strip
Courtesy of BMW OF NORTH AMERICA, INC.

G03389008

Fig. 76: Removing Connector From Housing Using Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

ECM Main Relay Connector

- Unlock wire flap (1) of connector being removed.
- Using special tool **61 1 136** or **61 1 137** press the spring latch down (2) and pull the connector from the housing.

G03389009

Fig. 78: Locating Spring Latch

Courtesy of BMW OF NORTH AMERICA, INC.

SOLDERLESS TERMINALS AND CONNECTORS

Mechanical strength of solderless terminal design and electrical conductivity must be maintained at all times. To ensure these characteristics are maintained in the vehicles electrical system several BMW repair kits are available.

The repair kits listed contain all the approved connectors, pins, and tools required for proper repair of BMW's electrical, electronics components.

- **Electrical Repair Kit IV**

P/N 90 88 6 619 020

The Electrical Repair Kit IV (Ref. SI. 04 18 92) is used in conjunction with the detailed repair procedures.

G03389011

Fig. 79: Identifying Electrical Repair Kit IV
Courtesy of BMW OF NORTH AMERICA, INC.

- Disassembling, replacing a plug connection on the various types of connectors.
- Cutting cable to length.
- Crimping stop parts (Contacts).
- Butt connectors for repairing a plug connection.

Operating instructions for special tools and the handling of individual parts in the repair kit are available under PN 61 9 029.

Three previous kits issued by BMW are:

- **Electrical Repair Kit I** (Black Case)

P/N 81 24 9 408 080

- **Electrical Repair Kit II** (Blue Case)

P/N 81 24 9 408 300

- **Electrical Repair Kit III** (Red Case)

P/N 82 11 9 408 400

Electrical repair kits I, II and III are primarily needed for repairing wiring harness and connectors of older vehicles (E30 and earlier).

Operating instructions for special tools in these kits are available under **PN 61 8 084**.

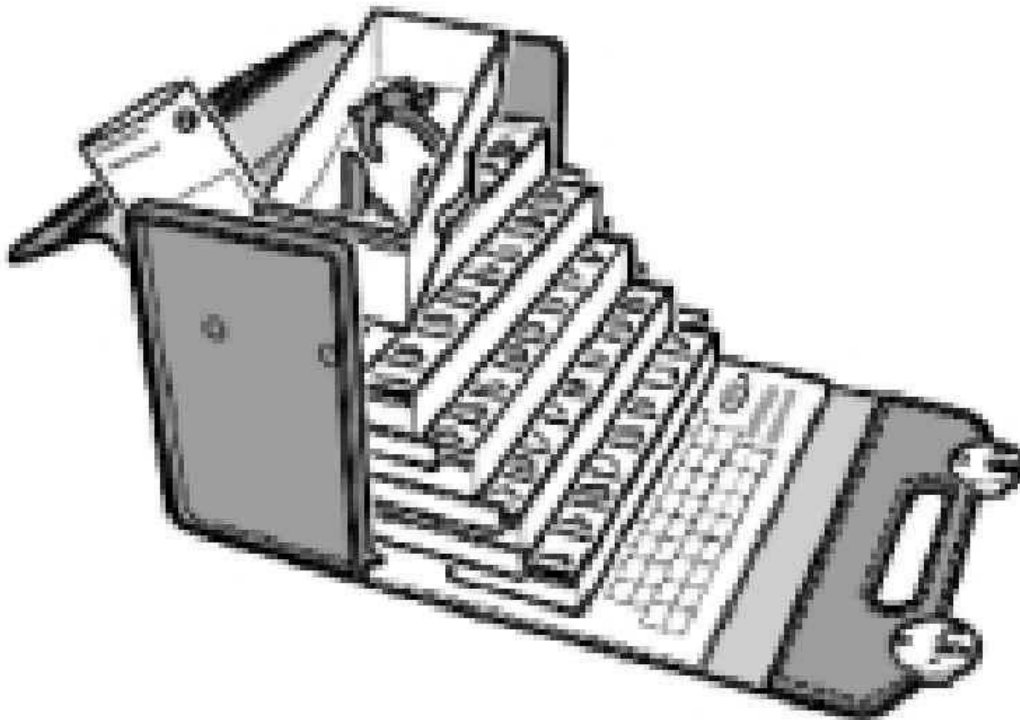

G03389012

Fig. 80: Identifying Electrical Repair Kits
Courtesy of BMW OF NORTH AMERICA, INC.

ELECTRICAL REPAIR KIT IV

The Electrical Repair Kits (I, II, III and IV) have gone through various upgrades.

Electrical Repair Kit IV (PN 90 88 619 020) has been developed to handle repairs of the specialized state of the art wiring and harnesses of the newest BMW products.

G03389013

Fig. 81: Identifying Electrical Repair Kit IV
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: The special tools contained in the Electrical Repair Kits I, II, III are not state of the art and are not suitable for specialized wiring harness repairs. Use exclusively Electrical Repair Kit IV for those repairs.

Electrical Repair Kit IV (61 9 020)

Contains the following:

61 9 041 Crimping Tool.

61 9 042 Matrix.

61 9 043 Cable Stripper.

61 9 044 Matrix.

Assorted Individual Parts.

Cable Stripper

Special Tool **61 9 043** Cable stripper with wire cutter for cutting and stripping insulation from cables.

G03389014

Fig. 82: Identifying Cable Stripper

Courtesy of BMW OF NORTH AMERICA, INC.

Crimping Tool

Special Tool **61 9 041** Crimping Tool with special tool **61 9 044** (matrix) for crimping cable guide and strain relief device on antenna elbow plug.

Supplementary kits for Electrical Repair Kit IV are released periodically.

G03389015

Fig. 83: Identifying Crimping Tool

Courtesy of BMW OF NORTH AMERICA, INC.

CABLE STRIPPING

Proper wire stripping and connector replacement is essential to ensure the integrity of the electrical connection. Always follow specific instructions in the Electrical Repair Kit IV instruction manual.

The length of wire to be stripped is determined by the wire gauge.

WIRE CROSS-SECTION SIZE SPECIFICATIONS

Wire cross-section size	stripped length:
mm ²	mm
0.35... 0.50	4.0
0.75... 1.00	4.5
1.00... 2.50	5.0

G03389016

Fig. 84: Inserting Wire Into Cable Stripping Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Proper use of the wire stripping tool will provide consistently positive results. Insert the wire (1) into the stripper. Stop the wire when the required strip length is past the cutter (2). Squeeze the handle of the tool.

G03389017

Fig. 85: View Of Wire In Stripper
Courtesy of BMW OF NORTH AMERICA, INC.

When the top jaw of the tool touches the wire (3) the mechanism shifts the clamping action to a pulling action which strips the wire of the insulation (4).

G03389018

Fig. 86: Removing Insulation Using Stripper
Courtesy of BMW OF NORTH AMERICA, INC.

CRIMPING

Use the wire crimper from the BMW Electrical Repair Kit. This crimper is designed for the specific connectors found in BMW automobiles. Proper use of the tools will provide consistent good quality connector crimps.

The crimper is designed to apply just the right amount of pressure based on the wire gauge and connector size.

G03389019

Fig. 87: Identifying Removable Crimper Jaws
Courtesy of BMW OF NORTH AMERICA, INC.

The tool has removable crimper jaws (3). This feature allows for an unlimited number of connector types for future compatibility. The article refers to the different sized crimping slots as "Nests". The gauge of the wire being crimped determines which "Nest" is used.

Fig. 88: Identifying Crimper Jaw Dimensions
 Courtesy of BMW OF NORTH AMERICA, INC.

WIRE CROSS-SECTION SIZE SPECIFICATIONS

Nest	Wire Cross-section size
1	0.035....0.50mm ²
2	0.75.....1.0mm ²
3	1.5mm ²
4	2.5mm ²

Example:

A. 75 - 1.0mm gauge wire requires nest 2 for proper crimping.

Throughout the Electrical Repair Kit instruction manual are illustrations of various connectors being crimped. The highlighted box of the 16 box grid in these illustrations refers to the storage compartment in the electrical kit drawers in which that specific connector can be found.

Insert the "crimping end" of the connector into the appropriate "nest". Illustration provides example of comb replacement connector (4) and inline splice connector (5).

G03389021

Fig. 89: Identifying Comb Replacement Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Squeeze the tool handle slightly to set the tool in the first ratchet latch position. This will hold the connector in the tool without closing the crimp (6).

Insert the stripped wire into the receiving end of the crimper tool making sure the wire is inserted far enough to ensure that only the wire insulation will be inside the insulation support barrel (7).

Properly crimped connectors exhibit the following characteristics:

G03389022

Fig. 90: View Of Connector In Tool

Courtesy of BMW OF NORTH AMERICA, INC.

- The insulation support barrel will be crimped consistently and snug against the insulation. The insulation will not be crushed (8).
- A bellmouth crimp will be visible at the wire end of the of the wire barrel (9).
- Wire strands will be visible at the contact end of the wire barrel (10).
- Insulation end will be visible in this area (11) (**Fig. 92**).

G03389023

Fig. 91: View Of Wire Insulation In Support Barrel
Courtesy of BMW OF NORTH AMERICA, INC.

The following are examples of unacceptable crimps: **(Fig. 93)**

- Excessive or no wire strands at the contact end of the wire barrel (10).
- Excessive or no insulation end in the acceptable area (11).

G03389024

Fig. 92: Identifying Properly Crimped Connector
Courtesy of BMW OF NORTH AMERICA, INC.

G03389025

Fig. 93: Identifying Unacceptable Crimps
Courtesy of BMW OF NORTH AMERICA, INC.

PREPACKAGED WIRING REPAIR SETS

Included with the Electrical Repair Kit IV are a variety of wiring repair sets. These sets contain various pre-crimped wiring connectors on assorted gauge wire lengths for simple splice connection repair into a wiring harness.

The repair kits also contain:

1. Various gauge lengths of wire with precrimped connectors.

2. In-line splice connectors.
3. Heat shrink tubing.

G03389026

Fig. 94: Identifying Prepackaged Wiring Repair Sets
Courtesy of BMW OF NORTH AMERICA, INC.

When used correctly the in-line splice connectors provide a BMW factory approved wire crimp. Use the correct size nest in the crimper tool and connect one side of the in-line crimp with the wire.

Slide a piece of heat shrink tubing on the wire and crimp the other side of the in-line connector.

G03389027

Fig. 95: Using Correct Size Crimper Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Use a heat gun to shrink the tube around the splice connector to provide a moisture resistant seal.

Part numbers for the wire sets or any component of all four electrical repair kits can be reordered from:

- The P/N reference card inside each repair kit.
- Special tools microfiche.
- The Electrical Repair Kit 1-4 component catalog (**SD 92-036**).

G03389028

Fig. 96: Identifying Electrical Connectors
Courtesy of BMW OF NORTH AMERICA, INC.

As new connectors are developed for new vehicles, the repair kits will be added to appropriate articles.

Soldering Connections

In the event that a wiring connection must be soldered in a vehicle's electrical system, there are certain procedures which must be followed. Improper soldering will result in poor electrical connections or damage to electrical components.

SAFETY: Adhere to the following basic guidelines when preparing to solder.

- **Safety glasses must be worn.**
- **Disconnect vehicle battery.**
- **Cover vehicle trim surfaces.**
- **Exercise your common sense.**
- **Provide adequate ventilation, it's the best safety precaution!**

Fig. 97: Identifying Correct Amount Of Wire For Soldering
Courtesy of BMW OF NORTH AMERICA, INC.

Soldering Preparation and Procedure

- The wire insulation must be stripped to expose an adequate amount of bare wire (not too little-not too much.)
- The wires and or connectors must be **clean** and free of grease, dirt, wax, etc.
- A thin coating of **rosin core flux** must be applied to the soldering connection.
- Have enough **60/40 (tin/lead)** general electrical **solder** on hand prior to starting.
- If heat transfer to a heat sensitive component is possible use "**heat sinks**".
- Use a soldering gun tip that is the right size for the job. Do not use an overly large tip which could melt wire insulation and block your view of what is being soldered.
- The soldering tip must be "**tinned**". This means to keep a thin layer of solder on the tip at all times during soldering. This will transfer the heat quickly and allow the solder to flow easily into the joint being soldered.

- Preheat the wires or connector. Introduce the solder into the joint not the soldering tip.
- When the solder starts to flow allow it to infiltrate the joint only for a moment. Almost simultaneously, pull the tip off of the joint to prevent overheating.
- A properly soldered joint will be smooth, shinny, and even surfaced.

Fig. 98: Identifying Soldering Procedure
 Courtesy of BMW OF NORTH AMERICA, INC.

BREAKOUT BOXES AND "V" CABLES

Breakout Boxes are used to:

- Provide a convenient "tap" into an electrical circuit.
- Minimize the possibility of damage to control unit connections and wire harnesses during diagnosis of electrical/electronic systems.
- Ensure solid meter connections for proper diagnosis, this in turn will help the technician to be more organized and efficient.
- Provide easier access to circuits for testing with equipment such as, multimeter, DISplus tester or other diagnostic tools.

CAUTION: Breakout box cable connections are universal in order to fit the varying coded connectors found in the vehicles. Always confirm that you are connecting the correct control module into the system harness that is on the other side of the breakout box. System damage will occur if it is not the correct system.

Example: DME and EGS/AGS control modules both utilize an 88 or 134 pin control module. These control modules reside in the same E-Box on most vehicles. The control modules are coded to prevent unintentional cross connecting at the vehicle harness. But, this connector coding is not present on the 88 or 134 pin breakout box(s). **Result:** A DME control module could be connected to a transmission control system. **Damage will result!**

Several different types of breakout boxes are available depending on the particular system being diagnosed.

G03389031

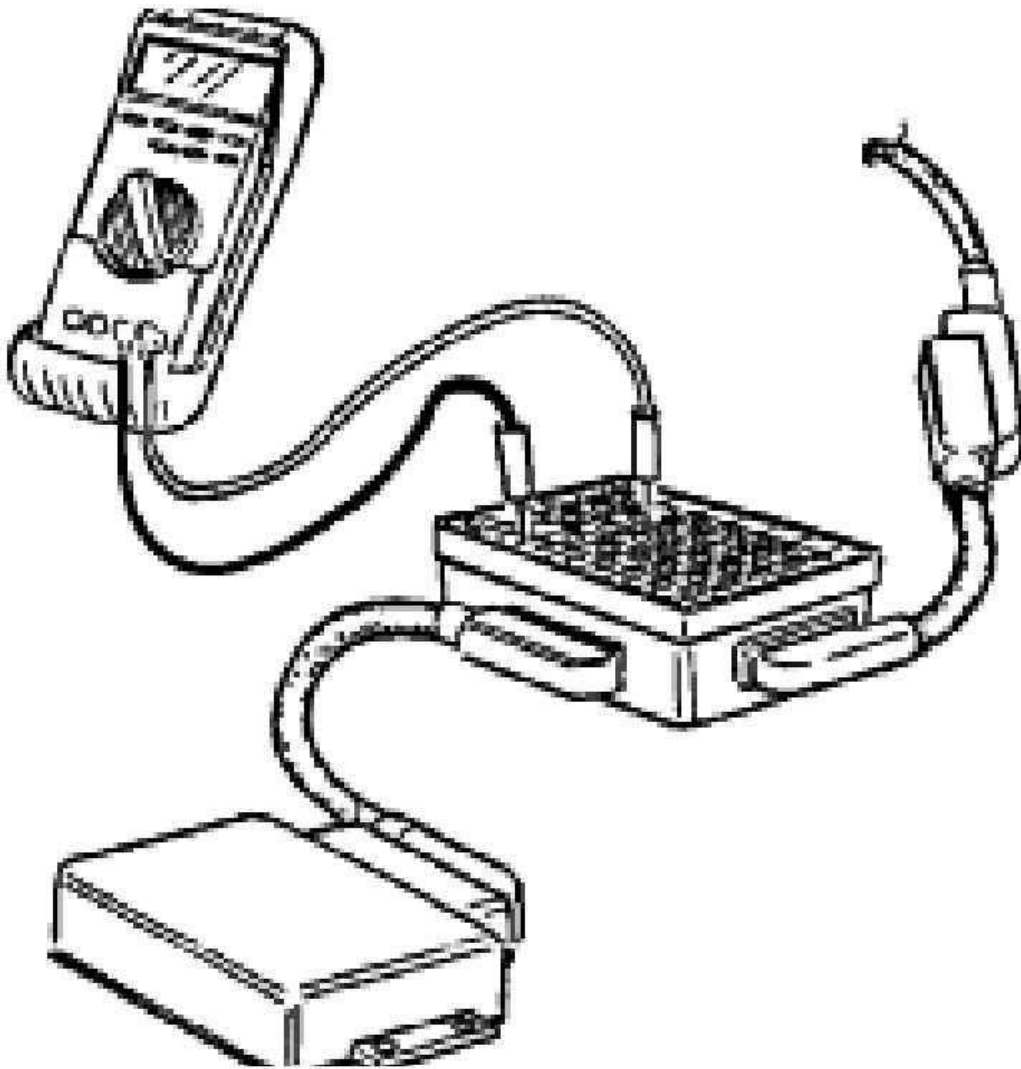

Fig. 99: View Of Breakout Box
Courtesy of BMW OF NORTH AMERICA, INC.

55 pin Breakout Box P/N 81 12 9 425 091

Used with control modules that have single multipin plugs from 25 to 55 pins.

- L-jetronic.
- ABS.
- Motronic.
- EGS.

Adapter cables are required.

G03389032

Fig. 100: Identifying 55 Pin Breakout Box P/N 81 12 9 425 091
Courtesy of BMW OF NORTH AMERICA, INC.

83 Pin Breakout Box (Red Face) P/N 90 88 6 614 420

When used with ABS/ASC 5 system, no adapter cables are required. There is an adapter harness for use with the Teves Mark IV G ABS system of the E36.

A PLASTIC KEY
IN THE CONNECTOR
OF THE BREAK OUT
BOX PREVENTS
CONTACTS IN THE
WIRING HARNESS
CONNECTOR FROM
TOUCHING. THIS KEEPS

DIAGNOSING

G03389033

Fig. 101: View Of 83 Pin Breakout Box (Red Face) P/N 90 88 6 614 420
Courtesy of BMW OF NORTH AMERICA, INC.

88 Pin Breakout Box (Green Face) P/N 88 88 6 614 410

Used with control units that have up to 88 pins;

- DME.
- EGS/AGS.
- ZAE/MRS.
- LCM.

No adapter cables are required when connected to a DME or EGS/AGS control module. There are adapter harnesses for ZAE/MRS and LCM systems.

G03389034

Fig. 102: Identifying 88 Pin Breakout Box (Green Face) P/N 88 88 6 614 410
Courtesy of BMW OF NORTH AMERICA, INC.

134 Pin SKE Control Module Breakout Box Set P/N 90 88 6 121 300

The 134 pin modular connector DME and AGS control modules use a combination of breakout boxes for troubleshooting. The part number above provides three breakout boxes and five adapter harnesses. The two

outside edge connectors use the familiar 26 pin breakout boxes. The three inside connectors use the boxes from the ordered set.

G03389035

Fig. 103: View Of 134 Pin SKE Control Module Breakout Box Set P/N 90 88 6 121 300
Courtesy of BMW OF NORTH AMERICA, INC.

26 Pin Breakout Box P/n 88 88 6 611 459

Used with system or peripheral control module that have up to 26 pins. This breakout box is used in conjunction with adapter cables called "V" Cables. There are many different types of "V" cables for the various connectors found on the vehicles.

G03389036

Fig. 104: Identifying 26 Pin Breakout Box P/N 88 88 6 611 459
Courtesy of BMW OF NORTH AMERICA, INC.

60 Pin Breakout Box P/N 90 88 6 614 390

Used for connecting all adapter leads with 27 pin to 60 pin plug connections.

G03389037

Fig. 105: View Of 60 Pin Breakout Box P/N 90 88 6 614 390
Courtesy of BMW OF NORTH AMERICA, INC.

TESTER AND ADAPTER SET FOR RELAYS

The Relay Adapter provides a platform to test a relay while allowing the relay to remain active in a circuit.

The adapters included enable different pin configurations of relays to be tested using a single tester.

G03389038

Fig. 106: Identifying Tester And Adapter Set For Relays
Courtesy of BMW OF NORTH AMERICA, INC.

Remove relay and compare plug in adapter with plug pattern on relay. Choose correct adapter (**Fig. 107**).

Fit adapter to Measuring bridge, noting the marker arrows (A). Fit the relay to the measuring bridge (**Fig. 108**).

Plug the assemble measuring bridge into the socket of the relay to be checked. Test using a multimeter. See the circuit diagram, testing instructions in the appropriate article for subsequent procedure (**Fig. 109**).

G03389039

Fig. 107: Identifying Relay And Compare Plug
Courtesy of BMW OF NORTH AMERICA, INC.

G03389040

Fig. 108: Fitting Adapter To Measuring Bridge
Courtesy of BMW OF NORTH AMERICA, INC.

G03389041

Fig. 109: View Of Measuring Bridge In Socket
Courtesy of BMW OF NORTH AMERICA, INC.

"V" Cables

"V" cables are available in different versions depending on the system being diagnosed. Always refer to the most recent information for the required special tools.

"V" cables are only used with the 26 pin breakout box to access input and output signals of peripheral modules and systems.

Fig. 110: Identifying "V" Cables

Courtesy of BMW OF NORTH AMERICA, INC.

- The appropriate cable is distinguished by the color of the connector end.
- The color will match the particular modules connector color. Unless the color matches, the cable will not fit the connector on the module being tested.
- Each colored "V" cable has a series of alignment tabs that will only fit it's particular module or system.

"V" cables with ELO connectors are also being used with the 26 pin breakout box. These cables are unique in that they have a locking arm on the component side of the cable. They are light green in color, and the number of pins will vary depending on the system being tested.

"V" harness adapters were introduced with the E38. These also have light green ELO connectors on the component side, but they do not require a breakout box.

There is a black plug on one side with same number of pins as the component being tested.

The plug has numbers stamped on it's side that corresponds with the pins on that particular component.

You access the signals by plugging the test equipment directly into those pin numbers.

As new systems and components are being introduced, new breakout boxes and cables will also be introduced.

GENERAL INFORMATION

Charging Systems - Overview

CHARGING SYSTEMS

Model: All

Production Date: All

PURPOSE OF THE CHARGING SYSTEM

The purpose of the charging system is to convert the mechanical energy of the engine into electrical energy that is used to recharge the battery and power the electrical accessories. When the engine is first started, the battery (s) supplies all the current required by the starting and ignition systems.

As the battery drain continues and engine speed increases the charging system is able to produce more voltage than the battery can deliver. When this occurs, the electrons from the charging device are able to flow in a reverse direction through the battery's positive terminal. The charging device now supplies the electrical system's load requirements and recharges the battery.

The charging system consists of:

- Battery.
- Generator.
- Drive Belt.
- Rectifier Assembly.
- Voltage Regulator.
- Charge Indicator.
- Ignition Switch.
- Cables and Wiring Harness

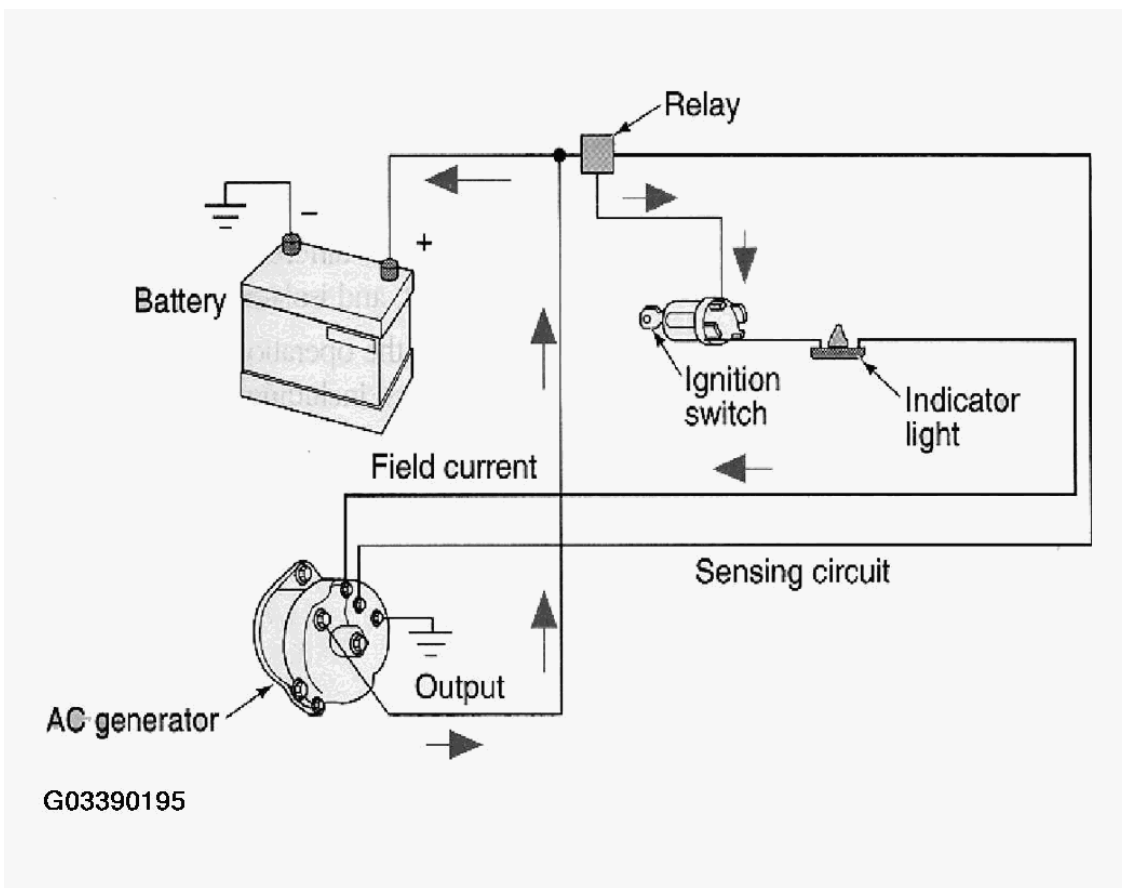

Fig. 1: Identifying Battery Charging System
 Courtesy of BMW OF NORTH AMERICA, INC.

SYSTEM COMPONENTS

Battery

The Battery is the primary EMF source in the automobile. The automotive battery is an electromechanical device that provides the potential difference (voltage). The battery does not store electrical energy. It stores chemical energy that is converted to electrical energy as it discharges.

Generator

The Generator produces free electrons necessary to charge the battery. The electron flow is produced through inductance, a magnetized rotor spinning inside a stator. The generator produces AC voltage which is converted to DC voltage or rectified.

Generator styles:

- Brush Type.
- Brushless Type.

NOTE: In an attempt to standardize terminology in the industry, the term alternator is being replaced with generator. Often an alternator is referred to as an AC generator.

Air or liquid (coolant) is used for generator cooling.

BRUSH TYPE GENERATORS

Brush Type generators consist of the following main components:

- Generator Housing.
- Stator Assembly.
- Rotor Assembly.

Generator Housing

The Housing is made of two pieces of die-cast aluminum. Aluminum is used because it is nonmagnetic, light weight and provides good heat dissipation.

Bearings for support of the rotor assembly are mounted in the front and rear housings.

G03390196

Fig. 2: Exploded View Of Generator Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Stator Assembly

The Stator is fixed to the housing of the generator and does not turn. It contains three main sets of windings wrapped in slots around a laminated, circular iron frame. Each of the three windings has the same number of coils as the rotor has pairs of north and south poles. The coils of each winding are evenly spaced around the core.

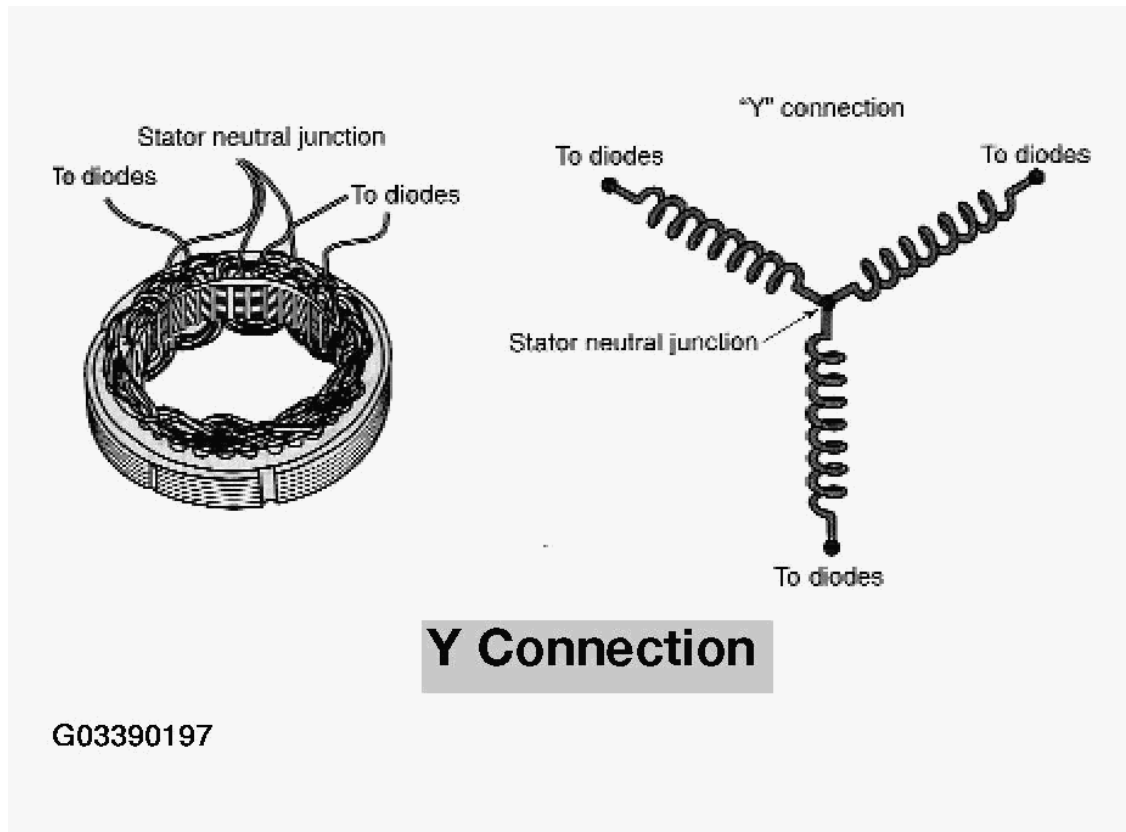

Fig. 3: View Of Stator Assembly (Y Connection)
Courtesy of BMW OF NORTH AMERICA, INC.

The three sets of windings alternate and overlap as they pass through the core in order to produce the required phase angles.

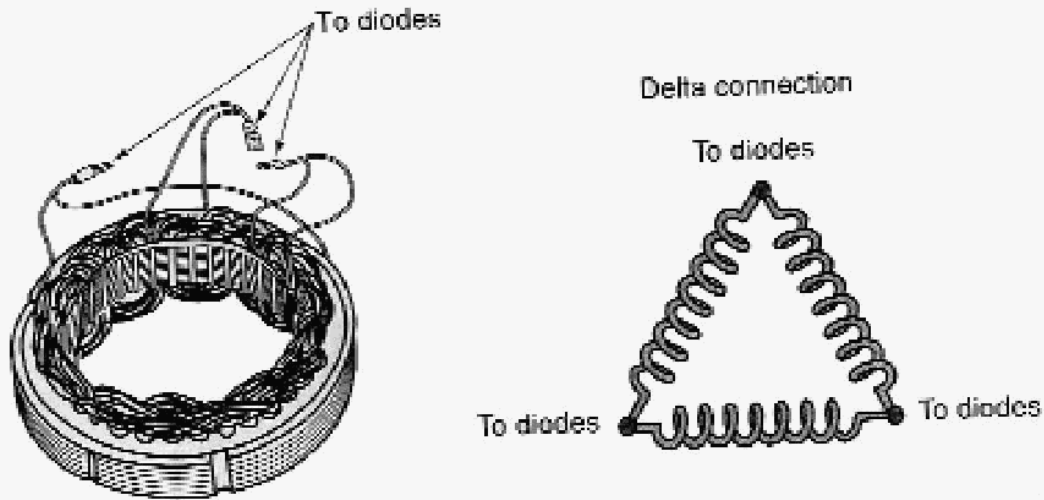

Each group of windings occupy one third of the stator, or 120 degrees of the circle.

The voltage produced by each loop of the stator is at a different phase angle, as a result the output of the stator is divided into three phases.

Two common methods of connecting the windings are:

- Y Connection.
- Delta Connection.

The parallel path of the Delta connection makes more current available.

Delta Connection

G03390198

Fig. 4: Identifying Stator Assembly (Delta Connection)
Courtesy of BMW OF NORTH AMERICA, INC.

Rotor Assembly

The Rotor Assembly consists of the rotor shaft, a winding around an iron core, two pole pieces and slip rings.

The rotor shaft is pressed into the core, then six-fingered malleable iron pole pieces are assembled on the shaft against each end of the winding core.

The pole pieces are placed so that the fingers mesh but do not touch. When direct current is passed through the field coil winding, the fingers become alternately North and South poles.

Fig. 5: View Of Rotor Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

As a result of this arrangement of poles, the magnetic flux lines will move in opposite directions between adjacent poles.

(Flux lines always move from North to South.)

This arrangement provides for several alternating magnetic fields to intersect the stator as the rotor is turning.

G03390200

Fig. 6: Identifying Rotor Assembly

Courtesy of BMW OF NORTH AMERICA, INC.

A slip ring pressed on to the rotor shaft is connected to the two ends of the field winding.

Two brushes are held by springs against the slip rings. One brush is connected through a switch to the battery B+, the other to the voltage regulator.

The brushes conduct only the field current (2 to 5 amps).

G03390201

Fig. 7: Locating Brushes On Rotor Assembly

Courtesy of BMW OF NORTH AMERICA, INC.

BRUSHLESS TYPE GENERATORS

Brushless Type generators are liquid cooled (coolant) and consist of the following main components:

- Generator Housing.
- Stator Assembly.
- Rotor Assembly.

1. Pulley
2. Rectifier
3. Voltage Regulator
4. Drive End Shield
5. Generator Housing
6. Coolant
7. Coolant Housing
8. Field Winding
9. Stator Housing
10. Stator Winding
11. Rotor
12. Non Magnetic Intermediate Ring
13. Rotor Pole

G03390202

Fig. 8: Cross Sectional View Of Brushless Type Generator
 Courtesy of BMW OF NORTH AMERICA, INC.

Generator Housing Water Cooled

The Water Cooled Generator is housed in an encapsulated metal shell enclosure. The enclosure is installed an aluminum shell.

The space between the inner surface of the shell and the outer surface of the generator creates a water jacket that engine coolant flows through.

Coolant flows from the engine into the shell through internal ports and exits via hose connections.

Liquid cooling minimizes noise generation through elimination of generator cooling fan.

Stator Assembly

Although different in appearance the Stator Assembly in a brushless generator performs the same functions as the brush type.

Rotor Assembly

1. Rotor Shaft With Pole Core
2. Left Pole-Finger Crown
3. Non-,Magnetic Retaining Ring
4. Right Pole-Finger Crown

G03390203

Fig. 9: Identifying Rotor Assembly

Courtesy of BMW OF NORTH AMERICA, INC.

The brushless generator Rotor does not contain the field coil. The pole-finger crowns rotate around a fixed field coil and are magnetized by the flux field of the field coil.

The two crowns form claw-pole half sections and are retained by a non-magnetic ring positioned below the pole fingers.

Rectifier Assembly

The Rectifier Assembly consists of six diodes, a pair of diodes for each stator winding. Each pair contain one positive biased diode and one negative biased diode. By using a pair of diodes that are reversed biased to each other, rectification of both sides of the AC sine wave is achieved. The negative biased diodes allow for conducting current from the negative side of the AC sine wave and putting this current into the circuit as positive current. The use of positive and negative biased diodes provide for full wave rectification because both halves of the sine wave are used.

Drive Belt

It is the function of the Drive Belt to transfer rotating energy from the engine to the generator. The drive belt rotates the rotor, spinning the magnetic field. A loose belt can inhibit charging system efficiency and a belt that too tight causes early bearing failure.

VOLTAGE REGULATOR

Voltage Regulators prevent excessively high voltage output of the generator. Excessive voltage would cause damage to the battery (through overcharging), light bulbs, motors, and particularly sensitive electronic components.

The regulator prevents these problems by limiting the current output of the generator.

Two types of regulators that are used:

- Standard Regulator.
- Multifunction Controller.

Standard Regulator

Electronic Voltage Regulators are mounted internally in the back of the generator assembly. Generator output is controlled by varying the amount of time the field coil is energized. The duty cycle of the field coil ground side is varied based on the demand placed on the electrical system.

The electronic voltage regulator compares field current supply voltage (from the stator windings through the diode trio) against a set voltage level (using a zener diode).

As the field current supply voltage surpasses the zener diode's breakdown voltage, the field current to the rotor is switched off. When the field current voltage to the rotor is off, the generator is not producing voltage. A rapid switching of the field current allows a fixed voltage output to be maintained. Additional diodes in the regulator,

prevent current flow when the ignition is off preventing battery drain.

Multifunction Controller

In addition to voltage regulation, the Multi-function Control electronic regulator provides the following features:

- Load response during start-up.
- Load response during driving.
- Fault display (under voltage, drive belt breakage, field coil interruption).

NOTE: Multi-function Control electronic regulators are available with and without start load response. The only difference is the time limitation of the rated current during the start procedure.

The start-up load response system provides for the alternator exciter current (field coil) to be started by a transistor two seconds after the battery indicator goes out. This means that engine start-up is unaffected by generator induced drag.

The load response during driving ensures that when large current consumers are switched on the generator output increases linearly allowing the DME/EML system to stabilize the engine speed and/or modify injection time if necessary.

Charge Indicator

The purpose of the Charge Indicator is to advise the driver that the vehicle's electrical system is not operating at peak efficiency and service should be performed.

The charge indicator operates differently depending on which type of regulator the vehicle is equipped with.

Standard Regulator

The charge indicator operates on the basis of opposing voltages. If there is no output through the diode trio, then the lamp circuit is completed to ground through the rotor field. Diode output applies voltage to the previously grounded side of the bulb, turning the bulb off (No current flow with equal voltage on both sides of the bulb).

Multifunction Controller

The charge indicator is activated by an electronic switch integrated in the controller. This internal switch receives its voltage supply from KL15 of the 2 pin generator connector. The controller measures internally the difference in voltage between KL30 and KL15 and switches the indicator circuit low in case of a fault.

Ignition Switch

The Ignition Switch provides initial power for the field circuit of the alternator, reducing the time required for the field to develop the magnetic field. Depending on which type of regulator is employed the ignition switch supplies power to the charge indicator to check bulb integrity.

Cables and Wiring Harness

The Cables and Wiring Harness are used to deliver the voltage produced by the generator to the battery for storage, and to vehicle systems to supplement battery voltage.

CHARGING SYSTEM PRINCIPLE OF OPERATION

Charging Systems (Brush or Brushless) use the principle of electromagnetic induction to generate electrical power. Electromagnetic induction occurs in a generator when a magnetic field is rotated within a stationary conductor. The magnetic field can be generated by permanent magnets or as in the case of the automotive generator by powerful electromagnets.

Passing electric current through a wire or winding causes a magnet field to surround the wire or winding. The number of turns in the winding and the magnitude of the current flowing through the winding determine the magnetic field strength.

The strength of the field is further increased by surrounding the coil with pole pieces. The poles will take on the polarity (North or South) of the side of the coil they touch or the ones they are closest to. The combined windings (field coil) and pole pieces are referred to as the rotor. Output of the generator is regulated through control of field coil intensity.

An examination of single phase AC voltage generation, will aid in the understanding of 3 phase AC voltage generation.

SINGLE-PHASE AC VOLTAGE GENERATION

Single Phase AC Voltage Generation requires one stator frame with windings and one magnetic field (North and South pole pieces).

G03390204

Fig. 10: View Of North/South Poles And Stator Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

As the North pole of the rotor pole piece approaches the winding of the stator, induced voltage level in the stator begins to rise. The closer the North pole gets to the stator winding the higher the induced voltage. As the North pole reaches 90° to the stator winding the maximum amount of flux lines are acting on the winding, induced voltage is at its highest positive value (1/4 turn).

G00433344

Fig. 11: Identifying Stator Rotation (1/4 Turn)
 Courtesy of BMW OF NORTH AMERICA, INC.

The rotor continues to rotate and the North pole gets further away from the winding. The voltage drops, until 0 voltage is induced through the stator (1/2 turn).

G00433345

Fig. 12: Identifying Stator Rotation (1/2 Turn)
 Courtesy of BMW OF NORTH AMERICA, INC.

With the South pole now approaching the winding voltage begins to increase negatively. When the South pole reaches 90° to the winding, again the maximum amount of flux lines are acting on the winding and induced voltage is at its greatest negative value (3/4 turn).

G00433346

Fig. 13: Identifying Stator Rotation (3/4 Turn)
 Courtesy of BMW OF NORTH AMERICA, INC.

The South pole continues to travel farther away from the winding decreasing the negative voltage value until 0 voltage is again reached (1 full turn).

This comprises one cycle or 360° rotation of the magnetic field.

G00433347

Fig. 14: Identifying Stator Rotation (1 Full Turn)
 Courtesy of BMW OF NORTH AMERICA, INC.

Sine wave produced by a single winding of the stator during a single revolution of one pair of pole pieces is called single phase voltage.

THREE-PHASE AC VOLTAGE GENERATION

Most AC generators use either a twelve or a fourteen pole rotor. Each pair of poles (North and South) produce one complete sine wave in each winding per revolution.

Fig. 15: Three-Phase AC Voltage Graph
 Courtesy of BMW OF NORTH AMERICA, INC.

Voltage of each stator winding is added together to create three-phase voltage.

During one revolution a fourteen pole rotor will produce seven sine waves. (The stator has one winding (coil) for each pair of rotors.)

The rotor generates three overlapping sine wave voltage cycles in the stator (one rotor three sets of windings in the stator).

The total output would be twenty one sine wave cycles per revolution (3 sets of stator windings, each with 7 coils).

G03390206

Fig. 16: Identifying Wave Cycle

Courtesy of BMW OF NORTH AMERICA, INC.

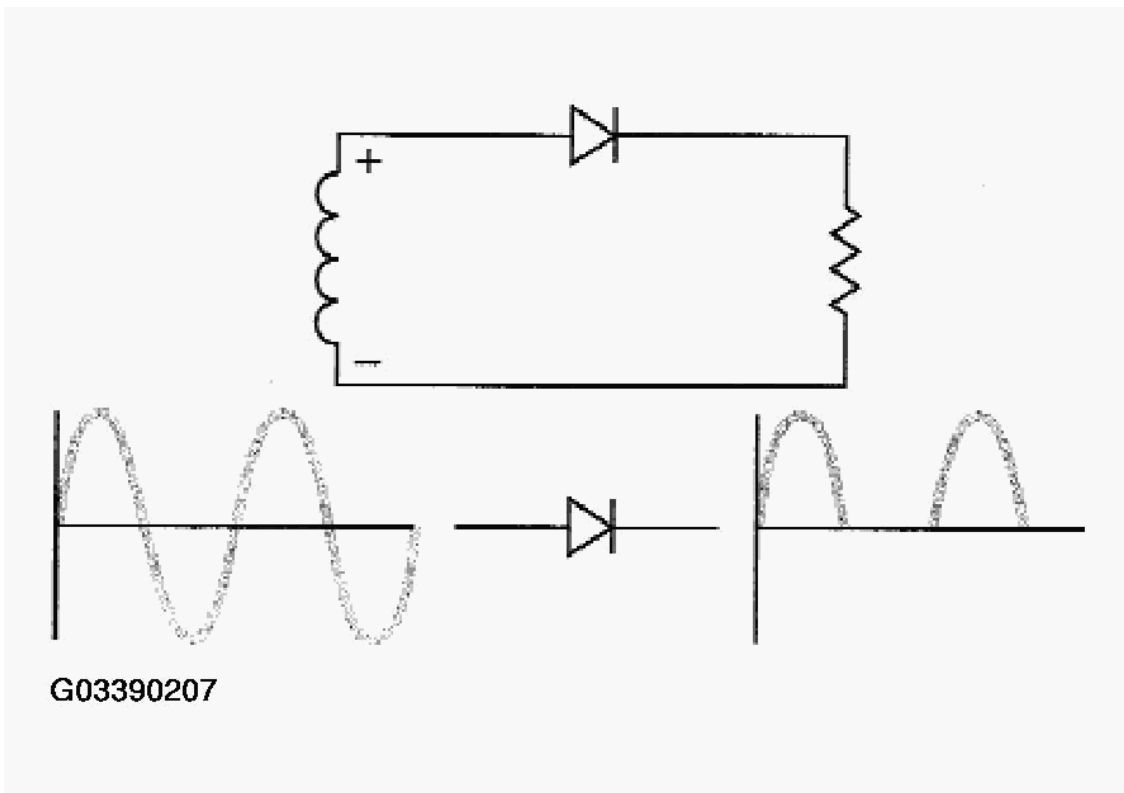

Sine wave cycle of a fourteen pole rotor and three phase stator.

VOLTAGE RECTIFICATION

The battery and the electrical system cannot store or use the 3-phase AC voltage produced by a generator, it must be rectified or converted to DC voltage.

A diode rectifier bridge is used to make the conversion.

The diode is similar to a non-return or one way valve which permits the passage of a fluid or gas in only one direction.

G03390207

Fig. 17: Identifying Voltage Rectification

Courtesy of BMW OF NORTH AMERICA, INC.

In a simple conversion the rectifier diode suppresses the negative half waves and allows only positive half waves to pass.

To make use of the negative value half waves full rectification is applied.

Full rectification of the negative half waves invert them into positive half waves.

The result is a rectified pulsating direct current.

Fig. 18: Identifying Half Waves
 Courtesy of BMW OF NORTH AMERICA, INC.

Rectified Pulsating DC current

THREE-PHASE VOLTAGE REGULATION

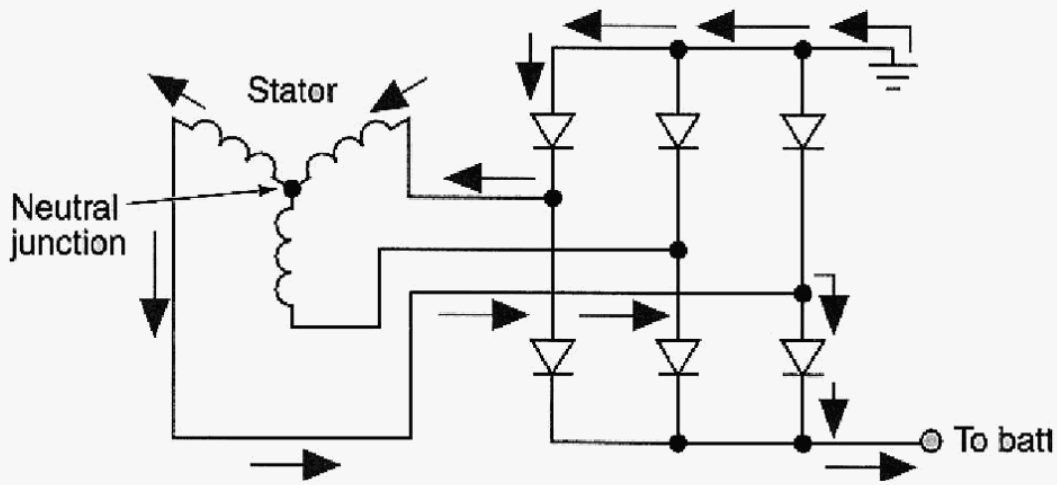

Six diodes are used to achieve three-phase AC voltage rectification. Three diodes are positive biased and three are negative biased.

The positive half-waves pass through the positive biased diodes and the negative halfwaves through the negative biased diodes.

Diode rectification of the negative half-waves invert them into positive half-waves.

With full rectification DC voltage supplied to vehicle by generator is not ideally smooth, but exhibits a slight ripple. This ripple is further smoothed by the battery which is connected in parallel with the generator.

The rectifier diodes in the generator not only convert the current but also prevent battery discharging through the 3 phase windings of the stator. Current flow can only take place from the generator to the battery.

Current flow through Delta wound stator.

Voltage Regulation

Standard Regulator

The Electronic Regulator uses a zener diode that blocks current flow until a specified voltage is obtained.

Sensing current from terminal 2 passes through a thermistor to the zener diode (D2). As the system voltage exceeds the breakdown voltage of the zener diode, current flows through the zener diode turning transistor 2 (TR2) on. With TR2 on transistor 1 (TR1) is shut off.

G03390212

Fig. 22: Regulator Circuit Diagram (1 Of 2)

Courtesy of BMW OF NORTH AMERICA, INC.

Transistor 1 controls field current to the rotor. With TR1 off no current flows to the field coil and the generator has no output.

A voltage drop below the breakdown voltage of the zener diode stops the current flow to TR2 which turns on TR1.

Voltage is again applied to the field allowing the generator to produce voltage.

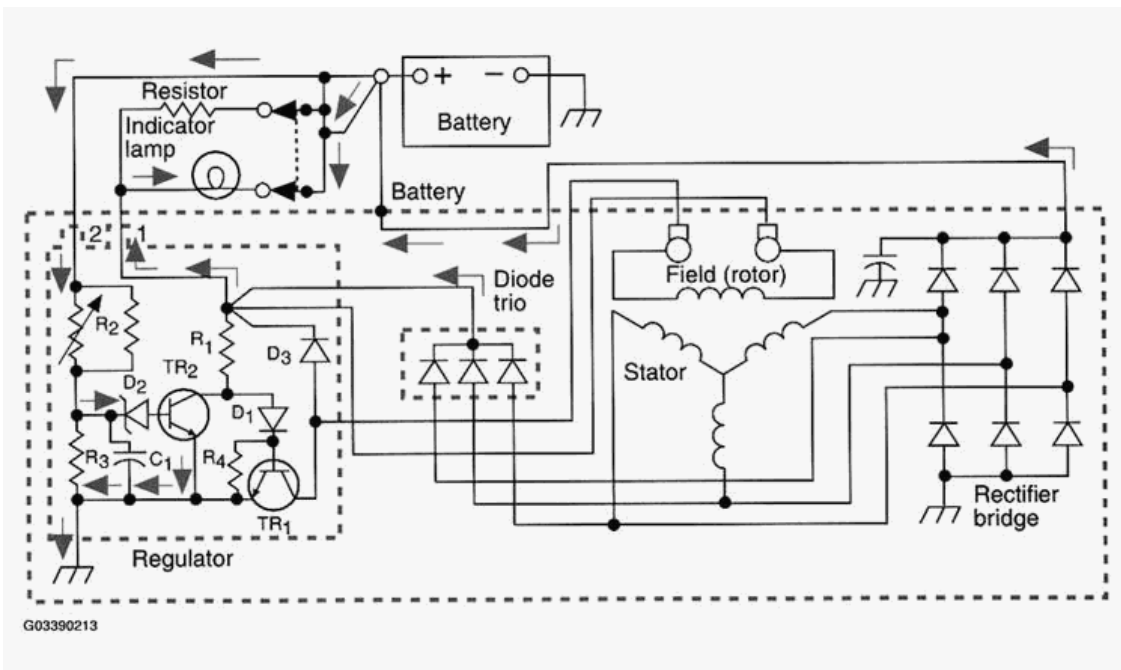

Fig. 23: Regulator Circuit Diagram (2 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

Field coil off, no charging.

Multifunction Controller

The Multifunction Controller regulates voltage in the same manner as the standard voltage regulator. Regulation is through duty cycle control of the field coil.

The differences as compared to the standard regulator are:

- Manner in which malfunction indicator lamp is controlled.
- Connections to wiring harness.

CHARGE SYSTEM INDICATOR

Standard Regulator

The Charging System Indicator light operates on the principle of opposing voltage. Battery voltage is supplied to one side of the light bulb, the other side of the bulb is connected to the voltage regulator. With the key turned on, power is sent to the light bulb, through to the regulator. No voltage is being produced by the stator, so there is no voltage from the diode trio. This lack of voltage from the diode trio, allows the voltage from the ignition switch to flow through the regulator to ground. This completes the circuit allowing the charge indicator bulb to burn.

As the generator begins to produce voltage, the output of the diode trio equals battery voltage. This equal voltage is supplied to the light bulb. With equal voltage on each side of the light bulb, no current can flow and

the light is turned off.

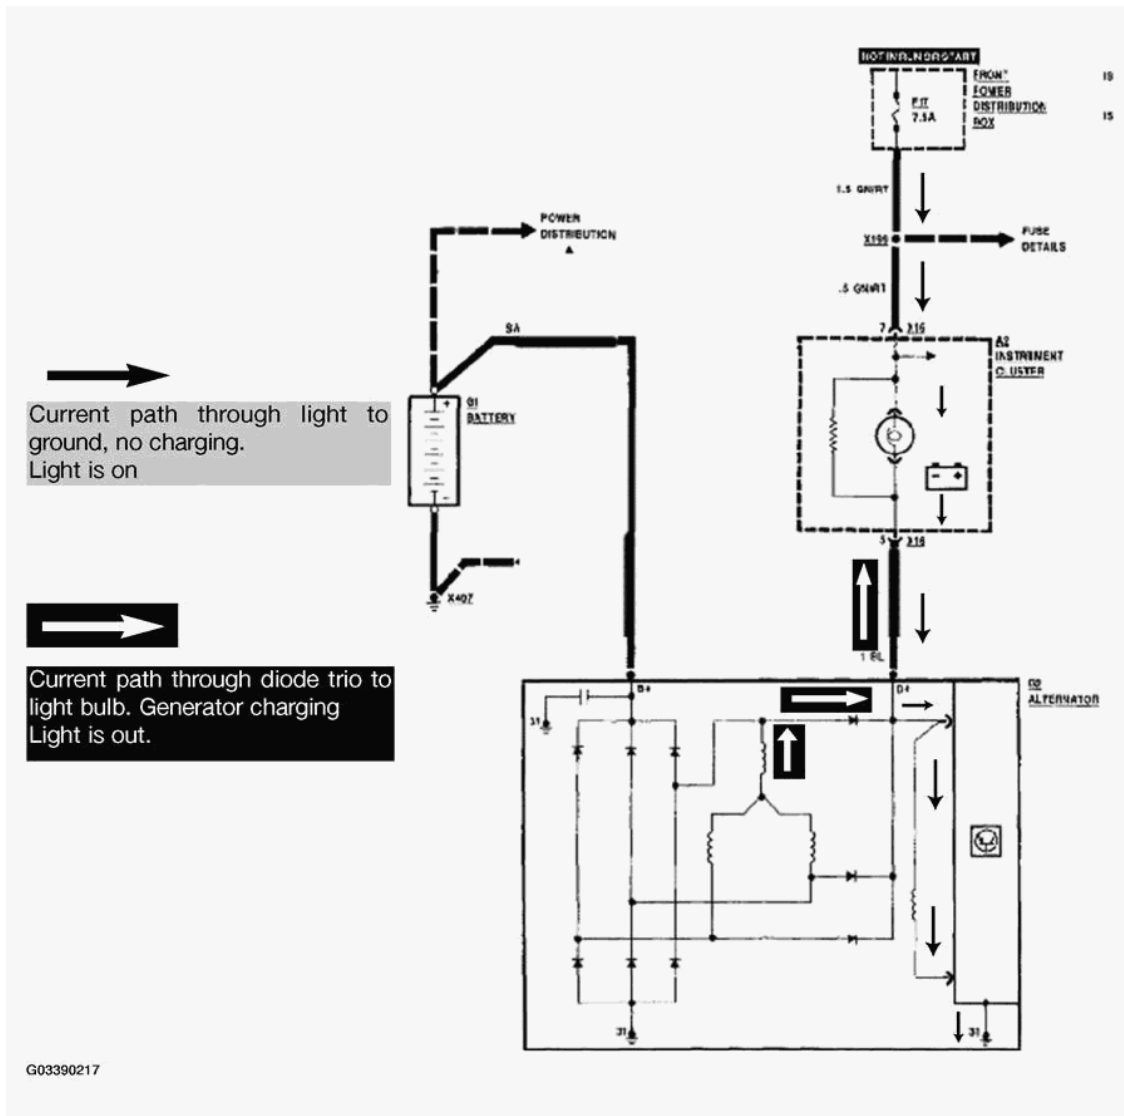

Fig. 27: View Of Charge Indicator System Circuit Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

Multifunction Controller

The charge indicator light is activated by means of an electronic switch integrated into the controller. This switch receives its voltage supply from terminal 15 on the 2 or 3 pin connector on the generator. Terminal D+ is replaced by an isolated electronic terminal 61E in generators with a multifunction controller. The task on this terminal is to activate the battery charge indicator lamp and to indicate to the various loads that the generator is in charge mode.

The indicator lamp is supplied with voltage via terminal 15 from the instrument cluster. The lamp is illuminated when the voltage at terminal 61E is below 1.5v and goes out when the voltage is above 8v.

The indicator is on during the following conditions:

- Key on, engine off.
- Generator not charging.
- Failure of drive belt.
- Interruption of field coil.
- Controller overvoltage.
- Break in charging cable.

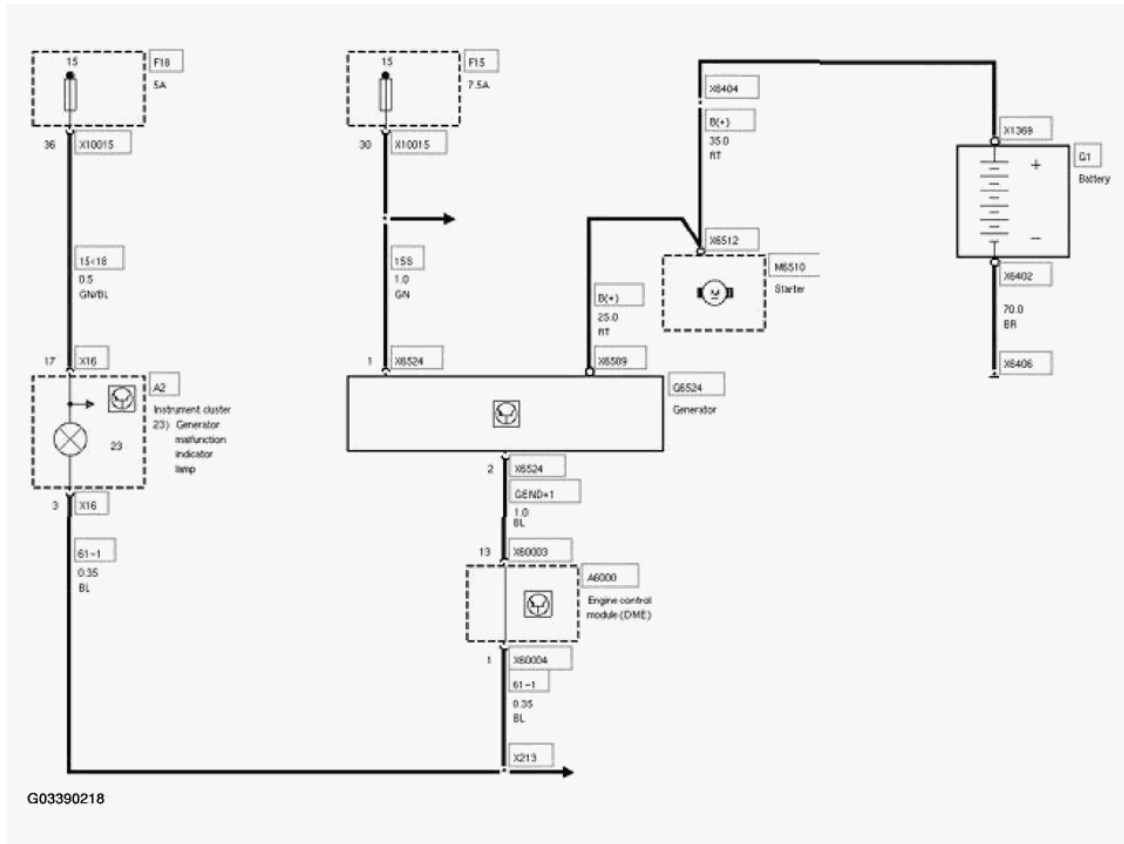

Fig. 28: View Of Multifunction Controller Circuit Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

GENERATOR DIAGNOSIS

Before beginning any generator diagnosis, ensure that the battery is in good condition and has passed all testing procedures. A weak or defective battery will influence the generator testing.

The generator may be tested using:

- DISplus.
- VAT testing equipment.

Workshop Hint:

Before beginning diagnostic procedures on the charging system do the following:

- Run engine at idle speed for about 5 minutes.
- Switch off all electrical loads.

This is done to ensure the battery is charged to such a level that the generator will not be fully utilized and that loads required during starting (e.g. starter, secondary air pump) will be already switched off.

Testing Generator With DISplus

Two modes of testing are available when using DISplus.

- Testing using Test Plan.
- Testing using Preset Measurement.

Testing Generator Using Test Plan

Testing the charging system using a test plan is the more complete method of testing.

When selecting this mode of testing, other components in the charging system are tested in addition to the generator.

Test plans available:

- Generator (Checks voltage and current output).
- Wiring from generator to battery (Performs voltage drop test).
- Charge indicator lamp (Condition of bulb, wiring and signal to bulb).
- ON delay and Start ON delay (If applicable).
- Ground side circuit wiring (Voltage drop test).

Sub-tests may be available with some of the component testing.

There are many advantages to using the test plan.

1. Complete system testing.
2. Functional description of system on screen.
3. Proper wiring diagrams provided during testing.
4. Test instructions and notes.
5. Instructions for proper test set-up.
6. Display of nominal values.
7. Solutions.

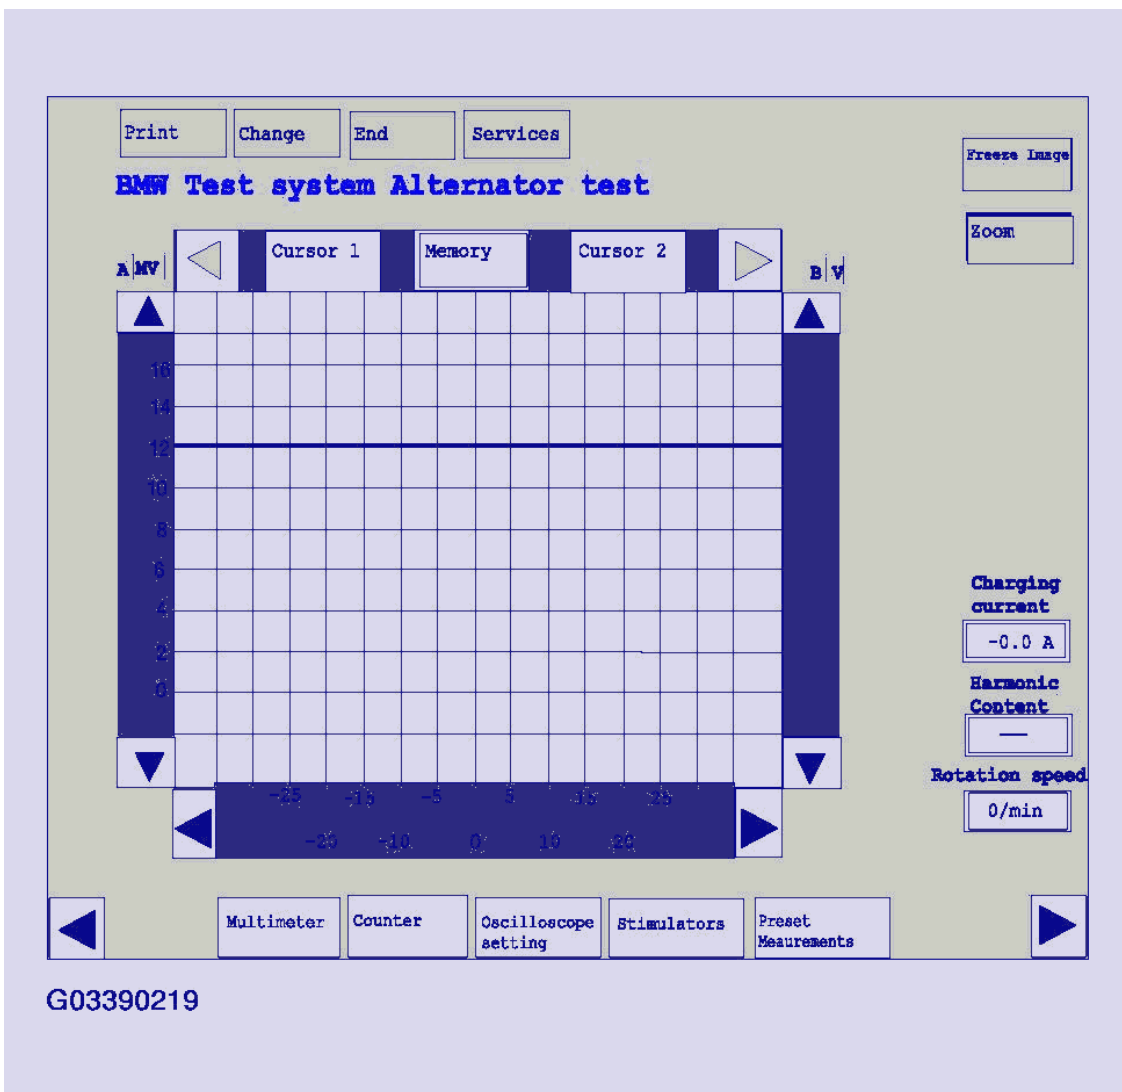

Fig. 29: Identifying DISplus Screen

Courtesy of BMW OF NORTH AMERICA, INC.

Testing Generator Using Measurement System

Enter the measurement system and select **Preset Measurements**.

Instruction on the proper hook-ups required are available through the **HELP** button, selecting **Help using Preset Measurement**.

The oscilloscope will display pre-configured for the testing.

Diagnostic information available through oscilloscope.

- Voltage Graph.
- Charging Current.
- Harmonic Content.

- Rotation Speed (Engine RPM).

G03390220

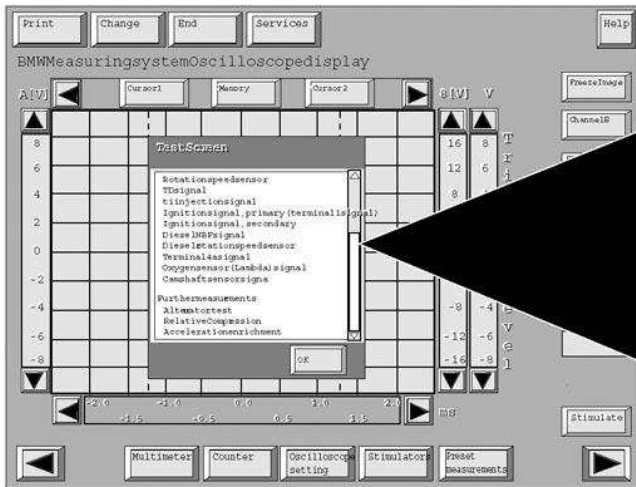

Fig. 30: View Of Special Tool 61 2 300
Courtesy of BMW OF NORTH AMERICA, INC.

Harmonic Content:

This is an expression of AC voltage contained in DC voltage.

The higher the percentage of harmonic content the larger the amount of residual AC voltage in the DC voltage.

High residual AC voltage is caused by weak or failing diodes in the generator. Generators which have harmonic content readings higher than specified (In TIS) should be replaced.

Signal Tests

- * Wire Tests
- * Potentiometer Tests

Signal Measurements

- * Status Diagnostic Socket
- * Status of OBD Socket
- * Engine Speed Sensor Signal
- * TD Signal
- * TI Injection Signal
- * Ignition Signal, Primary (Terminal 1 Signal)
- * Ignition Signal, Secondary
- * Diesel NBF Signal
- * Diesel Engine Speed Sensor Signal
- * Terminal 4a Signal
- * Oxygen Sensor (Lambd-a) Signal
- * Idle Actuator Signals
- * Throttle Valve Potentiometer Signal
- * Camshaft Sensor Signal

Futher Measurements

- * Alternator Test
- * Absolute Compression
- * Relative Compression
- * Smooth Running
- * Xenon Headlight Test Up to 8/99
- * Xenon Headlight Test from 9/98

Courtesy of BMW OF NORTH AMERICA, INC.

G03399791

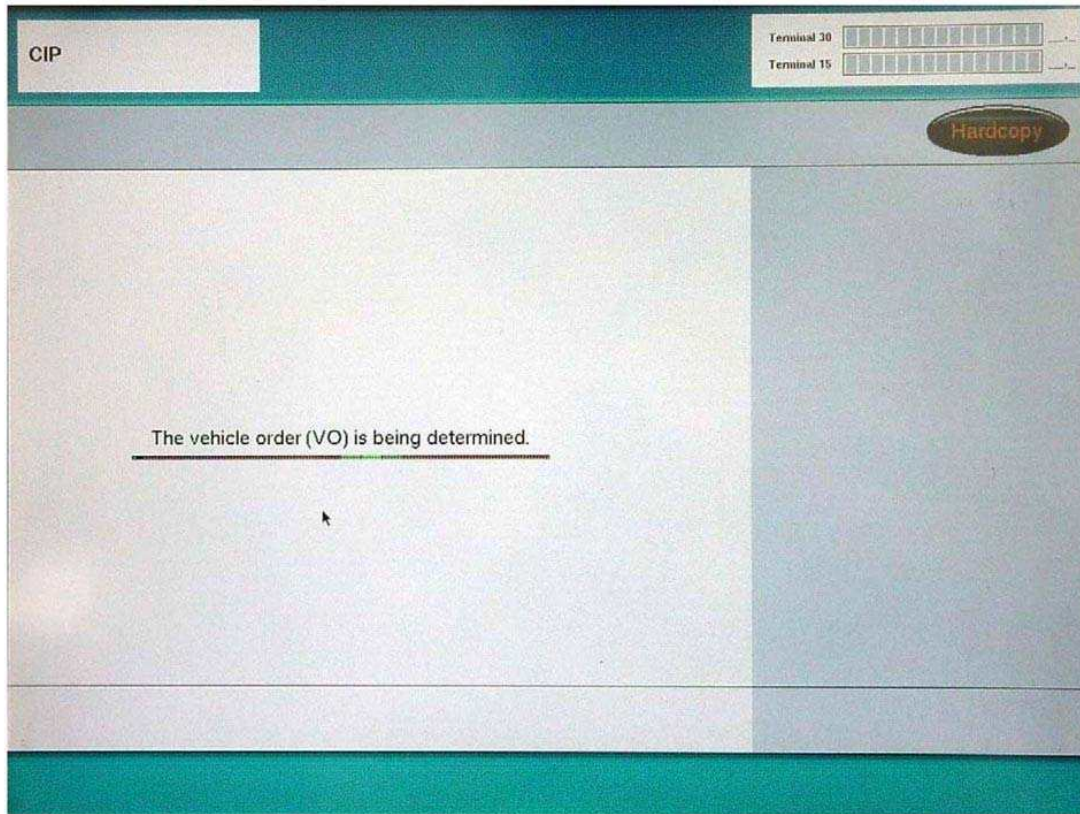

Fig. 3: Programming Screen - Retrofit Select
Courtesy of BMW OF NORTH AMERICA, INC.

Select depending upon programming required.

To retrofit select **Load SW**.

To update a vehicle select **Vehicle**.

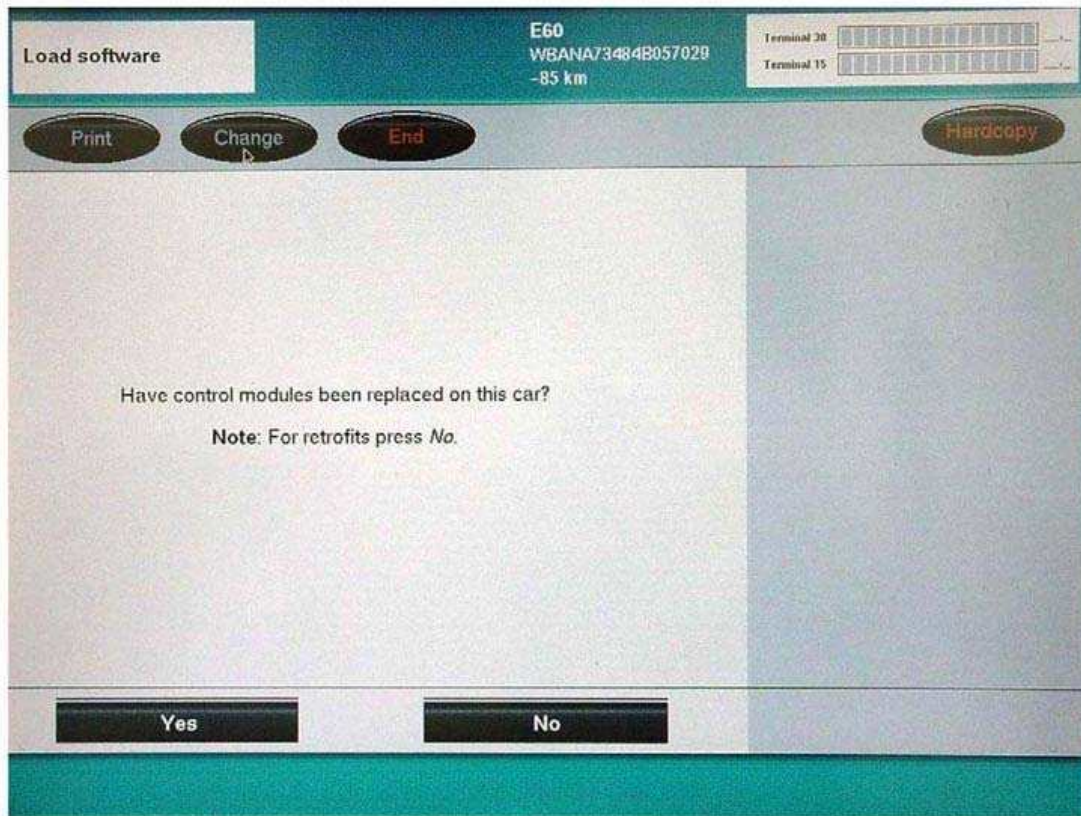

Selecting Vehicle will ensure that complete encoding is performed.

G03399792

Fig. 4: Programming Screen - Load Software
Courtesy of BMW OF NORTH AMERICA, INC.

Regardless of whether you have selected Load SW or Vehicle, the VO will be determined.

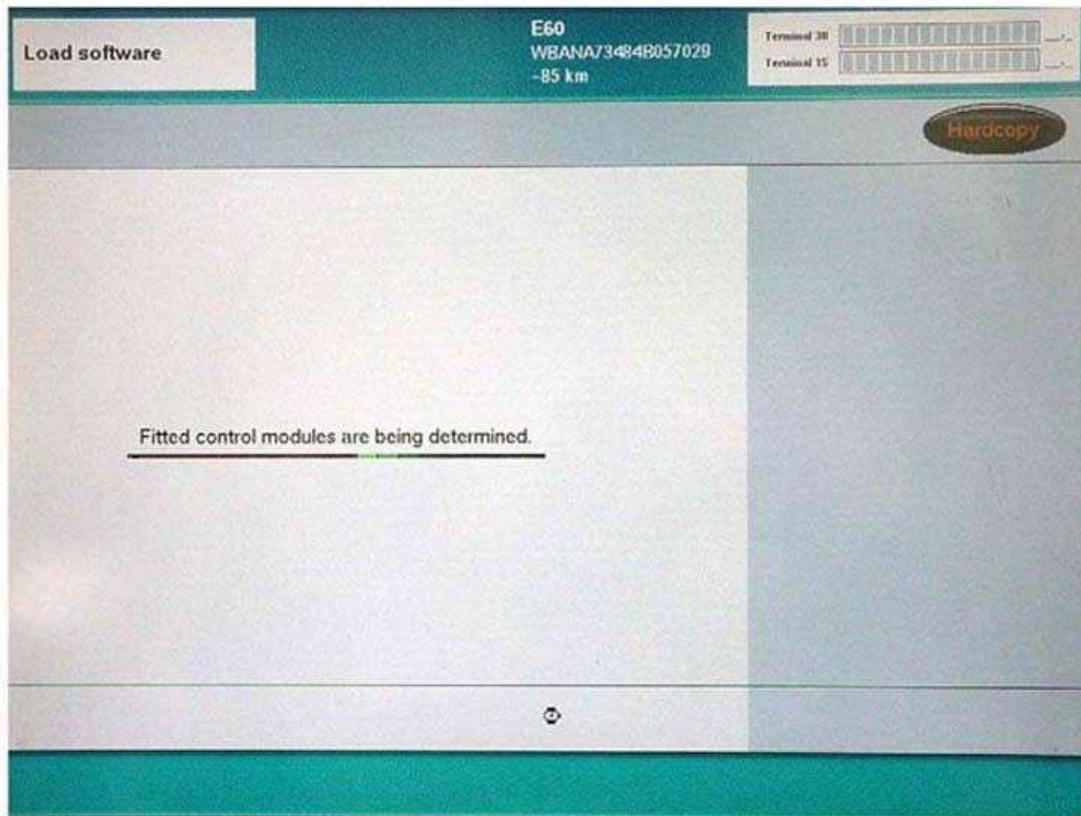

G03399793

Fig. 5: Programming Screen - Determine
Courtesy of BMW OF NORTH AMERICA, INC.

A **YES** selection will lead you to choose which control module(s) have been replaced.

A **NO** selection will lead you to **Retrofits** .

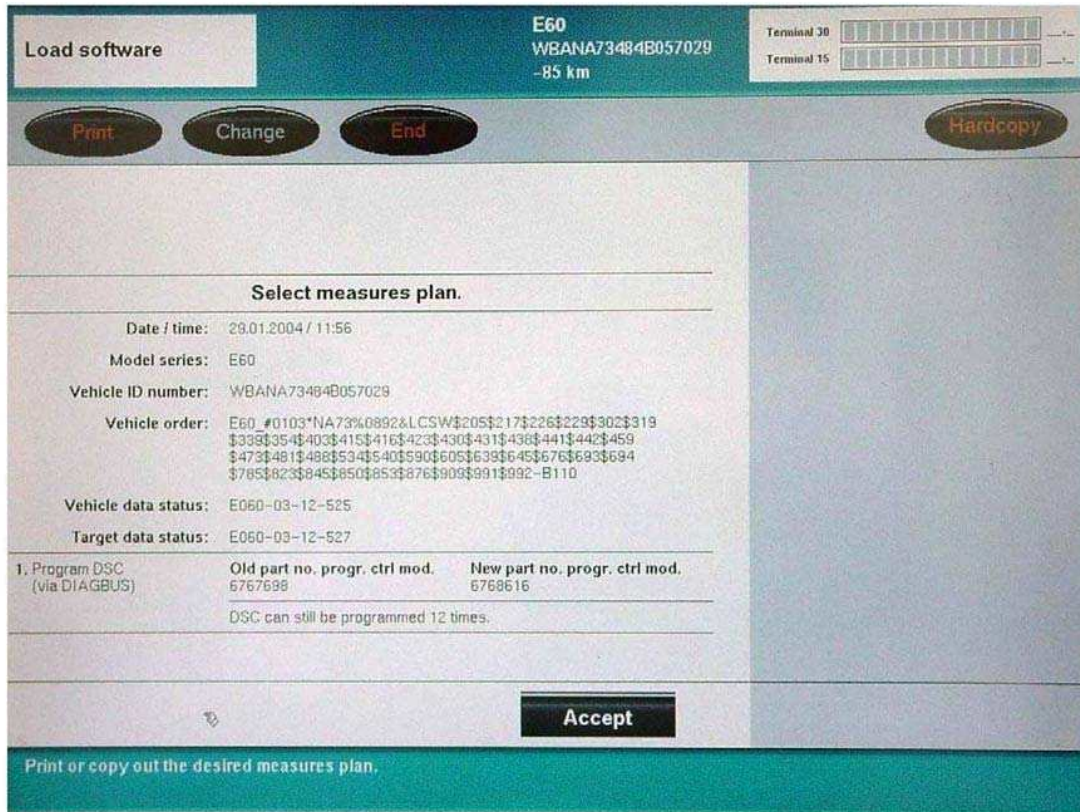

G03399794

Fig. 6: Programming Screen - Measure Plan

Courtesy of BMW OF NORTH AMERICA, INC.

After selecting YES fitted control modules will be determined.

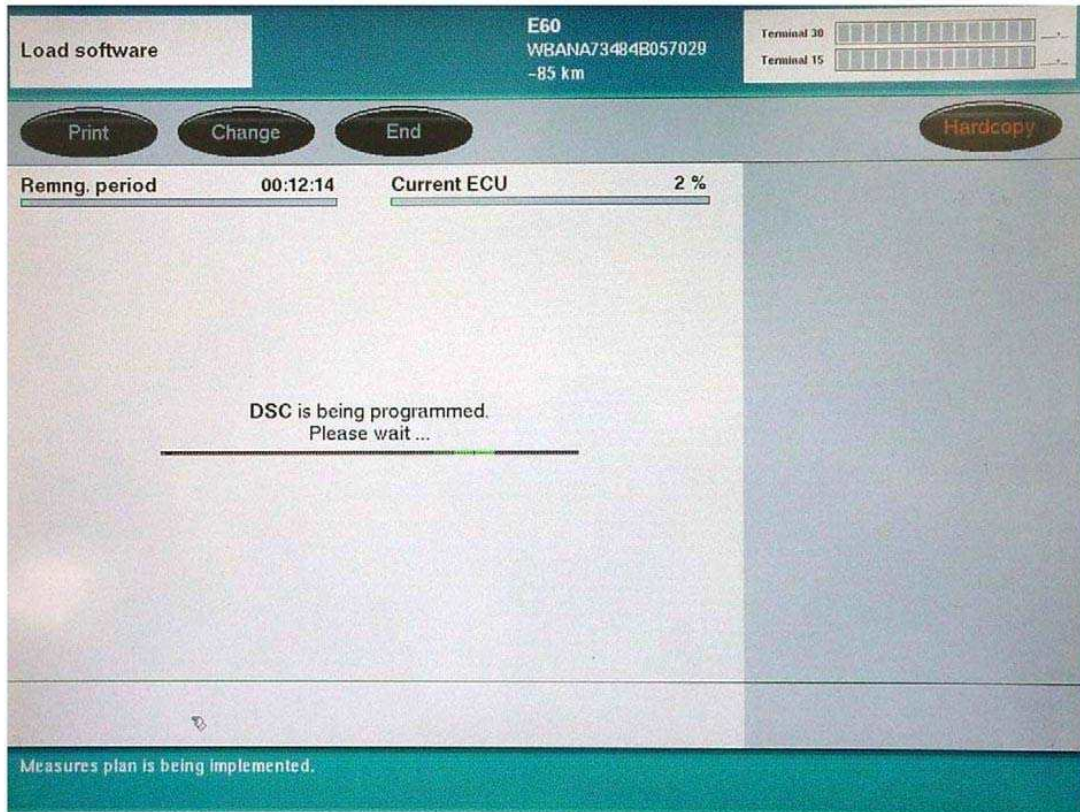

G03399795

Fig. 7: Programming Screen - Control Modules
 Courtesy of BMW OF NORTH AMERICA, INC.

After determining the fitted modules, a measures plan will be made. At this point you will be notified if control modules need to be replaced.

Control module replacement is required if the hardware level in a module can not be upgraded to a high enough software level.

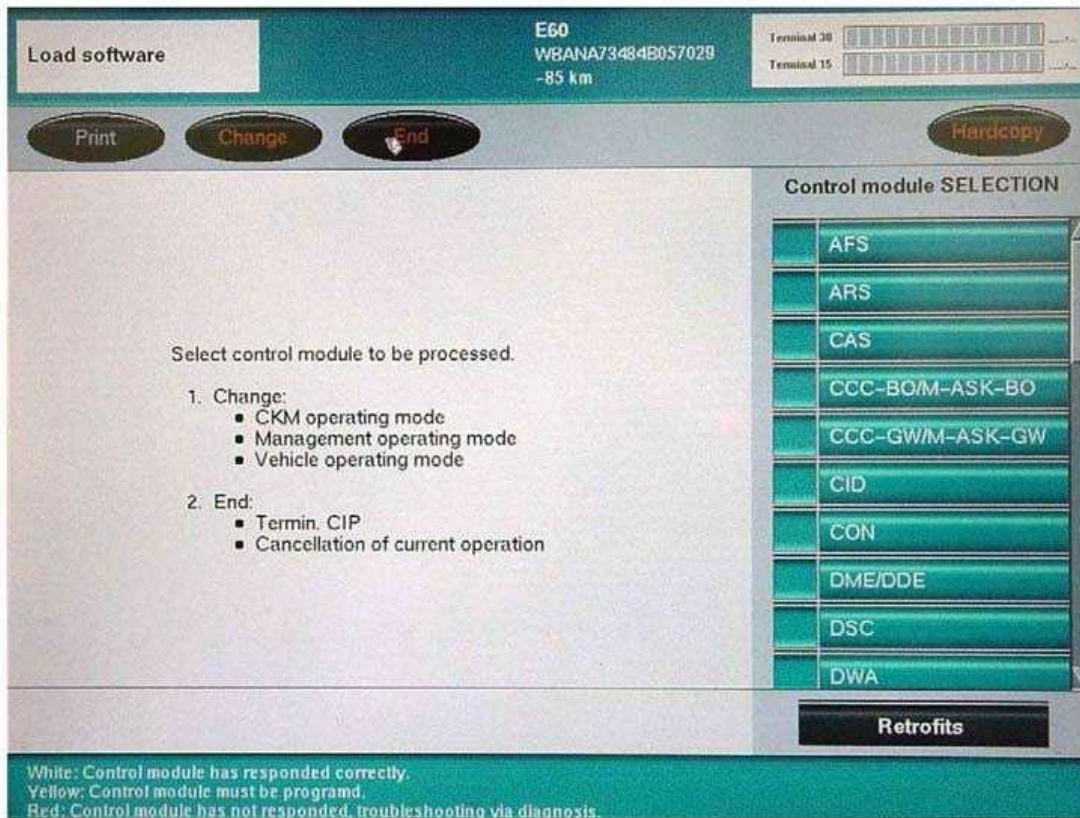

In the case above no modules need replacement, in fact on the DSC needs to be reprogrammed.

G03399796

You will be asked which battery the car has installed.

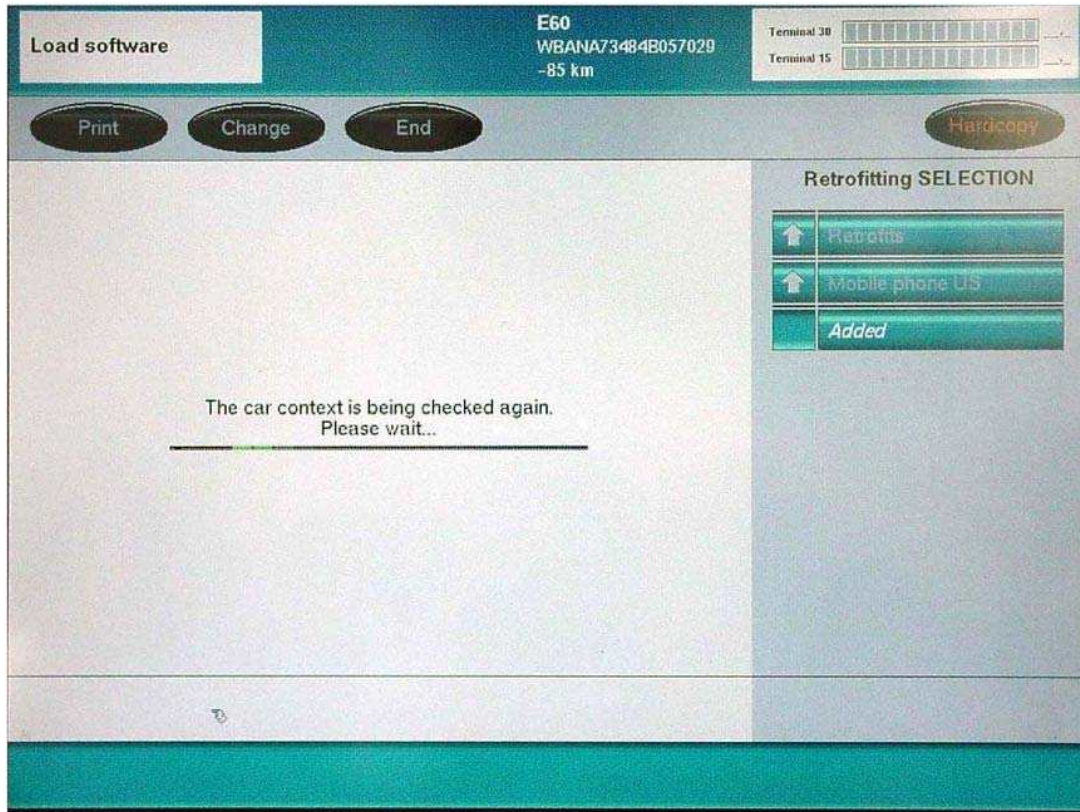

G03399801

Fig. 13: Programming Screen - Measures Plan
 Courtesy of BMW OF NORTH AMERICA, INC.

A measures plan will be determined and displayed to accomplish the retrofit.

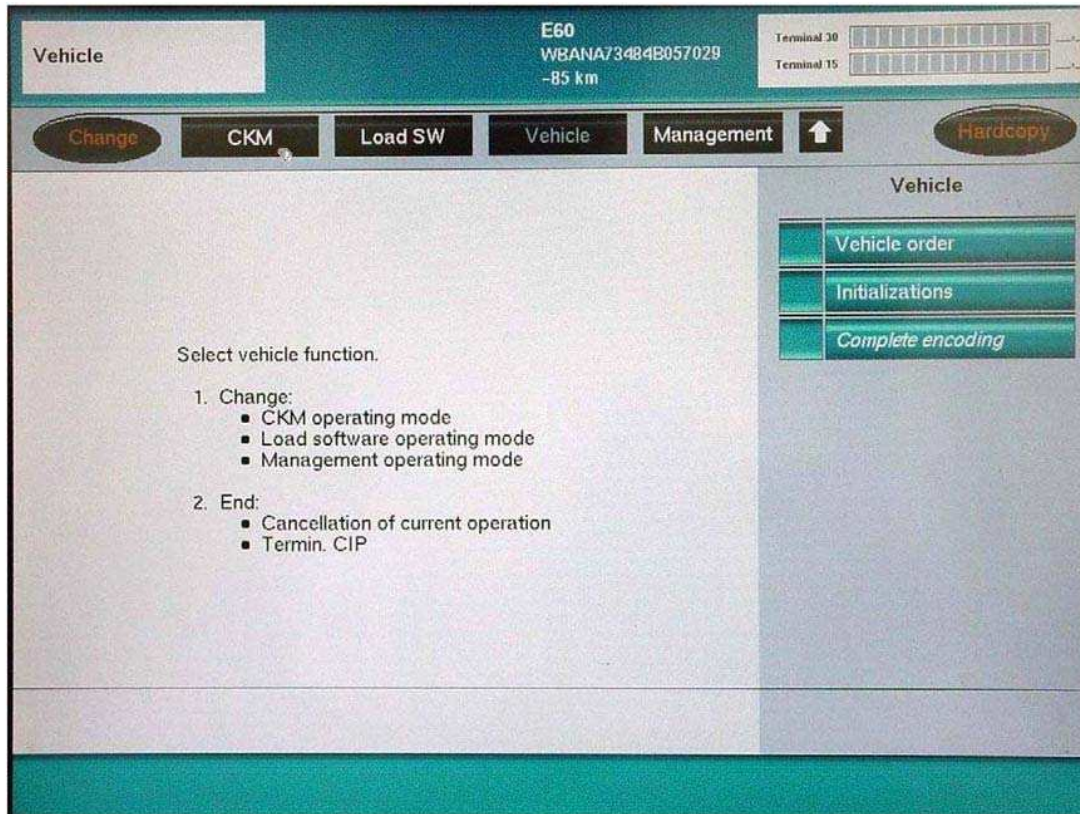

Press Accept.

G03399802

Fig. 14: Programming Screen - Retrofit Being Carried Out
Courtesy of BMW OF NORTH AMERICA, INC.

The retrofit is being carried out.

G03399803

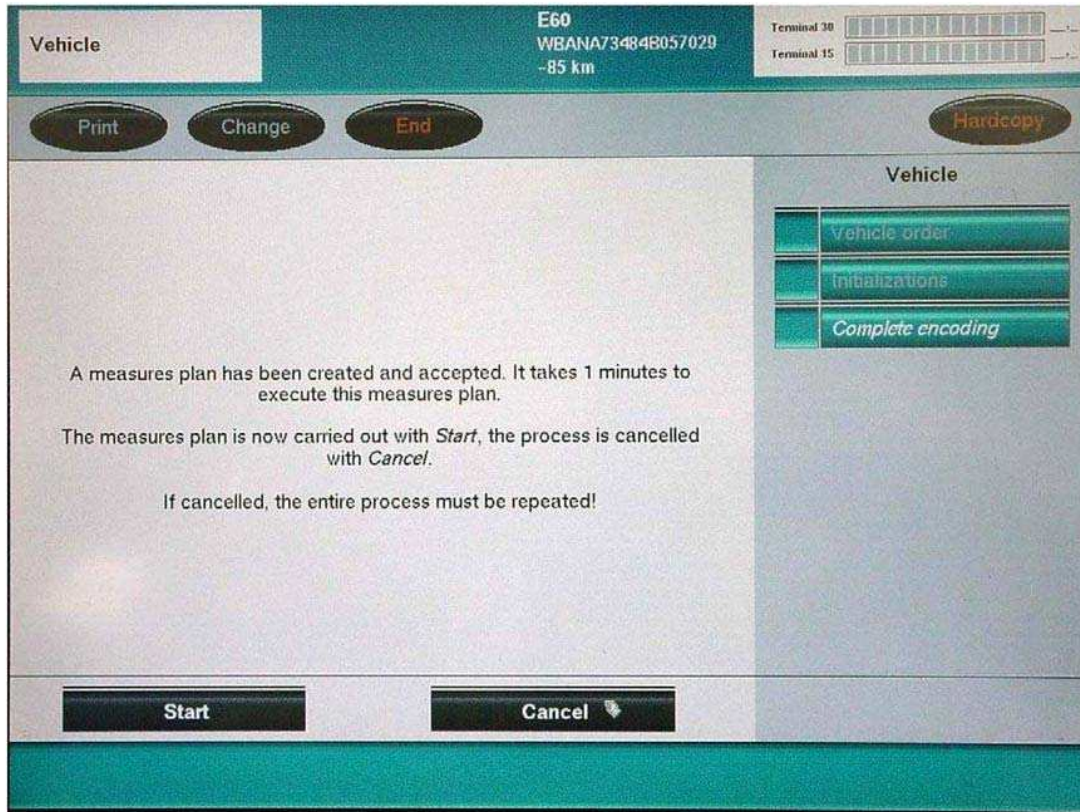

Fig. 15: Programming Screen - Vehicle Function
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting Vehicle initially when entering CIP, you will save time when updating the vehicle.

Updating through Load SW differs from Measures Plan determined through Vehicle.

When updating through Load SW only the module programmed is re-coded. You still need to come to this screen and perform Complete Encoding.

By updating through Vehicle, the entire car is automatically encoded, after the programming is complete.

G03399804

Fig. 16: Programming Screen - Pressing Start
Courtesy of BMW OF NORTH AMERICA, INC.

Press start to begin the programming and encoding procedure.

1986-06 GENERAL INFORMATION

Coding And Programming - Overview - All Models

INTRODUCTION TO CODING & PROGRAMMING

Model: All

Production: All

WHAT IS CODING?

It is a process utilized by BMW, which groups system specific operating requirements (Data) together and then assigns a label/code to each of these groups of data. The various groups of data are all pre-loaded into system specific "codable" control modules, along with a basic set of operating instructions (Program).

Types of operating requirements:

- Nominal values of device input signals (0.25V to 2.5V, 5W - 25W, ...)
- Type of device input signal (PWM, square wave, analog ...)
- Operational parameters (device activation/deactivation time, ...)
- Market specific operations (O2 Sensors, Fuel Type, Emission Control, ...)
- Country Specific Regulations (U.S., Canada, Japan, UK, ECE, ...)
- Powertrain Configurations (Manual, Auto, TLEV, ULEV, SULEV, Diesel, ...)

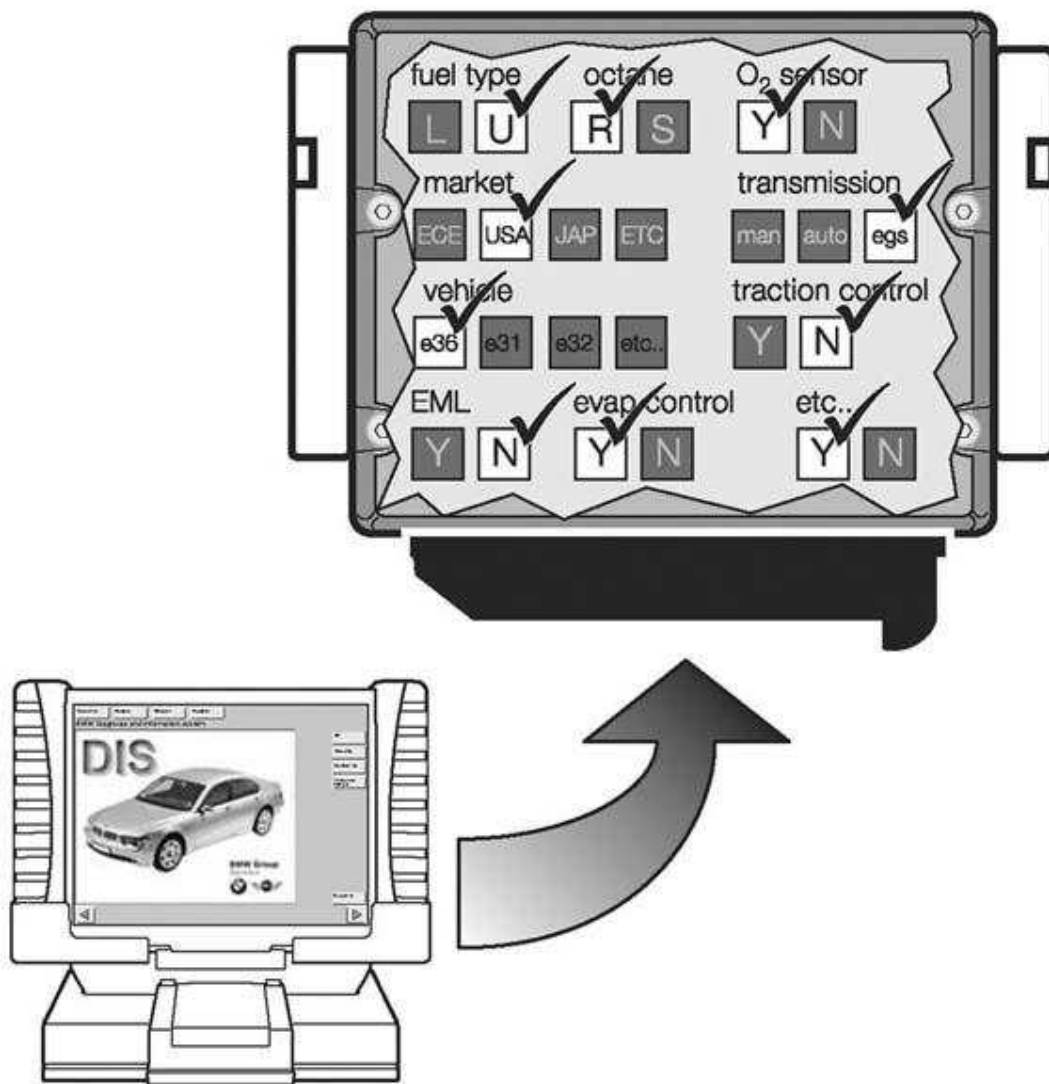

The procedure of assigning one specifically labeled group of data to the operating program of a specific control module/component is referred to as "coding".

G03397851

Fig. 1: Identifying Data Before Coding

Courtesy of BMW OF NORTH AMERICA, INC.

G03397852

Fig. 2: Identifying Data After Coding
 Courtesy of BMW OF NORTH AMERICA, INC.

A "codable" control module has a basic operating program already installed along with several specific variations of operating data. The coding process allows a specific set of operating data to be assigned to the basic operating program of that module/component, with respect to its specific application.

Coding can be performed for some systems/components:

- By installing a specific plug (coding plug) into a device/component
- By entering a 4 digit alpha-numeric code (variant code) via the programming selection on

DISplus/GT1/SSS

- Selecting customer specific system operational settings from a list of available features (VKM)
- Automatically by selecting a specific coding process available via ZCS Coding or CIP using the DISplus/GT1/SSS

NOTE: **Codable control modules/components are system specific, which means that not all control modules are codable.**

WHAT IS PROGRAMMING?

It is a process utilized by BMW to load application/system specific operating instructions

G03397853

Fig. 3: Identifying Data Before Programming
Courtesy of BMW OF NORTH AMERICA, INC.

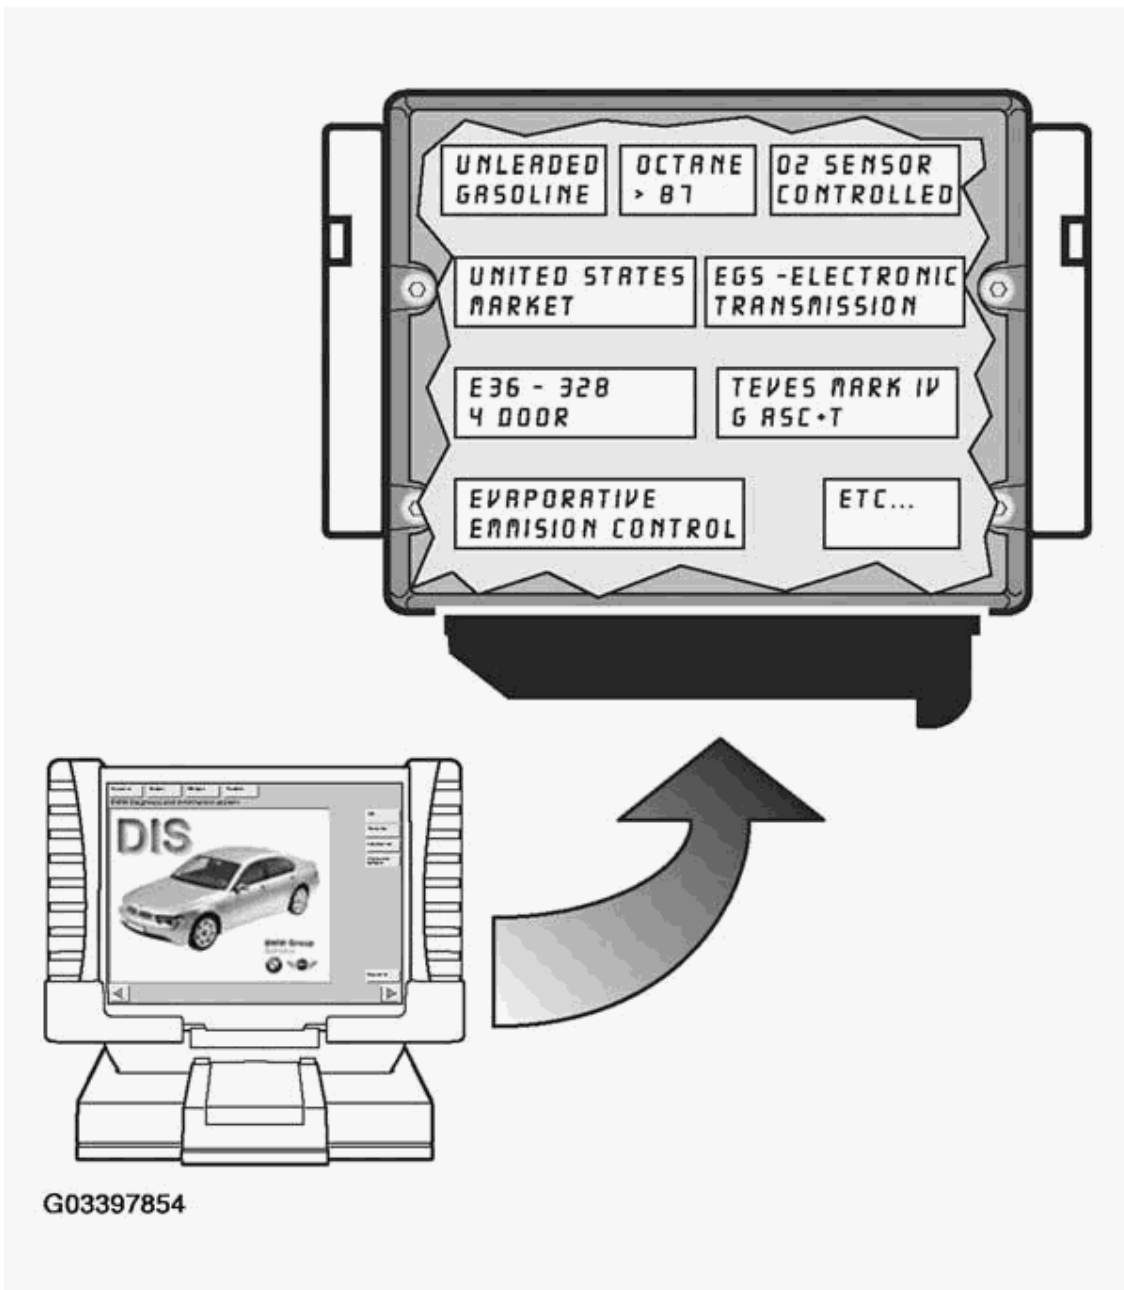

Fig. 4: Identifying Data After Programming
Courtesy of BMW OF NORTH AMERICA, INC.

(Program) into a module/component which already has the systems operating requirements (Data) installed, plus it can be used as a means of updating data and operating instructions previously installed in a control module.

Basic programmable control modules have a pre-defined set of operating data already installed which allows the module to be fairly generic until a specific operational program is installed.

Programming of system control modules is performed using a DISplus/GT1/SSS.

NOTE: Programmable control modules are system specific and not all control modules are programmable using workshop equipment like the DISplus,GT1 or SSS. The ability to program a module is limited to the number of times it has already been programmed and the hardware version of the control module itself.

WHAT IS THE PURPOSE OF CODING AND PROGRAMMING?

As a global manufacturer, BMW must design a large variety of control modules to meet numerous vehicle requirements pertaining to issues such as:

- Country Specific Regulations (U.S., Canada, Japan, UK, ECE, ...)
- Vehicle Equipment Level (Phone, Navigation, HiFi, IHKA, IHKR, ...)
- Vehicle Powertrain Configurations (Manual, Auto, TLEV, ULEV, SULEV, Diesel, ...)
- System Specific Operating Requirements (Nominal values, type of input signal, ...)

By using Coding and/or Programming, the large variety of control modules needed can be reduced to a smaller number of model specific hardware variations.

Codable control modules contain:

- A common operating program
- A large number/variety of specific operating data groups

In order to use this type of control module it must first be CODED to ensure that the operating data specific to that vehicle/model application is used by the operating program of the control module.

Programmable control modules contain:

- The required/specific operational data
- No operating program

In order to use this type of control module it must first be PROGRAMMED to ensure that the operating program specific to the vehicle/model application is used.

Prior to the availability of Coding and Programming in the workshop this task could only be performed at the factory.

Initially the factory installed Control Module(s) with a common operating program or data into vehicles and as these vehicles reached various points in the assembly process the control modules were updated with the required operating data or program specific to the application for that particular vehicle. Since replacement parts always need to be available, parts inventory needed to contain all variations of preprogrammed control modules installed in all varieties of vehicles that were manufactured. This was not a big problem in the early years, when the variety/quantity of models was smaller.

As the number of control modules and the complexity of the various systems installed into vehicles increased, the number of modules that needed to be stored in parts inventory began to increase as well. Eventually this led

to the stocking of hundreds of different control modules that were either pre-programmed or pre-coded for a specific application and model, but only differed slightly in the way they were coded or programmed.

Pre-programmed and pre-coded control modules always needed to be available in the event a control module failed once the vehicle left the factory floor, since this was the only place programming & coding procedures could be performed. In order for repairs to be made quickly, dealers were required to maintain a stock of several varieties of control modules, since technicians could only remove the failed module and installed a new pre-programmed or pre-coded module into the vehicle.

As a result of having to maintain a very large inventory of pre-programmed and pre-coded control modules in parts inventory, it was decided to make coding and eventually programming available in BMW workshops.

Fig. 5: Identifying BMW Workshop
Courtesy of BMW OF NORTH AMERICA, INC.

The following advantages have occurred since programming and coding can be performed in the workshop:

- Fewer control module hardware versions are needed (only need basic control modules)
- Lower parts and inventory costs
- Able to update software in a control module without having to replace the module (Re-Code/ Re-Program to address service Measures)
- Ability to add special equipment features to existing control modules (DWA, Day Time Running Lights,

...)

- Customization of vehicle operation (Conversions, VKM, A/C, ...)

The means by which coding or programming information is provided to a control module varies and is determined by the vehicle, model year and type of module(s) installed.

BMW currently uses the following methods to perform Coding or Programming:

- Coding Plug
- DME variant Coding
- Coding Code
- Central Coding Key (ZCS) or Vehicle Order (VO)
- EPROM Programming
- Flash Programming
- Vehicle and Key Memory (VKM)

WHERE IS DATA STORED IN A CONTROL MODULE?

The control modules used in our vehicles store data/information on one of the following:

- EPROM (**E**lectrically **P**rogrammable **R**ead **O**nly **M**emory)
- EEPROM (**E**lectrically **E**rasable **P**rogrammable **R**ead **O**nly **M**emory)

In essence these devices are similar to the harddrive of the PC (**P**ersonal **C**omputer) that many of us use daily to store the images and documents/files of information.

EPROM (Electrically Programmable Read Only Memory)

An EPROM is a computer memory chip that can be electrically programmed, however in order to erase data that is stored on the chip it must be removed from the device and exposed to UV lighting for a specific time period. An EPROM has what is commonly called a "window" on the top portion of the chip usually located underneath a protective label, it is this area that must be exposed to UV light of a certain intensity for a specific time period in order to erase the information stored on it.

Early engine control modules (DME 3.X) and transmission control modules were the first devices which allowed technicians to first remove the chip from the module, install a new "blank" EPROM and then program the module.

Fig. 6: Identifying EPROM (Electrically Programmable Read Only Memory)
 Courtesy of BMW OF NORTH AMERICA, INC.

EEPROM (Electrically Programmable Read Only Memory)

An EEPROM is a computer memory chip that can be electrically programmed and electrically erased, thereby not requiring the chip to be removed from the module or exposed to light. In general this chip is not easily removable from the device it is installed into.

Since the entire process of programming and erasing is done electronically this device is commonly referred to as "Flash Programmable".

During the programming process the following type of information may be loaded into the control module depending on the specific application or update that needs to be installed:

- Characteristic Maps (Ex. Ignition, Injection, Purge Control, DSC Regulation, ...)
- Control Constants/ Operational Data
- Operational Program
- Control Module Identification Information (Ex. Hardware Number, Program Number, Date of Modification, ...)

What is needed to Code and Program?

In order to code or program a vehicle, specific equipment and special software is required such as a DISplus, GT1 and an SSS which must all be connected to a network and have the most current version of CIP (Coding, Individualization & Programming) installed. CIP is the software program that contains all the latest data and program information to allow control modules to be updated to the latest level to address customer concerns and implement service solutions.

With the release of CIP 15.0 and the implementation of Progman (see **PROGMAN**) the DISplus and GT1 will only be capable of performing vehicle diagnosis and activation/initiation of a Coding, Individualization or Programming task through the SSS. A special program management tool (Progman) will only allow the DISplus

and GT1 to act as remote terminals to the SSS (regarding Coding, Individualization & Programming), which means that the SSS will be the single supplier of Coding, Individualization and Programming information to a vehicle and its respective control modules.

CODING & PROGRAMMING EQUIPMENT

Model: All

Production: All

EQUIPMENT AND SOFTWARE

Coding and Programming of a control module can only be performed within the workshop network using BMW Group Equipment and Software.

As of 2004 the standard diagnostic equipment available for a workshop consists of:

DISplus (Diagnostic Information System)

Used For: Vehicle Diagnosis, Coding, Programming and Individualization

With PROGMAN (CD14) the DISplus will no longer be able to do coding and programming directly, it will only be used as a remote terminal that can initiate Coding & Programming through SSS.

Connection: Direct to LAN/Workshop Network or Direct to OPSS/OPS/Diagnostic Head

G03397857

Fig. 7: Identifying DISplus (Diagnostic Information System)
Courtesy of BMW OF NORTH AMERICA, INC.

GT1 (Group Tester 1)

Used For: Vehicle Diagnosis, Coding, Programming and Individualization

With PROGMAN (CD14) the GT1 will no longer be able to do coding and programming directly, it will only be used as a remote terminal that can initiate Coding & Programming through SSS.

Connection: Wireless LAN or Direct to LAN/Workshop Network or Direct to OPPS/OPS/Diagnostic Head

G03397858

Fig. 8: Identifying GT1 (Group Tester 1)

Courtesy of BMW OF NORTH AMERICA, INC.

SSS (Software Service Station)

Used For: Vehicle Coding, Programming and Individualization. NO DIAGNOSTIC CAPABILITY.

With release of PROGMAN (CD 14) the SSS becomes the only tool for performing Coding, Programming and Individualization. All requests from GT1 or DISplus will be performed by the SSS. The SSS can also be used to directly initiate a Coding, Programming or Individualization request.

SSS will be capable for coding/programming multiple vehicles, Max 5 vehicles at a time.

Connection: LAN/Workshop Network or Direct to OPPS/OPS Head

G03397859

Fig. 9: Identifying SSS (Software Service Station)
Courtesy of BMW OF NORTH AMERICA, INC.

Diagnostic Head

Interface between vehicle and DISplus, GT1 or SSS

Used For:

- Vehicle Diagnosis, Coding, Programming and Individualization
- Not to be used for programming vehicles with a MOST bus (E60/63/64/65/66...)

Connection:

- Wireless to LAN/Workshop Network via access point
- Wireless connection direct to GT1
- Directly to LAN/Workshop Network using DK LAN cable
- Directly to GT1/DISplus/SSS using DK LAN Cable and adapter

Refer to **EQUIPMENT CONFIGURATIONS**

G03397860

Fig. 10: Identifying Diagnostic Head

Courtesy of BMW OF NORTH AMERICA, INC.

OPPS Head - (Optical Testing & Programming System)

Interface between vehicle and DISplus, GT1 or SSS

Used For:

- Vehicle Diagnosis, Coding, Programming and Individualization on Most bus equipped vehicles.

NOTE: **The OPSS is NOT ABLE to perform Diagnosis, Coding, Individualization & Programming on an I-bus equipped vehicle.**

- Optical diagnosis of MOST and Byteflight Bus systems.
- Simultaneously program vehicles equipped MOST Bus system (except E65/66) via MOST Bus access port and OBD Connections.

Connection:

- Directly to LAN/Workshop Network connection using DK LAN cable or
- Directly to GT1/DISplus/SSS using DK LAN Cable and adapter.

Refer to **EQUIPMENT CONFIGURATIONS**

Fig. 11: Identifying OPSS Head - (Optical Testing & Programming System)
Courtesy of BMW OF NORTH AMERICA, INC.

OPS Head - (Optical Programming System)

Interface between vehicle and DISplus, GT1 or SSS

Used For:

- Vehicle Diagnosis, Coding, Programming and Individualization

NOTE: The OPS is not able to perform optical diagnosis of MOST Bus and Byteflight systems nor can it be used to perform Diagnosis, Coding, Individualization & Programming on an I-bus equipped vehicle.

Connection:

- Directly to LAN/Workshop Network or
- Directly to GT1/DISplus/SSS using DK LAN Cable and adapter.

Refer to **EQUIPMENT CONFIGURATIONS**

Fig. 12: Identifying OPS Head - (Optical Programming System)
Courtesy of BMW OF NORTH AMERICA, INC.

Deutronic Automatic Battery Charger

Used For:

- Maintaining proper vehicle battery voltage level during Diagnosis, Coding and Programming.
- Follow the initial setup of the charger as indicated in the SIB.

Connection:

- During Coding or Programming Procedure the battery charger must be in the Power Supply (PS) mode.

- Place the charger into the power supply mode by depressing the "MENUE" button 3 times in rapid succession.

Refer to section on **EQUIPMENT CONFIGURATIONS**

G03397863

Fig. 13: Identifying Deutronic Automatic Battery Charger
 Courtesy of BMW OF NORTH AMERICA, INC.

Hardware Operating Conditions

HARDWARE OPERATING CONDITIONS

Device	Operating Temperature	Relative Humidity
GT1	+3°C - +43°C = +37.4°F - +109.4°F	10 - 80% (no condensation)
OPPS/OPS	+3°C - +43°C = +37.4°F - +109.4°F	10 - 90% (no condensation)
SSS	+10°C - +35°C = +50°F - +95°F	10 - 90% (no condensation)
Monitor SSS	+3°C - +35°C = +37.4°F - +95°F	10 - 90% (no condensation)

Coding & Programming Software

Whenever coding and programming are to be performed on a vehicle, the latest version of software for DISplus/GT1 and SSS must be loaded/installed on the equipment being used.

The DIS CD xx contains the diagnostic programs (test modules, schematics, system status values...) prior to CIP 15.0 all coding and programming information for early production vehicles (E31, E32, E34, E36, E38, E39,

E46, E53 and E52) was also available.

NOTE: With the introduction of CIP 15.0 all coding and programming information will be migrated to CIP and incorporated within Progman.

Whenever a new version of either DIS CD xx or CIP xx.x is released this indicates that an update or addition to a specific coding, programming or diagnostic routine has occurred. The change can be reflected by a new/updated programming software for a specific control module, the ability to code a new module or the ability to perform a new retrofit procedure when installing a new system.

NETWORKS

As the level of technology in our vehicles continues to increase so does the level of technology that we use in our diagnostic and programming equipment within the workshop.

In order to meet the ever growing demand for more rapid transfer of information we can no longer have multiple "stand alone" systems, therefore various infrastructures have been created to allow multiple "stand alone" devices/systems to interact with each other to share information.

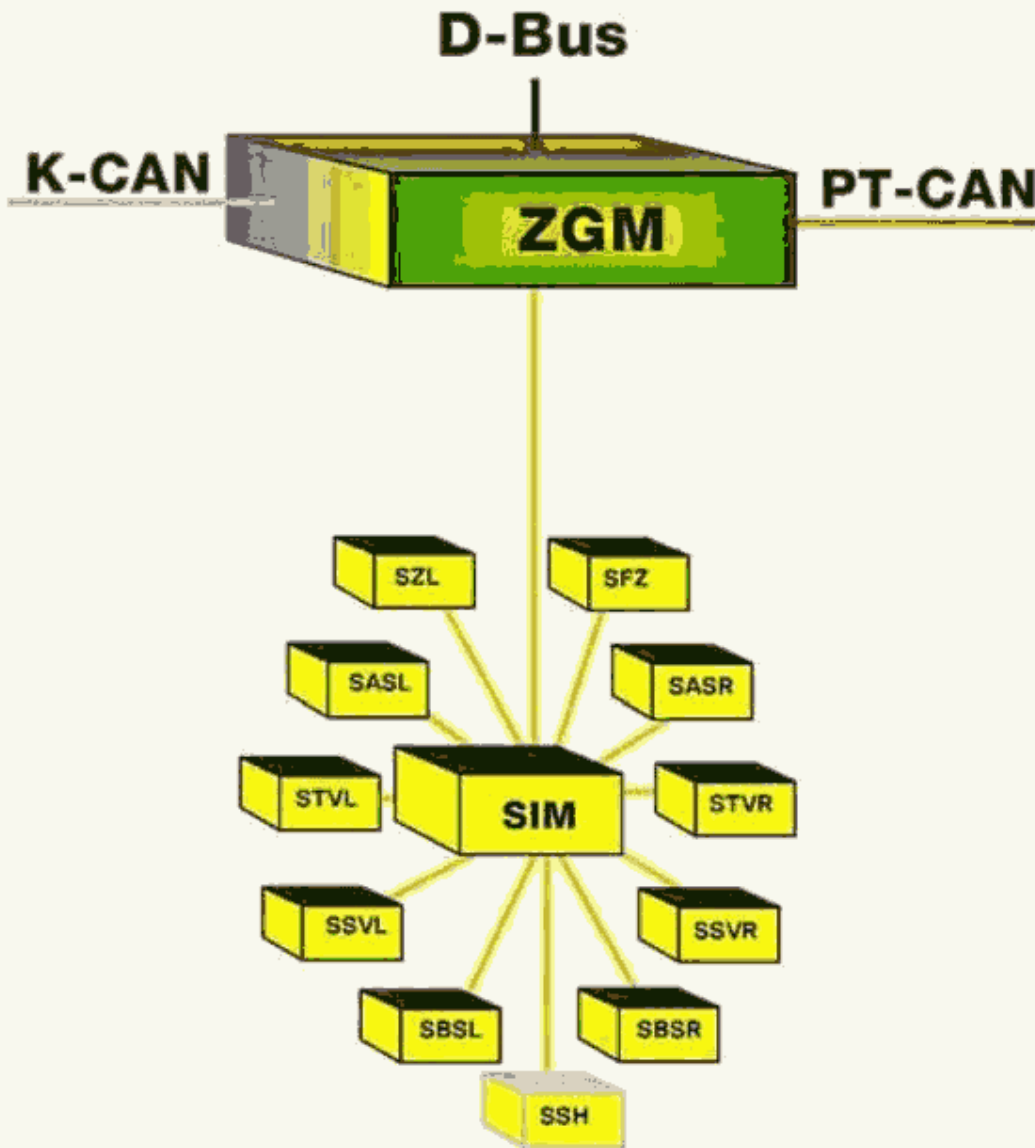

The sharing of information with various control modules in our vehicles has been occurring for quite some time, now we will also be doing this with the diagnostic equipment in the workshop as well.

Vehicle Bus Systems

In order to make the components used in our vehicles more efficient we utilize bus structures (commonly referred to as I-Bus, K-Bus, MOST Bus, Byteflight, PT-CAN, etc.). By using bus structures in vehicles, we can accelerate communication between several different control modules. Many common vehicle systems (such as entertainment, safety, powertrain, etc.) are "stand alone" systems but also require information from other modules/systems in order to be more efficient. In order to obtain the required information the systems must also be able to simultaneously communicate without interfering with each other, which is accomplished by using various bus structures.

Example:

The ISIS (Intelligent Safety Integration System) system on the E65 uses the Byteflight bus structure.

G03397868

Fig. 14: Identifying Vehicle Bus Systems

Courtesy of BMW OF NORTH AMERICA, INC.

Depending on the equipment level of the E65, the ISIS may consist of 11 satellite components (Control Modules/Sensors) that are connected, using fiberoptic cables, to the SIM (Safety Information Module) which monitors the status of the satellite components. Since this is a safety system, components need to be activated within a fraction of a second in order to be effective, there can not be any processing delays. The SIM is connected to the ZGM (Central Gateway Module) which monitors the activity of the SIM and will direct information to the SIM and other devices in the vehicles as necessary.

Workshop LAN Network

A network is nothing more than a group of devices interconnected so that they can communicate with each other. A LAN is a network that is localized to a specific area, such as a workshop or office.

The bus systems (I-Bus, K-Bus, PT-CAN, Byteflight, MOST Bus, ...) that we have been using in our vehicles for quite sometime, are nothing more than networks with different configurations. By looking at the byteflight system mentioned previously, a similarity to a workshop network can be established.

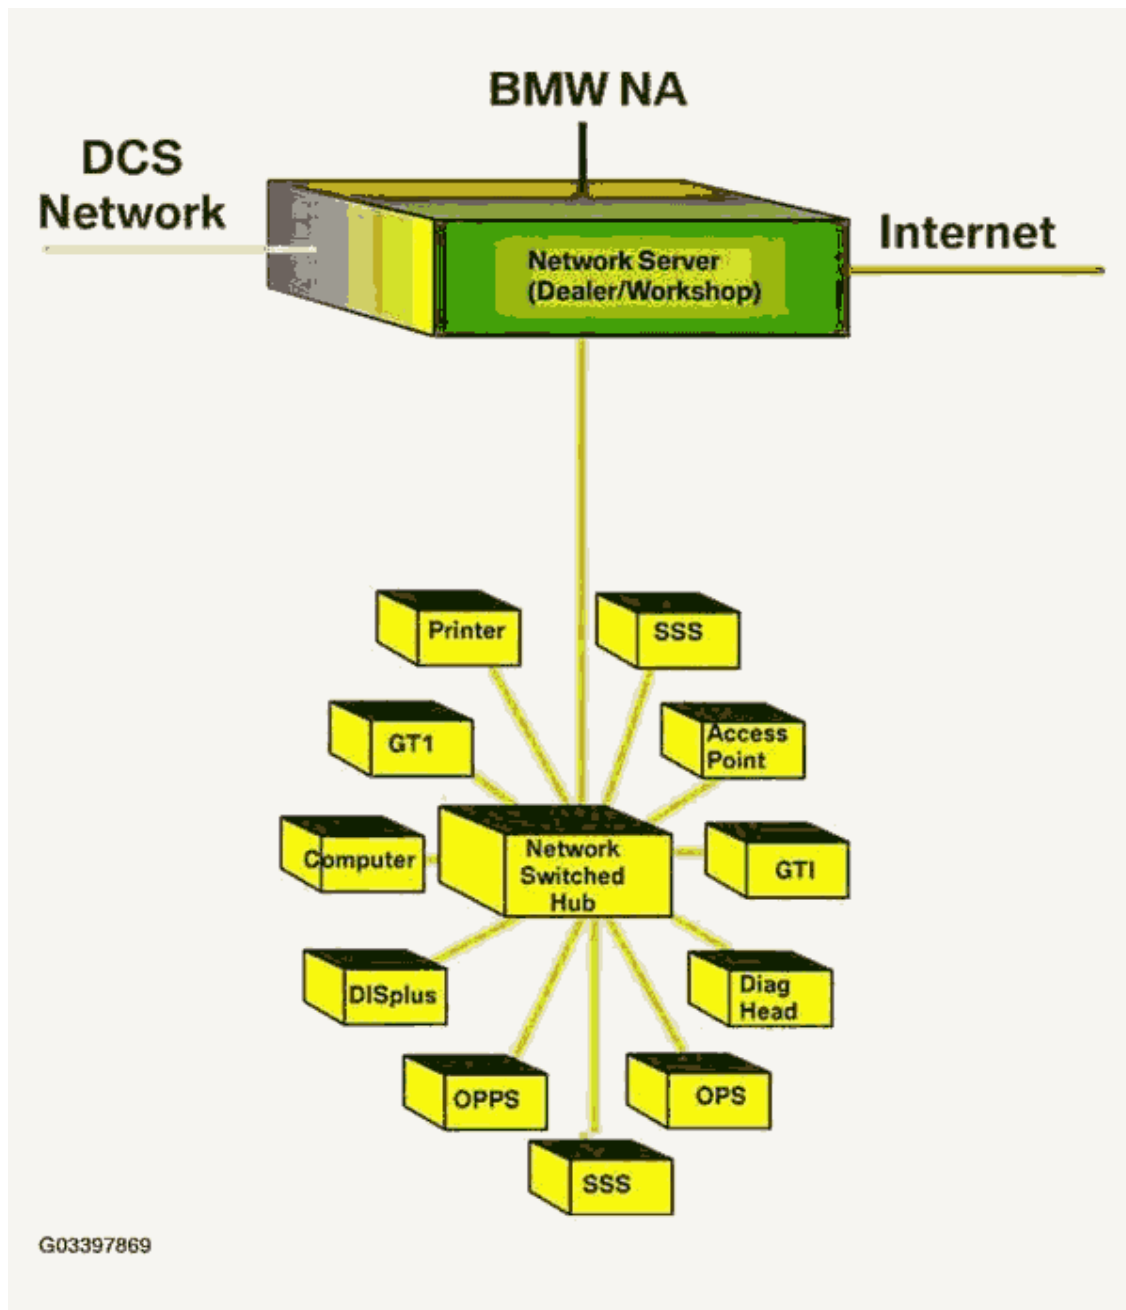

Fig. 15: Identifying Workshop LAN Network
Courtesy of BMW OF NORTH AMERICA, INC.

Workshop Network

All workshops are currently equipped with a GT1, DISplus, SSS, OPS, OPPS, Diagnostic Head, Access Point, desktop computer(s) and printer(s) which can be considered as satellite components (control modules/sensors). In order for these components to communicate with each other, either directly or indirectly, they must be interconnected via a cable/wire to a common point or switching device. Consider the switching device/hub to be similar to the SIM, which monitors all devices connected to it and allows the devices to communicate with each other. The interconnection of these devices results in the establishment of a network localized to the workshop area thereby establishing a Local Area Network (LAN) in the workshop.

Network Structure

By having the workshop configured to allow the various devices used on a daily basis to be interconnected/networked with each other, as indicated in the illustration, additional components can easily be added and online updates can automatically be installed on all connected devices, as long as they have an approved IP address.

***Example:** The network that exist in the workshop is not much different than the network structure that is used in our vehicles. In order for control modules to communicate with each other they must be correctly identified. The identification process can be considered to occur as part of the coding procedure which is done at the end of the assembly process or at anytime a new component/module/system is added to the vehicle. By not recoding the vehicle after adding or removing a module/system, the communication on a particular bus can be hampered especially if a response from a module that is no longer installed is expected or a new module transmits data that is not expected by anyone else on the bus because it is not correctly identified. The VO for a vehicle can be considered to contain the IP addresses of the modules installed in the vehicle.*

If the devices on the workshop network do not have a rigidly assigned IP address, online updates to specific devices can not occur. The operation/performance of a network can be greatly hampered if multiple devices share an address, since the transmitted data is not able to reach the correct device, it can result in jamming up the operation of the network.

G03397870

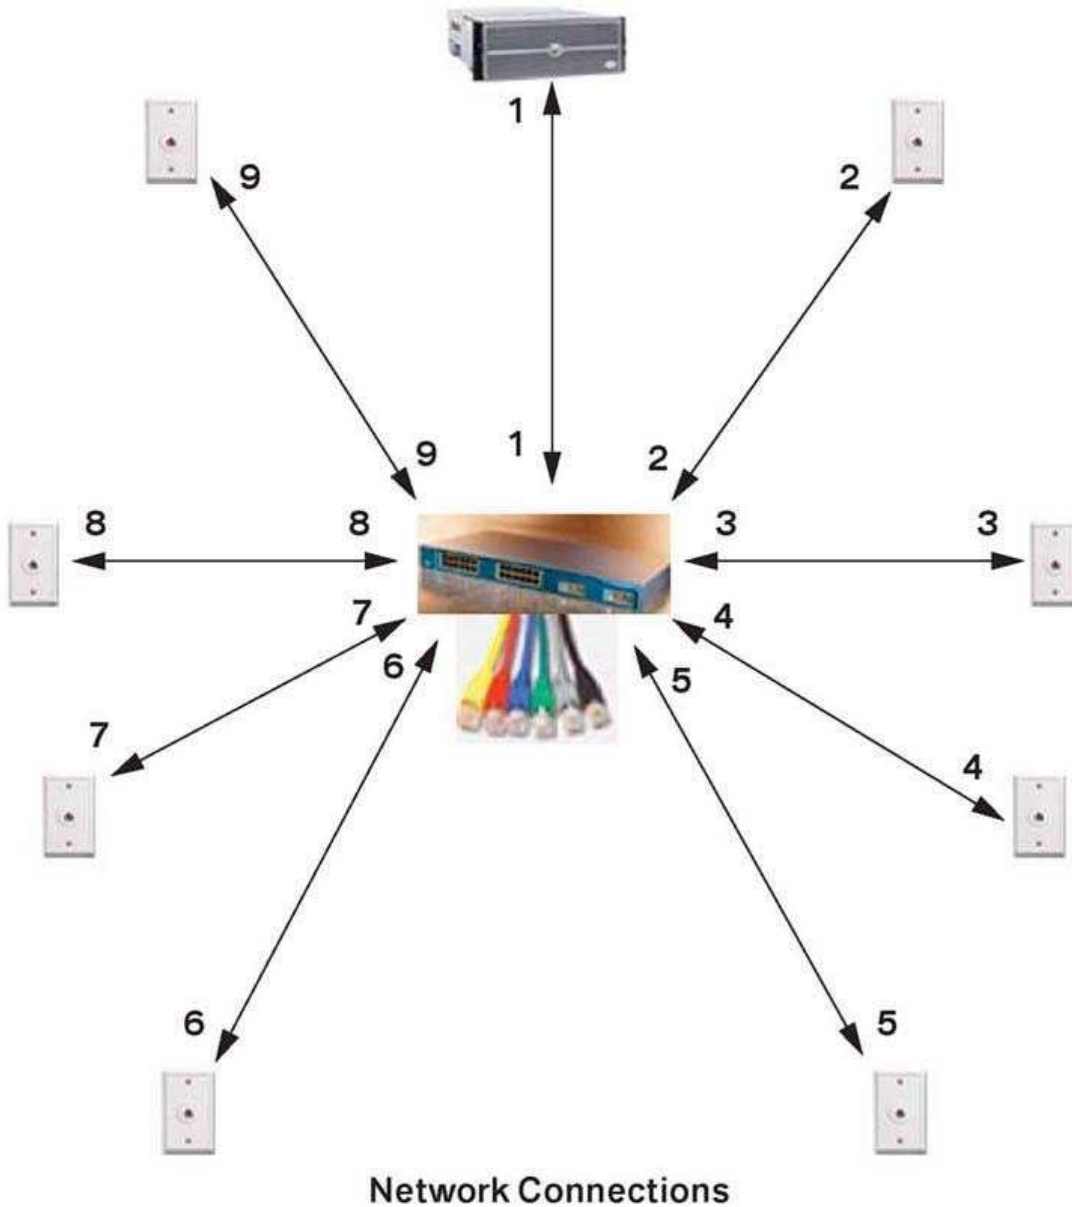

Fig. 16: Identifying Network Structure
 Courtesy of BMW OF NORTH AMERICA, INC.

Network Connections

When establishing a network which will utilize multiple access terminals/jacks it is recommended that the jacks and cables attached to the specific jacks are numbered and that the corresponding end of the cable that connects to the router/switched hub should be numbered as well.

Example: The illustration below shows a basic network structure with no miscellaneous devices connected, other than a Server and Switched Hub. The cables running to/from the Switched Hub are all numbered on both ends to make troubleshooting the network easier in the event of a problem with the cabling, wall jack or Switched Hub connections.

Not having the cable and wall jacks number would be like trying to troubleshoot a problem with an electrical circuit in the vehicle where all the wires are the same color and the components connected have no pin assignments.

G03397871

Fig. 17: Identifying Network Connections (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Once additional devices are connected it becomes very important that the configuration information (IP Address, Gateway Address, Subnet Mask and Device Name) is entered correctly for each device that is connected to the network. Each device must be assigned a specific/unique IP Address.

It is very important that the IP address not be shared by multiple devices located on the network, as this can result in "Locking-up" the network, which can have a detrimental effect on any control module(s) being programmed or coded.

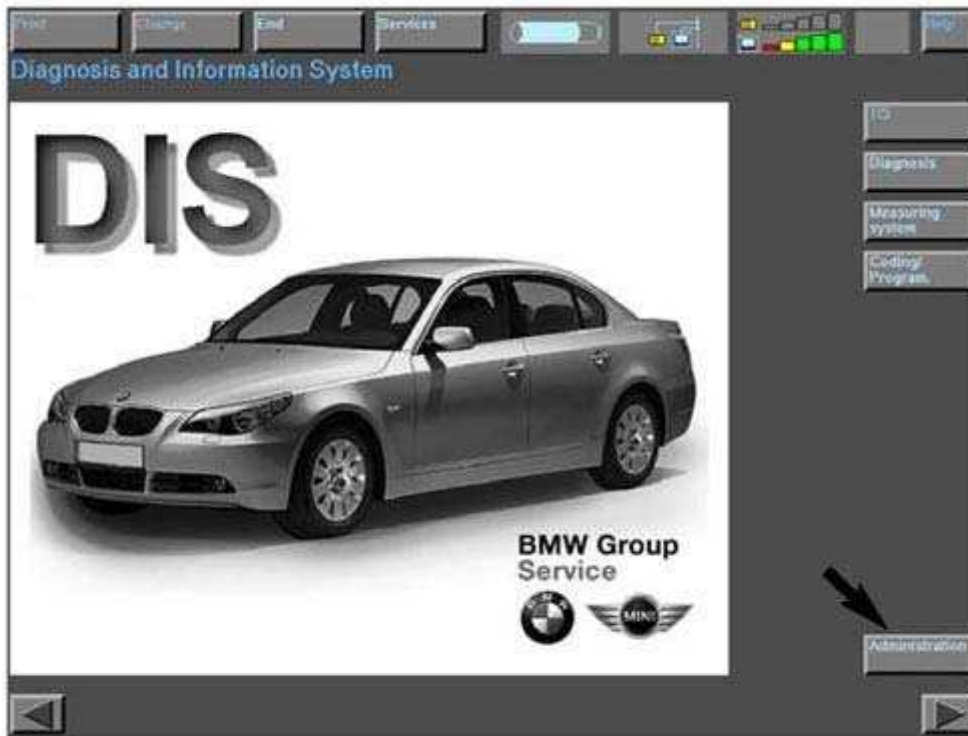

G03397872

Fig. 18: Identifying Network Connections (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Accessing Configuration Information - DISplus/GT1 & Interface(s)

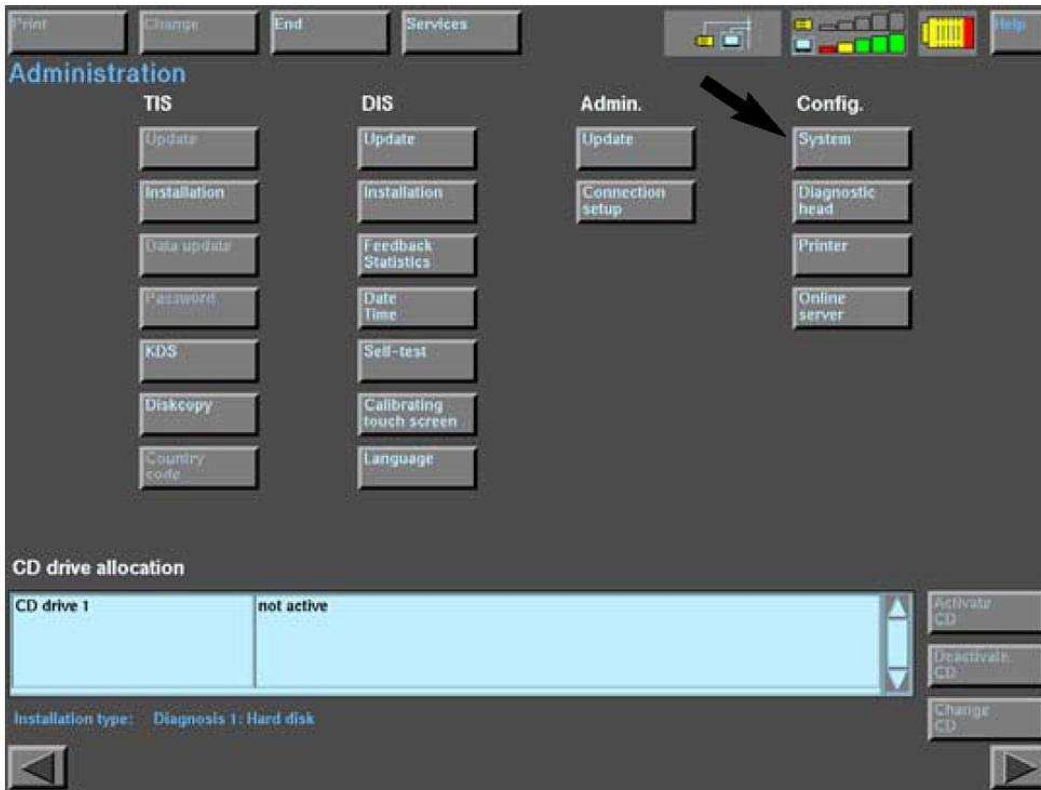

Select "Administration".

G03397873

Fig. 19: Display DISplus/GT1 (Administration)

Workshop Network Components

A LAN currently exists in all workshops to allow the diagnostic equipment (DISplus, GT1, SSS, OPSS, OPS & Diagnostic Head) to communicate with each other. In order to successfully diagnose, code and program a vehicle, it is required to have all equipment connected to the workshop network.

Components used to create a network infrastructure in the workshop consist of:

Access Point

Allows direct wireless access to LAN for GT1 and Diagnostic Head

OR

Diagnostic head establishes connection to LAN via wireless communication and thereby can be connected to DISplus or GT1, which are connected to LAN

Access point is connected directly to LAN.

Symbol - Model Spectrum 24/AP 3020-100

Wall Jack

Connection point for devices such as GT1, DISplus, Access Point, SSS, Diagnostic Head, OPSS/OPS Head, Printer and Network Server to Switched Router via RJ45 cable.

G03397880

Fig. 26: Identifying Wireless
Courtesy of BMW OF NORTH AMERICA, INC.

G03397881

Fig. 27: Identifying CAT 5 Ethernet Cable With RJ-45 Connectors
Courtesy of BMW OF NORTH AMERICA, INC.

CAT 5 Ethernet Cable with RJ-45 Connectors

Used to establish a connection between:

- Wall jack and Switched Router/Hub
- Wall jack and devices such as GT1, DISplus, Access Point, SSS, Diagnostic Head, OPPS/OPS Head and Network Server.

Switched Hub

LAN switched distribution hub for all devices connected to the network. Routes communication telegrams/messages to specific devices from specific devices. Allows multiple devices to communicate with each other without reducing data transfer rate.

Cisco Switch WS-C2950-24

Server

Central computer which controls interface/communication between all devices on the Workshop LAN and communication to external networks and internet. Keystone device for network operation along with switch/router.

G03397882

Fig. 28: Identifying Switched Hub
Courtesy of BMW OF NORTH AMERICA, INC.

Common Terminology

Network

A group of computers that are interconnected with each other and able to communicate with each other either by transferring data via a wired or wireless connection.

Local Area Network (LAN)

A network that exists within a specific area.

***Example:** By having all computers, testers and printers in the workshop interconnected results in a Workshop LAN.*

Ethernet

The term Ethernet is a communications protocol used to define a method & speed by which interconnected devices are able to communicate with each other by either a wired (twisted pair) or fiberoptic connection.

Common Ethernet communication protocol terms:

10BaseT - Able to transmit data at a rate of 10Mbps for a maximum distance of 100 meters per segment.

100BaseT - Able to transmit data at a rate of 100Mbps for a maximum distance of 1000 meters per segment.

The speed differences are obtained by modifying the method of encoding the data to be transferred. The maximum distance consist of the distance from switched hub to wall jack plus length of cable used to connect a particular device. The greater the distance the greater the chance of signal loss/disturbance.

Ethernet Cable (CAT 5)

A standard used to define an 8 wire cable (4 twisted pair) that is commonly used to interconnect various computers in the establishment of an ethernet network. Certified to transmit data at a maximum rate of 100Mbps.

RJ-45 Connectors

The plastic connectors at the end of a CAT 5 cable, used to connect the cable to device/computer, wall jack and hub.

Wall Jack

Accepts RJ-45 connectors when connecting devices to the network. Connection point for devices like DISplus, GT1, SSS, OPSS, OPS, Diagnostic Head, workshop computers and printer.

Recommendation is that outlet/jack is numbered and the corresponding end of the ethernet cable connected to the switched hub is numbered as well, to assist in troubleshooting in the event of a problem.

Example: A wall jack outlet is labeled as #1 the other end of the cable at the hub should also be labeled #1.

Switched HUB

Allows multiple devices to send information over the network at the same time without slowing down the communication process. A switched hub essentially isolates the two devices that are communicating, thereby providing each component on the network a separate connection at the maximum data transfer rate of the network.

Example: A switched HUB is similar to the use of cloverleaves on the highway, traffic does not need to stop if a change in direction needs to be made, plus traffic flows smoothly from point to point.

A regular HUB does not provide each component with a separate connection point to the network but rather a shared connection point. By sharing a connection point the data transfer rate of the network is reduced when multiple devices try to communicate.

Example: A regular HUB is similar to the use of a 4 way intersection, the smaller the amount of traffic using the intersection the quicker a car can go through the intersection and reach its desired destination. The greater the traffic the longer it will take for a car to reach its desired destination.

The switched hub installed as part of the workshop wiring project is a Cisco WS-C2950-24.

Network Server

A computer that provides information/data to other computers located on the network. A server allows

computers on its network to access information on another network, such as the internet. The server is the keystone device that allows computers on its specific network to access information on another network.

As an example a server can obtain and distribute software updates to all computers located on its network, instead of having to physically install the updates to each computer individually.

Automatic/Online Updates

The ability to connect the network server to the BMW server and check for new software updates (Diagnostic, Coding & Programming data) then downloads the information to all computers/equipment located on the network automatically at a specific time.

Example: New updates can be installed on SSS, GT1 and DISplus overnight in order to have latest data available the next morning.

The application that performs online updates is referred to as JETstream.

Access Point

The access point is a wireless communication device that is able to establish a wireless connection with a GT1 and/or a diagnostic head and allows them to communicate with other devices on the network.

Manufactured by Symbol - Model Spectrum 24 /AP 3020-100.

Fig. 30: Identifying Access Point
Courtesy of BMW OF NORTH AMERICA, INC.

Interface Name

The specific name assigned to the device (Ex. OPS Blue A)

IP Address

It is a unique four segment number used to identify a specific device located on a specific network. The number

represents the address of the device on the network and is necessary when communicating with other devices located on the network.

Example: 92.168.100.10

Usually the first three segments are used to identify the network and the last segment identifies the device. The IP Subnet Mask information generally defines which segments are needed to identify the network and which identify the device.

In order for a devices on the network to communicate with other devices on the network it must know the addresses of those devices. If a print command is sent from a computer to a printer on the network, the command must be addressed specifically to the desired printer.

Example: An IP address is no different than your home address, in order to receive a letter specifically directed to you, your name and address must be correctly displayed on the letter.

IP addresses are assigned by the network administrator/provider and are rigidly assigned to the device(s) located within the workshop network, by entering it into the device during the initial setup.

IP Subnet Mask

This information is used to define which segment(s) of the four segment IP address specifically identifies the device and which identify the specific network.

Example: 255.255.255.0

Indicates that the first three segments (255.255.255) identify the specific network that the device is located on. The last segment (0) indicates that this is the segment that will identify the specific device.

Gateway

This information identifies the four segment address of the component located on the network responsible for communicating from the current network to another network. If there is no address in this location then a connection to any devices outside of the current network can not be established.

NOTE: The network and device address information must be entered exactly as defined by the network administrator for your facility, otherwise the devices can not be accessed.

REMOTE CODING, INDIVIDUALIZATION & PROGRAMMING TERMINALS

G03397885

Fig. 31: Identifying GT1
Courtesy of BMW OF NORTH AMERICA, INC.

G03397886

Fig. 32: Identifying DISplus
Courtesy of BMW OF NORTH AMERICA, INC.

With the release of CIP 15.0 and the implementation of Progman (see **PROGMAN** section for additional information) the DISplus and GT1 will only be capable of performing vehicle diagnosis and activation/initiation of a Coding, Individualization or Programming task through the SSS. A special program management tool (Progman) will only allow the DISplus and GT1 to act as remote terminals to the SSS (regarding Coding, Individualization & Programming), which means that the SSS will be the single supplier of Coding, Individualization and Programming information to a vehicle and its respective control modules. By having all devices (DISplus, GT1 and SSS) connected to the network, the DISplus and GT1 can be utilized to perform diagnosis on a new vehicle after a request for vehicle programming as an example, has been sent to the SSS for the current vehicle.

Example: GT1(7) is connected to the LAN via access point (3) and to OPPS head (6) which is connected to LAN(4) and vehicle (5):

1. *Diagnosis of complaint is completed and test module result indicates that a control module needs to be updated/reprogrammed.*
2. *Coding and Programming/CIP is accessed on GT1(7) and a request to program specific control module on vehicle (5) connected to OPPS head (6) is made.*
3. *The SSS (1) takes over the programming process and begins to reprogram the control module and recode the vehicle (5).*
4. *At this point the GT1(7) is free to connect to a new OPPS/diagnostic head and begin a diagnostic routine or initiate another programming/coding session on a new vehicle.*

G03397887

Fig. 33: Connecting GT1 To LAN Via Access Point And To OPSS Head
Courtesy of BMW OF NORTH AMERICA, INC.

Software Service Station

The Software Service Station (SSS) was released to all centers for the sole purpose of Coding and Programming vehicles that can only be Coded/Programmed using CIP. The SSS is a dedicated desktop PC, that supplements the DISplus and GT1 diagnostic systems, since the SSS is only capable of performing Coding and Programming it frees up the DISplus and GT1 for diagnostic functions.

G03397888

Fig. 34: Identifying Software Service Station
Courtesy of BMW OF NORTH AMERICA, INC.

With the release of CIP 15.0 and the implementation of Progman, the SSS replaces the DISplus and GT1 (Group Tester One) diagnosis systems as the primary programming system. The DISplus and GT1 will only be able to send a request to Program or Code a vehicle directly through the SSS. The SSS performs the actual programming and coding process. In this configuration the SSS is able to program up to five vehicles at a time and the DISplus and GT1 are free to be used for other tasks, provided that all devices are connected to the workshop network and have been assigned specific IP addresses.

As with the DISplus and GT1, data is supplied to the Software Service Station by means of a CIP DVD-ROM or CD-ROM, additional data can also be provided by online updates via JETStream.

OPPS/OPS/Diagnostic Head

The OPSS (Optical Testing and Programming System), OPS (Optical Programming System) and the diagnostic head can all be used with the Software Service Station to serve as the interface to the vehicle. Optimal programming speed on MOST bus equipped vehicles is obtained by using the OPSS/OPS head connected to the OBD connector and directly to the MOST access port on E60, E63/64 and newer vehicles.

OPSS

The OPSS was first introduced with the E65 and is able to:

- Acts as interface between vehicle and DISplus/GT1/SSS
- Reduce programming time of MOST Bus control modules
- Diagnosis the fiber optic communication system utilized on the byteflight and MOST bus systems.

Fig. 35: Identifying OPSS

Courtesy of BMW OF NORTH AMERICA, INC.

- Simultaneously program vehicles equipped with a MOST bus system (except E65/66 up to 3/05 prod.) via MOST Bus access port and OBD connections.
- Perform vehicle diagnosis, coding and programming on all vehicles equipped with a MOST bus.
- Communicates via a wired connection (DK LAN cable) to Network or directly to GT1/DISplus/SSS

The OPSS is NOT ABLE to perform Diagnosis, Coding & Programming on an I-bus equipped vehicle.

OPS

The OPS is able to:

- Acts as interface between vehicle and DISplus/GT1/SSS
- Reduce programming time of MOST Bus control modules
- Simultaneously program vehicles equipped with a MOST bus system (except E65/66) via MOST Bus access port and OBD connections.
- Perform vehicle diagnosis, coding and programming on all vehicles equipped with a MOST bus.
- Communicates via a wired connection (DK LAN cable) to Network or directly to GT1/DISplus/SSS

Fig. 36: Identifying OPS

Courtesy of BMW OF NORTH AMERICA, INC.

The OPS is NOT ABLE to perform Diagnosis on the fiber optic communication system utilized on the byteflight and MOST bus systems nor can it be used to perform Diagnosis, Coding & Programming on an I-bus equipped vehicle.

Diagnostic Head

The diagnostic head is able to:

- Acts as interface between vehicle and DISplus/GT1/SSS
- Perform vehicle diagnosis, coding and programming and Vehicle & Key Memory on most vehicles.

Should not be used for coding and programming vehicles equipped with a MOST bus (E60/63/64/65/66...) as processor is too slow.

G03397891

Fig. 37: Identifying Diagnostic Head
Courtesy of BMW OF NORTH AMERICA, INC.

- Communicates via a wired connection (DK LAN cable) to Network or directly to DISplus/GT1/SSS
- Wireless communication to LAN/Workshop Network Connection via Access Point

MOST Direct Access Port

The MOST Direct Access port is installed on vehicles equipped with a MOST bus such as E60/E62/E63.... The port is utilized to allow separate programming of control modules connected to the MOST bus when using the OPSS/OPS head for Programming & Coding. By using this port in conjunction with the OBD socket when programming a vehicle the overall programming/coding time is reduced.

Access to the port differs corresponding to the model.

For E60 the port (5) is located on the left side of the glove box (3) behind the strut (2). To access the connection remove the cover (1) and remove the terminating plug (4) from the cable to allow connection to the port (5).

G03397892

Fig. 38: Identifying MOST Direct Access Port
Courtesy of BMW OF NORTH AMERICA, INC.

Example: Referring to the illustration below - Parallel programming of an E60 using OPSS head in conjunction with short OBD cable (1) P/N 666 111 and MOST bus programming cable (2) P/N 663 121 which connects to the MOST Access Port located in the glovebox. The OPSS is connected to the network via DK LAN cable 3.

NOTE: The OPS can be substituted for the OPSS.

G03397893

Fig. 39: Identifying OBD Cable P/N 666 111 And MOST Bus Programming Cable P/N 663 121
 Courtesy of BMW OF NORTH AMERICA, INC.

Equipment Configurations

The diagnostic and programming equipment available in the workshop should always be configured to have the DISplus, GT1 and SSS connected directly to the LAN/Workshop network. **To ensure uninterrupted service/data transmission, it is highly recommended that the radio/wireless connection of the diagnostic head is NOT used to perform any type of Programming or Coding function.**

The normal configuration (when coding or programming) of the DISplus & GT1 to the diagnostic/OPPS/OPS head are as follows:

DISplus (1) - Connected to network using SI LAN cable (2)

+ Diagnostic/OPPS/OPS head (3) - Connected to network using DK LAN cable (4)

+ OBD or Diagnostic plug cable - Connecting diagnostic head to vehicle

G03397894

Fig. 40: Connecting DISplus To Network Using SI LAN Cable
 Courtesy of BMW OF NORTH AMERICA, INC.

GT1 (1) - Connected to network using SI LAN cable (3) and LAN adapter BT1:1 (2)

+ Diagnostic/Ops head (5) - Connected to network using DK LAN cable (4)

+ OBD or Diagnostic plug cable - Connecting diagnostic head to vehicle.

G03397895

Fig. 41: Connecting GT1 To Network Using SI LAN Cable And LAN Adapter BT1:1
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For optimum programming speed the OPPS/OPS head (5) can be substituted for the diagnostic head:

- + Connect OPPS/OPS head (5) directly to a network drop via a DK LAN cable (4)
- + Connect OPPS/OPS head to the OBD connector using the short OBD cable P/N 663 111

G03397896

Fig. 42: Connecting OPDS/OPS Head Directly To Network Drop Via DK LAN Cable
Courtesy of BMW OF NORTH AMERICA, INC.

In the event that the workshop network is disabled/down the DISplus and GT1 can still be used to diagnose a vehicle by utilizing the following configurations:

GT1 (1) - Not connected to network

+ Diagnostic/OPPS head (5) - Connected to GT1 using DK LAN cable (4) and LAN adapter BT1:1(2) plus LAN adapter BT X (3)

+ OBD or Diagnostic plug cable (5) Connecting diagnostic head to vehicle

G03397897

Fig. 43: Connecting Diagnostic/OPPS Head To GT1 Using DK LAN Cable And LAN Adapter BT1:1 Plus LAN Adapter BT X

Courtesy of BMW OF NORTH AMERICA, INC.

DISplus (1) - Not connected to network

+ Diagnostic/OPPS/OPS head (3) - Connected to DISplus using DK LAN cable (4) and PC LAN cable (2)

+ OBD or Diagnostic plug cable - Connecting diagnostic head to vehicle

G03397898

Fig. 44: Connecting Diagnostic/OPPS/OPS Head To DISplus Using DK LAN Cable And PC LAN Cable
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **OPPS/OPS can not be used to perform diagnosis on an I-bus equipped vehicle (i.e. E32, E36, E38, E46, E53...).**

PROCEDURE FOR CODING & PROGRAMMING

An important prerequisite for ensuring trouble-free programming is the correct preparation of the vehicle.

A diagnostic procedure must first be performed on the vehicle prior to any programming. Programming must not be started before faults in the vehicle electrical system are ruled out.

Correct preparation of the vehicle avoids errors during programming.

The programming procedure may be terminated if a bus signal is generated as the result of activation of electric loads during programming. The programming procedure should be repeated following termination. In exceptional cases it may be necessary to replace the control unit if communication is no longer possible.

Prior to beginning any programming or coding procedure some general guidelines need to be considered in

order to ensure that the process goes as smoothly as possible:

Check

Action /Procedure

Engine

Turn off engine, ignition key on - KL15

G03397899

Fig. 45: Identifying Engine Start/Stop Switch

Courtesy of BMW OF NORTH AMERICA, INC.

Manual gearbox/SMG

Transmission in neutral.

Parking brake applied.

G03397900

Fig. 46: Identifying Manual Gearbox/SMG
Courtesy of BMW OF NORTH AMERICA, INC.

Automatic Transmission

- Transmission in position P.
- System temperature below 80°C.

Attention: Do not apply parking brake on vehicles equipped with the electromechanical parking brake.

G03397901

Fig. 47: Identifying Automatic Transmission Selector Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Loads

- All electric loads, lights and indicator lights switched off.
- Wipe/wash system switched off. Insure that the wipers can move freely. Wipers may be activated during programming.

Do Not Block the Wipers.

G03397902

Fig. 48: Identifying Button

Courtesy of BMW OF NORTH AMERICA, INC.

Check

Action /Procedure

Diagnosis

Perform quick test.

Using the diagnosis system, rectify any problems before programming and clear stored fault codes.

G03397903

Fig. 49: Identifying DISplus
Courtesy of BMW OF NORTH AMERICA, INC.

Battery

The battery should be sufficiently charged at the start of the programming procedure (12.6 V).

G03397904

Fig. 50: Identifying Battery

Courtesy of BMW OF NORTH AMERICA, INC.

Battery Charger

IMPORTANT: Vehicles must be connected to the Deutronic Automatic Battery Charger prior to beginning the programming or coding procedure, this is the only approved battery charger for MOST bus-equipped vehicles.

During the programming or Coding procedure the battery charger must be in the Power Supply (PS) mode.

Place the charger into the power supply mode by depressing the "MENUE" button 3 times in rapid succession.

Do not connect or disconnect the charger during programming. The system voltage must not drop below 12.6 V during the programming procedure.

G03397905

Fig. 51: Identifying Battery Charger
Courtesy of BMW OF NORTH AMERICA, INC.

DO NOT USE Radio Connection for Programming or Coding!!

Diagnostic head/OPPS head (5) must be connected directly to a network drop to ensure uninterrupted programming.

The DK LAN cable (4) MUST NOT BE routed through an open window of the vehicle, leave a door open.

G03397906

Fig. 52: Connecting Diagnostic Head/OPPS Head To Network
Courtesy of BMW OF NORTH AMERICA, INC.

Programming

Check CKM values, also observe individual settings on the vehicle if applicable, start programming procedure.

Attention: The data status of the Software Service Station must always be kept updated!

Fig. 53: Identifying Progman

Courtesy of BMW OF NORTH AMERICA, INC.

Make sure that no switches, radio etc. are operated during programming as this could terminate the programming procedure.

DO NOT TOUCH CODING/PROGRAMMING ACTIVE

CODING PLUG

Model: E23, E24, E28, E30, E32, E34, E36

Production: 9/87 - 2002

CODING PLUG

A coding plug is a mechanically keyed or electronically coded device/plug, that can open or bridge circuits in a particular component to allow it to operate differently dependent on the type of plug installed/inserted.

BMW used a mechanical coding plug which simply opened or bridged circuits to assign market specific data to the instrument cluster of the E23, E24, E28 and E30 vehicles. With the introduction of the E32 in 1988 and the E34 in 1989, electronic coding plugs were utilized in the instrument cluster.

G03397908

Fig. 54: Identifying Coding Plug

Courtesy of BMW OF NORTH AMERICA, INC.

The change to an electronic coding plug which allowed market specific data to be assigned to the instrument cluster also contained Non-Volatile Random Access Memory (NV-RAM), which provided an ability to retain vehicle specific data in the plug such as:

- Vehicle Identification Number
- Accumulated Mileage
- Service Indicator Information
- Coding plug number
- Fuel Tank Size data

By using a plug that is able to store data, the instrument cluster can be replaced without losing vehicle mileage, unless the coding plug is damaged.

Fig. 55: Identifying External Coding Plug
 Courtesy of BMW OF NORTH AMERICA, INC.

With the introduction of vehicles like the E31 and E38 the instrument cluster no longer utilizes a coding plug since it receives most of its input signals directly from a control module, EKM (E31) or IKE (E38), this allows vehicle data to be directly stored in the control module and the instrument cluster is no longer coded. For these vehicles and newer models, market specific data is stored in the control module (EKM or IKE). By coding these modules by way of ZCS coding (refer to **ZCS CODING PROCEDURE**) market specific data is assigned/released to the control module.

Coding Plug Identification

Each coding plug features a stored 5-digit numerical code that varies between model/equipment, etc.

The code can be read out through the instrument cluster display by pressing the odometer reset button and turning the ignition switch to KL R. The coding plug number will be display in the instrument cluster matrix.

Fig. 56: Identifying Coding Plug Identification Number
Courtesy of BMW OF NORTH AMERICA, INC.

If this is no longer possible, the coding plug must be removed in order to read the code on the label of the coding plug.

Ordering Replacement Coding Plug

The coding plugs are received pre-coded and installing them automatically codes the cluster.

The first digits of the 5-digit code is changed on coding plugs when they are replaced.

ORDERING REPLACEMENT CODING PLUG

	E32	E34
ORIGINAL NUMBER	1 1101	2 0101
REPLACEMENT NUMBER	5 1101	4 0101

NOTE: It is not possible to input the mileage reading, the service interval status and the chassis number into the replacement coding plug.

CODING PLUG OVERVIEW

Since the introduction of the E32 several versions of instrument cluster coding plugs have been introduced, this section will provide an overview of the different versions, plus provide identification and coding information.

Coding Plug Identification - E32/E34

The E32/E34 Instrument cluster coding plugs progressed through three variations of design.

Start of production up to 2/89.

The original E32/E34 instrument cluster coding plug was installed in the wiring harness connector (X16) which plugged into the instrument cluster. This plug contained all of the vehicle specific coding data for the instrument cluster and retained accumulated mileage and service interval information.

In the event that the instrument cluster must be replaced the coding plug is reused with the new cluster. By reusing the old/original plug the mileage in the odometer does not change, since the coding plug is able to retain the information.

- If the coding plug must be replaced, the total mileage and Service Interval information will be lost.

X16 CONNECTOR
PLUGS INTO BACK
OF CLUSTER

CODING PLUG IS
PRESSED OUT OF
CONNECTOR

G03397911

Fig. 57: Removing Coding Plug
Courtesy of BMW OF NORTH AMERICA, INC.

- Replacement coding plugs pre-coded by part number and are available from the parts department.

From 2/89 to 9/91 Production

The E32/E34 instrument cluster and coding plug were redesigned in 2/89. As a result of this redesign the coding plug became an external component and plugged directly into the back of the instrument cluster, no longer part of the X16 connector.

Even though the plug can be removed without disconnecting the harness, all power must be disconnected from the cluster prior to removal, to prevent data loss from the coding plug.

9/90 Revision

In 9/90 the cluster was slightly redesigned again to address changes in the fuel gauge and some minor physical changes. The electronics of the cluster as well as the coding plug were upgraded considerably.

The coding plug and the instrument cluster are not compatible with the earlier redesign. The printed circuit board and the coding plug are colored blue for distinction over the components of the earlier redesigned cluster.

The new blue coding plug is also keyed differently to prevent unintentional exchange with the earlier coding plug.

E32/34 as of 9/91 (1992 Model Year)

After 9/91 production, the instrument cluster coding plug can be coded using the ZCS function within CIP by selecting the specific module via the DISplus/GT1/SSS. The physical characteristics of the coding plug did not change.

A replacement uncoded coding plug (P/N 62 11 8 359 368) must be coded after installation into the instrument cluster, refer to **ZCS CODING PROCEDURE** .

A precoded coding plug (P/N 62 11 8 359 369) is available for this cluster as well. When ordering include with your order the following information:

- ZCS code for the vehicle
- VIN for the vehicle

E36 Instrument Cluster

318i/is, 325i/is and M3

The instrument cluster for these vehicles does not utilize a coding plug. The entire cluster is coded model specific, by using the ZCS coding procedure in CIP by selecting E36.

Recently, a new procedure has been made available that transfers the accumulated mileage and service interval data from a defective instrument cluster into a new replacement cluster for these vehicles.

318ti and Z3 Roadster

These vehicles are equipped with an instrument cluster that is not connected to the diagnostic link and therefore

can not be coded using ZCS. Since the cluster can not be coded, these vehicles require a coding plug for vehicle specific coding.

Like the E32/E34, the coding plug is able to store the accumulated mileage and service interval information. In addition to storing the data on the coding plug the instrument cluster is also able to internally store the data on an EEPROM (Electrically Erasable Programmable Read Only Memory), as redundant back. If the cluster main processor or coding plug need to be replaced, the mileage and SI Indicator data can be transferred to the new component using the clusters test step procedure #9. higher value overwrites the lower.

Test No. 09

DISTANCE READING Test - 09 allows the total stored mileage to be updated if one of the storage components has to be replaced. The test step will be used if the manipulation dot is illuminated in the cluster display. This test step will identify which component has the lower mileage.

Display Example:

012654 I - Indicates the mileage in the internal EEPROM is lower than the mileage stored in the coding plug.

000325 E - Indicates the mileage in the external coding plug is lower than the total mileage stored in the internal EEPROM.

Pressing the reset button for 4 seconds will over write the lower mileage with the higher mileage and cancel the manipulation dot. The SI data will also be transferred at the same time.

To remove the coding plug from the instrument cluster first remove the snap off cover. Pull the coding plug from the connector in the cluster.

G03397912

Fig. 58: Removing Coding Plug From Instrument Cluster
Courtesy of BMW OF NORTH AMERICA, INC.

FEDERAL ODOMETER DISCLOSURE REQUIREMENT 92-513

The Federal Odometer Disclosure Requirement 92-513 states that, whenever an instrument cluster component is replaced that brings the odometer back to 0 (coding plug), the mileage prior to its replacement along with the date that the replacement occurred must be recorded on the left door frame of the vehicle.

A permanent label to record this information is included with every coding plug (except E36/5 and E36/7) that is ordered from the parts department.

Additional labels can be ordered separately under Part Number 89 89 1 000 500.

ODOMETER NOTICE

ODOMETER HAS BEEN REPAIRED OR
REPLACED AND SET TO ZERO ON:

ADD MILEAGE OF VEHICLE AND DATE WHEN THE CLUSTER WAS REPLACED IN SERVICE WARRANTY INFORMATION BOOKLET

Speedometer (Odometer Memory) changed:

Mileage 14,671

Date 4/5/95

It is the responsibility of the person making this replacement to record this information on the vehicle and in the Owner's Service Warranty Information Booklet.

G03397914

Fig. 60: Identifying Vehicle Mileage And Cluster Replacement Date
 Courtesy of BMW OF NORTH AMERICA, INC.

Strict compliance with this requirement must be followed through with the following vehicles if mileage is reset to 0:

VARIANT CODING

Model: E24, E28, E30, E32, E34, E36

Production: 3/87 - 12/95

VARIANT CODING

A Variant Code is another means by which market specific application data can be released/assigned to a control module, this process allows one base control module to be utilized for different market applications.

The variant code is a 4 digit hexadecimal (alpha-numeric) code that is entered into a control module as part of the coding process. By entering a valid code into the module a set of operational data (characteristic maps) specific to the code entered is assigned to the operating program of that control module. The operational data and code are semi rigidly assigned, meaning that if a new code is entered, a different set of data is assigned to the program.

Variant coding is only used on engine control modules. Engine control modules which utilize variant coding were first introduced into production vehicles as of 3/87 production with Motronic M1.1 (Engine Control Module ECM/DME).

Variant coding is only used on Engine Control Modules with version M1.X.

ENGINE CONTROL MODULE ECM/DME INFORMATION

DME Version	Series	Cyl.	Engine	Year
M1.1	E28/E30	6	M20/M30	3/87 - 8/92
M1.2	E24/E28	6	S38	87 - 88
M1.3	E34	6	M20/M30	6/87 - 9/90

M1.3	E34	6	M30	6/88 - 12/92
M1.3	E32	6	M30	3/87 - 7/92
M1.7	E30/E36	4	M42	3/90 - 12/93
M1.7.2	E36	4	M42	1/94 - 12/95

Using the DISplus/GT1/SSS with the latest CIP programming software contained within Progman, allows the technician to:

- Code a new, uncoded control module.
- Recode a previously coded control module.

The variant code is entered into the control module either by:

- Adopting the existing code from the defective DME control module (if diagnostic communication is possible).
- Manually entering the variant code via the keypad displayed on the screen of the DISplus/GT1/SSS.

Fig. 61: Entering Variant Code Into Control Module
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: M1.X DME control modules can only be coded up to eight (8) times. The GT1/DISplus will display the remaining number of times the control module can be recoded.

If variant coding of an M1.3 control module for an M20 engine is not possible, the cause may be that Pin 18 (DME Code Link) of the 20 pin diagnostic connector may be backed out of the connector preventing communication between the tester and DME control module.

Variant Code Identification Display

The variant code for a DME M1.X control module can be accessed in three ways:

- Electronically via DISplus or GT1:
 - DME Control Module Identification screen
 - Select "Programming" then "DME variant code", installed variant code is displayed.
- DME control module variant code label
- **SI B13 02 90 (3009)**

The quickest and most accurate way to access the variant code of the installed DME is by viewing the DME Identification page using the DISplus or GT1.

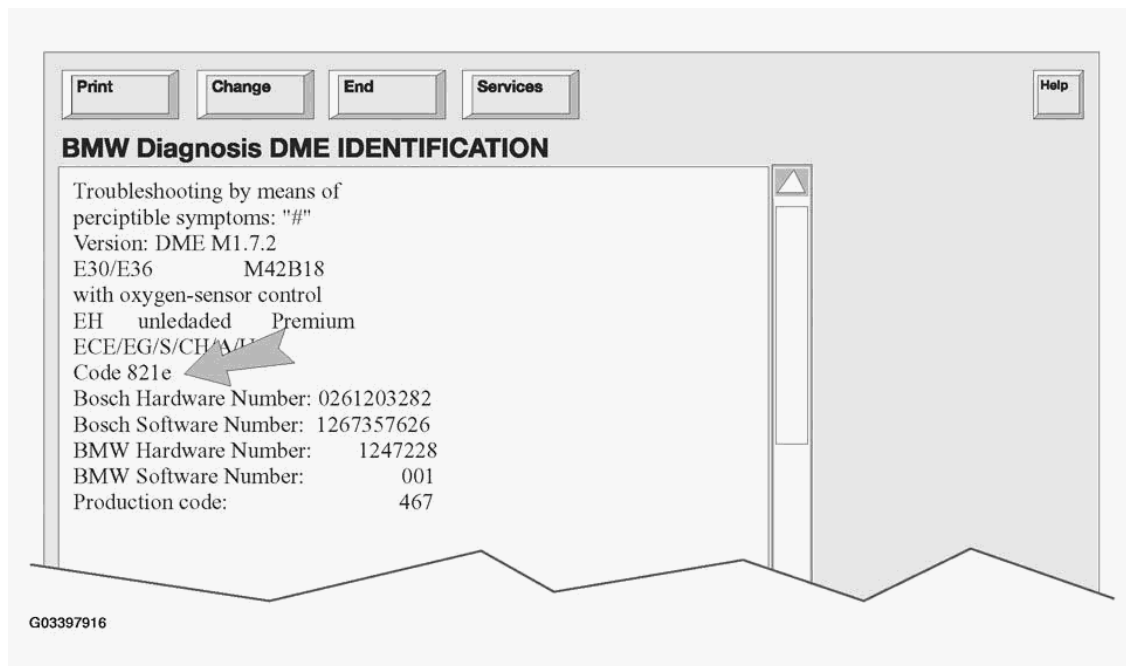

Fig. 62: Identifying DME Identification Page
Courtesy of BMW OF NORTH AMERICA, INC.

If a control module malfunction is suspected cross reference the BMW and Bosch part numbers in the display with the installed variant code. Problems can occur if:

- The correct variant code is installed in the wrong control module.
- An incorrect variant code is installed in the correct control module

Variant Code Structure

The four digit structure of the variant code consists of a 16 bit binary code which converts to a 4 digit hexadecimal code. Each hex character provides information pertaining to specific functions, characteristic maps and vehicle data.

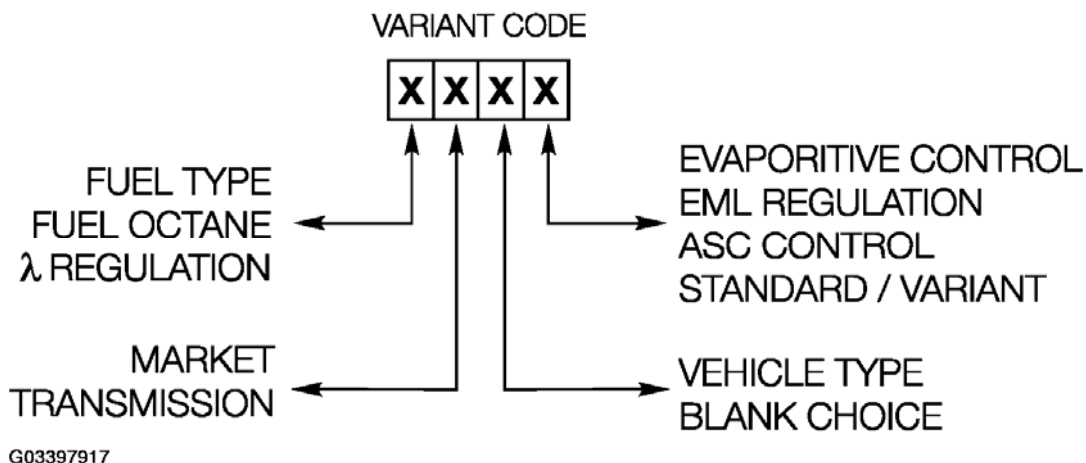

Fig. 63: Identifying Variant Code Structure

Courtesy of BMW OF NORTH AMERICA, INC.

The information from the variant code is used to define the operational data to be assigned to the operating program of the module.

Each hex digit has a binary equivalent that provides four 1's or 0's which results in a total of 16 bits of information (or choices) per hexadecimal digit.

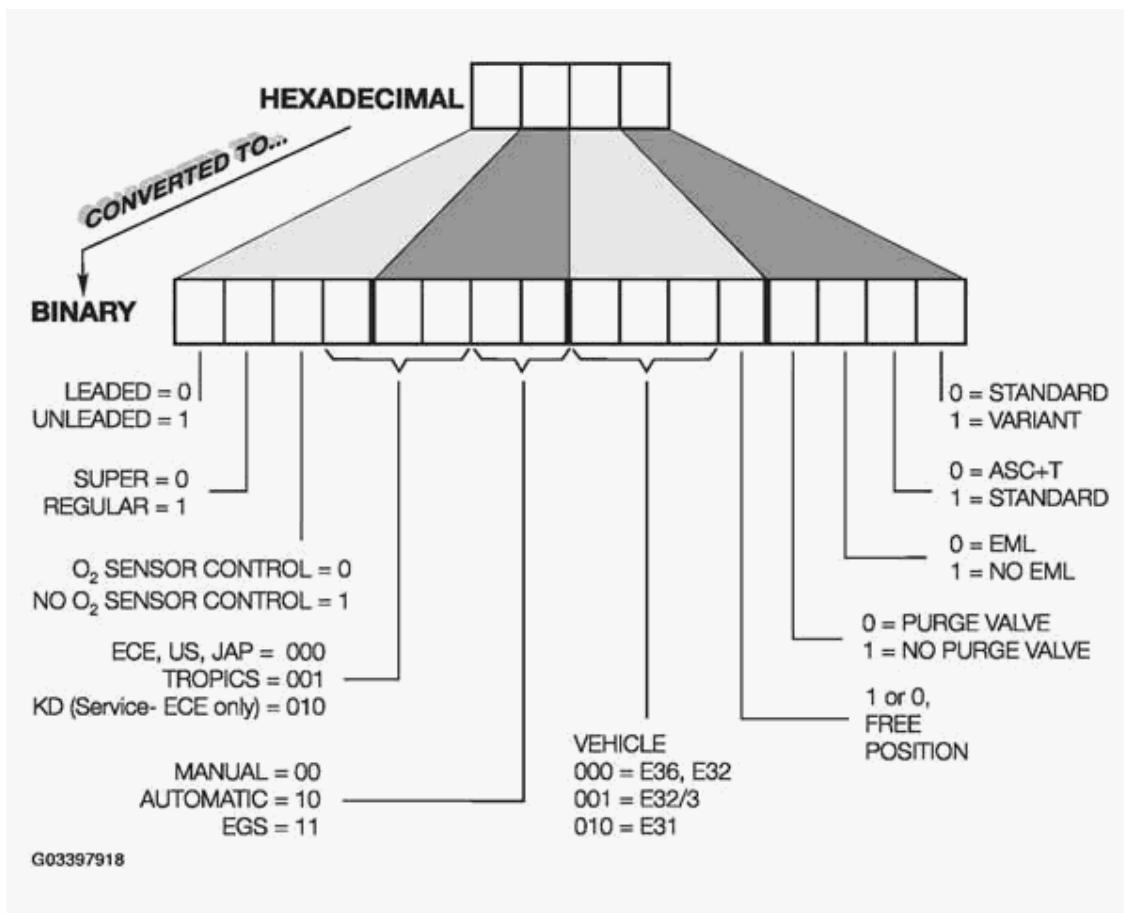

Fig. 64: Identifying Variant Code Information
 Courtesy of BMW OF NORTH AMERICA, INC.

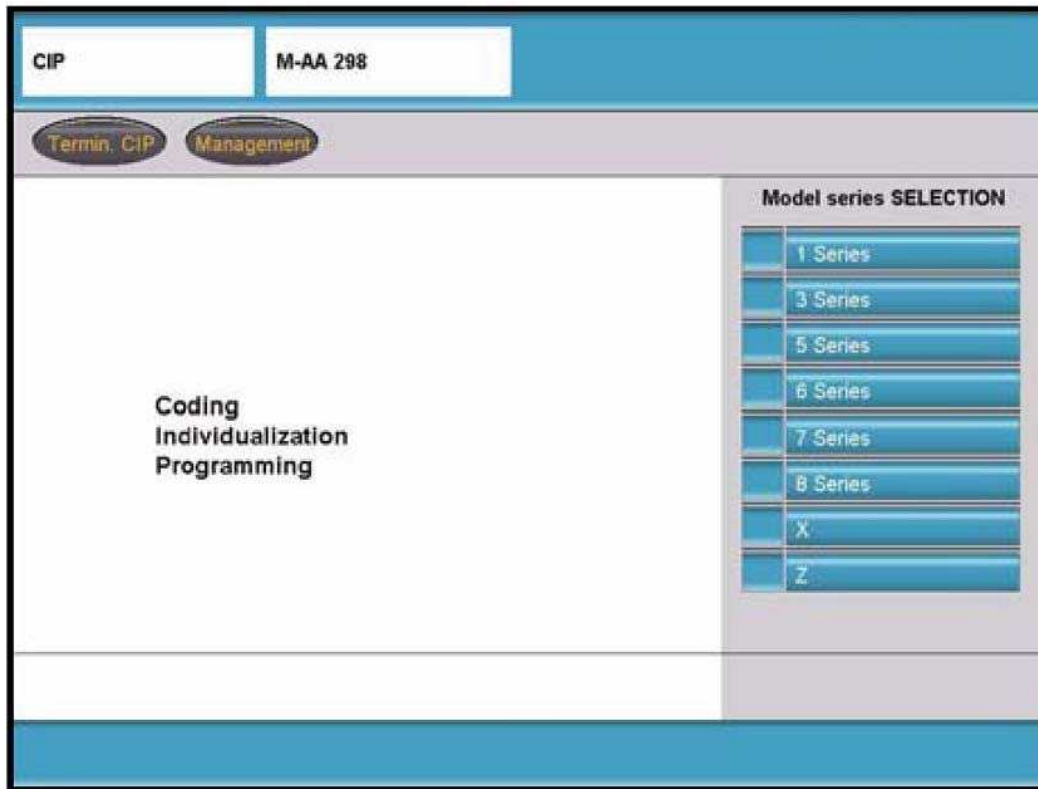

Under no circumstances should the variant code to be changed from the assigned number for the vehicle. Erratic engine operation and possible engine damage may result.

Variant Code Procedure

In the event that an M1.x control module needs to be replaced or recoded the process can be accessed through Progman with CIP 15.0 or higher.

To perform the procedure from CIP the Model series must be selected.

Then select the body (E32, E36 ...)

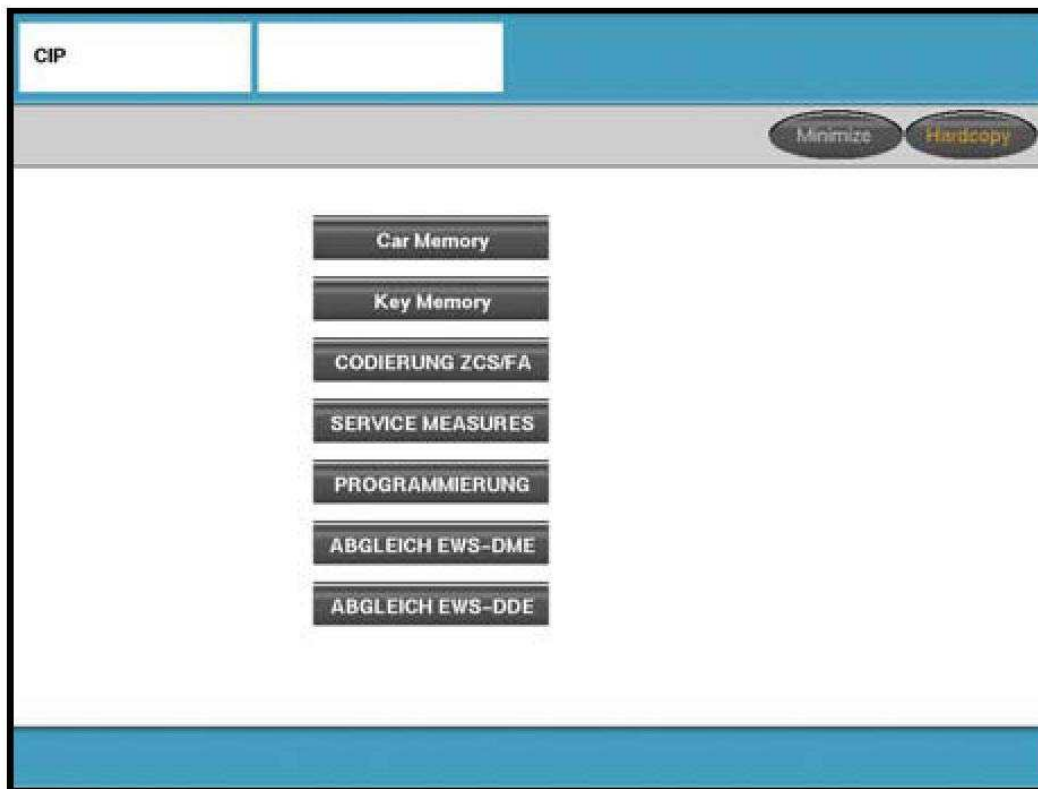

G03397919

Fig. 65: Selecting Model Series Selection Menu
Courtesy of BMW OF NORTH AMERICA, INC.

Select: "**Programmierung**"

Advance screen to the right two times to enter the programming/variant coding selection screen.

G03397920

Fig. 66: Selecting Programmierung
Courtesy of BMW OF NORTH AMERICA, INC.

From the "Selection" screen:

Select: **"DME Variant Code"**

Select: **"Exchange Control Unit"**

Select: The Engine version installed on the connected vehicle to be coded Ex. "M40/42/43"

The following steps are based on the selection of "M40/42/43":

"M40/42/43 4-Cyl. has been selected ? Y/N"

Select: **"Y"**

"Is the vehicle fitted with a DME M1.7.3 (M43 engine from 9/95) ? Y/N"

Select: "N"

Select: **1 "New Coding"**

Select: **1 "Adopt code from old control unit"** and follow the procedure indicated once selection is made.

OR

Select: **2 "Enter code manually"** (See **ENGINE CONTROL MODULE ECM/DME INFORMATION** for Variant Code) and follow the procedure indicated once selection is made.

If DME M1.X control module replacement is required, determine which method of variant coding you will need.

- Adopt variant code from existing control module
- Manual input of variant code from control module label

NOTE: For vehicles produced with the M42B19 engine (M1.7.2 Engine Control Module) a replacement EPROM was made available for vehicles produced 1/94-12/95 to address a service issue. Since the control module for this engine requires a variant code in order to assign the correct operating data to the program a variant code must still be assigned to the module upon installing the EPROM.

Adopt a Variant Code

The preferred method of coding a replacement module is by "Adopting" the code from the old module, since this method prevents accidentally entering the wrong code which may occur when trying to manually enter the code. If the control module cannot communicate on the diagnostic link the manual input method will be necessary (refer to **MANUALLY ENTERING A VARIANT CODE**).

G03397921

Fig. 67: Identifying Variant Code Adopting Chart
 Courtesy of BMW OF NORTH AMERICA, INC.

Manually Entering a Variant Code

The process of manually entering a variant code should only be utilized when it is not possible to communicate

with the Engine Control Module (DME) via the DISplus or GT1. The variant code to be entered can be taken from the label of the problem control module and checked against the listing of variant codes provided in *SI B13 02 90 (3009)* prior to entering the code into the new module.

Fig. 68: Entering Variant Code

Courtesy of BMW OF NORTH AMERICA, INC.

CODING CODE

Model: E32 and E34

Production: 10/90 - 9/91

CODING CODE (CODE NUMBER)

E32 and E34 vehicles produced from 9/90 to 10/91 were not ZCS compatible. For this limited range of production a coding code is required in order to properly code the following control modules:

- IHKR 2 & 3
- EDC III
- DWA

All other replacement control modules (except DME) within this production range are precoded at the factory.

The coding code is a single digit. Like variant coding, the code is entered via the DISplus/GT1/SSS. By entering a valid code into the module a set of operational data specific to the code entered is assigned to the operating program of that control module.

Code Number Identification

Along with the VIN, the Code number for the installed control module(s) is printed on a label, located on the underside of the fuse box cover.

Additional labels are available from the parts department under P/N 01 99 9 784 735

WBAHD23D8MBG11081

CODE IHKR II: 0

CODE EDC III: 2

G03397923

Fig. 69: Identifying Code Identification Number
Courtesy of BMW OF NORTH AMERICA, INC.

Coding Code Procedure

With the original module still installed in the vehicle, select the Coding/Programming function which can be accessed through Progman with CIP 15.0 or higher using the DISplus/GT1 or SSS.

1. From Progman establish a connection to the interface connected to the vehicle and access CIP

To perform the procedure from CIP the Model series must be selected (**3 series, 7 series ...**)

Then select the body (**E32, E36 ...**)

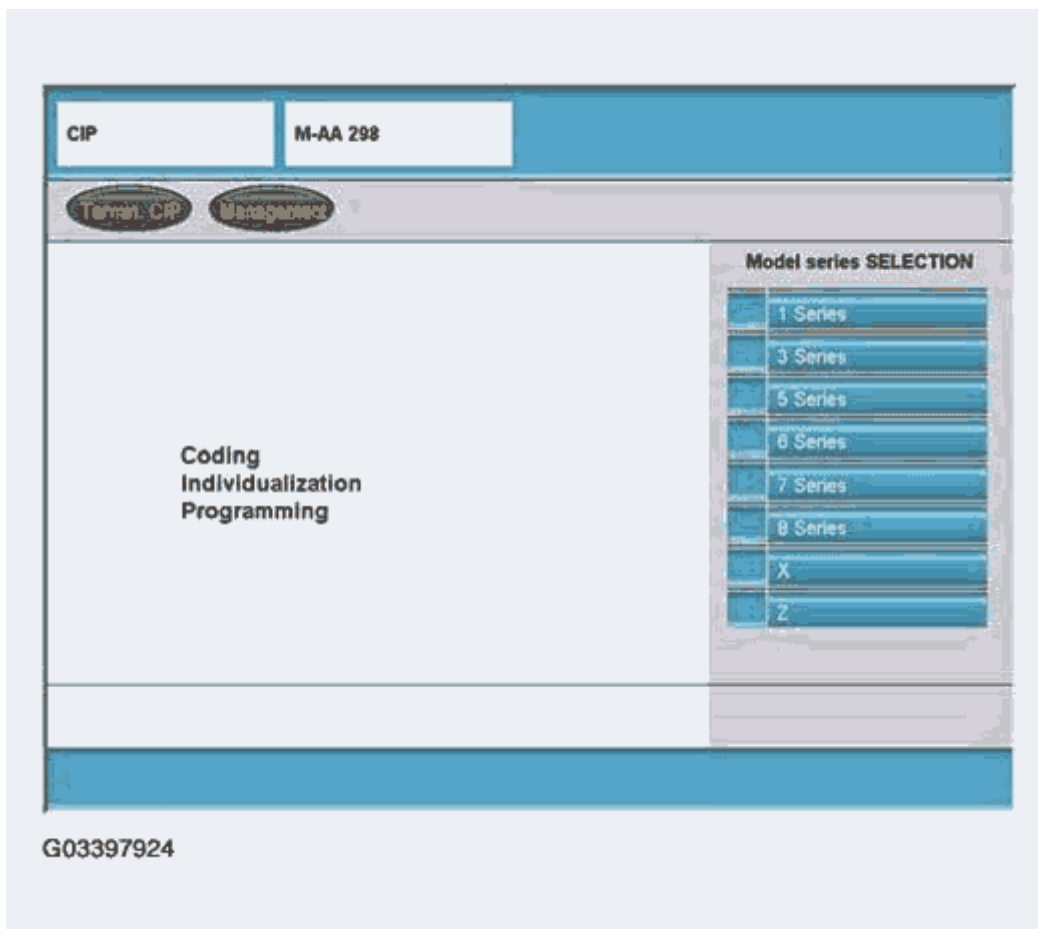

Fig. 70: Selecting Model Series Selection Menu
Courtesy of BMW OF NORTH AMERICA, INC.

2. Select "Codierung ZCS/FA "

(Advance screen to the right two times to enter the selection screen.)

3. Select: Specific model series
4. Select: "**Recoding**" or "**Coding Code**"
5. Select: "**Replacement part**"

Fig. 71: Selecting Codierung ZCS/FA
Courtesy of BMW OF NORTH AMERICA, INC.

6. Select: Specific system/module to be coded
7. Turn off ignition and remove the old module, install new module and turn ignition on.
8. Advance the screen and enter "0" plus the number located on the label of the module
9. Confirm entry
10. 10. If the displayed number is correct confirm and coding will begin A message "Coding Complete" will be displayed when finished coding.

Ordering Pre-Coded Modules

Pre-coded control modules are available from the parts department and requires the following information:

- Part number "Basic Control Module"
- VIN of vehicle for which it is needed
- The "Code Number" indicated on the module

Workshop Exercise

Access the initial start screen in CIP for performing the Coding Code procedure.

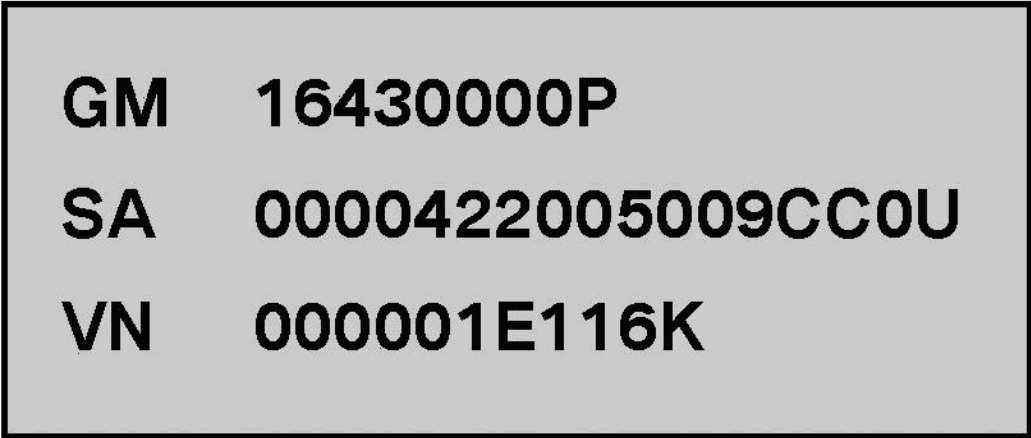

VEHICLE CODING INFORMATION

Model: All

VEHICLE CODING INFORMATION

Introduction

As part of an ongoing process to reduce the need for country, model and option specific control modules, BMW began to utilize a multi digit vehicle coding structure referred to as a Central Coding Key (ZCS) and later changed to a structure referred to as a Vehicle Order (VO/FA).

GM	16430000P
SA	0000422005009CC0U
VN	000001E116K

G03397926

Fig. 72: Identifying Vehicle Coding Information Number
Courtesy of BMW OF NORTH AMERICA, INC.

The Central Coding Key (ZCS) is a unique 37 digit (originally a 48 digit) code that contains specific model, country variation and individual equipment/option information for a vehicle.

During the manufacturing process of a vehicle, the ZCS code is created to identify the specific vehicle being built and to properly code the control modules installed during the assembly process once the vehicle reaches the end of the line. To ensure that the ZCS code can be retrieved once the vehicle leaves the factory it is stored in one or two control modules, depending on the model.

ZCS is often referred to as a "key" since it is able to automatically "unlock" or "activate" specific functions of a

new control module or can be used to recode a used control module to be compatible with the specific vehicle it has been installed into. With the introduction of the E31 the ZCS information was used for the first time as a coding key for replacement vehicle control modules, this ensured that the replacement modules would be coded to the required specification of the vehicle.

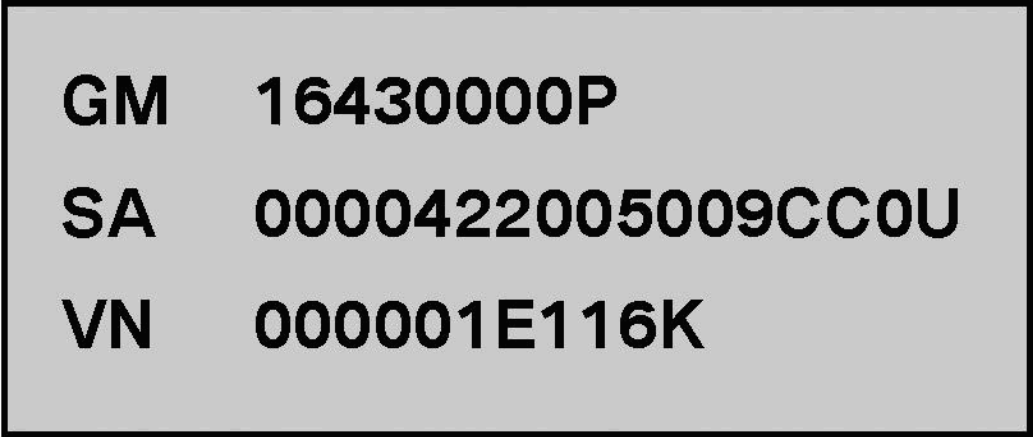

As the number of options & accessories available for installation in a vehicle increased, an alternative to the ZCS code was introduced on 9/01 production E46 vehicles. The ZCS system was replaced with a system known as the Vehicle Order (VO/FA). The VO is a straight forward listing of vehicle specific information including a list of the option codes pertaining to the systems or equipment installed in the vehicle and is used in the same manner as the ZCS to properly code replacement or additional modules.

Regardless of which structure is utilized on a vehicle, codeable modules have no limit as to the number of times that they can be recoded.

ZCS STRUCTURE

The 37 digit structure of the ZCS is subdivided into three segments. The segments represent specific information about the vehicle.

Each segment ends with a checksum "digit". A checksum is utilized by the coding software to detect unacceptable/erroneous manually entered coding information.

GM	16430000P
SA	0000422005009CC0U
VN	000001E116K

G03397927

Fig. 73: Identifying ZCS Structure

Courtesy of BMW OF NORTH AMERICA, INC.

The information/digits of the ZCS code reflects the options installed in the vehicle and should never be changed manually unless it is necessary for special recoding functions such as:

- Canadian market vehicle being moved to the US
- Retrofit installation of an accessory system (ie. CPT9000 phone system or BMW ULF system)

If a modification needs to be made to the ZCS structure and there is no information available in a service bulletin then the BMW Technical Hotline should be contacted for assistance by submitting a PUMA case, requesting a modified ZCS code.

Each portion of the ZCS provides specific information regarding that vehicle:

GM (Grundmerkmale) - Identifies the "Basic Features" of the vehicle and contains 9 digits that are used to describe:

- Vehicle type (E36, E38, E39 ...)
- Specific body style of the vehicle (Sedan, Coupe ...)
- Country specific coding identification (US, UK, ECE ...)
- Unique equipment that affects the basics of the vehicle (with sunroof, without sunroof, wheel size ...)
- Basic language variant (English, Spanish, German ...)

SA (Sonderausstattungs) - Identifies the "Special Equipment" of the vehicle and contains 17 digits that describe what features/functions are installed in the vehicle, such as:

- Power Windows or Manual windows
- Power Door Locks or Manual Door Locks
- Power Sunroof or Manual Sunroof
- Power Convertible Top or Manual Convertible Top
- Phone Pre-wire

The SA segment is configured to provide a total of 64 possible number combinations (option groups) for all series vehicles worldwide. The information is modified whenever a new component/accessory is added to the vehicle via a retrofit coding procedure.

VN (Versionsnummer) - Identifies the "Version Number" of the vehicle and contains 11 digits that are used to describe:

- Series specific coding data that are not reflected in the GM or SA segments. This includes, model year dependent data, software and hardware versions of the control modules installed, coding instructions, etc.

The VN is displayed as 40 possible combinations of digits. A deliberate change in the VN will result in erroneous coding data being used when recoding a module or coding a replacement module which will affect the proper operation of a control module(s) coded with an incorrect VN.

NOTE: In its original form the ZCS was displayed as a 48 digit code containing a fourth segment, the AM (Antriebsmanagement) which identified Powertrain management information specific to the vehicle, however this information was

eliminated and was not needed for coding a control module.

FOUR DIGIT PORTION REPRESENTS VEHICLE BODY AND SPECIFIC BODY EQUIPMENT (COUPE, SEDAN, ROADSTER, SUNROOF, ETC,)

There are 4096 possible combinations of digits per model.

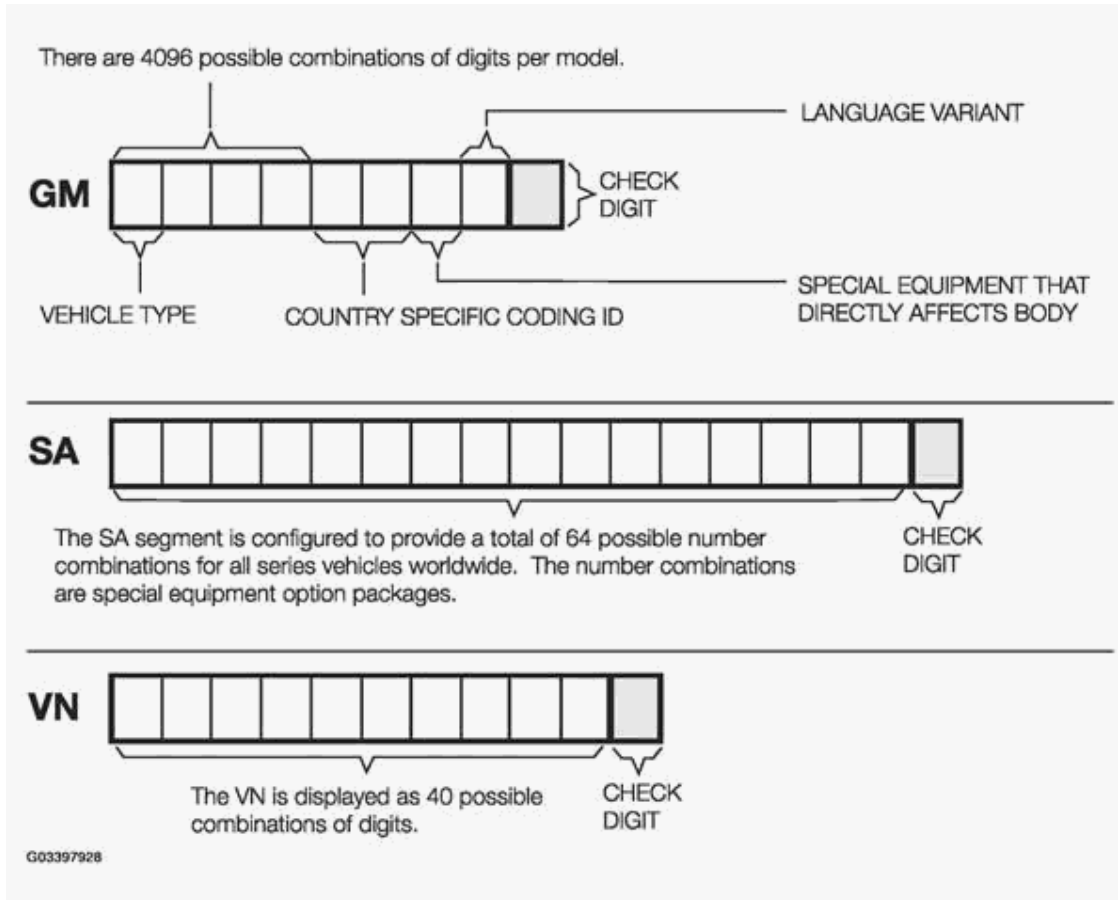

Fig. 74: Identifying ZCS Structure Information Chart
 Courtesy of BMW OF NORTH AMERICA, INC.

ZCS Stored Location In Vehicle

The ZCS is stored in the vehicle to simplify the coding procedures when a module needs to be recoded or a replacement module needs to be coded. Depending on the vehicle, the ZCS information is stored in the following locations:

ZCS STORED LOCATION IN VEHICLE

Vehicle	Model	Module	Vehicle	Model	Module
E31	All	EKM	E39	All	Instrument Cluster/EWS
E32	All	Instrument	E38	All	Instrument

		Cluster			Cluster/EWS
E34	All	Instrument Cluster	E46 ⁽¹⁾	All	Instrument Cluster/LSZ
E36	318i/is 325i/is M3	Instrument Cluster	E52	All	Instrument Cluster/LSZ
E36	318ti Z3	EWS II As of 9/98: Instrument Cluster/EWS	E53	All	Instrument Cluster/LSZ

(1) The E46 switched to a Vehicle Order (VO) data structure in 9/01.

The procedure to code control modules that utilize the ZCS information can be performed via the DISplus/GT1 or SSS using Progman with CIP 15.0 or higher and accessing the "Codierung ZCS/FA" function.

When coding a ZCS codable control module the coding program in CIP automatically searches the stored location, based on the VIN, and codes the selected module according to the information provided in the ZCS code.

On later production vehicles the ZCS information began to be stored in two locations, referred to as redundant data storages, this insures that the information is always available in the event the primary device storing the data fails.

NOTE: On early production vehicles without redundant data storage, if the module being coded or recoded is the module that stores the ZCS information, then the vehicles ZCS information must be obtained from the label located on the vehicle or electronically accessed from the module and printed out then entered manually via the input screen on DISplus/GT1 or SSS.

For vehicles with redundant data storage the coding of the module storing the data is performed automatically using the information stored in the "back up" module.

ZCS Identification/Display

The ZCS information for a specific vehicle can be obtained by:

- Accessing the control module(s) that electronically stores the information, using the DISplus/GT1 or SSS
- Locating the ZCS label affixed in the vehicle

Accessing Stored ZCS Information

From Progman establish a connection to the interface connected to the vehicle and access CIP.

To perform the procedure from CIP the Model series must be selected (**3 series, 7 series ...**).

Then select the body (**E32, E36 ...**).

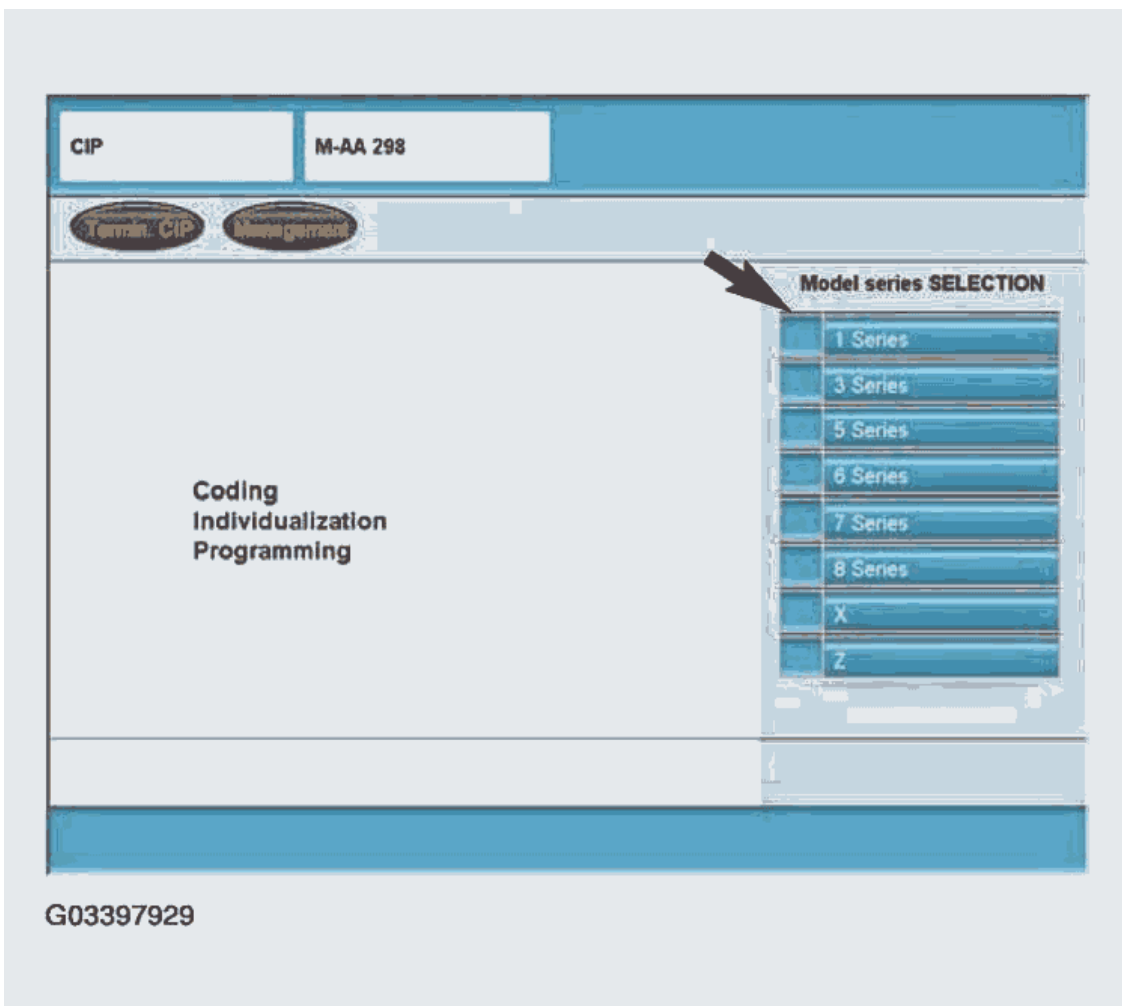

Fig. 75: Selecting Model Series Selection Menu
Courtesy of BMW OF NORTH AMERICA, INC.

Select "**Codierung ZCS/FA**".

Then advance screen to the right two times to enter the vehicle series selection screen.

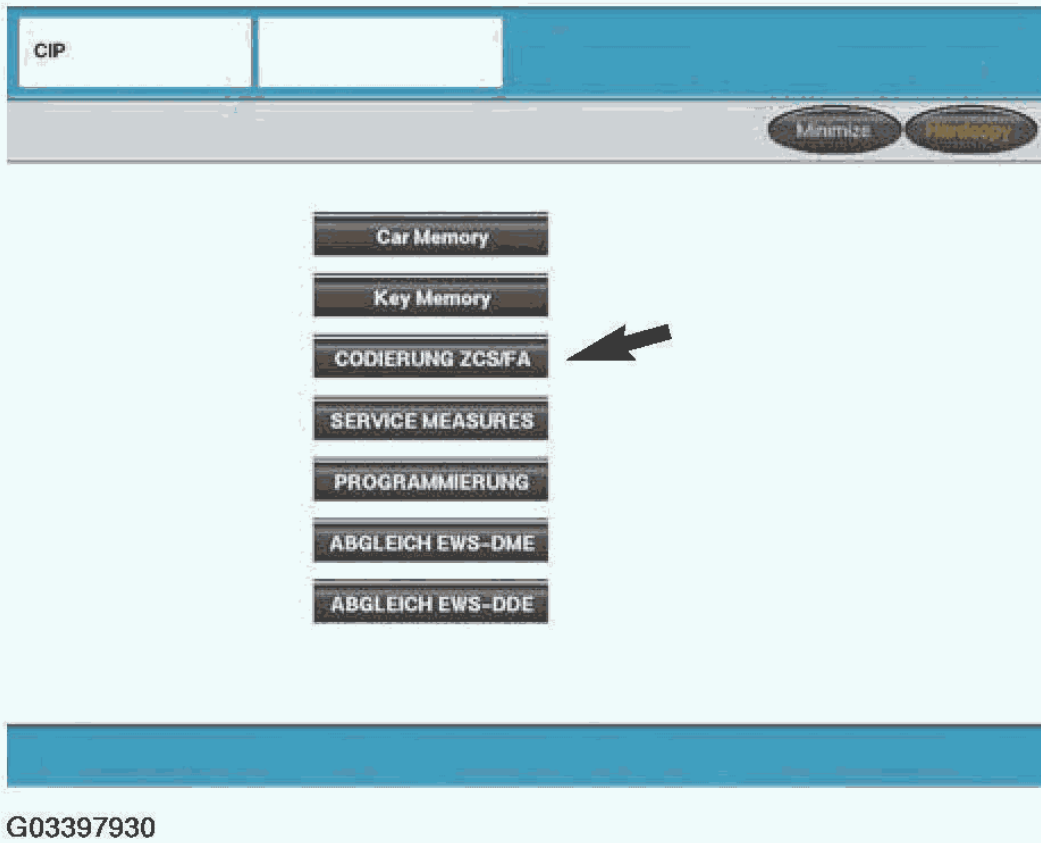

Fig. 76: Selecting Codierung ZCS/FA
Courtesy of BMW OF NORTH AMERICA, INC.

Example:

Select vehicle series (i.e "E36 Series").

ZCS Information for vehicle is displayed along with the stored location.

G03397933

Fig. 79: Display ZCS Information For Vehicle Along With Stored Location
Courtesy of BMW OF NORTH AMERICA, INC.

Accessing ZCS Information Label

On earlier production vehicles the ZCS label is affixed to the vehicle in a specific location depending on the model:

- E36 - Under rear seat; center area or next to left sending unit of fuel tank.
- Z3 Roadster - In Trunk; under carpet on floor, forward of tool kit.
- E31/32/34 - In fuse box cover
- E38 - In E-Box cover

VN 00000002A9 8

G03397934

Fig. 80: Identifying Accessing ZCS Information Label

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: As of 9/98 production the ZCS label was eliminated from the vehicle. Some older vehicles will have identification labels containing an AM segment, this information is not needed for coding or recoding a control module on that vehicle.

ZCS Codable Control Modules

Control modules located in a vehicle that are ZCS codable are listed/identified by the "Codierung ZCS/FA" function contained in CIP.

A list of the modules specific to the model can be accessed as follows:

From Progman establish a connection to the interface connected to the vehicle and access CIP.

To perform the procedure from CIP the Model series must be selected (**3 series, 7 series ...**).

Then select the body (E32, E36 ...).

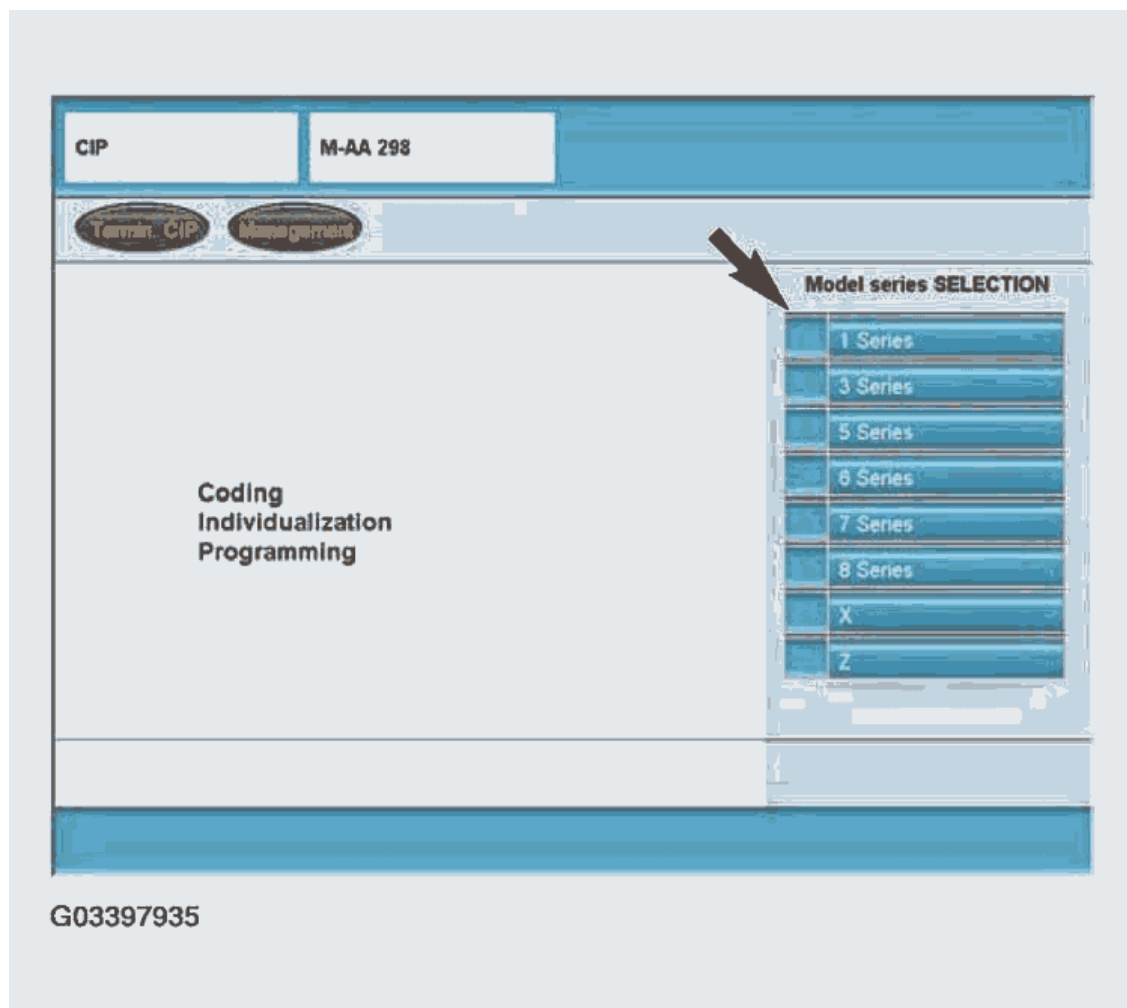

Fig. 81: Selecting Model Series Selection Menu
Courtesy of BMW OF NORTH AMERICA, INC.

Select "CodierungZCS/FA".

Then advance screen to the right two times to enter the vehicle series selection screen.

Fig. 82: Selecting CodierungZCS/FA

 Courtesy of BMW OF NORTH AMERICA, INC.

Workshop Exercise

Access the ZCS coding information on an E36, E39, E46 or E53. and identify where the information is stored.

Determine which modules in an E36, E39, E46 or E53 are codable.

VEHICLE ORDER

In 9/01 the ZCS vehicle data structure on the E46 was replaced with what is referred to as the Vehicle Order (VO) or Fahrzeugauftrag (FA). The vehicle order structure is utilized on all new models introduced/produced as of 9/01, such as E65/66, E60, E63/64, E83, E85 etc. Models such as E36, E39, E52, and E53 produced after 9/01 continued to be manufactured using the ZCS structure until production of the model is complete.

Vehicle Order for E46 as of 9/01 Production:

Vehicle identification number: KW17732	E-Wort:	521,522,534,550,639, 645,650,661,674,692, 818,823,832,845,853, 876,925,926,992,302,
Vehicle order:	HO-Wort: 633L,	Vehicle order and vehicle identification number are stored in KOMBI
Model series: E46		
Type des. code: EV33		
Time criterion: 0904	SA:	
Paint code: 0A08	1CA,205,210,240,249,	
Upholstery code: N6SW	279,354,403,411,431,	
Assbly. no.:	438,441,459,465,473, 488,494,495,502,520,

+O112

Vehicle data status: E060-04-09-504

Target data status: E060-04-09-504

G03397941

Fig. 87: Vehicle Order Chart (For New Models As Of 9/01 Introduction)
Courtesy of BMW OF NORTH AMERICA, INC.

The vehicle order format contains information pertaining to the production of a specific vehicle such as:

Series Type - (E46, E65, E60, etc.)

Time Criterion - Identifies date the options/hardware equipment available for installation into the vehicle was standardized/"locked". This information does not refer to the production date of the vehicle. A problem with coding or programming may occur if a module or option based on a newer or older time criterion date is installed into the vehicle.

Model Code (Basic Type) - Base level from which the vehicle is "created/built".

Paint Code - Identifies the color of the vehicle at time of production.

Upholstery Code - Identifies the type of upholstery installed in the vehicle at time of production.

Assembly Number - Identifies the programmed part number for powertrain (Not used)

E-Wort - Identifies additions/options added to the vehicle that are not part of standard SA codes/options

HO-Wort - Identifies options installed at Center/Dealer using 3 digit option code (Currently not used).

Installed Option/SA Codes - Listing of accessories & equipment options installed in the vehicle.

The information contained in the vehicle order is used to identify the module(s)/system(s) that are/should be installed in the vehicle and also what if any control modules need to be updated if a new system/option is added or removed to/from the vehicle to ensure proper compatibility with the devices installed in the vehicle. The information contained in the vehicle order such as installed options, is modified whenever a new component (module/system) is installed and coded to the vehicle. If the new component is not properly coded to the vehicle the SA listing is not updated and problems can be encountered whenever a measures plan for the vehicle is created, vehicle needs to be recoded or VKM/Individualization functions are to be modified.

A listing of the components that need to be updated is provided whenever a measures plan is generated.

Example: Information contained in the VO of an E60

Select measures plan.

Date / time: 10.11.2004 / 13:31

Model series: E60

Vehicle ID number: WBANA53584B848013

Vehicle order: E60_#1203*NA53%0475&LCBA\$1CA\$205\$248\$2RA
\$302\$319\$354\$403\$415\$416\$430\$431\$438\$441
\$442\$459\$465\$473\$488\$494\$502\$534\$540\$563
\$605\$609\$620\$639\$645\$676\$694\$697\$785\$818
\$823\$850\$853\$876\$8SP\$925\$992-B110+K639+O111
+O112

Vehicle data status: E060-04-09-504

Target data status: E060-04-09-504

G03397942

Fig. 88: Identifying Select Measures Plan

Courtesy of BMW OF NORTH AMERICA, INC.

Series Type: E60

Time Criterion: Identified as 1203 indicates the date (month/year) that the list of available options/hardware available for installation into the vehicle was standardized/"locked". Although the vehicle referenced was produced in 6/04 the time criterion of 1203 is still valid and indicates that no changes were made to the available option packages/hardware available for installation into that specific model since 1203.

Model Code: Identified as NA53 indicates the vehicle and engine type plus provides information pertaining to the country the vehicle was built for (i.e. LH or RH drive). If an automatic transmission is installed it will be considered an NA63, however the model code contained in the VO will always reflect the base level which is a manual transmission vehicle.

Paint Code: Identified as 0475 indicates the color of the vehicle at time of production.

Upholstery Code: Identified as LCBA indicates the type of upholstery installed in the vehicle at time of production.

Installed Option/SA Codes: Listing of accessories & equipment options installed in the vehicle ICA - Selection COP relevant vehicles

205 -Automatic transmission

248 - Steering Wheel Heating

EPROMS & EEPROMS

Model: E31/32/34/36/38/39

Production: All

INTRODUCTION

Early Engine and Transmission Control Modules used EPROMs (Electrically Programmable Read Only Memory device) to store operational programs and operating data specific for the application that they were used for. Since the operating program and associated data is installed at the factory during the vehicle assembly process updates could not be provided for vehicles once they were programmed and left the factory floor. In order to install a new or updated program (DME or TCM) the module needed to be replaced. Eventually it became possible to replace EPROMs and/or update them which dramatically reduced the cost of updating a module and a vehicle.

ENGINE CONTROL MODULE EPROM PROGRAMMING

With the introduction of M3.X & DME/ECM control modules it was no longer necessary to replace the entire control module in order to install updated engine operating programs and/or data.

ENGINE CONTROL MODULE EPROM PROGRAMMING DATA

M3.X	DME/ECM Version	Vehicle Application
	M3.1	E36 - 325i/is (up to 8/92)
		E34 - 525i (up to 8/92)
	M3.3	E31 - 840Ci (9/93 - 12/95)
		E32 - 740i/iL (9/92 - 8/94)
		E34 - 530i/it & 540i (3/93 - 12/95)
		E38 - 740i/iL (9/94 - 12/95)
	M3.3.1	E36 - 325i/is & M3 (as of 9/92)
		E34 - 525i/it (as of 9/92)

M3.x engine control modules allow EPROMs:

- To be removed & replaced
- Programmed or updated depending on control module version

M3.1 Engine Control Modules

Beginning with M3.1 DME/ECM control modules, BMW introduced the ability to program an EPROM using BMW diagnostic equipment. On the M3.1 control module the originally installed EPROM needs to be removed from the control module and a new partially blank EPROM installed in order to update the existing control module.

For the M3.1 systems the replacement EPROM that is installed does not contain all the data necessary for the engine to operate, it is a "basic" EPROM that only contains some basic data referred to as "resident data" which helps identify the module and allows the diagnostic equipment to determine what program and associated data needs to be installed/loaded.

RESIDENT
DATA

G03397943

Fig. 89: Identifying EPROM Replacement Information (Basic State)
Courtesy of BMW OF NORTH AMERICA, INC.

RESIDENT
DATA & ALL REQUIRED PROGRAMS

G03397944

Fig. 90: Identifying EPROM Replacement Information (Programmed)
Courtesy of BMW OF NORTH AMERICA, INC.

M3.3 & M3.3.1 Engine Control Modules

As later versions of engine control modules (M3.3 & M3.3.1) were introduced it was not always necessary to replace the EPROM in order to perform an update to the module. The EPROMs installed on the newer systems are larger and allow additional information to be loaded without having to install a new EPROM. In the event that the size of the update exceeds the space available on the installed EPROM or an update was previously performed, then the installed EPROM will need to be replaced.

THE UPDATE CANCELS THE OLD FUNCTIONS CHARACTERISTICS AND ADDS THE UPDATED FUNCTION TO THE EPROM

G03397945

Fig. 91: Identifying EPROM Before Update

Courtesy of BMW OF NORTH AMERICA, INC.

G03397946

Fig. 92: Identifying EPROM After Update
Courtesy of BMW OF NORTH AMERICA, INC.

For the M3.3 & M3.3.1 systems the replacement EPROM that is installed does not contain all the data necessary for the engine to operate, it is a "basic" EPROM that only contains some basic data referred to as "resident data" which helps identify the module and allows the diagnostic equipment to determine what program and associated data needs to be installed/loaded.

ENGINE CONTROL MODULES FLASH (EEPROM) PROGRAMMING

At the end of 1995 new variations of DME/ECM control modules were introduced that no longer contained a removable EPROM but instead contained a soldered in EEPROM. An EEPROM is an Electrically Erasable Programmable Read Only Memory device, which means that programs & data stored on the chip can be electrically erased and replaced with new/revised programs or data. In order to erase the data on the chip a short duration low level voltage/charge is applied to a pin on the EEPROM and the stored data is erased, hence the name "Flash". Once the data is erased new data is loaded.

By using a newer technology, these control modules have the ability to be updated a total of 13 times before they need to be replaced.

Theoretically an EEPROM can be erased and reprogrammed more than 13 times, BMW set the number to 13, since a point will be reached where the update being installed may no longer be compatible with the hardware of the installed module which could result in erroneous operation. If the program is not compatible with the hardware version of the module, the program used to determine the correct update for the module will indicate that the module will need to be replaced before the update can be performed.

The reference to Flash programming is a result of the technology used to erase the EEPROM prior to installing a new program and or data.

The control modules listed identify when EEPROMs were first introduced into the DME/ECM:

CONTROL MODULES INFORMATION DATA (DME/ECM)

DME/ECM Version	ENGINE	Vehicle Application
M5.2	M44	E36 - 318i/iA (as of 12/95) E36 - Z3 (as of 1/96)
	M62	E39 - 540i/iA (as 3/96) E38 - 740iLA (as of 12/95) E31 - 840iCA (as of 1/96)
MS41.1	M52	E36 - 328i/iA (as of 10/95) E39 - 528i/iA (as of 2/96)
MS 41.2	S52	E36 - M3 (as of 1/96)

The utilization of EEPROMs within the Engine Management Systems continues to be used today, and has expanded into other control modules as well.

TRANSMISSION EPROMS

Beginning with vehicles produced in the early 1990's the Transmission EPROM can be replaced on some vehicles in order to address customer complaints that would normally be addressed by having to replace the Transmission Control Module (TCM). Service EPROMs are available for the following systems:

TRANSMISSION CONTROL MODULE (TCM) INFORMATION DATA

TCM Version	Engine	Application
EGS 1.27	M70B50	E31 - 850iA (1/90 - 9/91)
EGS 1.29	M70B50	E31 - 850iA (9/91 - 12/91)
EGS 4.16	M42B18	E36 - 318iA/isA/iCA/itA (12/92 - 12/95)
	M50B25	E36 - 325iA/iSA/iCA (10/91 - 9/95)
		E34 - 525iTA/iA (9/90 - 12/95)
EGS 7.30	M60B30	E34 - 530iA (3/93 - 8/93)
AGS 7.32	M60B30	E34 - 530iA (9/93 - 6/95)
EGS 9.20	M60B40	E34 - 540iA (3/93 - 8/93)
		E32 - 740iA/iLA (9/92 - 9/94)
		E31 - 840CiA (9/93 - 9/94)
AGS 9.22	M60B40	E34 - 540iA (9/93 - 5/96)
		E38 - 740iA/iLA (9/94 - 5/95)
		E38 - 750iLA (1/95 - 6/95)

TRANSMISSION CONTROL MODULE FLASH (EEPROM) PROGRAMMING

The introduction of newer generation Transmission Control Modules introduced with the M44, M52 and M62 engines at the end of 1995, brought with it the ability to "flash" program this module as well. By being able to electrically erase and install a new program and or data stored on the EEPROM, it no longer becomes necessary to replace the chip to get an updated transmission program installed.

The technology used on the Transmission Control module is the same as explained in the section "**ENGINE CONTROL MODULES FLASH (EEPROM) PROGRAMMING**".

WHEN IS EPROM REPLACEMENT AND/OR PROGRAMMING NECESSARY?

The program and or data of an engine or transmission control module only needs to be updated or replaced if:

- The control module is replaced with a non programmed/basic module.
- A Service Action, Recall or customer concerns have resulted in the release of a new/updated program or revised operational data.

The programming procedure of the diagnostic equipment will identify if:

- a DME EPROM needs to be replaced or can be updated
- a control module (DME or Transmission) can still be programmed or needs to be replaced if the reprogramming limit of 13 times has been reached

How A Replacement EPROM Or Control Module Is Determined

DME/ECM EPROM

As mentioned previously on the M3.1 Engine Control Modules the EPROM needs to be replaced whenever an update is to be performed. On M3.3 and M3.3.1 Control Modules the EPROM's for these modules generally have enough additional space to add/load one update. However, if the update that needs to be installed is too large, then the installed EPROM needs to be removed and a Basic EPROM reinstalled. The diagnostic equipment (DISplus, GT1 or SSS) contains a program within CIP that will determine the part number of the replacement EPROM or control module that needs to be installed.

For some control module variations there is more than one replacement EPROM available.

Example: An M3.1 DME has three different hardware versions:

Bosch Hardware Number 0 261 200 402

Bosch Hardware Number 0 261 200 403

Bosch Hardware Number 0 261 200 405

This requires three different replacement EPROM's, however one EPROM is not necessarily specific to one hardware version.

TCM

Regarding the replacement EPROM for Transmission Control Modules there are specific Service Bulletins which identify various situations that can be addressed by replacing the EPROM in the control module. The replacement transmission EPROM does not require any type of programming after being installed, as it already contains all the program and operational data.

If an early version Transmission Control Module, for vehicles prior to 1996 model year, is replaced it generally also does not need to have the EPROM replaced as the required program is already installed.

Programming Procedure

Within CIP is a procedure that requires the selection of the model/series whenever a/an:

- EPROM needs to be updated/replaced
- EEPROM needs to be updated
- Control module needs to be replaced

Then select "Programming" - "DME Programming" or "EGS Programming" and follow the steps given in the respective SIB.

Workshop Exercise - SIB Look-up

Detailed information pertaining to updates and replacements is provided in:

SI B12 08 95(4274) - DME EPROM replacement

SI B12 08 94(4117) - M50 DME EPROM Update

SI B12 07 94(4116) - M50 DME Programming Update,

SI B12 09 94(4132) - M60 DME EPROM Update

SI B 12 07 95(4273) - M60 DME EPROM Needs Replacement

SI B12 05 96 - Programming Flash Control Modules (DME)

SI B2404 96 - EPROM Replacement Application Chart

SI B24 05 95 - EGS/AGS EPROM Replacement

Plus additional situation/complaint specific Service Bulletins available on the TIS website.

Determination Process for DME EPROM

In the event a DME EPROM, a control module or the program of a control module needs to be updated or replaced the program contained within CIP will provide the information necessary to perform the specific task. A program within CIP is used to determine the correct replacement part numbers (EPROM, Control Module or software update) to be installed.

For earlier production vehicles there are two ways to perform this process:

- "automatic" determination

or

- "manual" determination.

The automatic determination is the preferred method as it is faster and mistakes made during data entry into the tester are avoided. For newer production vehicles that utilize EEPROMs/Flash programming the determination process is done automatically as part of determining a measures plan (refer to **CIP** section or more information).

Automatic Determination

In order to determine which EPROM needs to be installed there is a special procedure that is executed as part of the "Exchange EPROM" process. The procedure will "automatically" determine the correct replacement EPROM or control module part number, based on the "Basic part number" and "Programmed part number" stored on the installed EPROM, if the EPROM is not damaged.

The procedure is run automatically if "YES" is selected for the answer to the question Is old EPROM still installed.

During the automatic determination process the tester compares the part numbers stored in the EPROM of the

currently installed DME control module with a list of possible replacement part numbers contained in the program of the tester.

The comparison is done to determine if the tester can "recommend" a replacement EPROM or control module part number.

Manual Determination

If the EPROM is damaged then the "Basic part number" and "Programmed part number" indicated on the label of the control module that is located on the cover of the module must be entered "manually" via the touch screen on the tester so that the replacement part numbers can be determined.

This procedure is followed if "NO" is selected for the answer to the question "Is old EPROM still installed?"

During a manual determination you will need to:

- Enter the part number for a basic (programmable) control module.
- Enter the VIN number of the vehicle.
- Enter the part number of a programmed control module

Once the correct numbers are entered, the tester searches a "master list" for the proper replacement part number and will display either that part number or the message "no substitute found."

Regardless of which process is used if the replacement part does not match the part number displayed and "expected" by the program on the tester, programming will not occur. You need to obtain the proper replacement part.

At no time during the determination or programming process should you turn off the ignition, disconnect the control module or tester/interface.

Once the EPROM is programmed by way of the "Automatic" or "Manual" determination process it contains the operating program for the engine and the associated operational data or characteristic maps. In the event a basic replacement control module is installed, the EPROM installed in the control module will be programmed in the same manner.

NOTE: The EPROM in a basic replacement module does not need to be replaced since it only contains the "resident data" and nothing else.

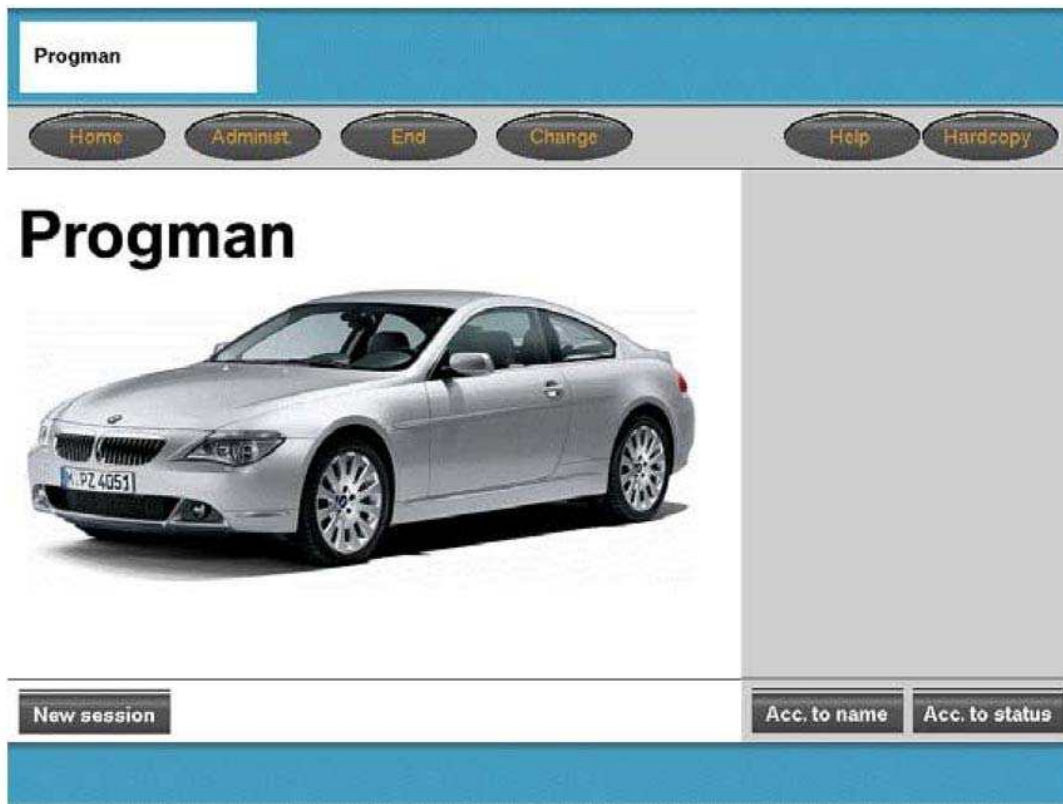

PROGMAN

Model: All

Production: All

PROGMAN INTRODUCTION

With the release of CIP 15.0, BMW released a new software program known as Progman.

G03397947

Fig. 93: Identifying New Software Program Known As Progman
Courtesy of BMW OF NORTH AMERICA, INC.

Progman is a software package that operates with Windows XP Embedded to manage:

- Administration & assignment of OPPS/OPS/Diagnostic heads plus network configuration/addressing.
- Installation/loading of new data updates via Jetstream.
- Activation of a Coding, Individualization or Programming request from a GT1 to an SSS via a multiconsole/multisession feature.
- Coding, Individualization or Programming of older vehicles via the SGC/UNIX application.
- Coding, Individualization & Programming functions of CIP.

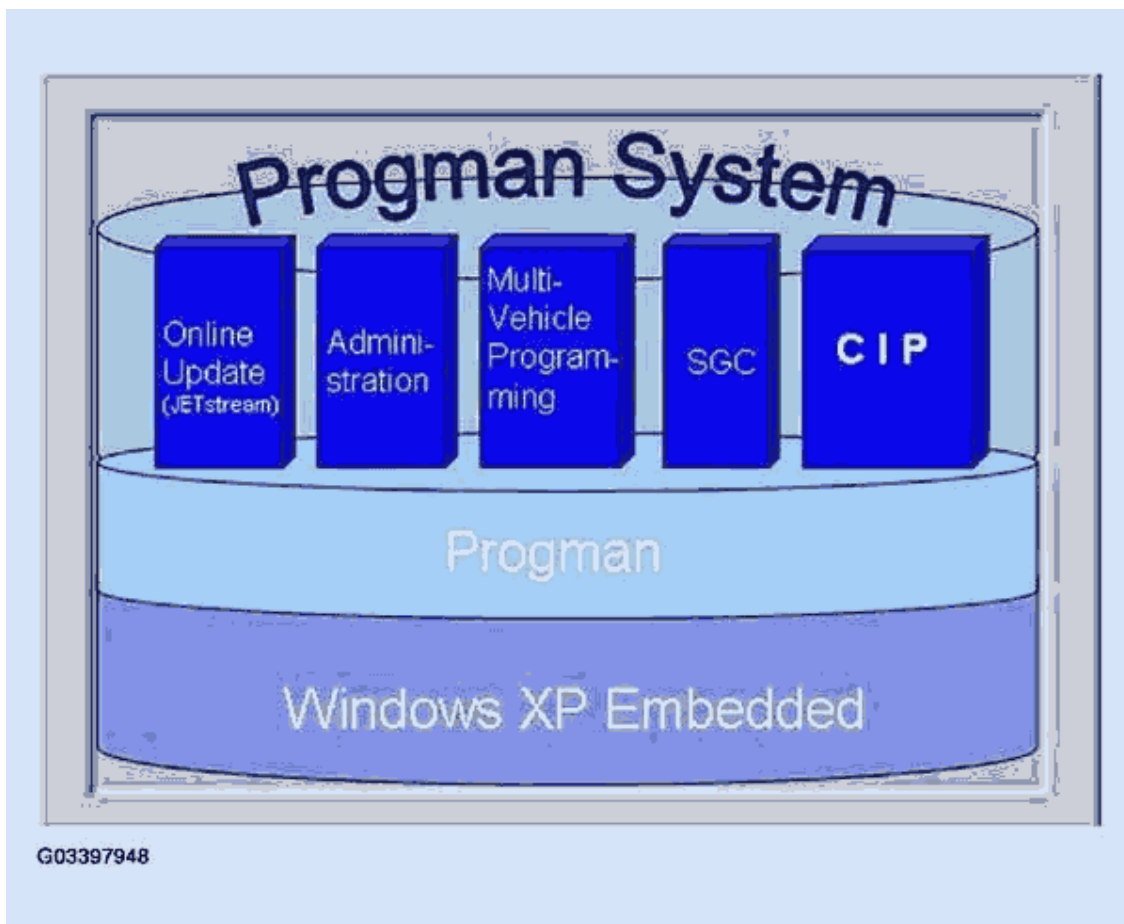

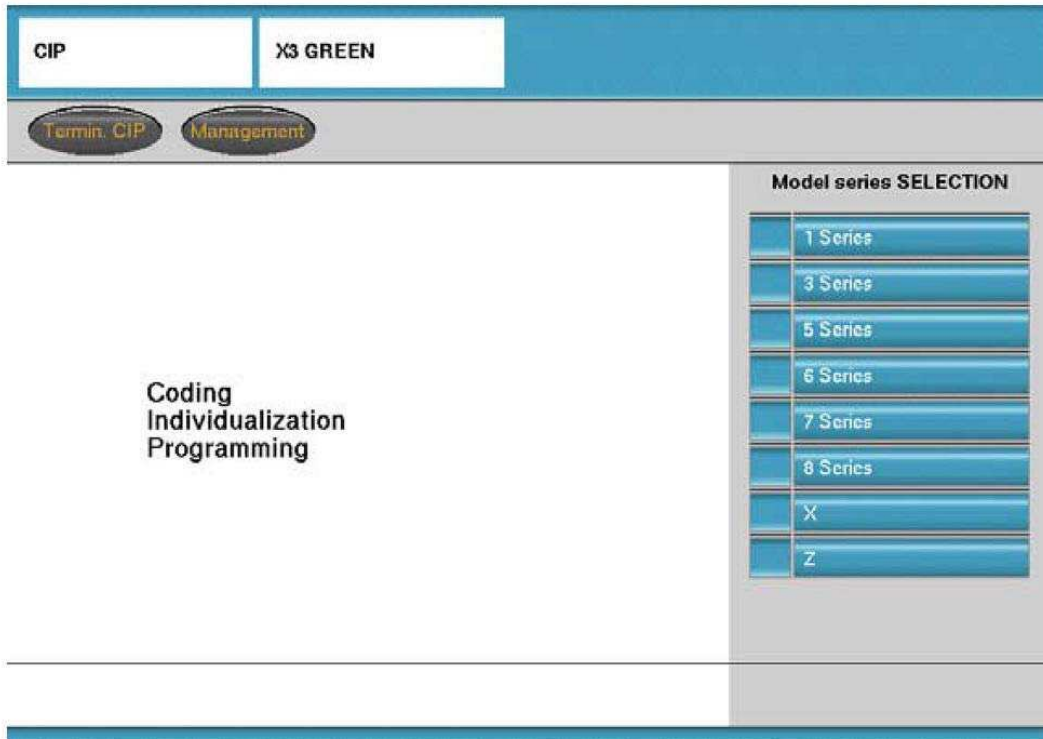

Fig. 94: Identifying Program System With Windows XP Embedded
 Courtesy of BMW OF NORTH AMERICA, INC.

Progman

The new programming management tool utilizes a new operating system (Windows XP Embedded) to manage the programming processes that can be initiated via the SSS.

Progman utilizes Windows XP Embedded which will serve as the basis for all further programs required for programming applications. No changes can be made to the operating system of this Windows variant and it can be used only in connection with the corresponding hardware (Software Service Station).

G03397949

Fig. 95: Display Model Series Selection Menu
 Courtesy of BMW OF NORTH AMERICA, INC.

Progman incorporates all Coding, Individualization & Programming functions that were previously part of the DIS CD for E31/32/34/36/38/39/46/52 & E53, which operates under the old SGC/UNIX application, into the CIP application.

Since CIP is incorporated into Progman, it will now contain all Coding, Individualization & Programming functions. CIP will be used to launch the SGC/UNIX application for the older vehicles as well as launch the Windows XP based application for Coding and Programming the newer vehicles.

In the future the E36/38/39/46/52/53 applications will be converted/integrated directly into CIP and be based on Windows XP Embedded. The structure for the E31/32/34 will not be changed and will remain SGC/UNIX based.

Administration

The administration tool provides the same setting options as before however, Progman adds additional features/capabilities:

- Ability to view and select accessible "Interfaces" (Diagnostic Head, OPSS, OPS...)

- Configure interfaces
- Adjust SSS and network specific settings
- View available SSS units and select a specific unit
- Select language specific to each SSS

JETstream

JETstream is the application that provides online data updates for Coding and Programming data. The feature allows the SSS to be up to date on the current/new vehicle data regarding coding and programming information prior to the release of an update DVD. The application can be configured to automatically search for online updates at a specific time (ex. after normal shop hours every night) and install any updates found at a specific time/point in the systems operation cycle.

In order for this feature to work the SSS must:

- Be located on the workshop network
- Be connected to BMW via a network connection
- Have the correct network specific data entered in the "Network" mask
- Have the host/domain name and IP address of the BMW server entered in the "Online Service" mask
- Have the "Automatic Online Update" feature active

Multiconsole/Multisession

Since the SSS is the primary Coding and Programming system, coding and programming tasks can be "transferred" to the SSS from any GT1 located on the workshop network. In order to monitor the tasks assigned to a specific SSS a menu of active jobs is displayed via Progman and can be accessed by any GT1 or SSS on the network.

MULTICONSOLE/MULTISESSION FUNCTION

Multiconsole	The multiconsole function makes it possible to control programming procedures both via the Software Service Station as well as via the BMW diagnosis systems GT1.
Multisession	The multisession function makes it possible to program several vehicles simultaneously.

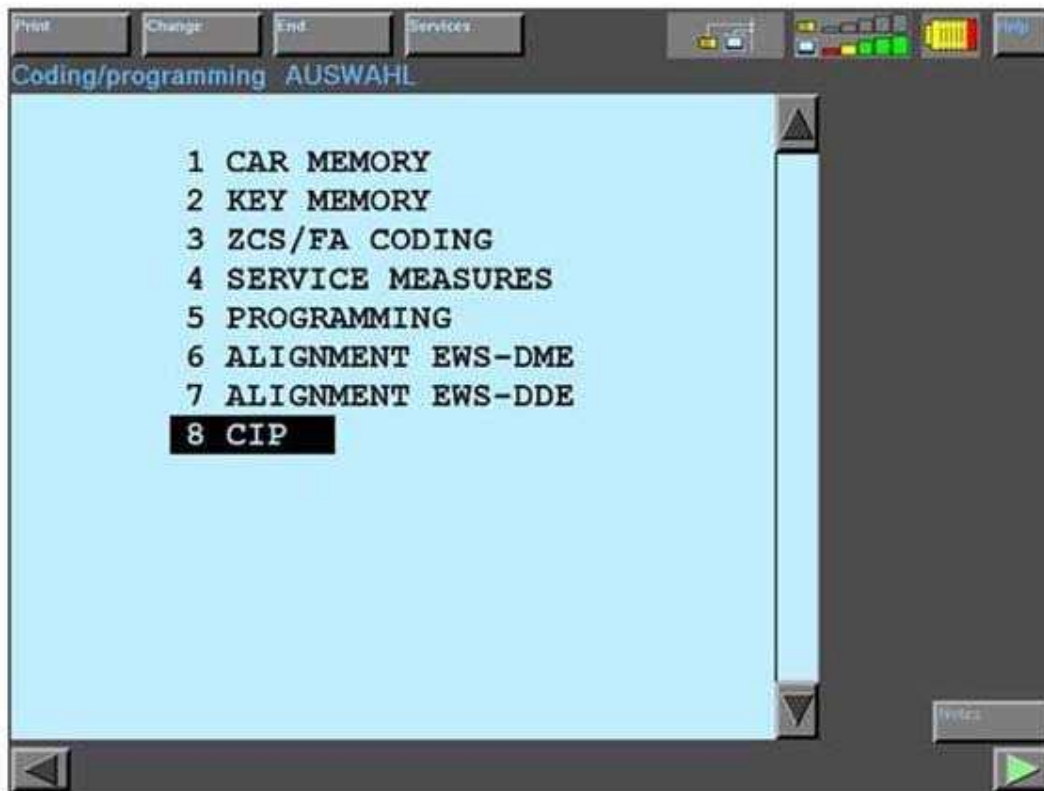

This function allows the GT1 to be remote terminals for the SSS with respect to Coding and Programming and once a task is transferred to an available SSS, the GT1 can be used to diagnose another vehicle and/or transfer another coding/programming task to an SSS.

CIP

The Coding, Individualization and Programming application that has been used previously since the introduction of the E65 continues to operate the same as before. The only major change is that all of the Coding and Programming functions for the older vehicles (E31/32/34/36/38/39/46/52 & E53) that was only available on

the DIS CD for use on DISplus and GT1 has been incorporated into CIP.

Prior to CIP15.0 SGC/Unix functions for Coding, Individualization & Programming were incorporated into DIS CD VXX.X.

G03397950

Fig. 96: Display Coding, Individualization And Programming Application (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

As of CIP 15.0 SGC/Unix functions for Coding, Individualization & Programming are incorporated into CIP.

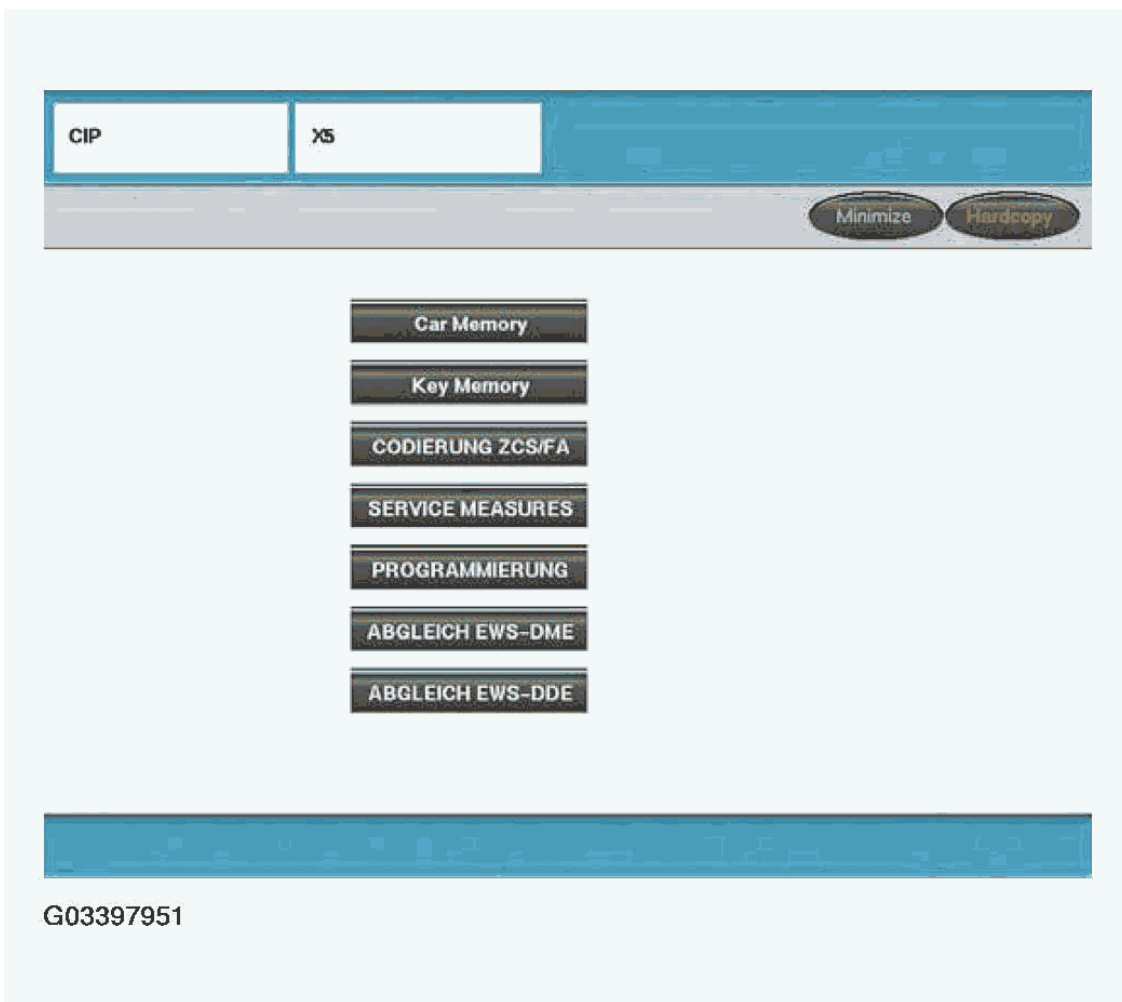

Fig. 97: Display Coding, Individualization And Programming Application (2 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

WHAT WILL PROGMAN DO FOR ME?

Progman allows the GT1 to be released from the task of Programming and Coding vehicles. The GT1 will be capable of performing vehicle diagnosis while the SSS is used to Program and Code a vehicle(s).

Example: Given a workshop with 10 active workstalls (CORA) and equipped with 2-GT1's, 1-DISplus, 1-SSS, 3-Diagnostic Heads, 1 OPSS Head, 2-OPS Heads

Before Progman (CIP 15.0)

CIP INFORMATION BEFORE PROGMAN (CIP 15.0)

Device	# of MOST-bus equipped Vehicles able to be Programmed at one time	# Vehicles able to be Diagnosed while another is being Programmed
GT1	1	0
GT1	1	0

DISplus	0	1
SSS	1	0
TOTAL	3	1

With Progman (CIP15.0)

CIP INFORMATION WITH PROGMAN (CIP 15.0)

Device	# of MOST-bus equipped Vehicles able to be Programmed at one time	# Vehicles able to be Diagnosed while another is being Programmed
GT1	0	1
GT1	0	1
DISplus	0	1
SSS	5	0
TOTAL	5	3

By installing CIP 15.0 on all of the GT1's and SSS's, Progman can be accessed via any GT1 or SSS but is controlled/operated by the Software Service Station (SSS) only. Since the SSS controls/runs Progman, it will be the only device able to code and program vehicles, the GT1 will be viewed as a remote terminal for Progman.

With the introduction of Progman, parallel programming of up to five vehicles can be performed. The vehicles to be programmed do not need to be the same model series nor have the same data status or be connected at the same time.

GETTING STARTED WITH PROGMAN

Progman is launched from the GT1 whenever the Coding/Programming function is selected. On the SSS Progman is always active as this is the only program installed on the system.

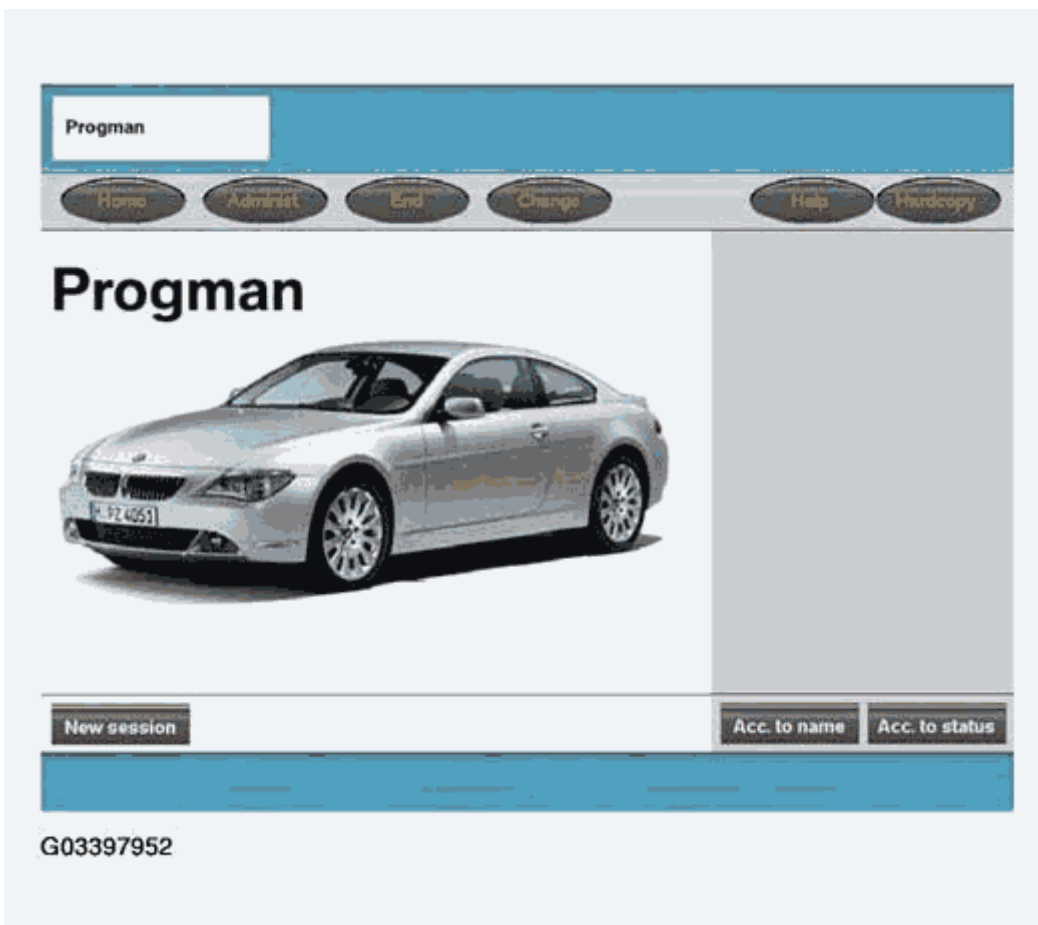

Fig. 98: Display Progman System

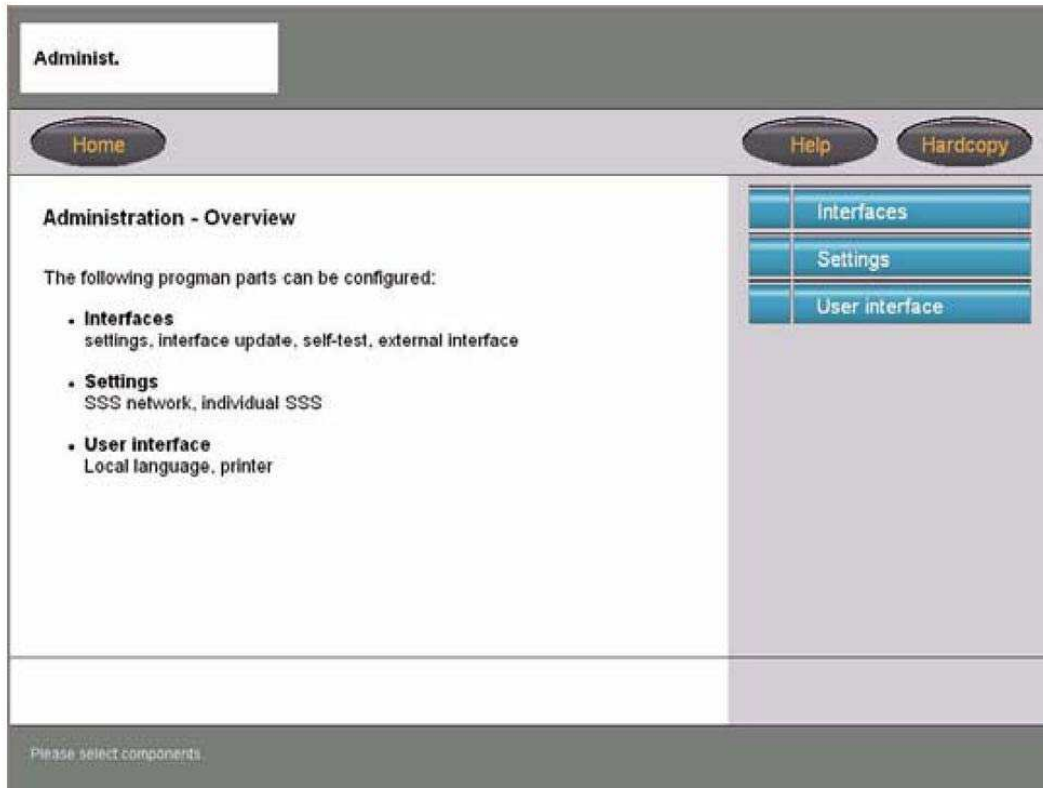

Courtesy of BMW OF NORTH AMERICA, INC.

From the main menu screen in Progman the administration features for system configuration can be accessed or a new session can be started. By selecting "Help" a more detailed document explaining Progman can be accessed.

ADMINISTRATION

In order to insure initial system setup selecting "Administration" will bring up a new screen which explains the menu selections available on the right side.

At this point Interfaces, Settings or User Interface can be selected.

G03397953

Fig. 99: Display Administration Overview
Courtesy of BMW OF NORTH AMERICA, INC.

Interfaces

By selecting "Interfaces" an overview of all available and/or connected interfaces is obtained along with information pertaining to the status of the interface, device name, software level and IP address.

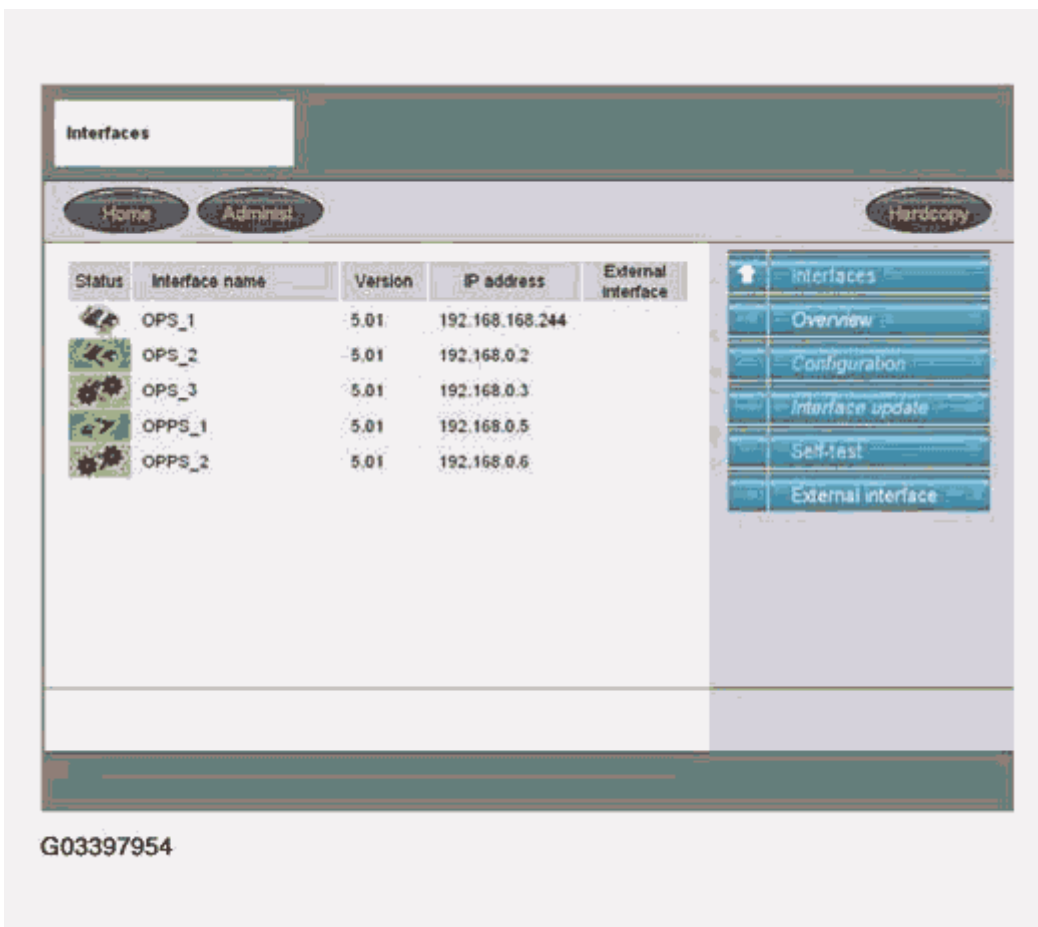

Fig. 100: Display Status Of Interface, Device Name, Software Level And IP Address
 Courtesy of BMW OF NORTH AMERICA, INC.

Explanation of Status Indicators

Symbol Description

	Green background - interface is free and can be selected
	Grey background - interface not detected - It is currently being shut down or started up - It is unconfigured referred to the sub-network in which it is located
	Red background - the interface is occupied and is not available for a session It is possible to query the configuration and the current session.
	Black lettering - interface can be selected
	Grey lettering - interface cannot be selected as it is not available or cannot be reached
	Black question mark- interface is unconfigured referred to the sub-network in which it is located
	Grey question mark - connection to interface is not possible, the device cannot be reached
	Black gear wheels - the interface is currently being used exclusively. Only the configuration data can be queried.
	Diagnostic Head
	OPS
	OPPS
	OPS with grey background and grey question mark: The OPS can not be detected as it is currently being started up or shut down or is not correctly configured/connected for the current network When devices are not connected, they are indicated as a grey question mark on a grey background without the interface symbol.
	OPPS with grey background and black question mark: A black question mark means that the OPPS is not configured for the current network.
	Diagnostic head with red background and black gearwheels: The diagnostic head is currently being used and is not available for a new session at this time. Only the configuration of the diagnostic head can be queried.

G03397955

Fig. 101: Identifying Interfaces Status Indicators Explanation
Courtesy of BMW OF NORTH AMERICA, INC.

Examples of Possible Combinations

Interface Name

An interface name can be freely assigned to each interface so as to simplify definition of the interface in the

workshop. The name used should be helpful in locating/identifying the particular interface if necessary.

Version

The firmware version indicates the software level currently installed on the selected interface (OPPS/OPS/diagnostic head). It is recommended that the version on the interface be the same as that of the SSS it is being used with.

IP Address

The IP address (internet protocol address) is a unique and specifically assigned address for each device in the workshop network. This address consists of a number block which is normally structured as follows.

Example: 192.168.100.10

The IP addresses must be structured so that each device in the network is distinguished from all the others and must be exclusive to that device and not shared among other devices connected to the network.

External Interface

This column indicates whether the current interface is an external interface. External interfaces are located in external subnetworks and can be used in connection with this Software Service Station.

Overview

If an interface is selected and items on the right of the screen in the menu listing are selectable (not grey) then additional information can be accessed for that device.

In this example "Overview", "Interface update", "Configuration" and "Self-test" are available.

If a device is not correctly configured for the network certain selections may not be available for that device.

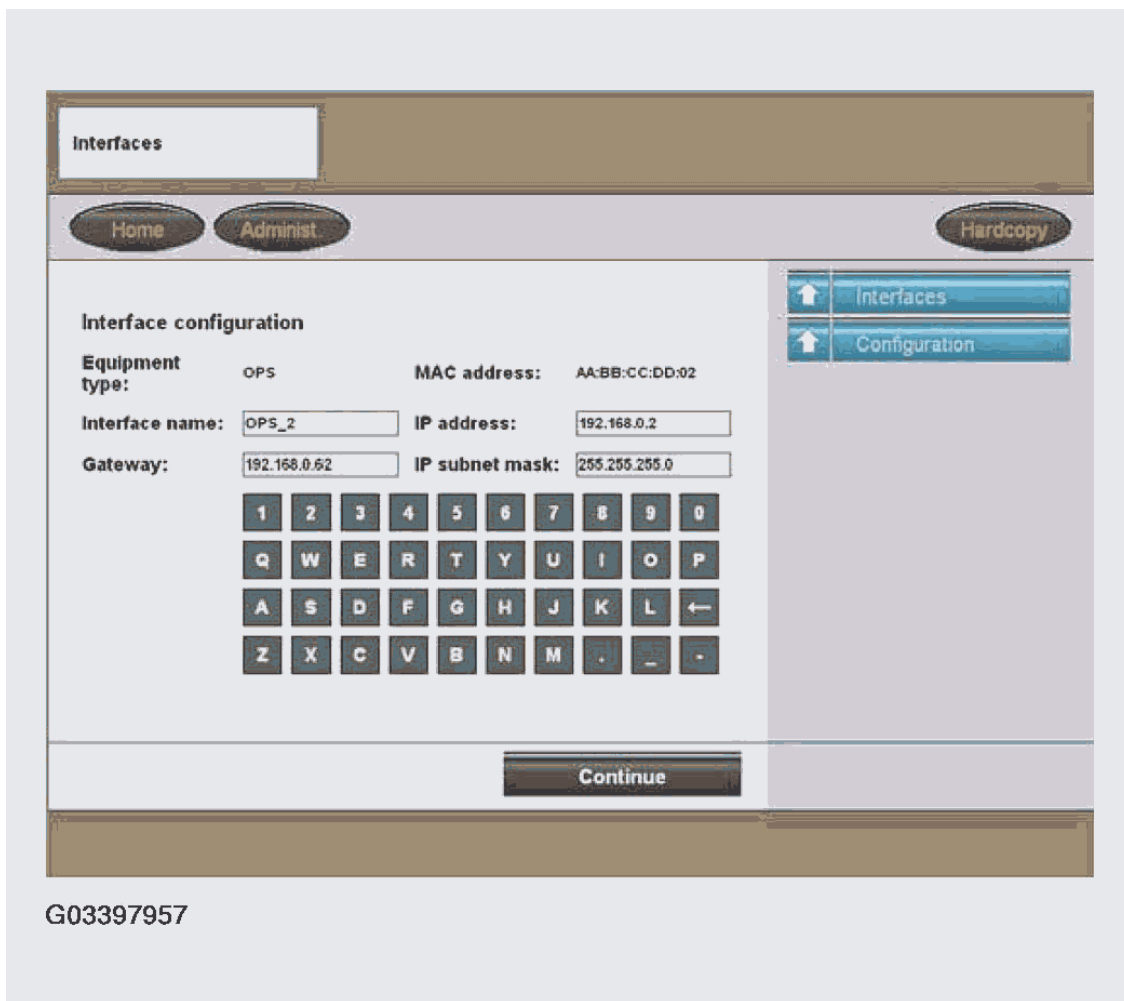

Fig. 102: Display Interfaces Name, Version And IP Address
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The Interface list does not automatically update as devices are utilized or freed up. The only way to update the list is to select "Overview".

Configuration

Configuration provides information for the device selected pertaining to:

- Interface Name
- Gateway
- IP Address
- IP Subnet Mask

G03397957

Fig. 103: Display Interfaces Configuration Information (1 Of 3)
Courtesy of BMW OF NORTH AMERICA, INC.

Interface Name

The specific name assigned to the device (Ex. Blue A). The name used should be helpful in locating/identifying the particular interface if necessary.

IP Address

A specific four segment number assigned exclusively to the device. The number represents the address of the device on the network and is necessary when communicating with other devices located on the network.

Gateway

This information identifies the four segment address of the component located on the network responsible for communicating from the current network to another network. If there is no address in this location then a connection to any devices outside of the current network can not be established.

IP Subnet Mask

This information is used to define which segment of the four segment IP address specifically identifies the device and which identify the specific network.

Example: 255.255.255.0

Indicates that the first three segments (255.255.255) identify the specific network that the device is located on. The last segment (0) indicates that this is the segment that will identify the specific device.

NOTE: The network and device address information must be entered exactly as defined by the network administrator for your facility, otherwise the devices can not be accessed.

After entering the necessary information and continue is selected, Progman will run a check on the values/information entered and will indicate if the information is acceptable.

Fig. 104: Display Interfaces Configuration Information (2 Of 3)
Courtesy of BMW OF NORTH AMERICA, INC.

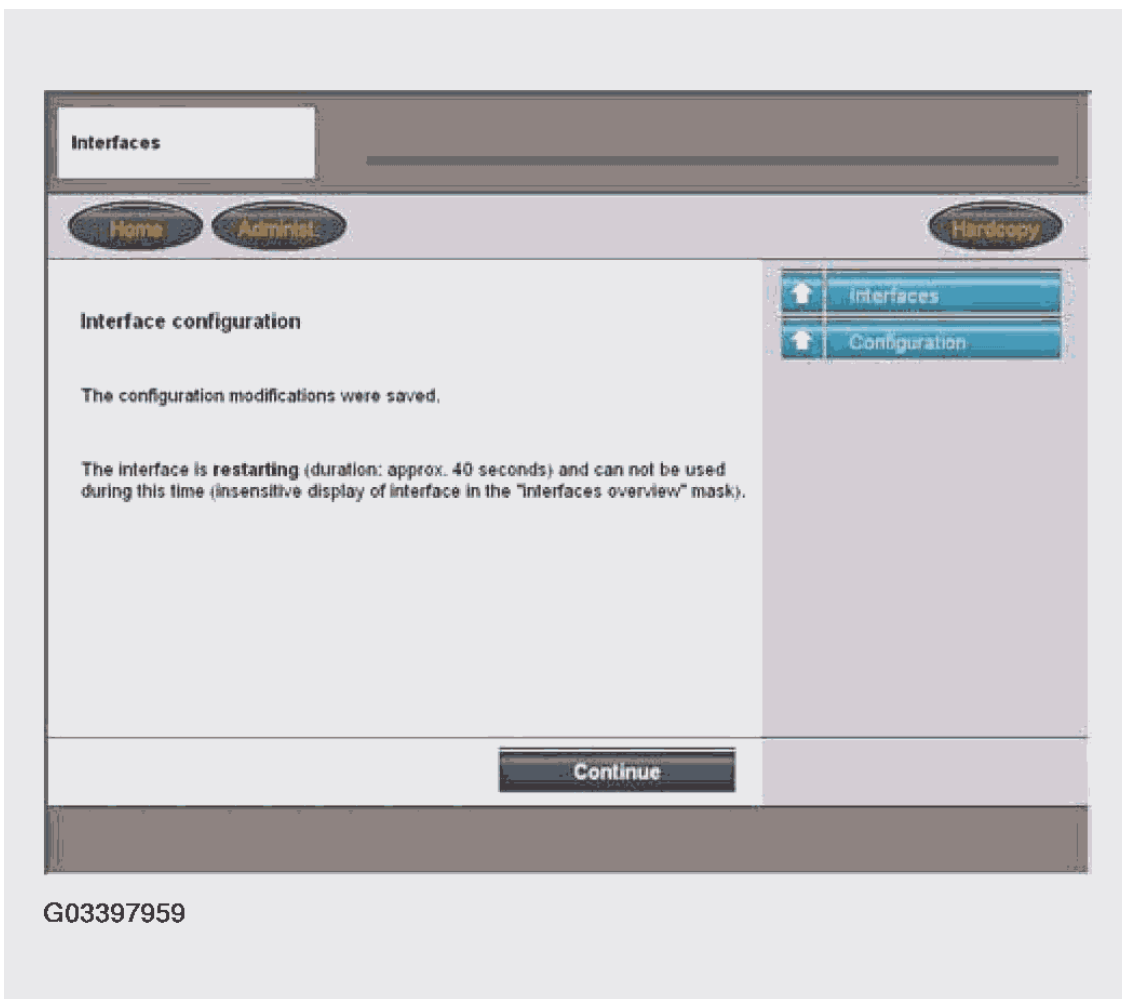

Fig. 105: Display Interfaces Configuration Information (3 Of 3)
Courtesy of BMW OF NORTH AMERICA, INC.

Interface Update

Interface update can only be selected if the selected interface is not being used by another device (interface symbol has a green background).

This function allows the firmware of the interface to be checked against the version of the SSS.

It is recommended that the version of the SSS and the Interface be at the same level to reduce susceptibility to errors and system conflicts.

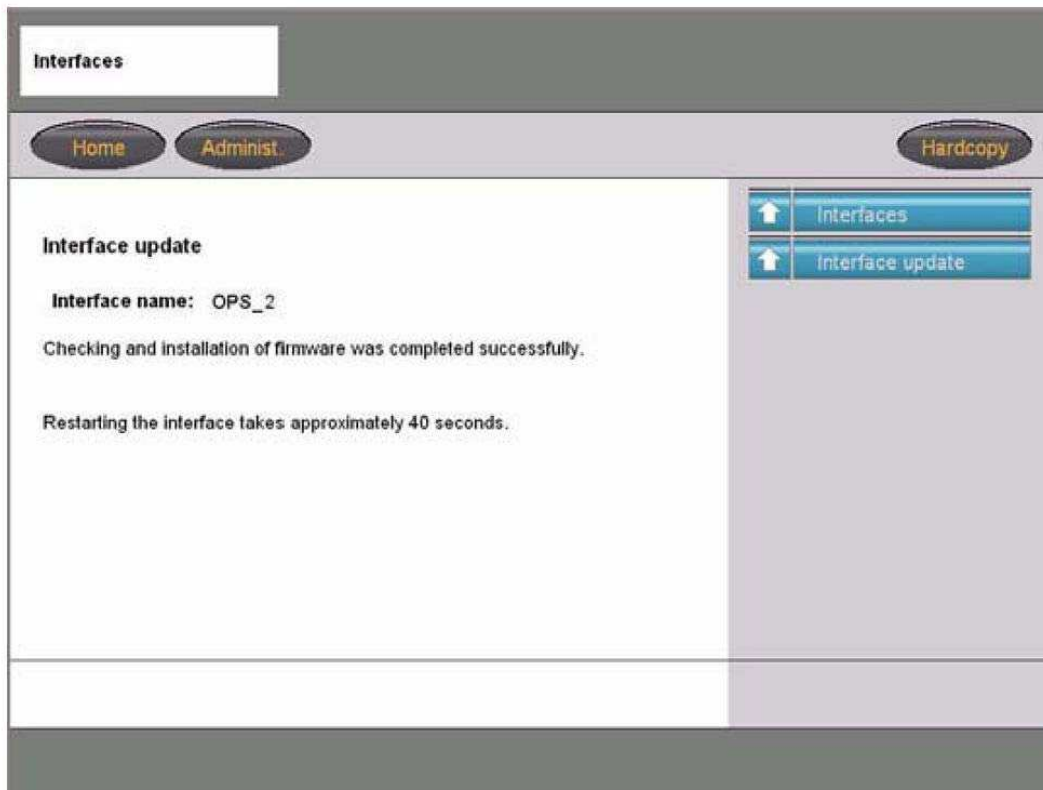

Fig. 106: Display Interface Update Information (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

The SSS will check which firmware version is installed in the interface and then searches for the newest available version on the SSS. Depending on the result of the search, Progman will make a recommendation as to what action should be taken.

- If both versions are equal no action is required.
- If the version on the SSS is newer then Progman will suggest updating the version on the interface.
- If the version on the SSS is older, Progman is able to change the version on the interface to the older one.

Once the update is successfully completed a corresponding message is displayed.

G03397961

Fig. 107: Display Interface Update Information (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Updating Interface after Initial Install

After the initial installation of Progman with CIP 15.0, the firmware installed on the interfaces that will be used with Progman must first be updated. If the firmware level of the interface is not at a predefined level then it will not be recognized/identified within the Progman application, thereby not allowing a connection to the interface. This update only needs to be performed when an interface is used for the first time with Progman.

Using the GT1 update the firmware in the interface.

Select the interface

G03397962

Fig. 108: Selecting Interface

Courtesy of BMW OF NORTH AMERICA, INC.

With a connection to the interface established a message should be displayed indicating that the firmware in the head needs to be updated, perform the update by selecting the "Diagnostic head Update" button.

After the update is complete select "Quit connecting".

Access Progman and verify that the interface is recognized

G03397963

Fig. 109: Selecting Quit Connecting Button
 Courtesy of BMW OF NORTH AMERICA, INC.

From Progman the firmware level of the interface should also be checked and updated if necessary. Progman does not automatically inform the user if the firmware of the interface needs to be updated.

Updates to the interface are checked and performed by selecting the specific interface from the list, located under "Administration" - "Interfaces", then selecting "Interface Update" (refer to previous page for additional information).

Self-Test

Self-test can only be selected if the selected interface is not being used by another device (interface symbol has a green background).

Depending on the interface selected a test loop must be attached to the interface.

- For opps use test loop 663124 and 663131
- For OPS use test loop 663124
- For Diagnostic Head, no test loop is needed

External Interface

An external interface is an interface that is not automatically detected by Progman or is not contained in the subnet of the workshop network, such an interface can be added manually to the list of available interfaces or removed using this function. In order to add an interface the I/P address of the interface must be entered.

Interfaces

G03397964

Fig. 110: Display Interfaces Menu For Entering IP Address
Courtesy of BMW OF NORTH AMERICA, INC.

Example: The dealer has two separate service facilities each with its own network, an external interface can be connected to a vehicle located within one network and accessed by a GT1 or SSS located in the other network in order to Code/Program the vehicle.

Settings

From the Administration screen the "Settings" tap allows access to information specific to a selected/specific SSS.

G03397965

Fig. 111: Display Administration - Settings Tap
Courtesy of BMW OF NORTH AMERICA, INC.

Overview

The overview tap provides a listing of all SSS's that are located on the network.

Fig. 112: Display SSS Overview Menu (1 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

The Overview screen provides information pertaining to:

- Operating status of a particular SSS

Ready (Green) = Usable

Full use of SSS is possible

Limited (Yellow) = Usable

The number of possible sessions is limited (Ex. a download of a new update is in progress)

Not Ready (Red) = Maintenance

No new sessions are possible (Ex. an update is currently being installed)

- Number of active sessions on each SSS
- The CIP version installed on each SSS

Upon selecting a particular SSS additional menu selections are possible.

The selected SSS is highlighted in a blue frame and all items are possible for the selected SSS are active in the menu.

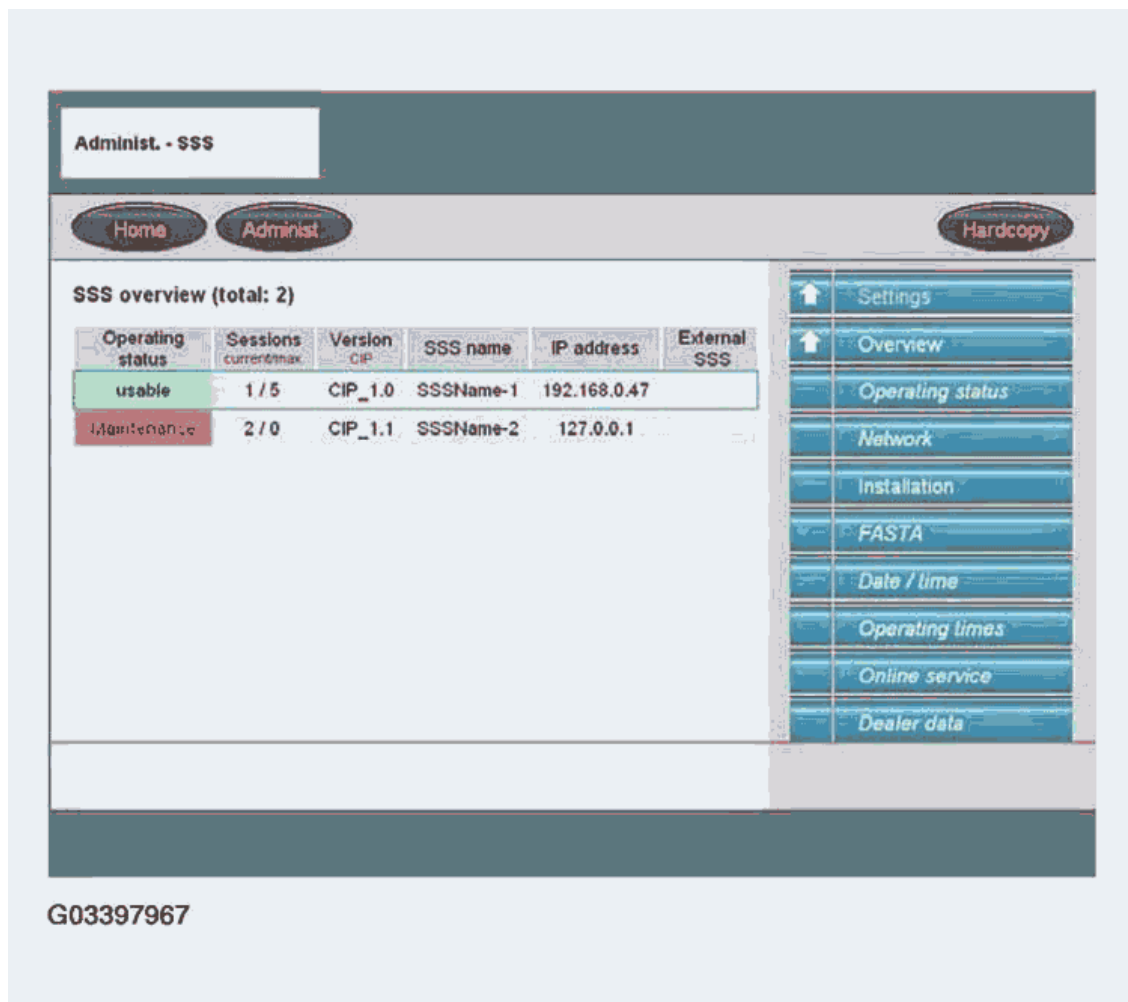

Fig. 113: Display SSS Overview Menu (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Operating Status

This menu item provides a more detailed status information for specific SSS than the Overview table.

G03397968

Fig. 114: Display SSS Operating Status Menu
 Courtesy of BMW OF NORTH AMERICA, INC.

The name of the SSS is displayed with a colored background indicating the status of the selected SSS.

Green = Ready **Yellow** = Limited **Red** = Maintenance

Additional status information is also displayed:

MAC address - Media Access Control address is an unchangeable and unique address for identification of a network device.

Serial Number - Serial number of specific SSS

Operating Status - Provides detailed information about the current operation of the SSS

Sessions - Indicates the number of currently active/started CIP sessions.

Interfaces - Indicates how many interfaces are connected to the specific SSS

Online Service - Indicates whether the online update is activated on the SSS

From this location it is also possible to change the operating status of the SSS, as long as the selected SSS is currently in the "Ready" status, plus **this is also the recommended location from which the SSS should be restarted or shutdown using the buttons at the bottom of the screen.**

Network

The Network function allows network configuration information specific to the SSS to be entered, these settings should have been set during the initial installation of Progan/CIP15.0.

NOTE: Maintain a copy of the system configuration information, in the event information gets disturbed, printout a copy and keep in a binder along with information for DISplus, GT1 and the interfaces.

Fig. 115: Display Network Configuration Menu (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Information that can be entered is similar to the information needed to configure an interface. The following information must be entered to correctly configure the SSS to the network:

- Assign a name specific to the SSS
- Gateway Address
- IP Address specific to SSS
- Information pertaining to the IP subnet mask

Any changes that are made to the configuration are saved by selecting continue and will go into effect once the SSS is restarted.

NOTE: Restart immediately means that Progman checks the current status of any sessions that are still active and once the sessions are complete the system will restart.

Restart later indicates that Progman will wait until the end of the day (specified under "Operating Times") to check and restart the system.

Installation

The Installation tap is selected when updates need to be installed either by a way of a new CIP DVD or checking for new online updates (Automatically or Manually). The updates that can be installed pertain to the Progman application as well as updated vehicle data files for utilization by CIP.

The table provides an overview of the software program and version currently installed.

The selection/activation of Automatic online updates via the BMW server is selected from this screen.

"DVD update" can be selected whenever a new CIP DVD needs to be installed.

"Online update" allows a manual check for online updates to be initiated.

G03397971

Fig. 117: Display Installation Menu

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: It is recommended that the Automatic Online Update feature be activated to insure that needed Program and Coding updates are received in a timely

manner. When new updates are made available they are downloaded and installed after the normal operating times of the workshop as specified under "Operating Times".

"Display status" provides information pertaining to the installation of the latest update.

Information pertaining to an erroneous installation of an update is displayed in the messages section.

NOTE: If frequent error messages are displayed contact your service provider for assistance and have available a copy of the error messages that have been received.

G03397972

Fig. 118: Display Installation - Status Menu
Courtesy of BMW OF NORTH AMERICA, INC.

FASTA

The FASTA function assures that vehicle operation and service data from the diagnostic and programming devices are sent to BMW. With Progman if data is available it is transmitted automatically every five minutes

This function shows if any data is available for transfer and when it will be sent.

By selecting "Send data" (manual send) make sure that no sessions are currently running on the SSS as this will lengthen the data transmission process.

It is preferred that the automatic transfer process be utilized.

G03397973

Fig. 119: Display FASTA Function Menu

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: In order for FAST data transmission to be possible the correct BMW server address must be entered in the "Online Service" menu.

Date and Time

In this function the current date and time must be entered. An automatic correction for daylight savings time to standard is made automatically.

Operating Times

The normal operating time of the workshop/service facility is entered in this function. The time is used to establish a maintenance period for the SSS. The end of normal operating time signals Progman to start executing/installing any online updates that may be available.

User Interface

Under this menu language settings specific to the individual SSS and printer configuration information can be set.

Example: If the language of the SSS is set to German then all information displayed on the SSS will be in German, however it does not mean that the GT1 will also display the text in German when accessing Progman and "connecting" to that SSS.

Workshop Exercise - Configuration Check

1. Check/access network configuration information for:
 - SSS
 - DISplus
 - GT1
 - Interfaces (Opps, OPS & Diagnostic Head)
2. Check firmware level of interface's via SSS.

STARTING A PROGRAMMING OR CODING SESSION WITH PROGMAN

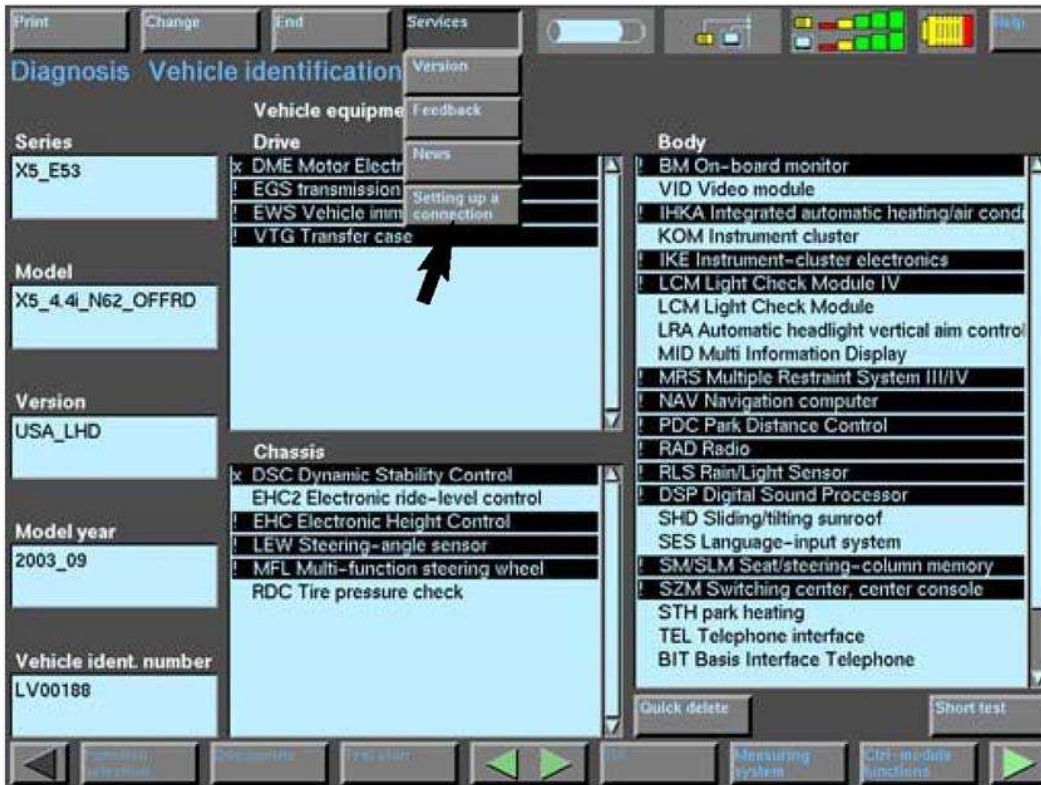

In order to start a session in Progman the Diagnostic, OPSS or OPS head that will be selected can not be connected to the DISplus or GT1.

Disconnecting From Interface To Be Used By Progman

If the vehicle to be programmed was previously being diagnosed using a diagnostic head with the GT1, then the connection with the head must be broken before that head will be recognized by Progman.

Explanation of session status indicators:

- 1 - Black text with white background indicates that session is running and does not require any input, the status of the session can be reviewed.
- 2 - Grey text indicates a session is active/in progress and is currently being accessed or reviewed by another user. This session can not be accessed by an additional user.
- 3 - Orange text indicates that input is required before program can continue, this session should be accessed and reviewed to provide required input.

Going From Progman To Diagnosis On GT1

If using a GT1 it is possible to switch from Progman to a diagnostic function.

From the Progman home screen select "Change"

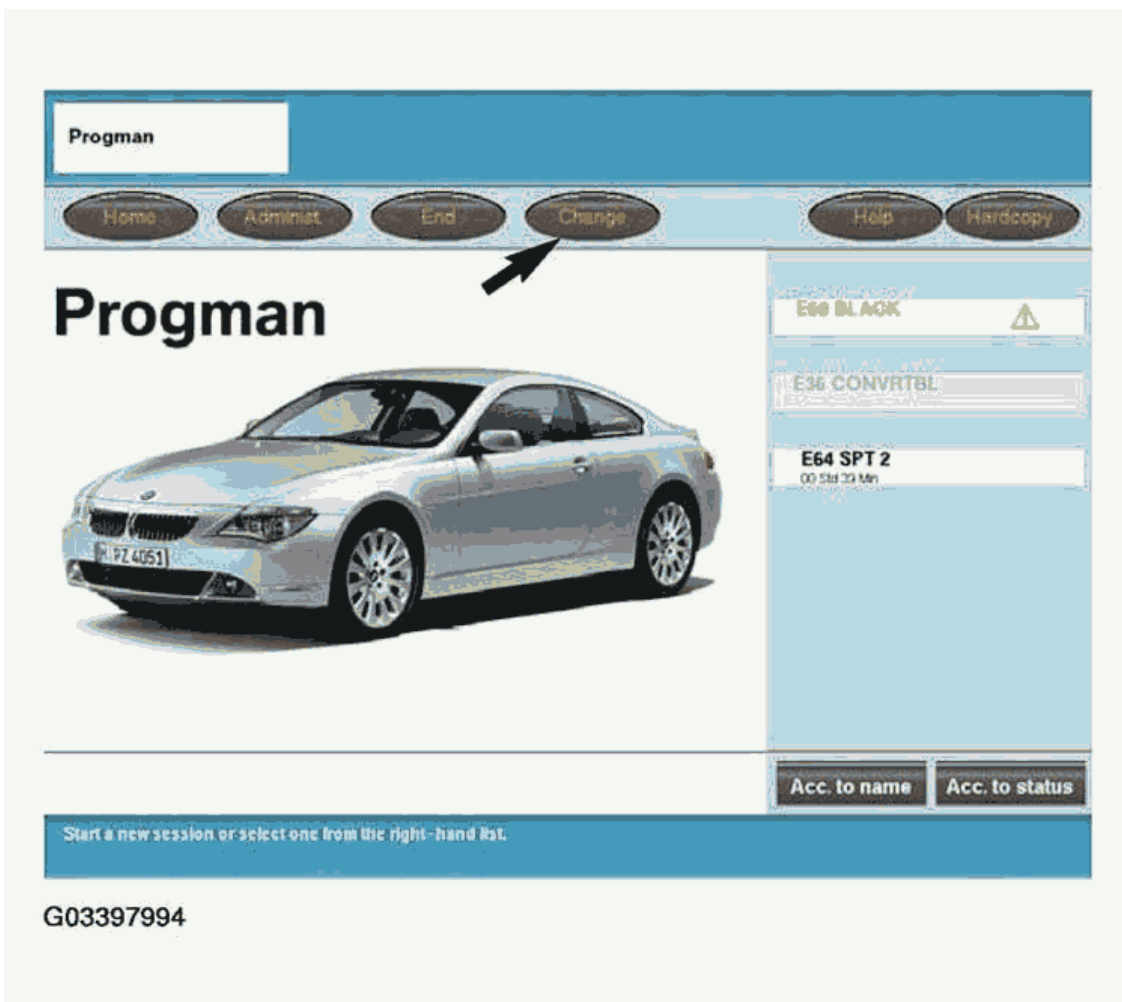

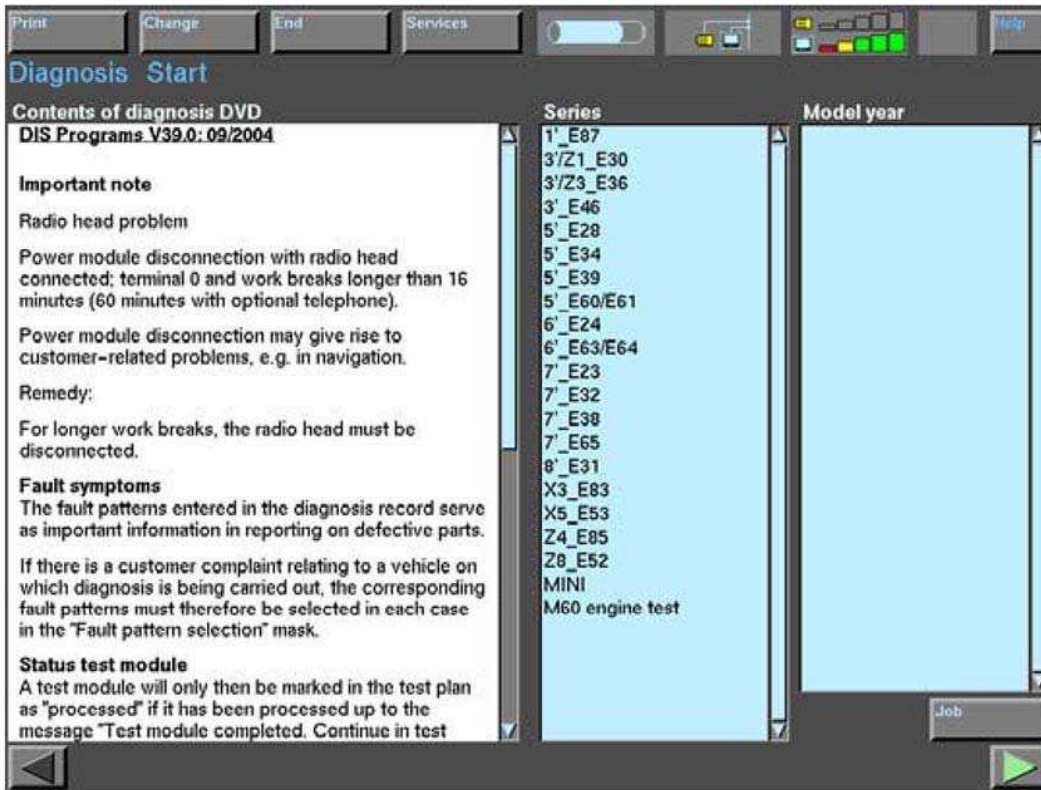

Fig. 140: Selecting Change Button

Courtesy of BMW OF NORTH AMERICA, INC.

The GT1 will switch to diagnostics and a new diagnostic session can be started by connecting to an available interface, if nothing was previously active.

Or

If a diagnostic session was previously active then the system will return to that point, prior to having switched over to Progman.

G03397995

Workshop Exercise - Access CIP & ZCS

1. Access CIP for an E60.
2. Access ZCS functions to obtain the central coding key on an E53 or Vehicle order on an E46.

CODING, INDIVIDUALIZATION & PROGRAMMING (CIP)

Model: All

Production: All

CODING, INDIVIDUALIZATION & PROGRAMMING

Introduction

With the introduction of the E65 in 2001, BMW not only introduced a vehicle loaded with the latest technology

but also introduced a new way of performing vehicle coding and programming. In order to code and program an E65, a software program commonly referred to as CIP was introduced. The acronym CIP stands for **C**oding, **I**ndividualization & **P**rogramming and with the introduction of Progran & CIP 15.0 it has become the sole software tool for coding and programming vehicles.

Initially CIP was developed for use on the E65/E66 and newer models but has since been expanded to include all vehicles produced prior to the introduction of the E65 that utilize a an SGC/UNIX programming structure.

The intention of the CIP program is to insure that whenever a module is updated or replaced it will still be compatible with all the other modules installed in the vehicle (equipped with a MOST bus). Since all of the communication between the various modules installed in a vehicle is over a bus network structure, it is very important that all of the installed modules be able to communicate with each other without problems.

To ensure compatibility/seamless integration between control modules, the CIP software reads out the part numbers of all the control modules installed in the vehicle as well as the software levels of the respective modules. The information from the various installed modules is then cross referenced against a "master reference list" to determine if a module(s) needs to be updated and how this update will effect the other installed modules. Once this cross reference process is started it can result in additional issues such as:

- If the software level in a selected module is updated will the hardware of the module still be able to function correctly.
- If the software to be installed is not going to be compatible with the installed hardware then the module will need to be replaced.
- If updated software is installed in the selected module will this have any impact on any other installed modules and will they need to have the software updated or will the hardware need to be updated in additional modules in order to install the revised software.

***Example:** A desktop computer originally built with a Pentium I, 75 Mhz processor using Windows 95 is not able to operate using Windows 2000. In order to operate with Windows 2000 this old desktop computer needs to be upgraded with new hardware. However, a desktop computer designed to operate with Windows 2000 can be updated to Windows XP without having to upgrade the hardware of the computer.*

All hardware devices that utilize software/programs to operate can only have the installed software updated a certain number of times before the operating capacity of the installed hardware is exceeded and no longer compatible, this results in the device no longer being able to function. In order for these devices to continue to operate the installed hardware/control modules will need to be updated, which is what happens in our vehicles or desktop computers over time.

Integration Levels

All new models produced as of the E65 have a minimum allowable software level, based on production date, which is referred to as an integration level or data status. The integration level defines the software level that all the control modules installed into a particular model, at time of production, must be at in order to ensure compatibility. Once an integration level for a specific production period is defined/"locked", the modules installed in those vehicles can not be updated beyond that level.

The Integration level or data status for vehicles equipped with a most bus is provided in the "Status report" or

"Measures plan" as shown below.

Vehicle data status: E060-04-09-503

Target data status: E060-04-09-55

If the vehicle data status and target data status are not the same, this indicates that some of the installed control modules need to be updated to bring the vehicle up to the latest level.

If the software levels were not locked it would be quite complex to track all software and hardware variations for all models through all production ranges. It would be extremely difficult to determine what software and hardware level is compatible with each module installed in a specific vehicle(s) and exactly what needs to be updated if one module is updated or replaced, therefore a limit or locked point must be define for specific production periods by model.

***Example:** MY2002 vehicles can not be programmed with software that is assigned to MY2003 vehicles since the defined integration level for each Model Year is different. Similarly Windows 2000 can not be installed & operated on a computer originally developed to run with Windows 95.*

Measures Plan

A measures plan is generated by CIP to identify what if any control modules need to be updated in order to bring a vehicle up to the latest integration level or data status. The measures plan also identifies the part number of the old/installed programmed control module and also what the new part number will be after the update is performed.

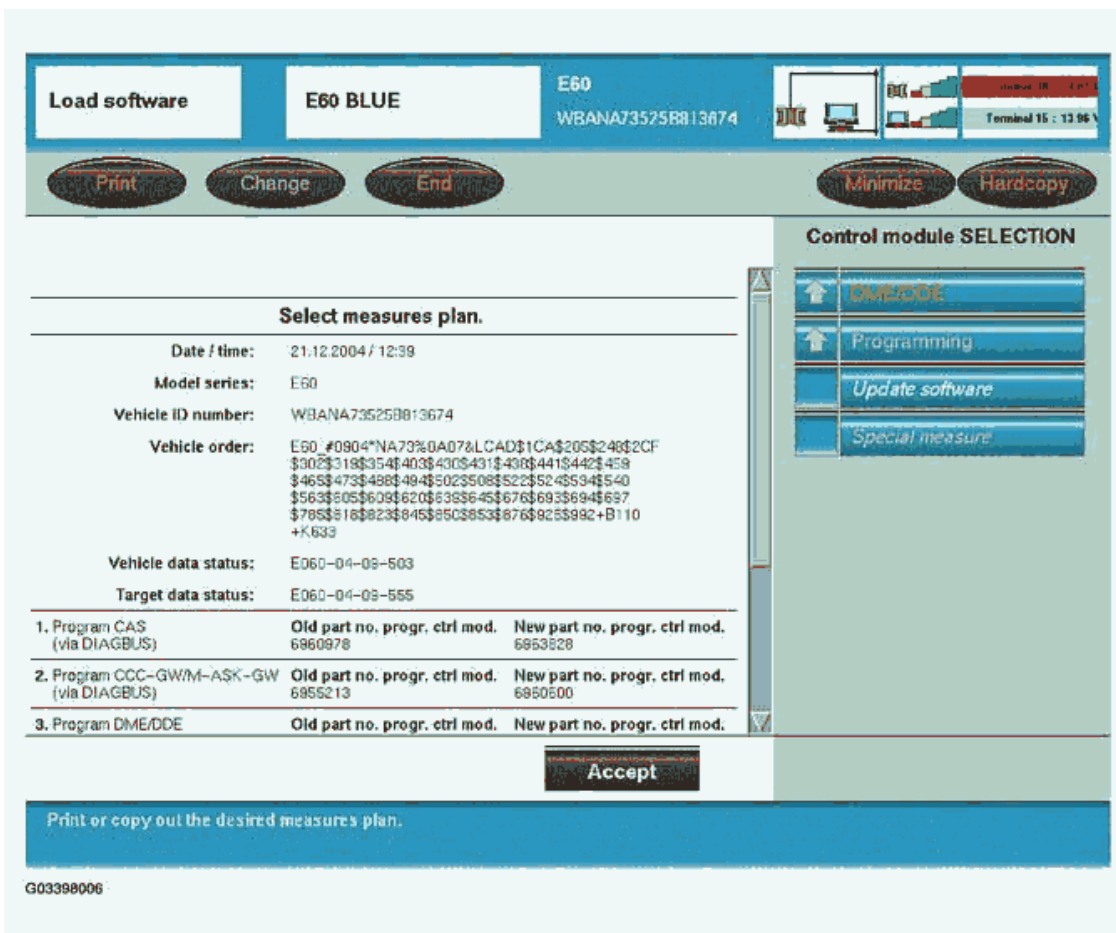

Fig. 152: Display Select Measures Plan Screen
 Courtesy of BMW OF NORTH AMERICA, INC.

By accepting the defined plan all modules that are listed will be updated "automatically".

IMPORTANT: Whenever a measures plan is defined it should always be printed out before proceeding in order to document the work performed, by attaching it to the repair order.

NOTE: An all inclusive status report or measures plan is only generated for vehicles equipped with a MOST-bus, to ensure compatibility. For all other vehicles a measures plan is generated only for the module selected to be updated (i.e. DME, TCU, EGS...) no evaluation of the other modules in the vehicle is made.

Initial CIP Screen

Fig. 153: Display Initial CIP Screen

Courtesy of BMW OF NORTH AMERICA, INC.

From the initial CIP screen select the model for which a coding or programming session is to be performed.

CIP Main Selection Screen

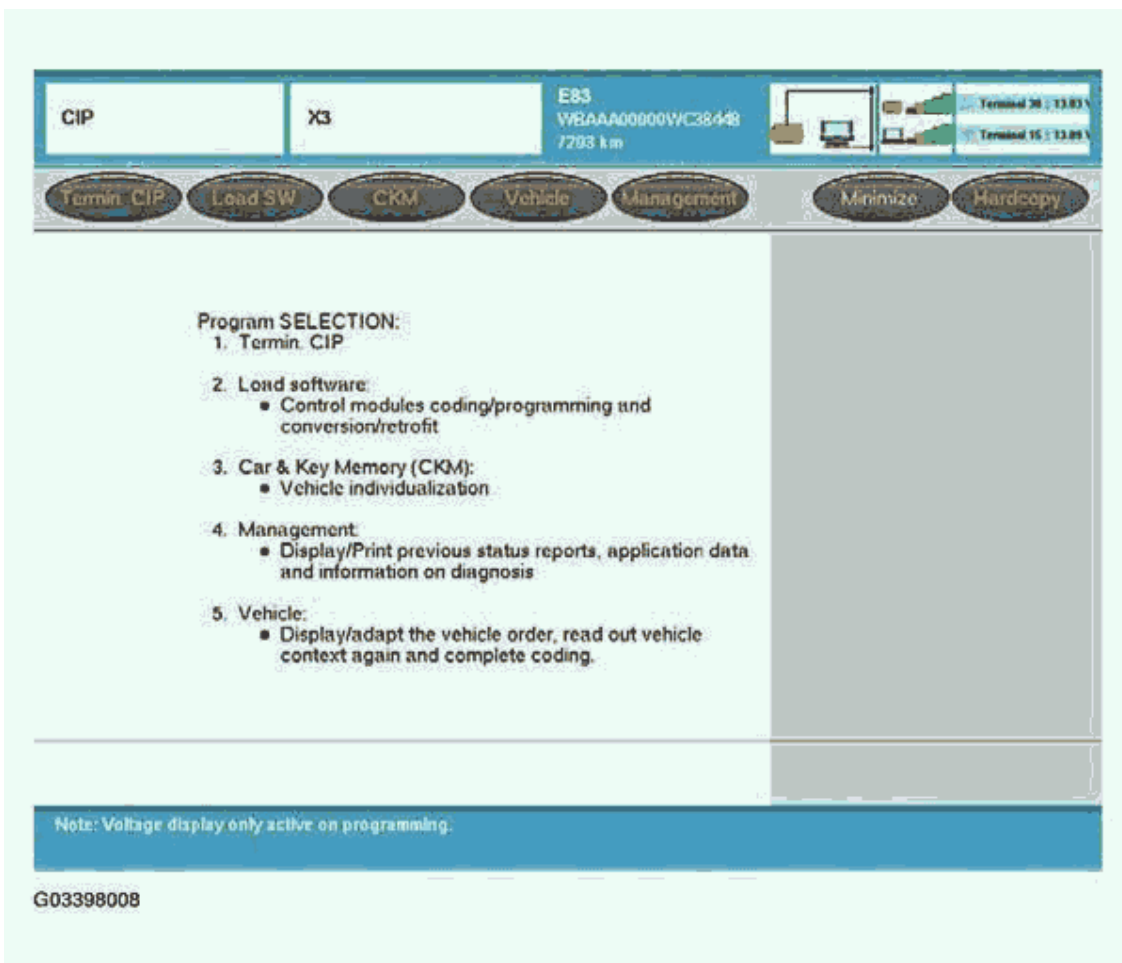

Fig. 154: Display CIP Main Selection Screen
 Courtesy of BMW OF NORTH AMERICA, INC.

Selection of CIP functions/options:

Termin. CIP - End the CIP program and return to Progman home screen

Load SW - Load software function to be selected if:

- Control module has been replaced
- Retrofit process is to be carried out
- Vehicle software is to be updated
- Coding/programming of one or more module(s) is to be performed

CKM - Vehicle and Key Memory/Individualization allows various driver selectable features (such as drive way locking, seat memory, central locking/unlocking, daytime running lights etc.) to be coded to the vehicle or individual keys.

Management - Provides the ability to:

- display the current version of CIP installed
- print previously performed Service Measure Reports
- run a test on the software currently installed on system (SSS)

Vehicle - Allows access to:

- Vehicle Order
- Initialization
- Service Functions
- Complete vehicle coding

Control Module Replacement Yes/No

Load software X3 E83 WBAAA00000WC44237 2871 km Terminal 30 : 13.71 V Terminal 15 : 13.83 V

Print Change End Minimize Hardcopy

Have control modules been replaced on this car?
 Note: For retrofits press *No*.

Yes No

G03398009

Fig. 155: Display Control Module Replacement Menu
 Courtesy of BMW OF NORTH AMERICA, INC.

At this screen information is needed to determine which path is to be followed.

Answer "Yes" if:

- A previously installed control module has been replaced.

Answer "No" if :

- No control module(s) has been replaced but an update on one or more modules needs to be performed.
- A retrofit needs to be performed on the vehicle (such as installation of CD player, ULF, phone cradle installation, activation of bluetooth, etc...).
- A control module for a new system/accessory is installed as part of a retrofit installation.

CIP FUNCTIONS - IF NO (NON MOST-BUS VEHICLES WITH VO)

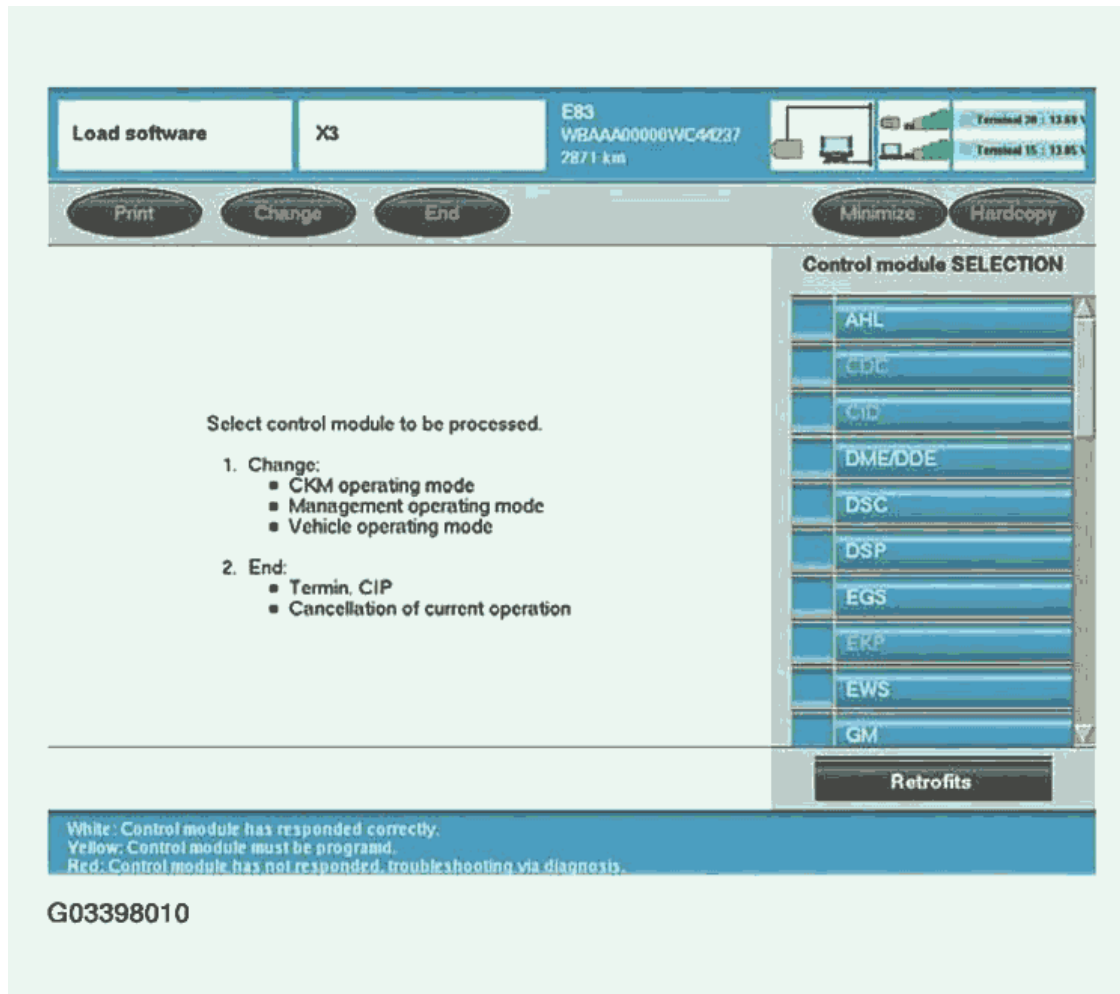

Fig. 156: Display Select Control Module Menu
 Courtesy of BMW OF NORTH AMERICA, INC.

Select the module to be reprogrammed

Or

Select "**Retrofits**" if an accessory function/feature is to be added or deleted.

Example: DME/DDE was selected on previous screen.

Programming is selected if:

- Checking for availability of updated software for selected control module.
- It is known that updated software is available for the selected control module. Replacement is selected if a module was replaced.

EWS is selected if:

- Alignment of EWS & DME must be performed

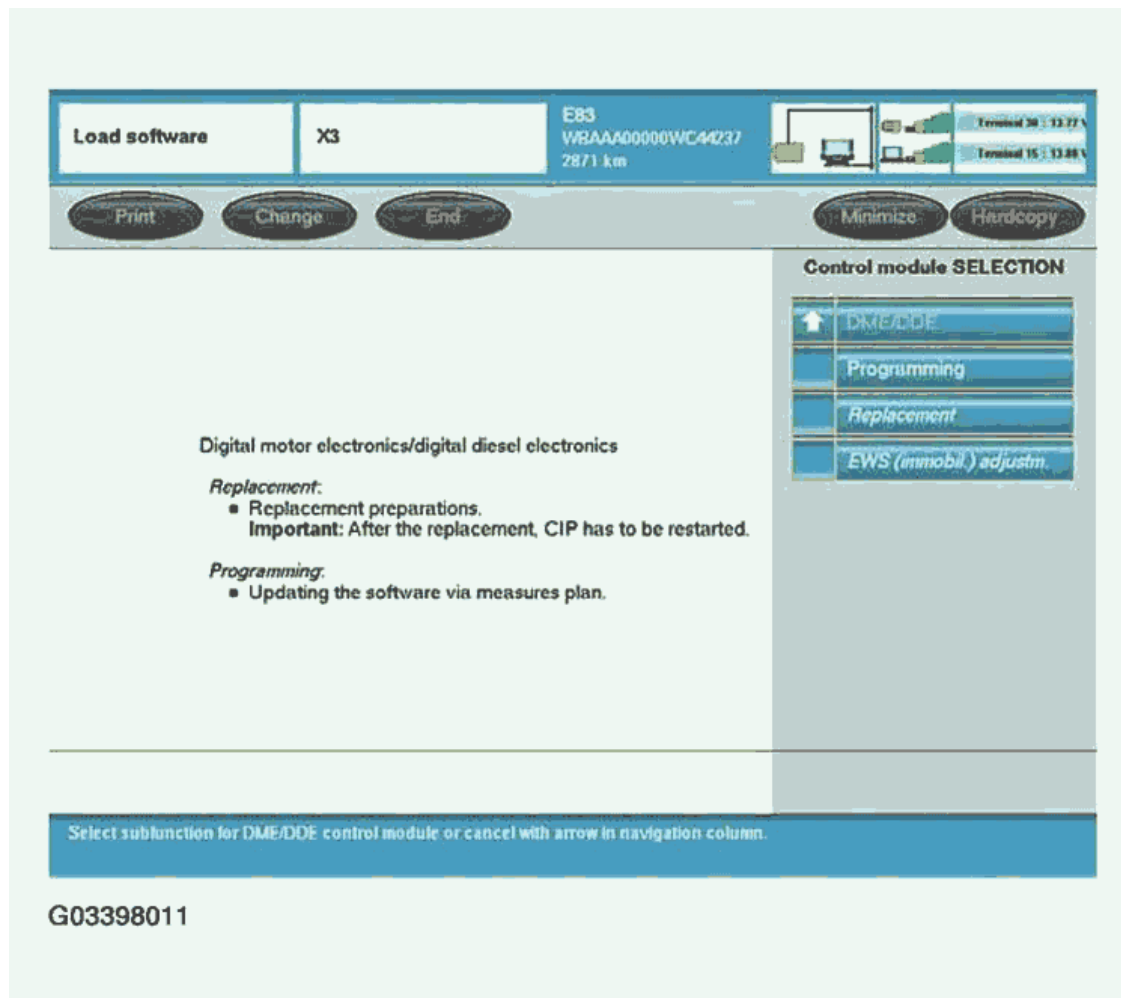

Fig. 157: Selecting Programming Button
Courtesy of BMW OF NORTH AMERICA, INC.

Example: Programming was selected on previous Screen.

Upon selecting "**Update software**" a measures plan will be generated that is specific to the module selected.

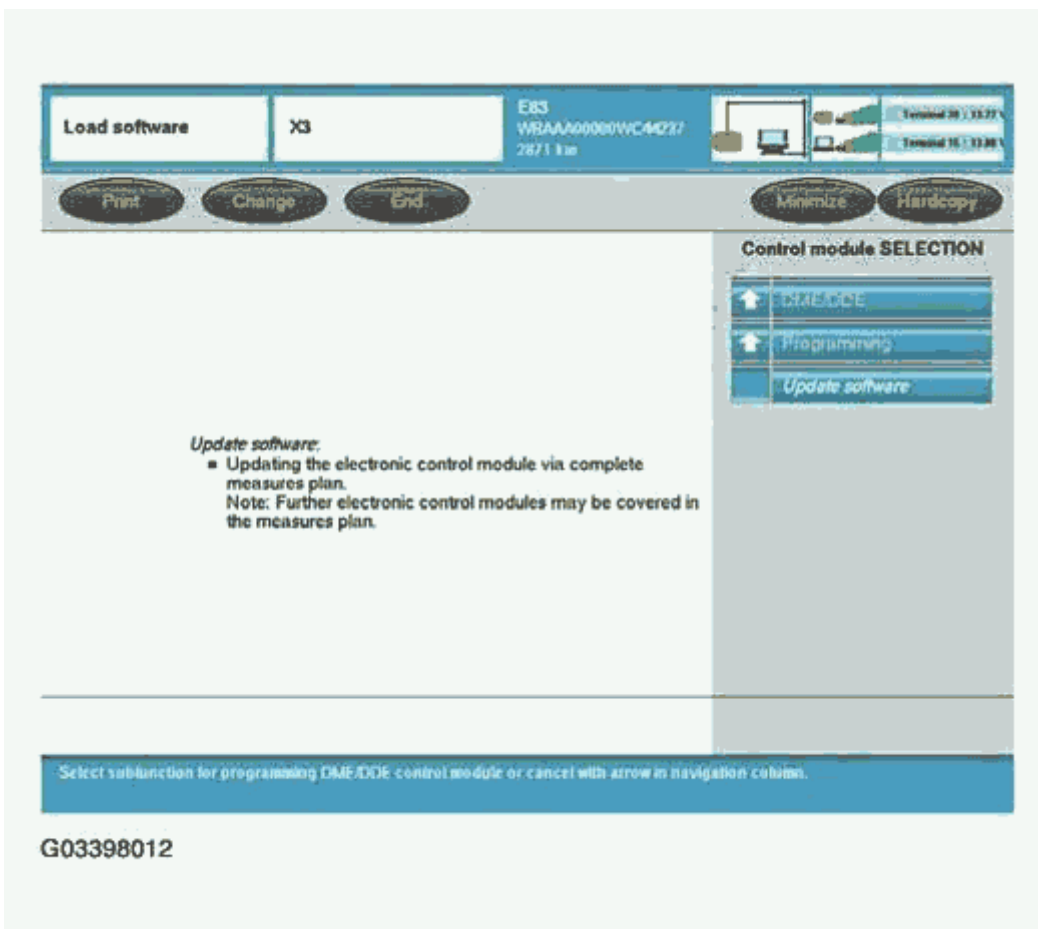

Fig. 158: Selecting Update Software

Courtesy of BMW OF NORTH AMERICA, INC.

A measures plan for the selected system/module is displayed.

A measures plan identifies the programmed part number for the control module(s) installed:

- "Old part no. progr. ctrl. mod." - indicates p/n for software currently installed.
- "New part no. progr. ctrl. mod." - indicates the p/n if the module is updated, by accepting the displayed measures plan the module will be updated to the new number and software.

NOTE: **The "update" does not need to be performed if the two part numbers are the same.**

G03398013

Fig. 159: Display Select Measures Plan Screen
 Courtesy of BMW OF NORTH AMERICA, INC.

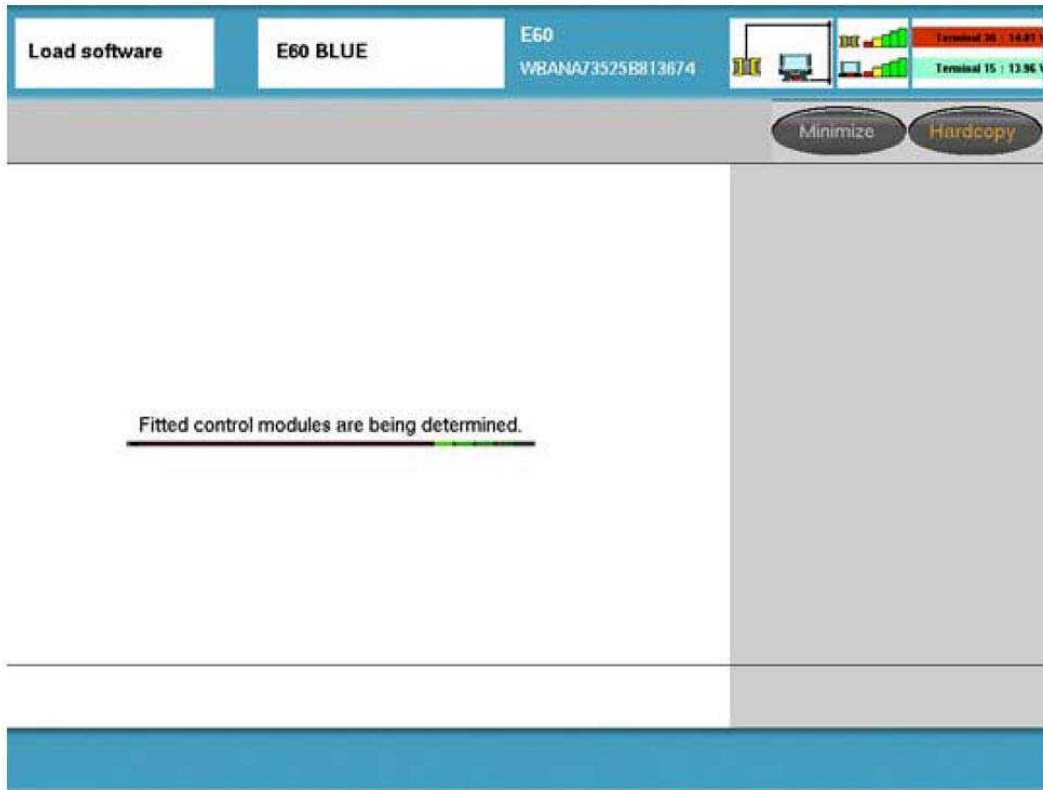

On vehicles without a MOST-Bus, a "Measures plan" provides information on updates that are available for the selected control module. By selecting accept, only the module listed in the measures plan will be updated.

NOTE: Prior to selecting accept, printout a copy of the measures plan and attach it to the repair order to document the work performed.

IMPORTANT: If the measures plan identifies any control modules that will need to be replaced exit CIP.

CIP FUNCTIONS - IF NO (MOST-BUS VEHICLES)

After selecting "No" CIP evaluates the installed control modules to determine if any updates are required.

G03398014

Fig. 160: Display Fitted Control Module Determined
Courtesy of BMW OF NORTH AMERICA, INC.

Once the evaluation is completed and CIP determines that there are updates available a "Status report" is generated.

NOTE: Status report is similar to a measures plan.

The status report identifies the control modules for which an update is available and also indicates if the module will need to be reprogrammed or replaced.

Information is also provided indicating the current programmed part number and also what the number should be after an update is performed.

Control Module Selection-Programming-Special Measures

IMPORTANT: The "Special Measures" function is only to be used in the event that a control module(s) can not be programmed during the "Update Software" process that is executed as a result of a developed "Measures plan"/"Status report" or specific instructions are given in a Service Information Bulletin which require the use of special measures to update a module.

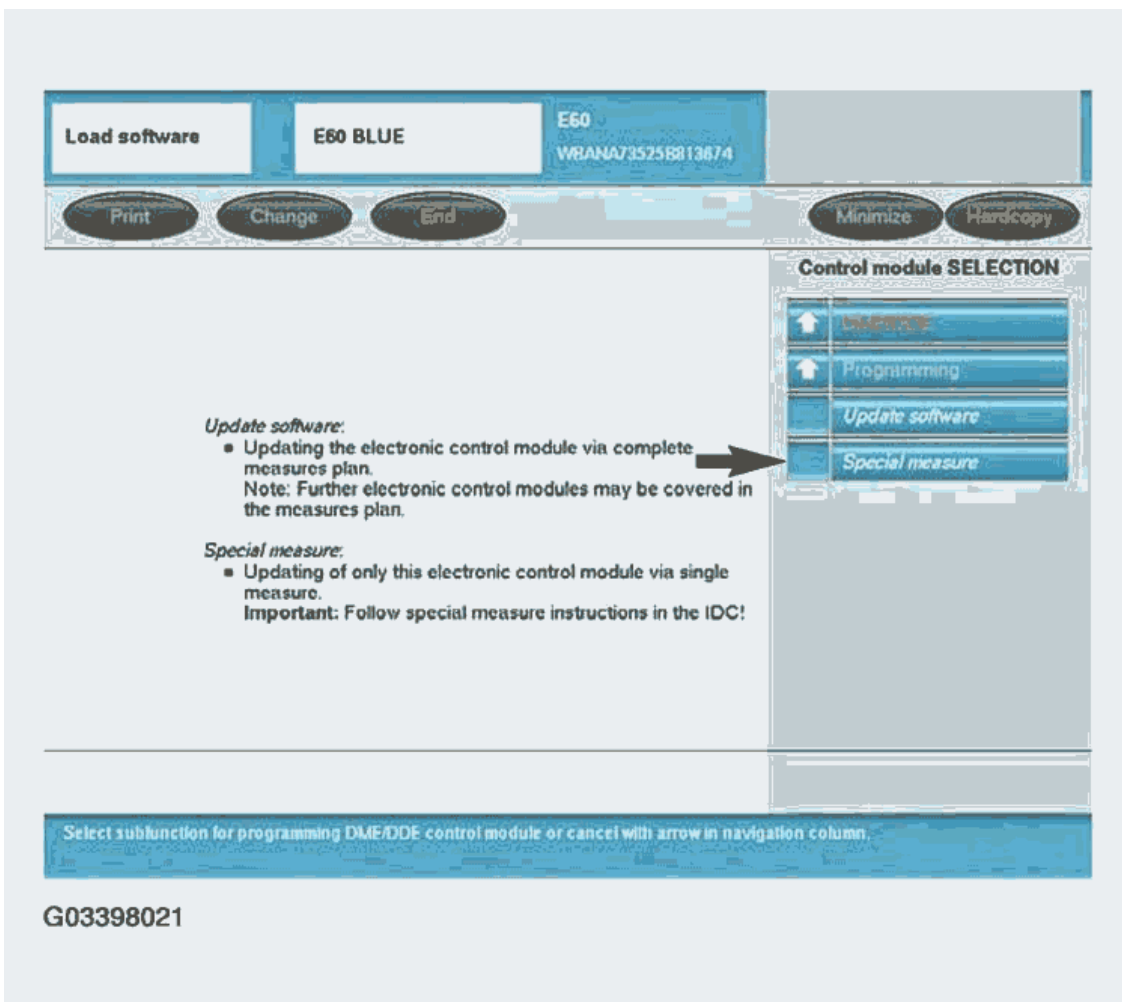

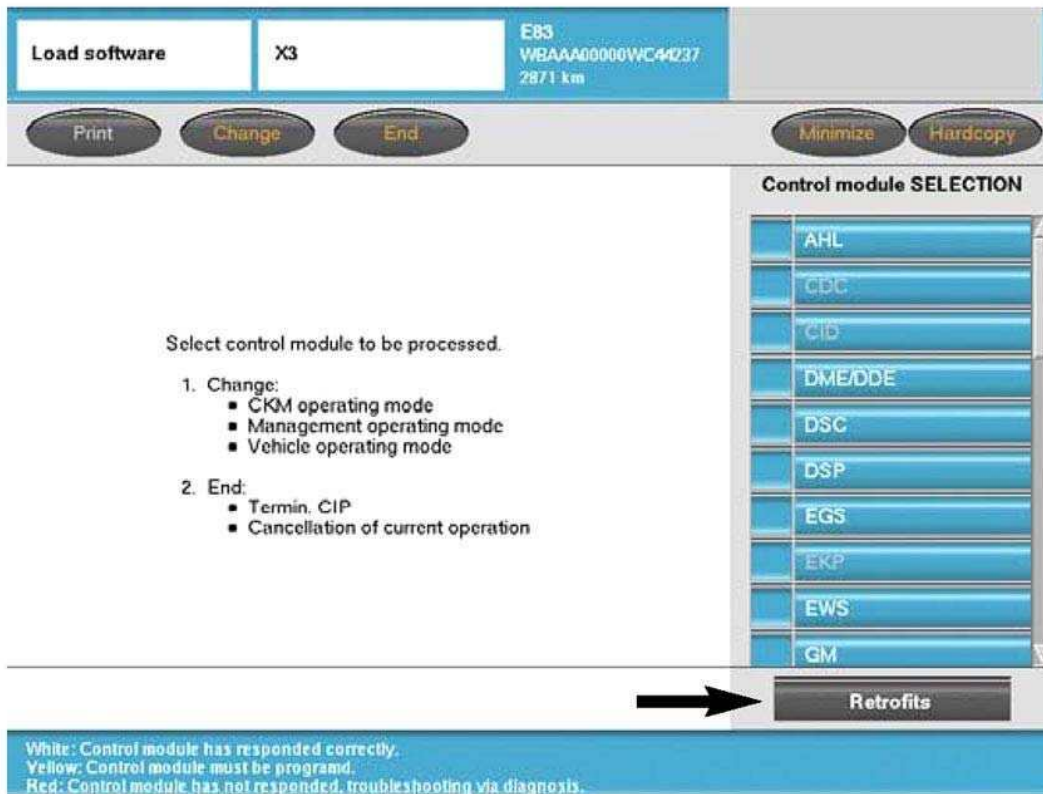

Fig. 167: Selecting Special Measure Button
Courtesy of BMW OF NORTH AMERICA, INC.

In the event that a control module(s) can not be programmed successfully the information will appear next to the specific module(s) in the final report, which is generated upon completion of an update or "Measures plan".

Retrofits

Select "**Retrofits**" to view a list of functions/features that can be modified or installed.

G03398022

Fig. 168: Selecting Retrofits Button

Courtesy of BMW OF NORTH AMERICA, INC.

The initial screen displays information pertaining to:

- Airbag activation/deactivation
- Telematics On/Off
- Language (setting control display/monitor language)
- Maintenance interval - reset/checking
- USA-Canada conversion
- Retrofits - listing accessories installed or available for installation.

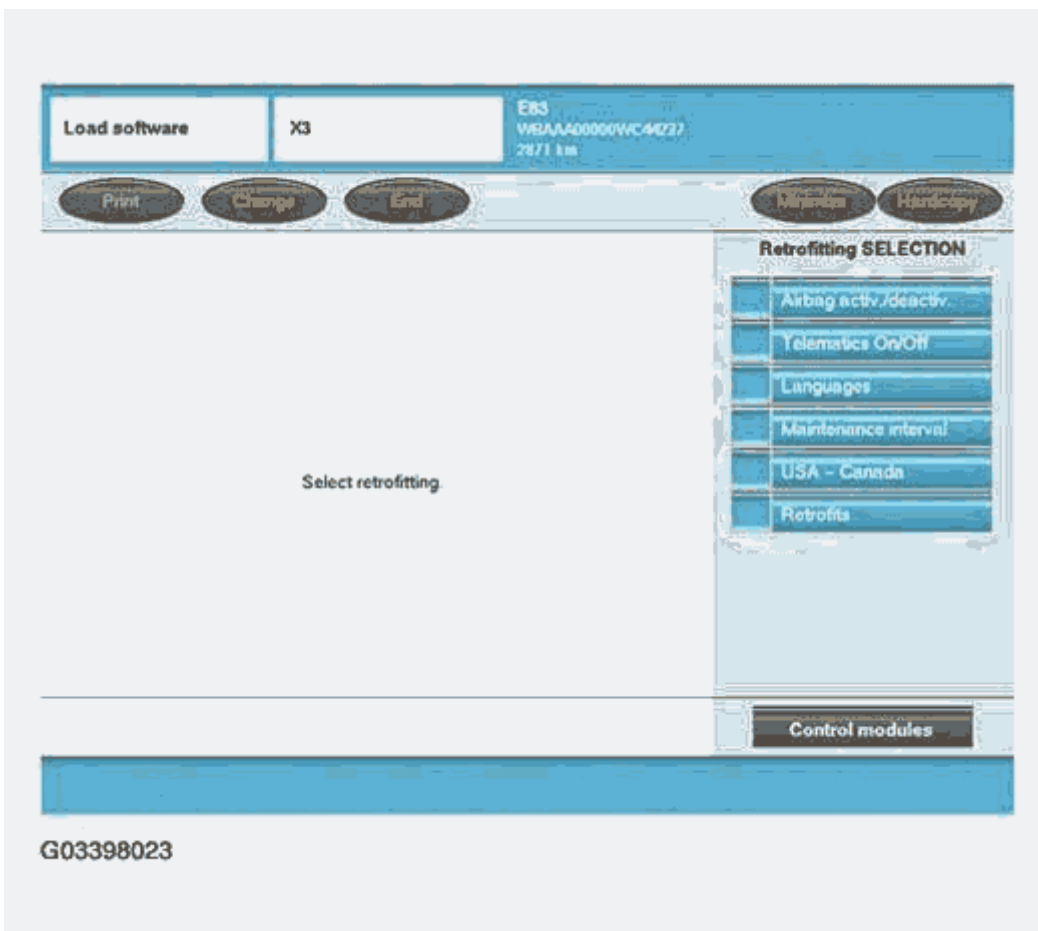

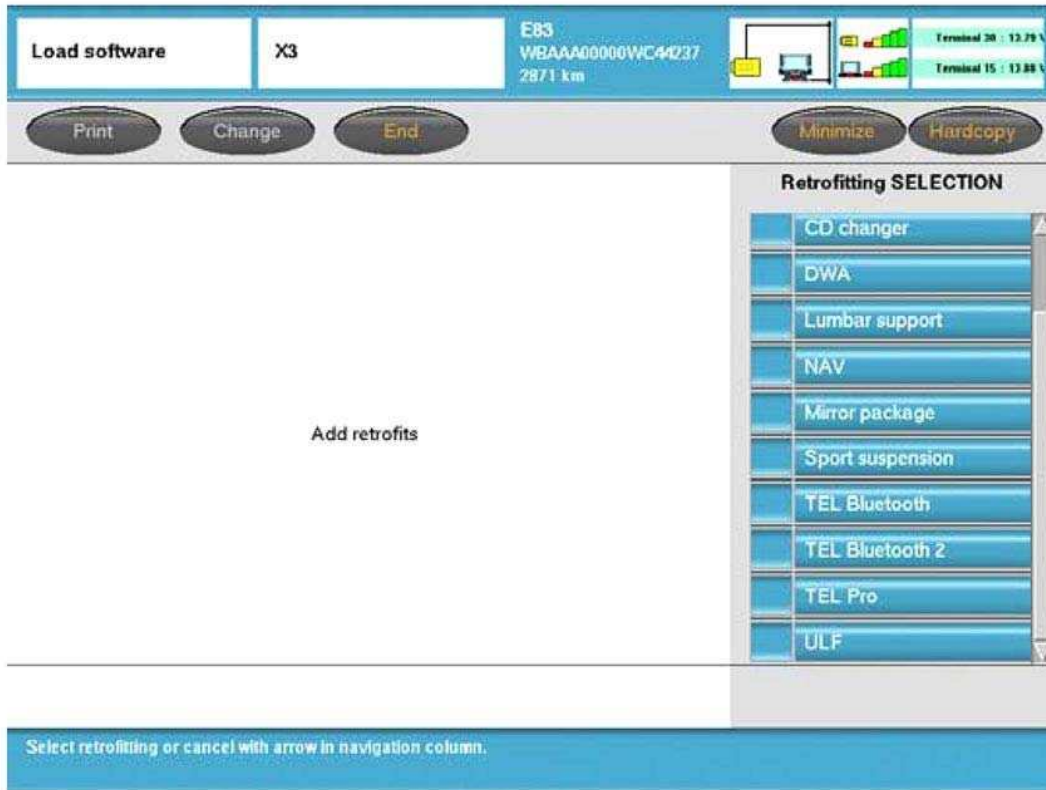

Fig. 169: Display Retrofitting Selection Screen
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "**Retrofits**" on the previous screen a list of accessory systems available for installation is obtained.

NOTE: **Some of the items listed may not be available as retrofits for US vehicles.**

G03398024

Fig. 170: Display Add Retrofits
Courtesy of BMW OF NORTH AMERICA, INC.

Example: ULF was selected on previous screen.

If this system/module is installed the vehicle order will be modified to reflect the addition of this module/accessory to the vehicle by selecting "**Continue**".

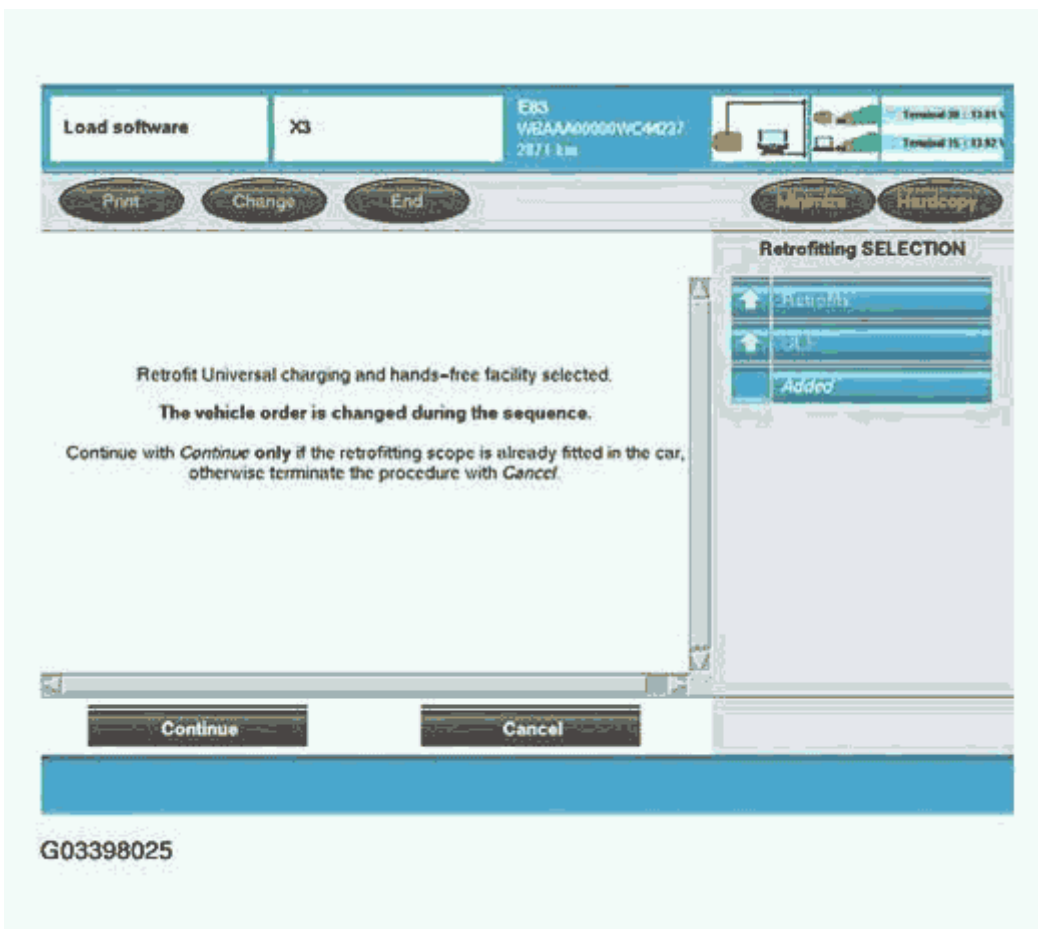

Fig. 171: Selecting Continue Button

Courtesy of BMW OF NORTH AMERICA, INC.

MANAGEMENT

"Management" can be selected from the main/initial CIP screen.

Fig. 172: Selecting "Management" From Main/Initial CIP Screen (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Or

"Management" can be selected from the Main CIP Selection screen.

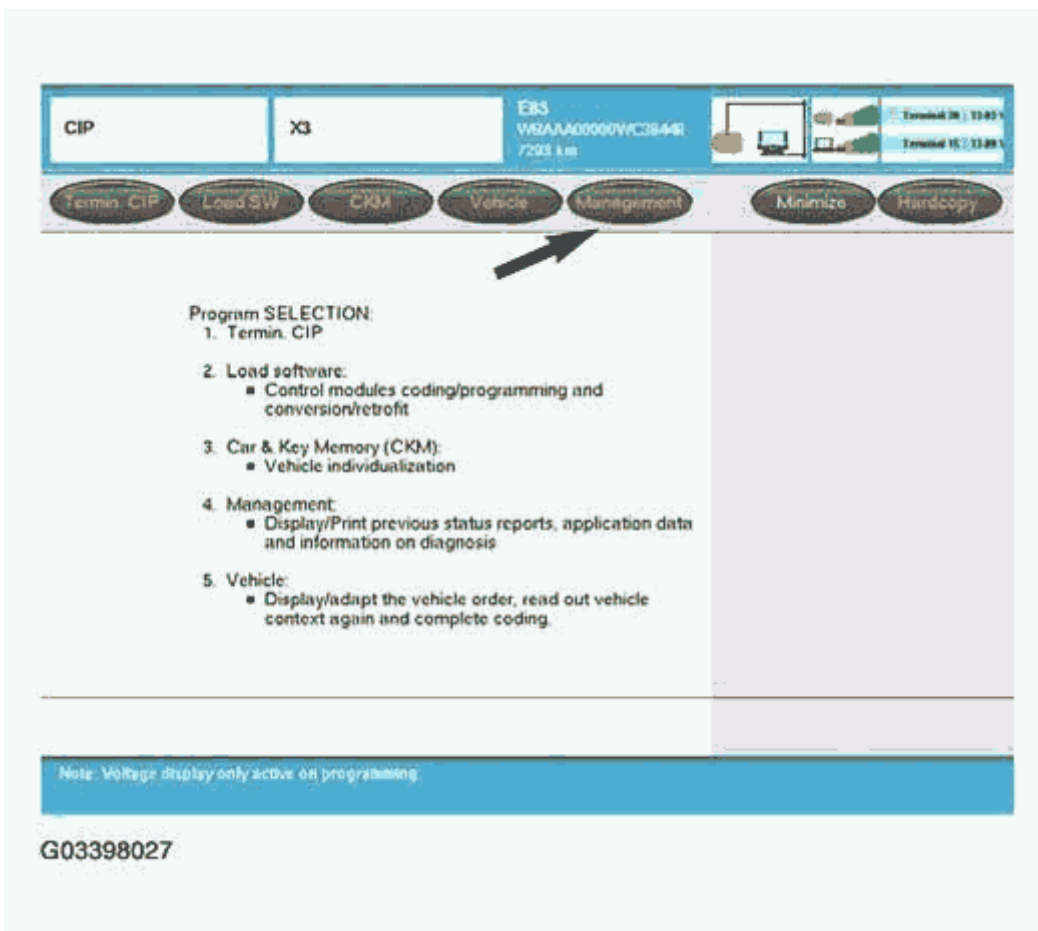

Fig. 173: Selecting "Management" From Main/Initial CIP Screen (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Management" the following functions can be accessed:

- Print previously performed Service Measure reports
- Display the current version of CIP installed
- Run a test on the software currently installed on the system (SSS)

Management - Reports

To access the most recently generated measures plans select "**Reports**".

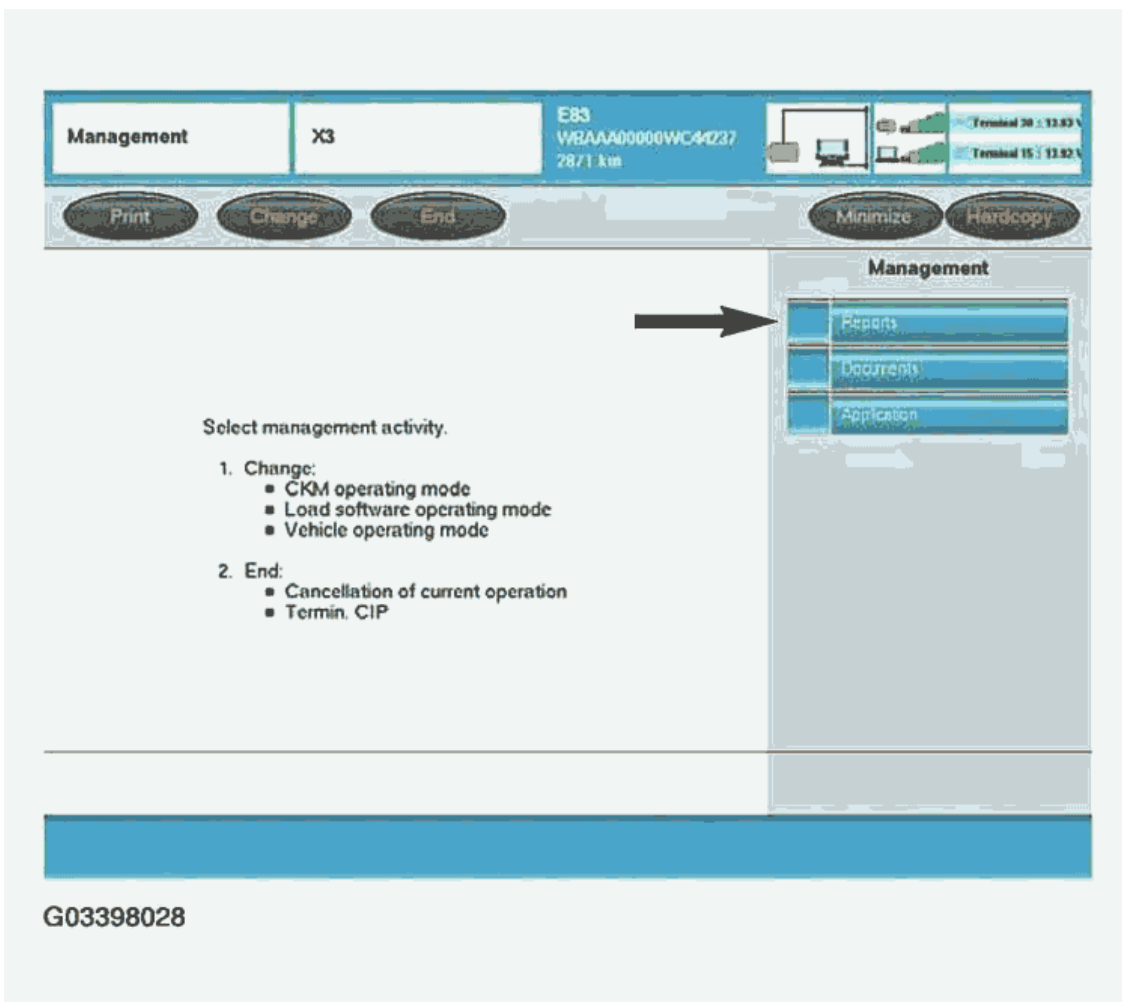

Fig. 174: Selecting Reports Button

Courtesy of BMW OF NORTH AMERICA, INC.

The 16 most recently generated measures plans can be accessed/viewed.

NOTE: The reports are not specific to the vehicle currently connected but are a cumulative listing of vehicles recently connected/accessed using CIP via a specific SSS.

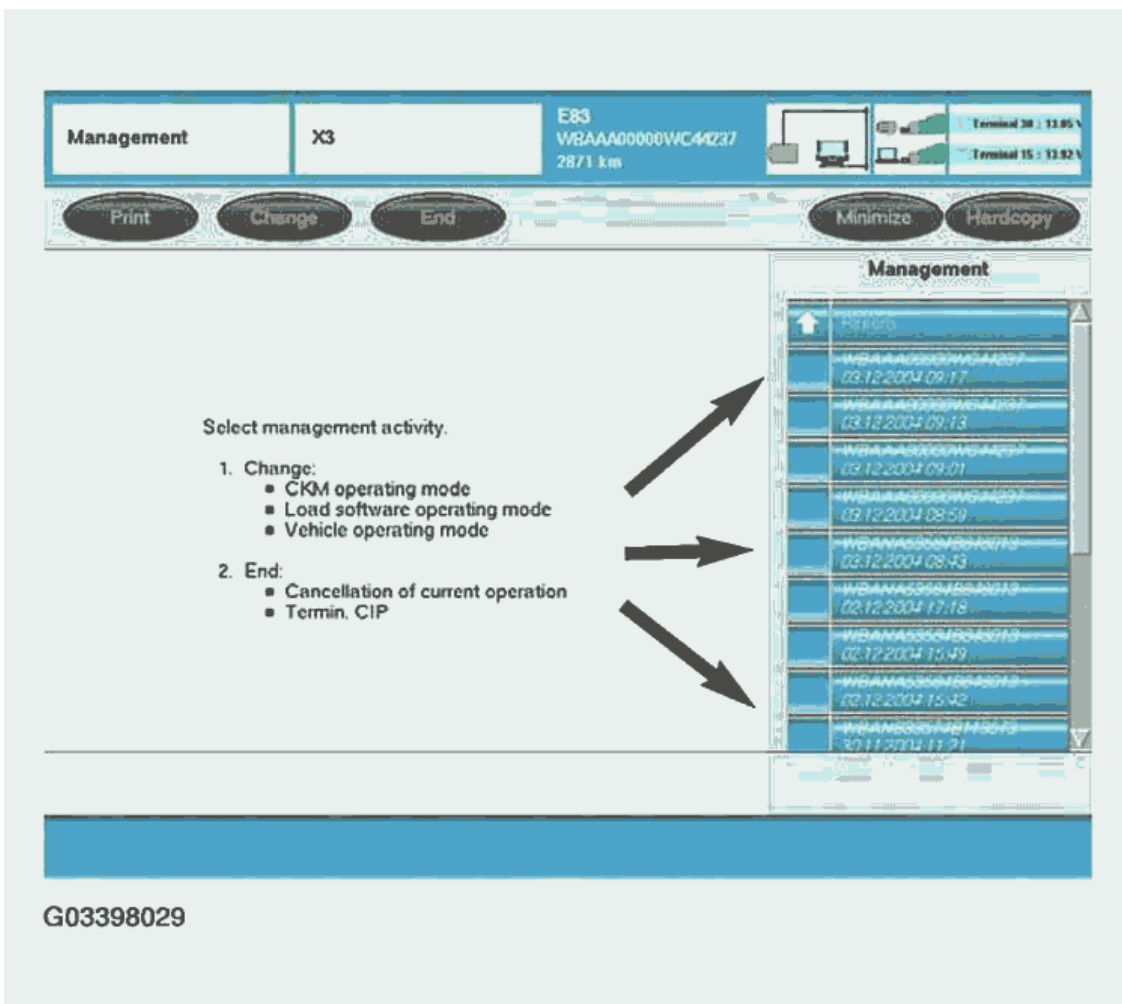

Fig. 175: Display Management Screen
 Courtesy of BMW OF NORTH AMERICA, INC.

Management - Application - Test & Version

The "Application" function provides the ability to:

- Run a system test
- Determine information regarding the version of CIP currently installed

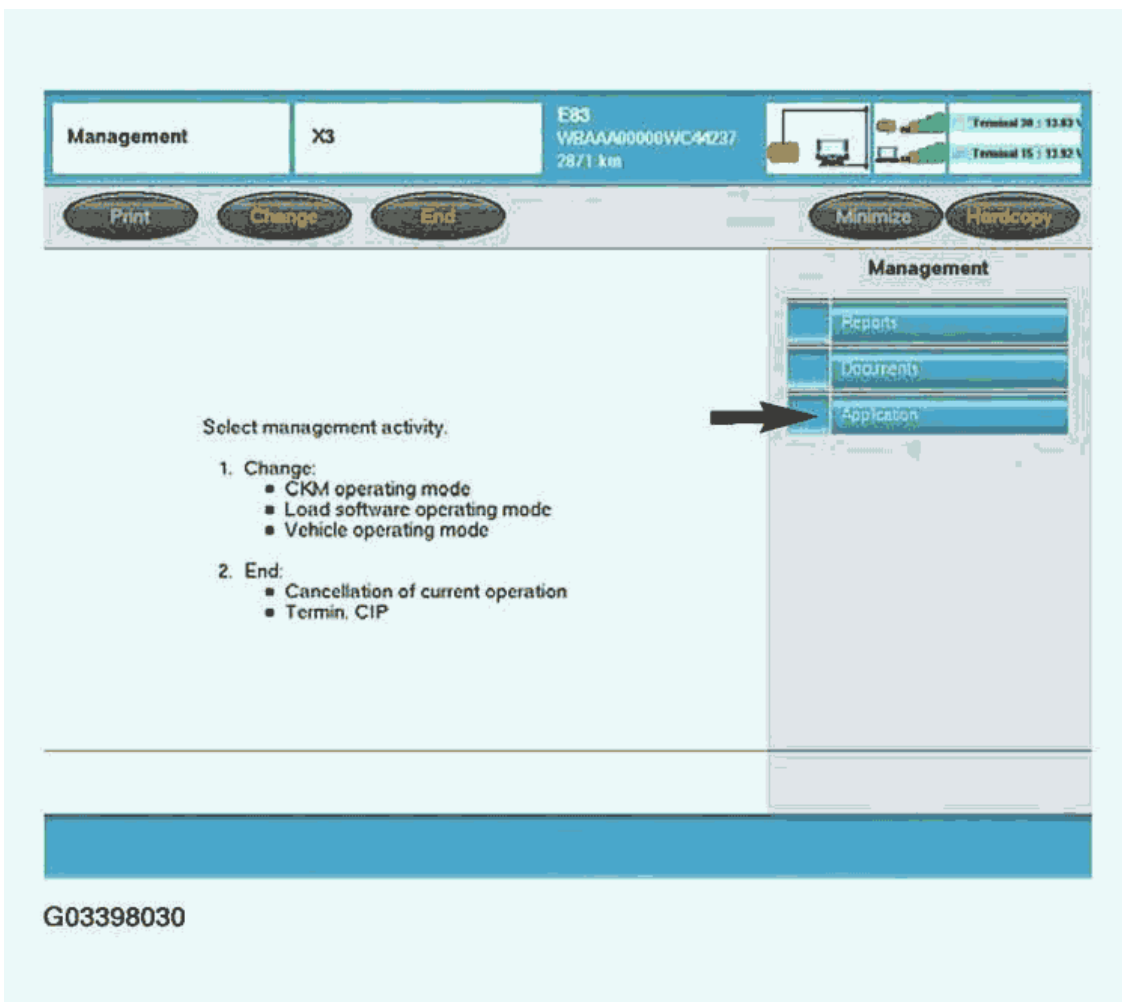

Fig. 176: Selecting Application Button
Courtesy of BMW OF NORTH AMERICA, INC.

Select "Test" if system files are to be checked.

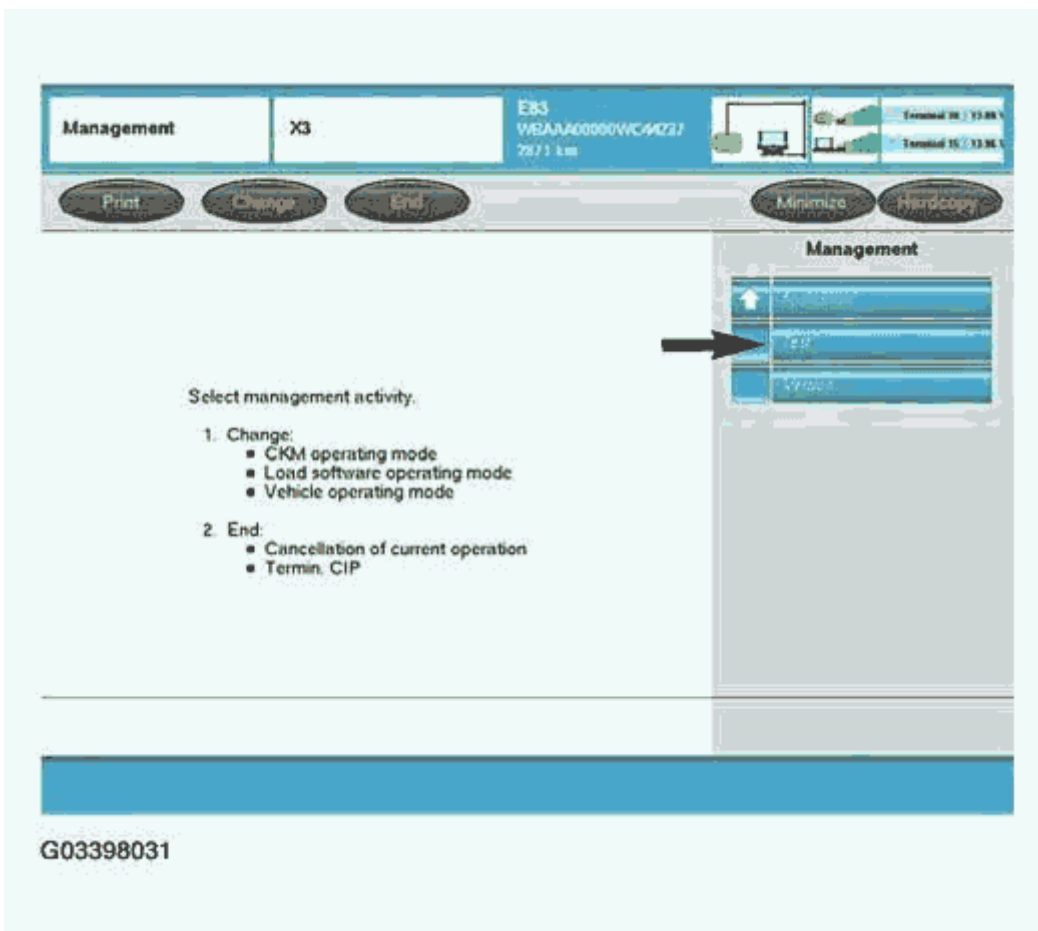

Fig. 177: Selecting Test Button

Courtesy of BMW OF NORTH AMERICA, INC.

By selecting the "Start" button a brief test of the system files will be performed.

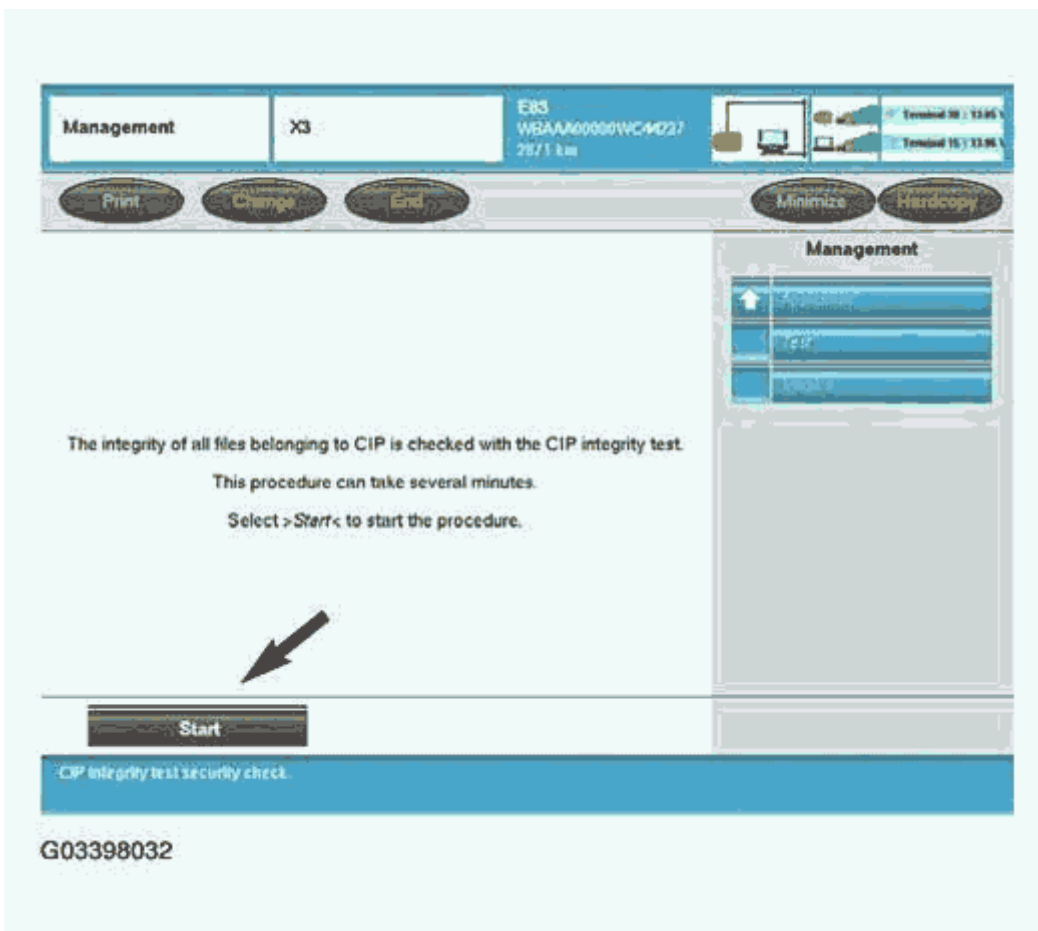

Fig. 178: Selecting Start Button

Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Version" installed application information will be displayed.

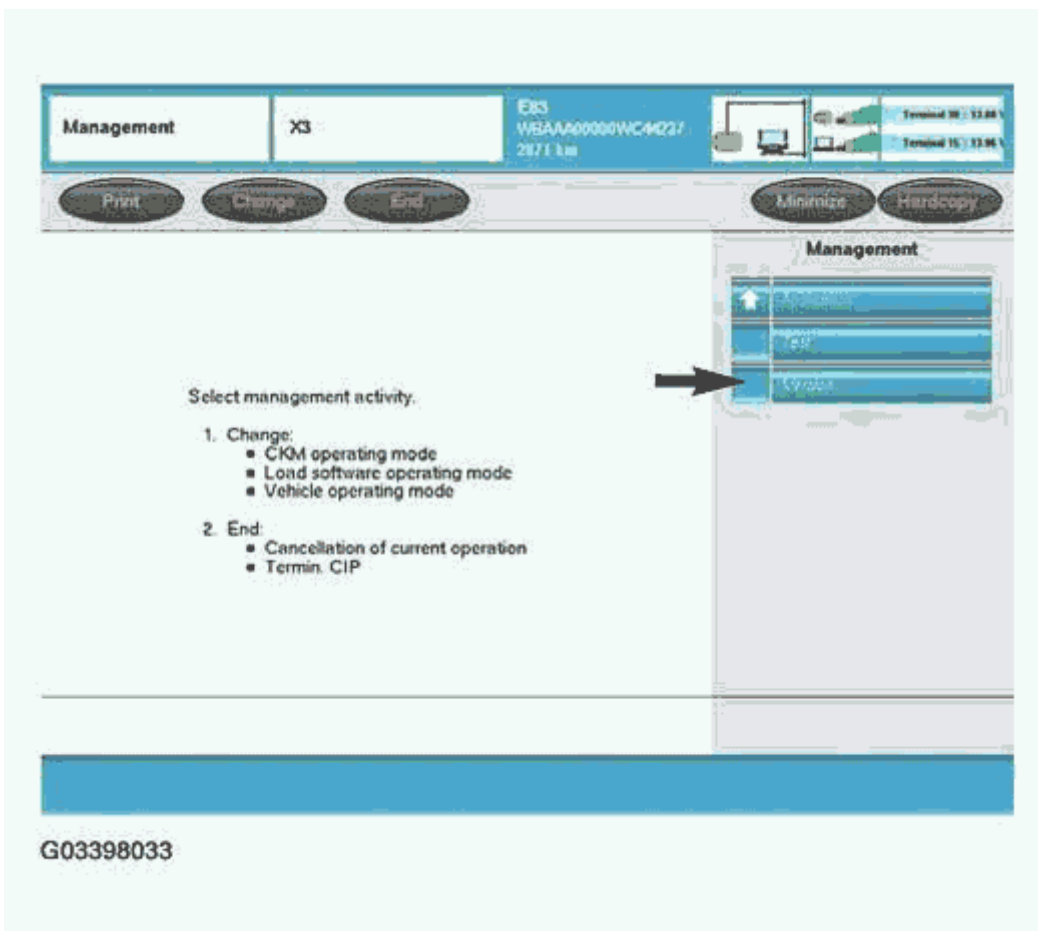

Fig. 179: Selecting Version Button

Courtesy of BMW OF NORTH AMERICA, INC.

A list of the various files/applications installed as well as their software levels is displayed.

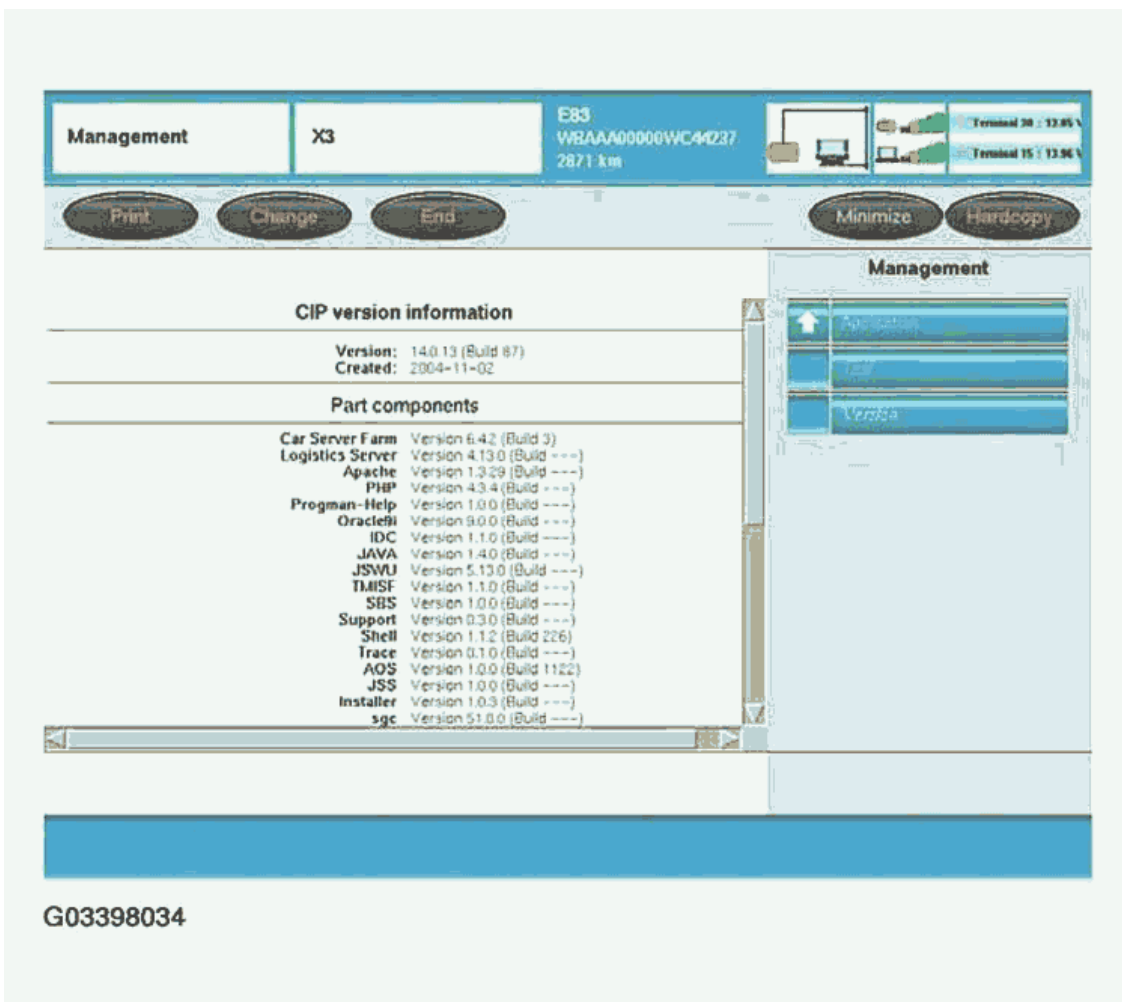

Fig. 180: Display CIP Version Information List
 Courtesy of BMW OF NORTH AMERICA, INC.

VEHICLE

"Vehicle" can be selected from the main CIP selection screen to access additional functions:

- Vehicle order
- Initialization
- Service functions
- Complete encoding

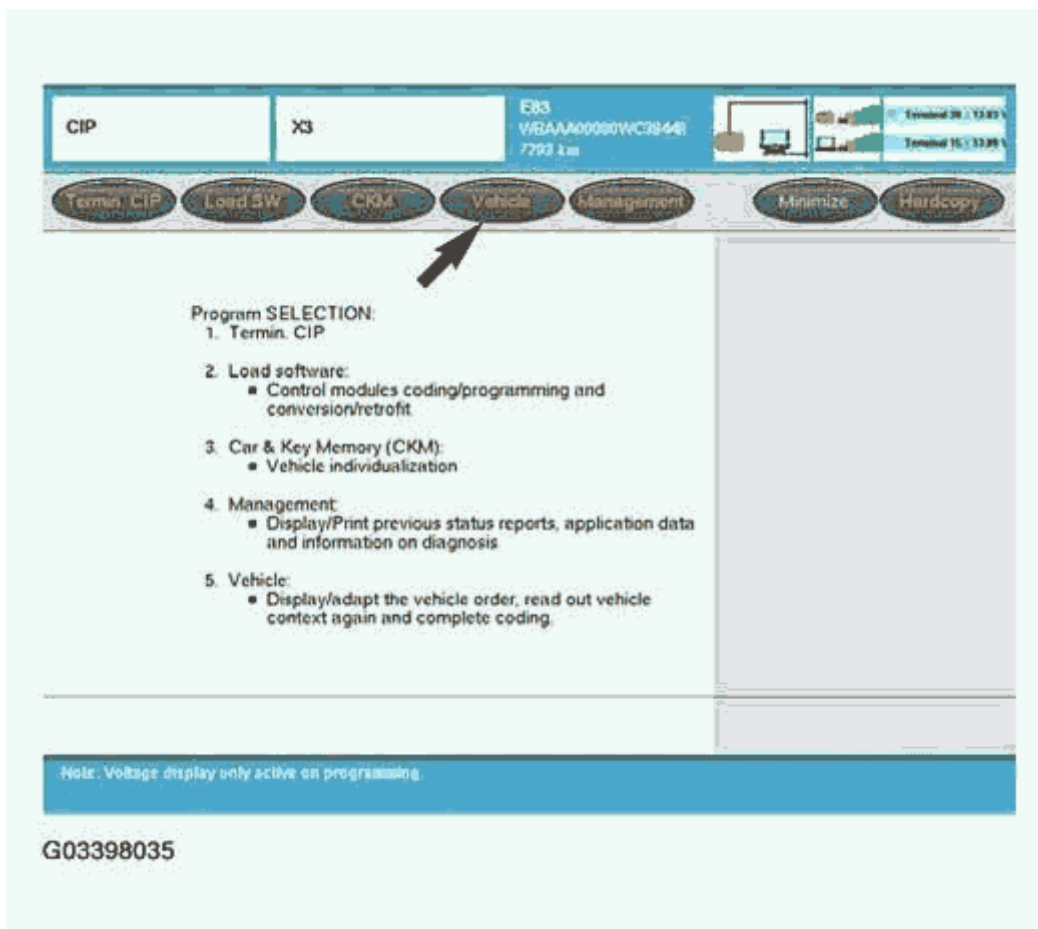

Fig. 181: Selecting Vehicle Button From Main CIP Selection Screen
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Vehicle" the following functions can be accessed:

- Vehicle Order
- Initialization
- Service functions
- Complete encoding

Vehicle - Vehicle Order

By selecting "**Vehicle order**" the ability to adapt/modify the vehicle order can be accessed.

NOTE: Changing the vehicle order may affect vehicle operation. Modifying the vehicle order should only be performed when directed to do so by the Technical Hotline, Service Information Bulletin or Aftersales Installation Instructions.

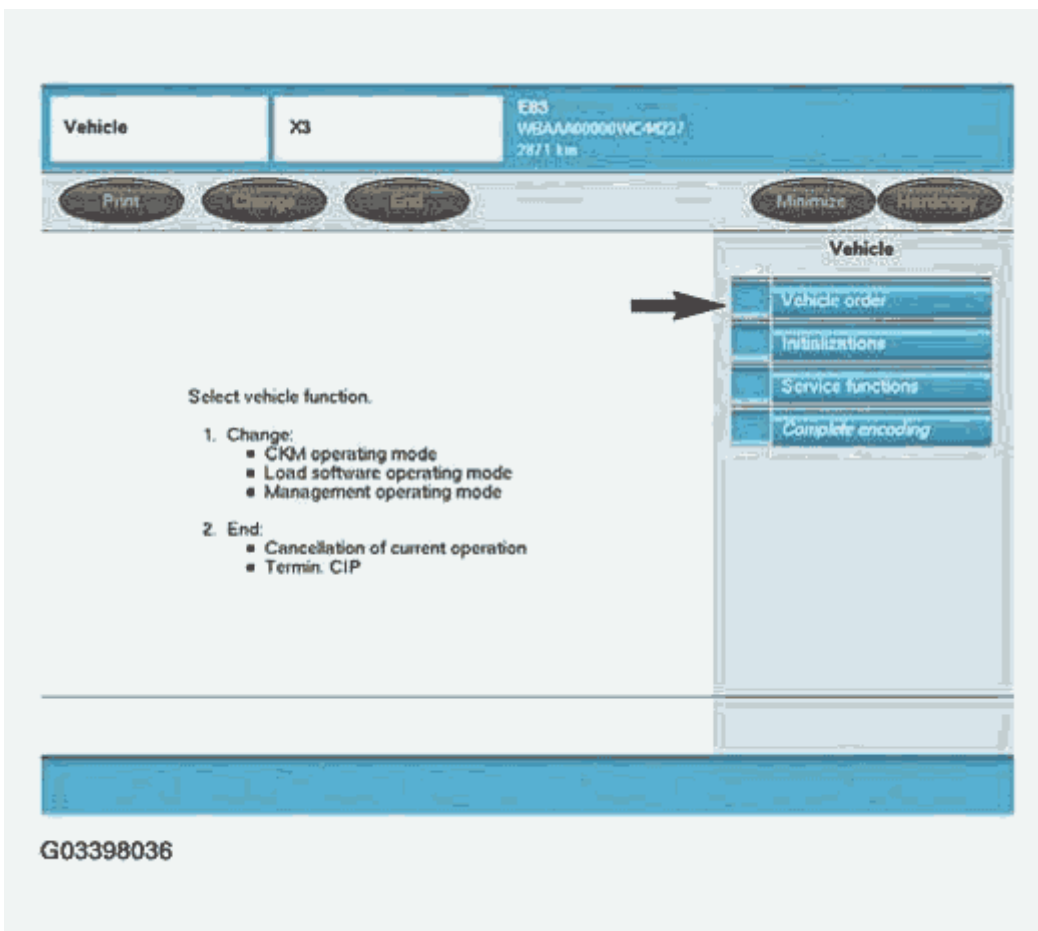

Fig. 182: Selecting Vehicle Order Button

Courtesy of BMW OF NORTH AMERICA, INC.

Selection of "Adapt VO" provides the ability to install a modified Vehicle Order file.

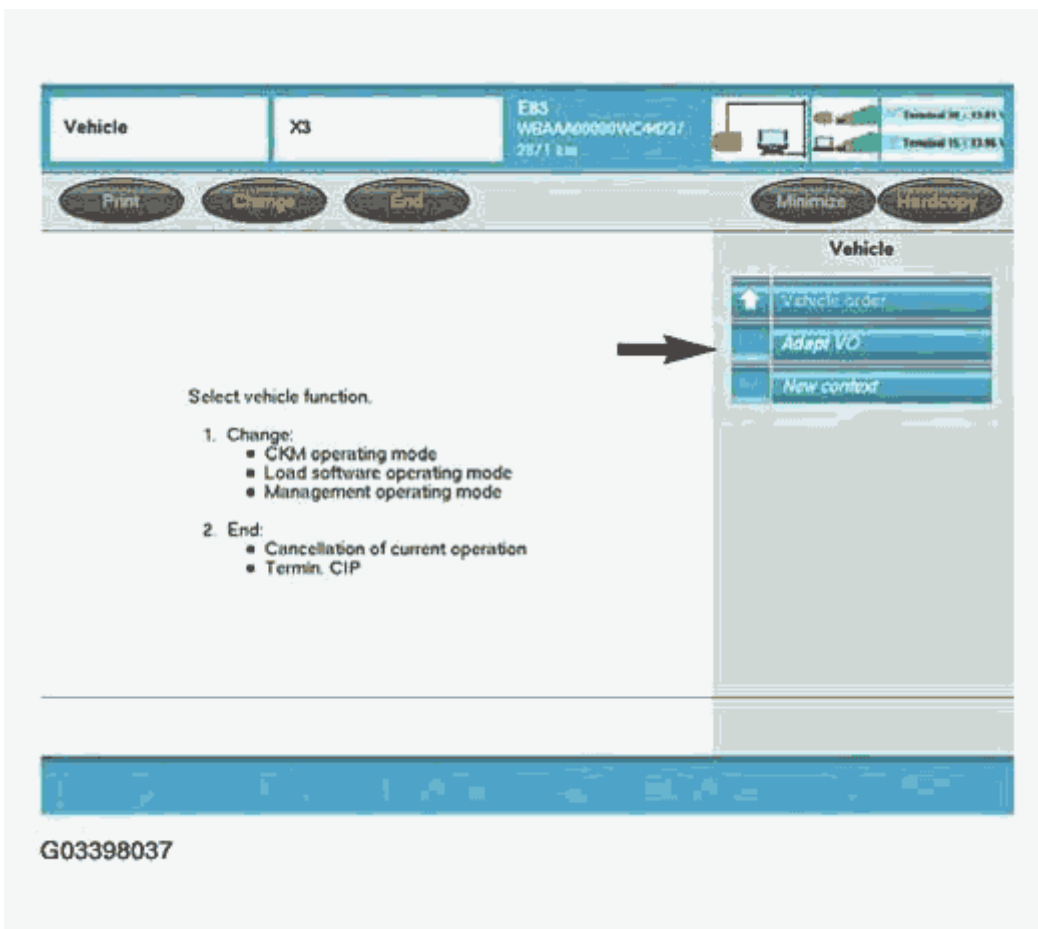

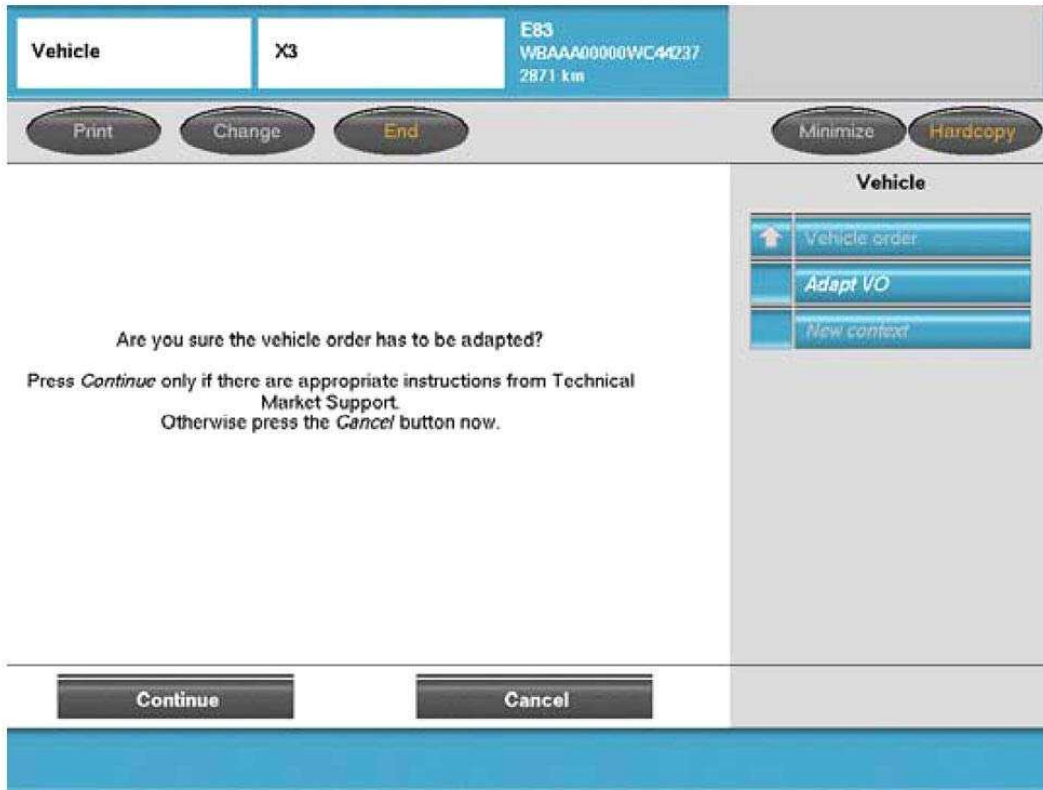

Fig. 183: Selecting Adapt VO Button

Courtesy of BMW OF NORTH AMERICA, INC.

Before selecting "Continue" a floppy disk (1.44) containing the modified/new vehicle order must be inserted into the disk drive of the SSS.

NOTE: The modified VO file is obtained from the Technical Hotline by submitting a PUMA case requesting a modified VO, the PUMA case should indicate what accessory/feature needs to be added or removed. The modified file will be sent via E-mail and must be copied on to a 1.44" floppy disk. Do not attempt to open the received file on a PC, as this may corrupt the data contained in the file.

G03398038

Fig. 184: Selecting Continue Button
Courtesy of BMW OF NORTH AMERICA, INC.

Vehicle - Initialization

The "**Initialization**" function provides access to three different functions:

- Start system time - Used to synchronize all modules contained on the vehicles bytflight bus.
- Delete fault memory
- CAS or EWS calibration

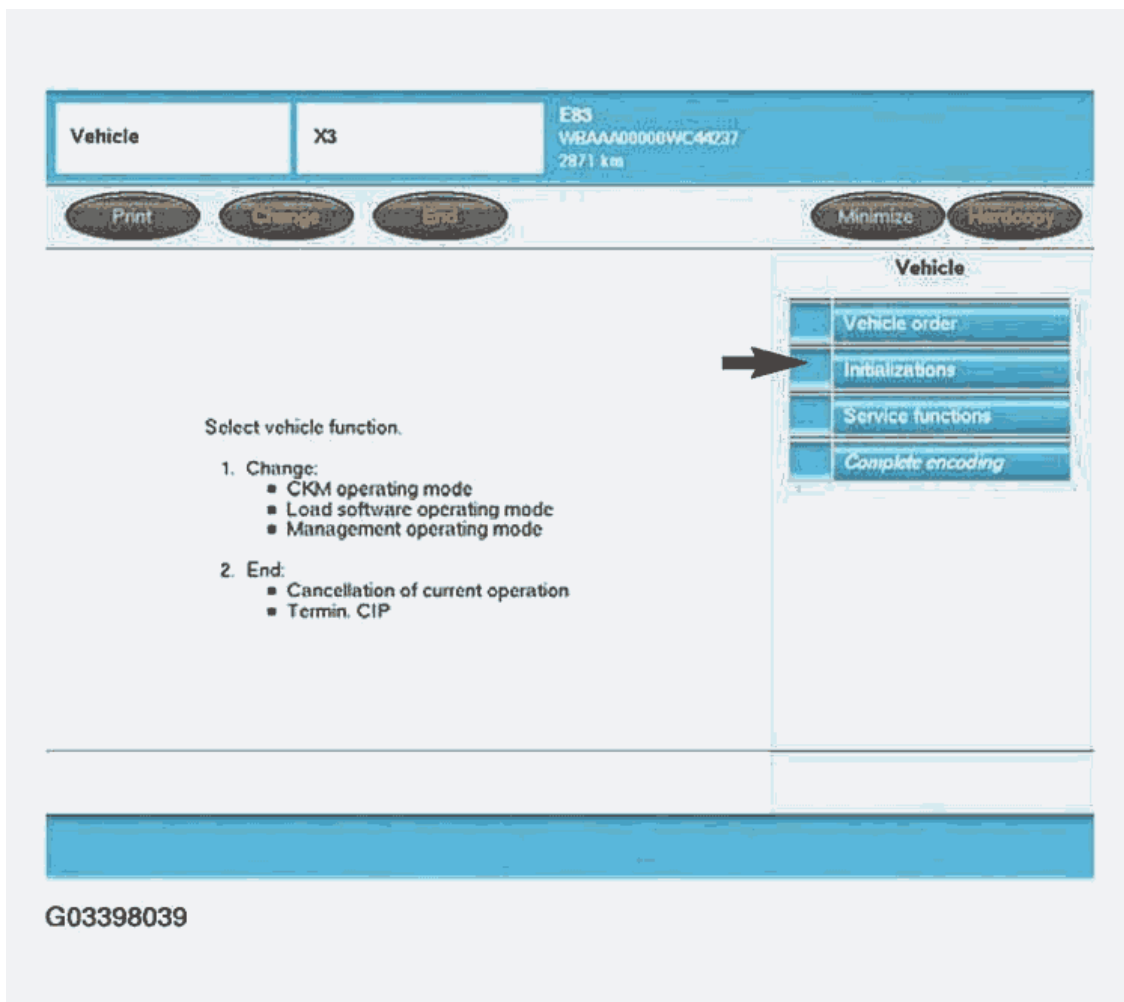

Fig. 185: Selecting Initialization Button
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Delete fault memory" the fault memory of all installed control modules will be cleared.

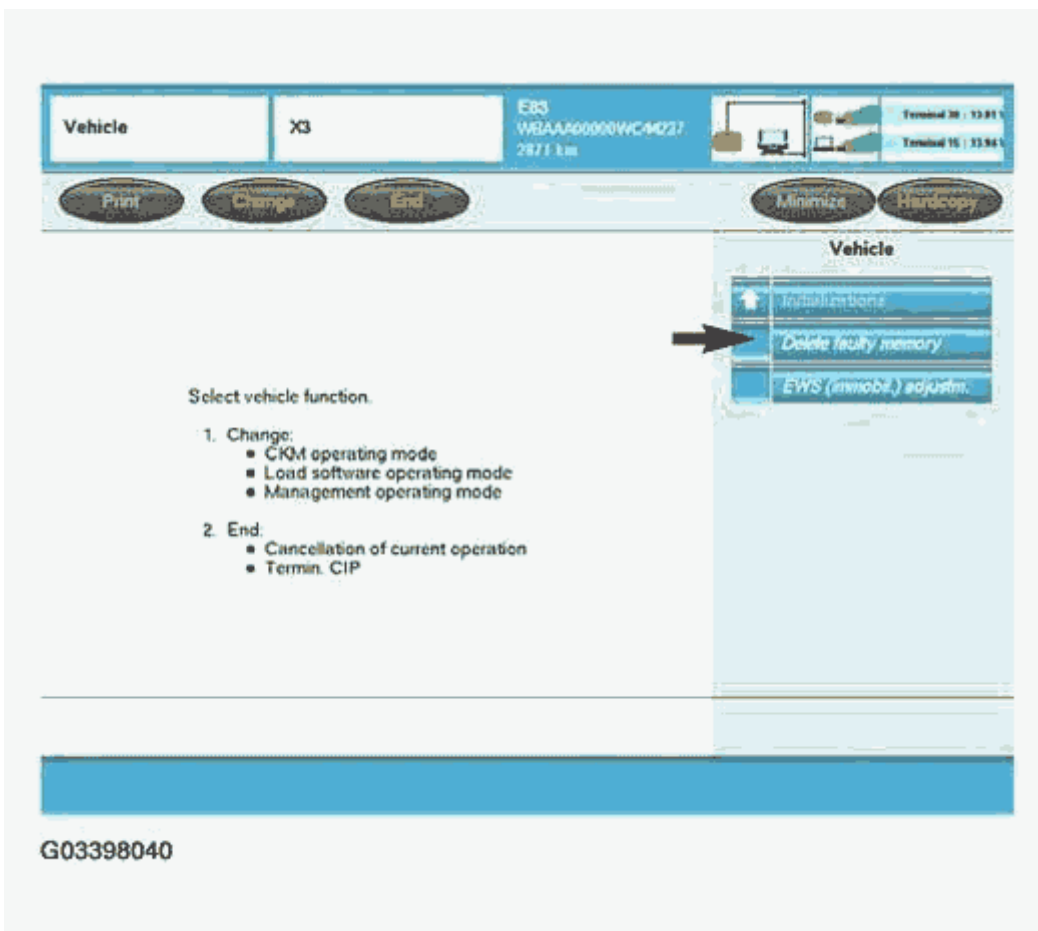

Fig. 186: Selecting Delete Fault Memory Button
Courtesy of BMW OF NORTH AMERICA, INC.

Displays a report pertaining to the clearing of the fault memory on all installed modules.

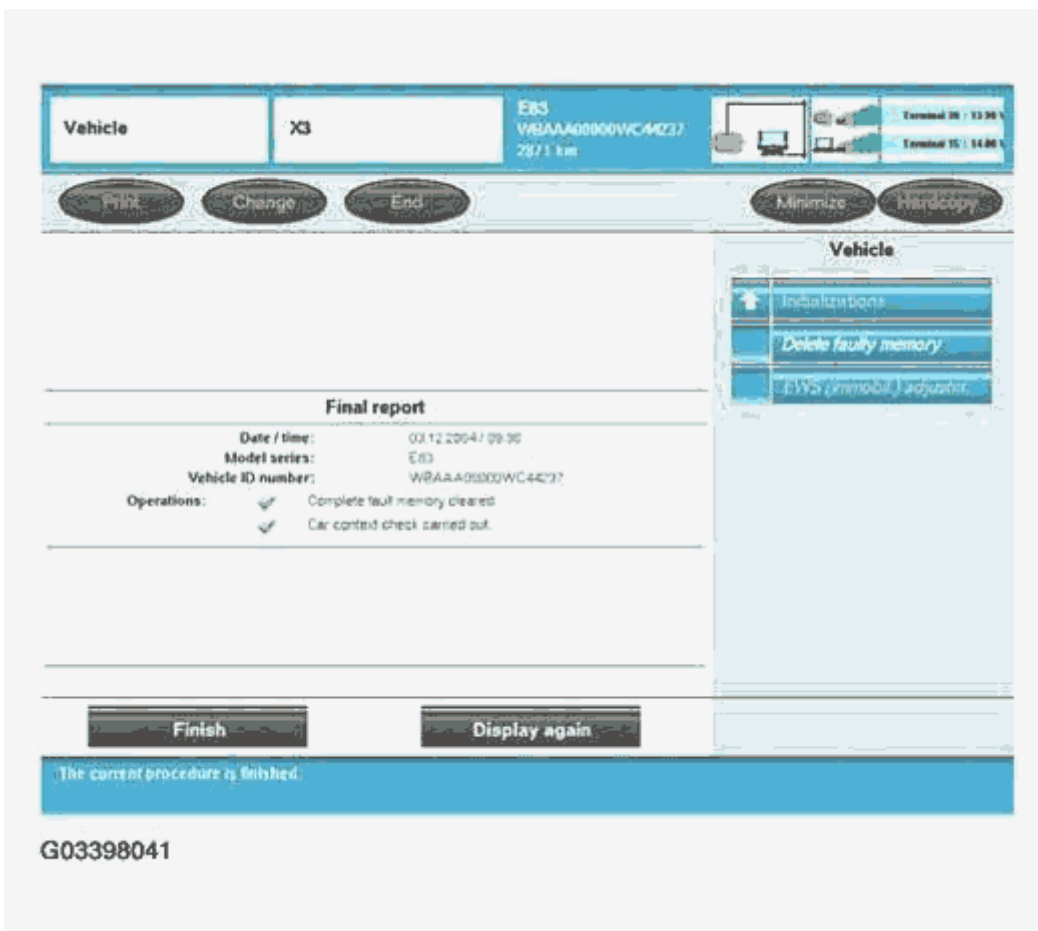

Fig. 187: Display Final Report

Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "EWS adjustm." or "CAS Calibration" the rolling code tables can be initialized.

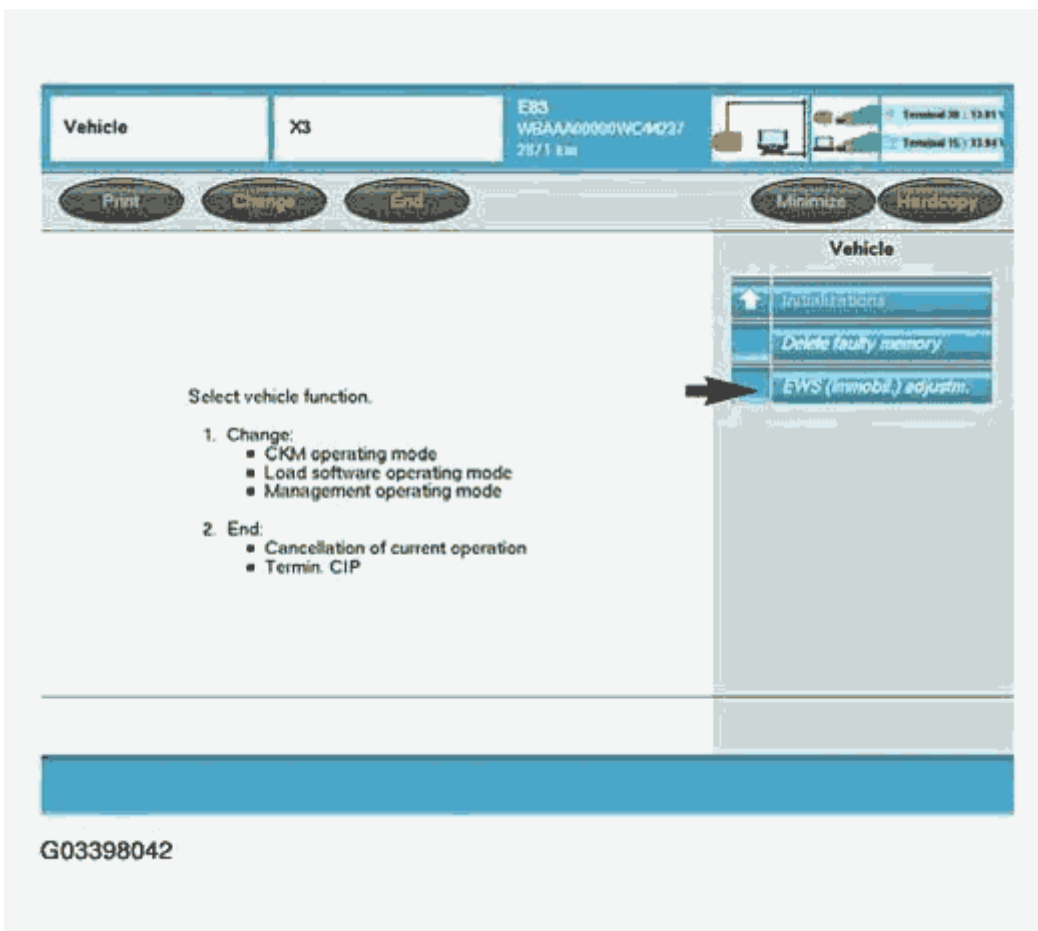

Fig. 188: Selecting EWS Adjustment Button
Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Yes" the calibration/initialization of the rolling code tables in the DME and CAS or EWS modules will be carried out.

Fig. 189: Selecting YES Button

Courtesy of BMW OF NORTH AMERICA, INC.

Vehicle - Service Function

The "Service function" feature provides access to various calibration functions.

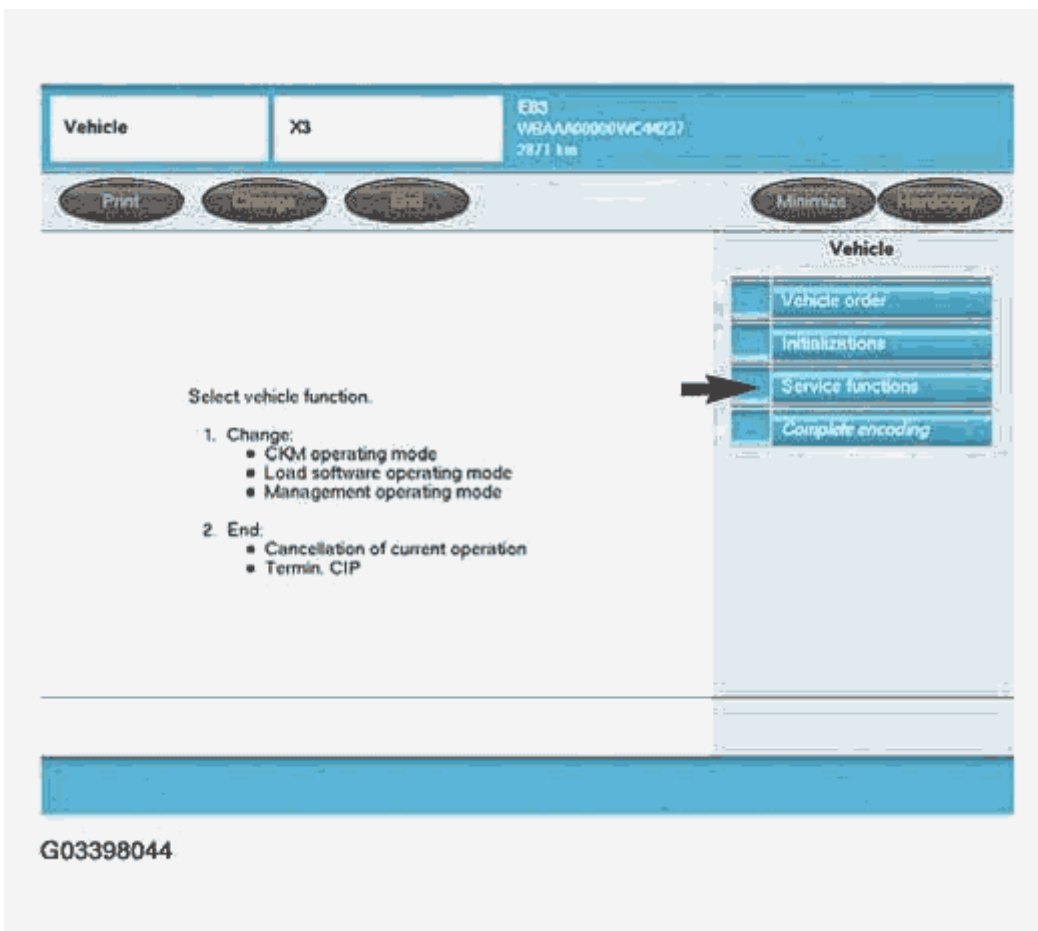

Fig. 190: Selecting Service Function Button

Courtesy of BMW OF NORTH AMERICA, INC.

Selecting "LWS" will provide the ability to calibrate the steering angle sensor.

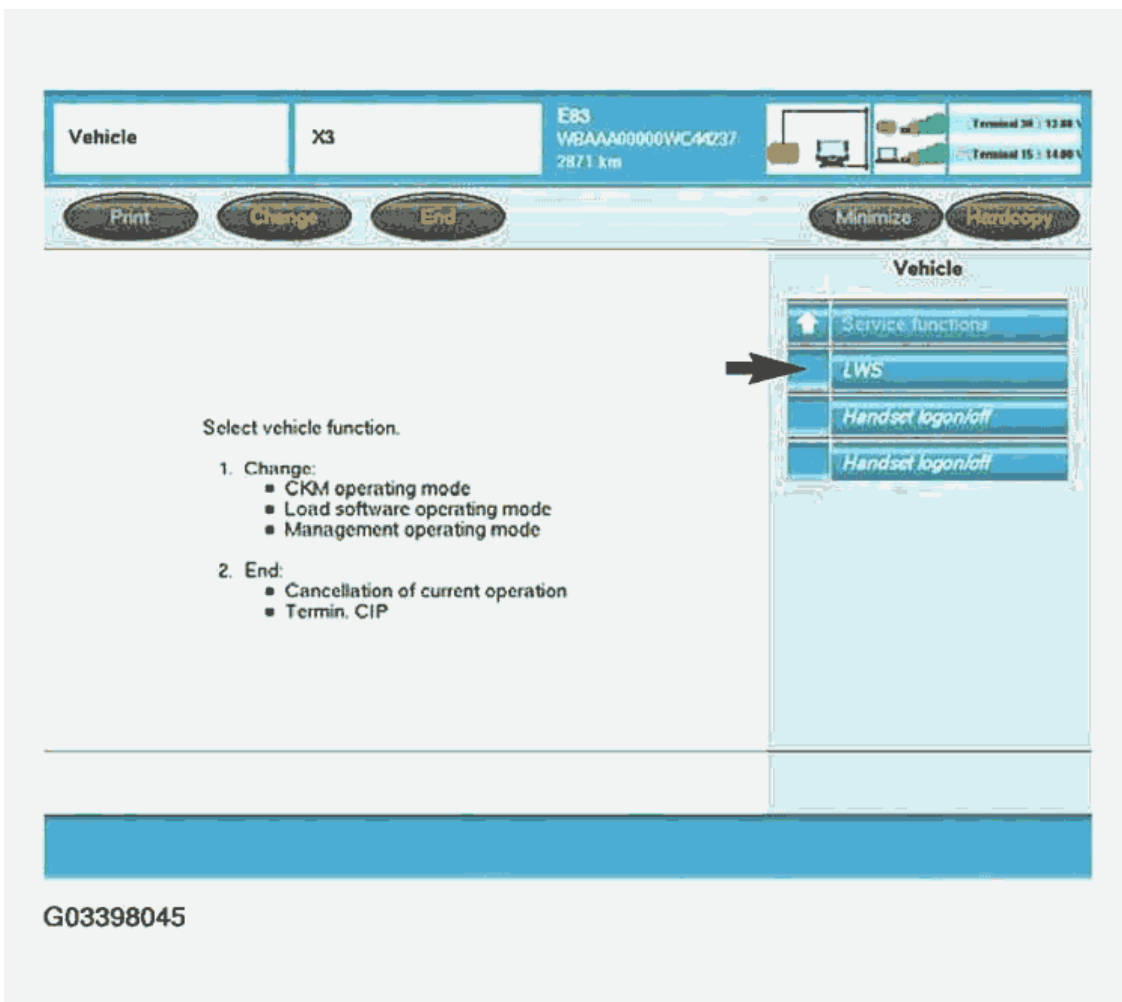

Fig. 191: Selecting LWS Button

Courtesy of BMW OF NORTH AMERICA, INC.

By selecting continue the process to calibrate the steering angle sensor will be carried out.

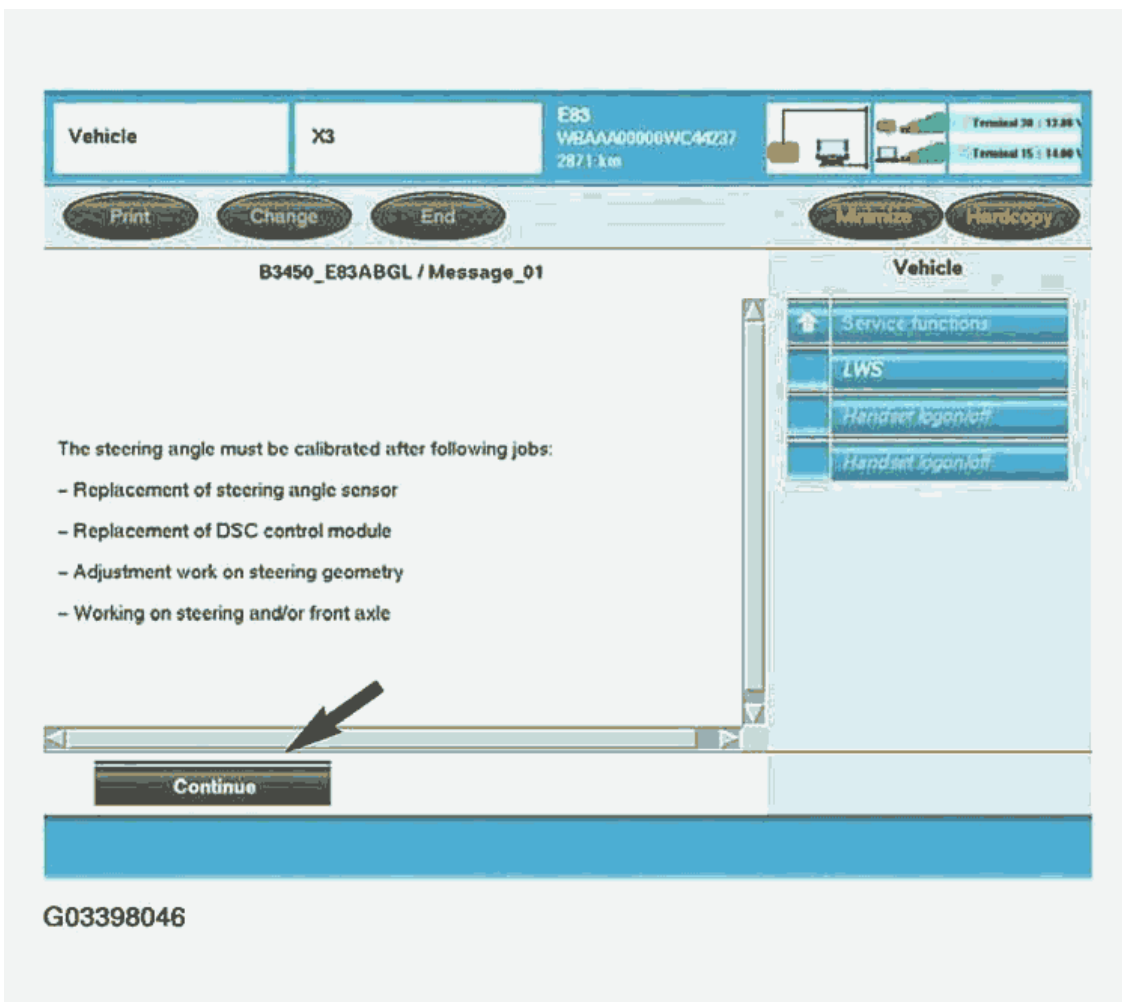

Fig. 192: Selecting Continue Button
Courtesy of BMW OF NORTH AMERICA, INC.

Vehicle - Complete Encoding

"Complete encoding" provides the ability to code/recode all control modules installed in the vehicle.

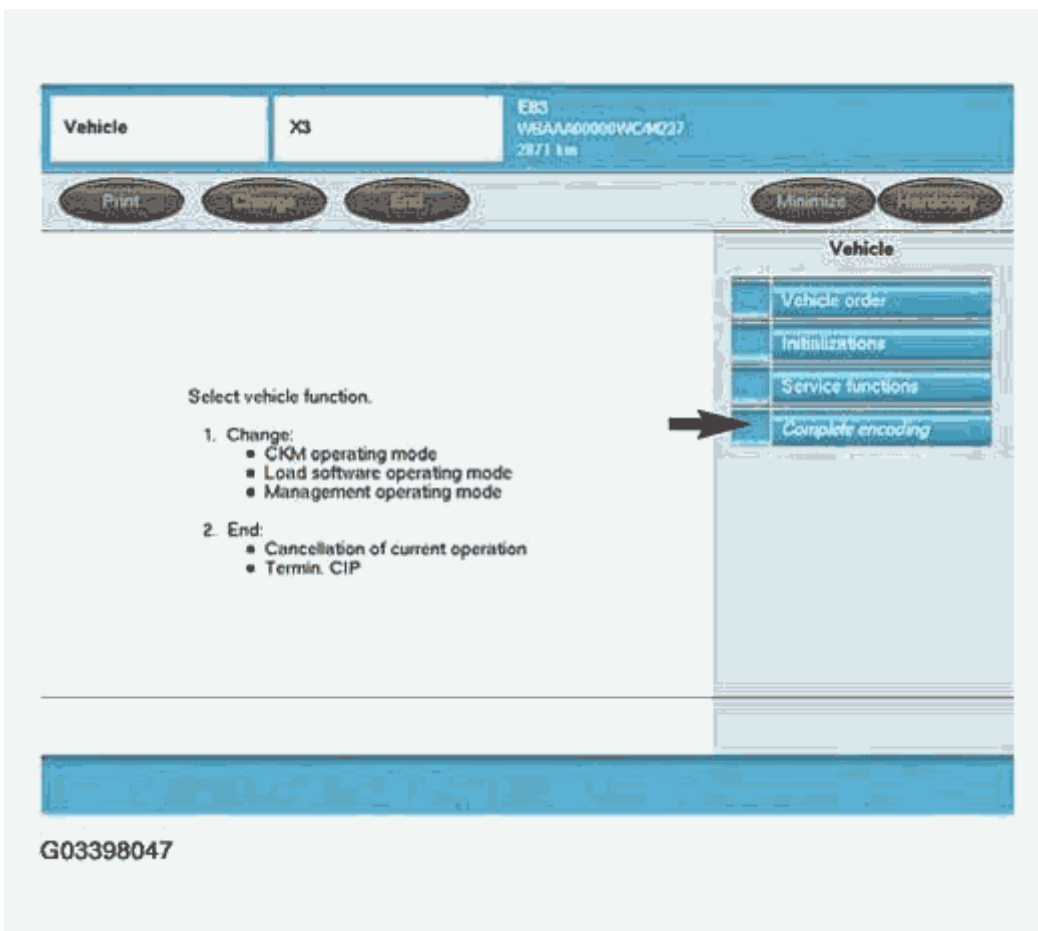

Fig. 193: Selecting Complete Encoding Button
Courtesy of BMW OF NORTH AMERICA, INC.

Recoding all the installed control modules may result in the loss of initialization or system settings such as radio station presets or seat/mirror memory.

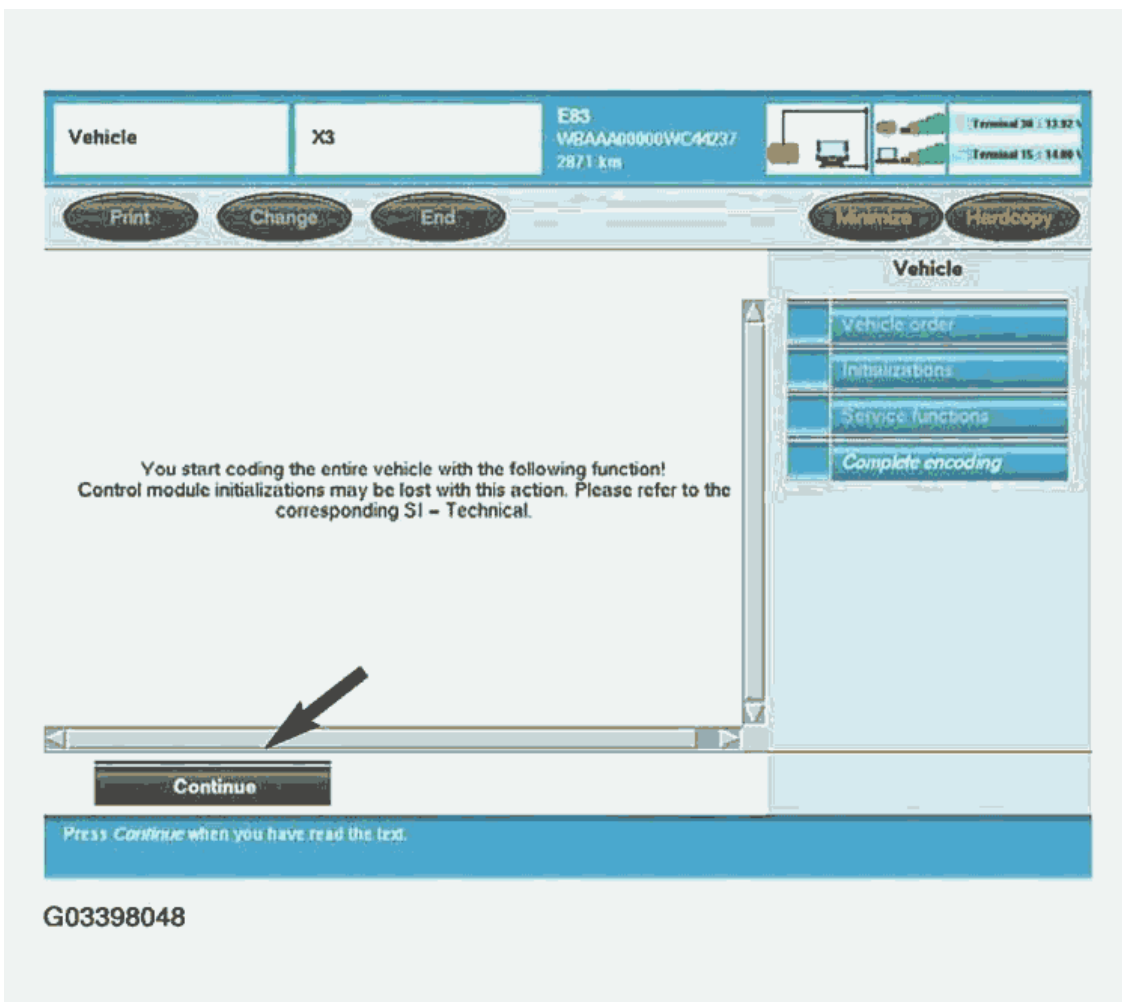

Fig. 194: Selecting Continue Button

Courtesy of BMW OF NORTH AMERICA, INC.

By selecting "Yes" all installed control modules will be recoded based on the information contained in the Vehicle Order.

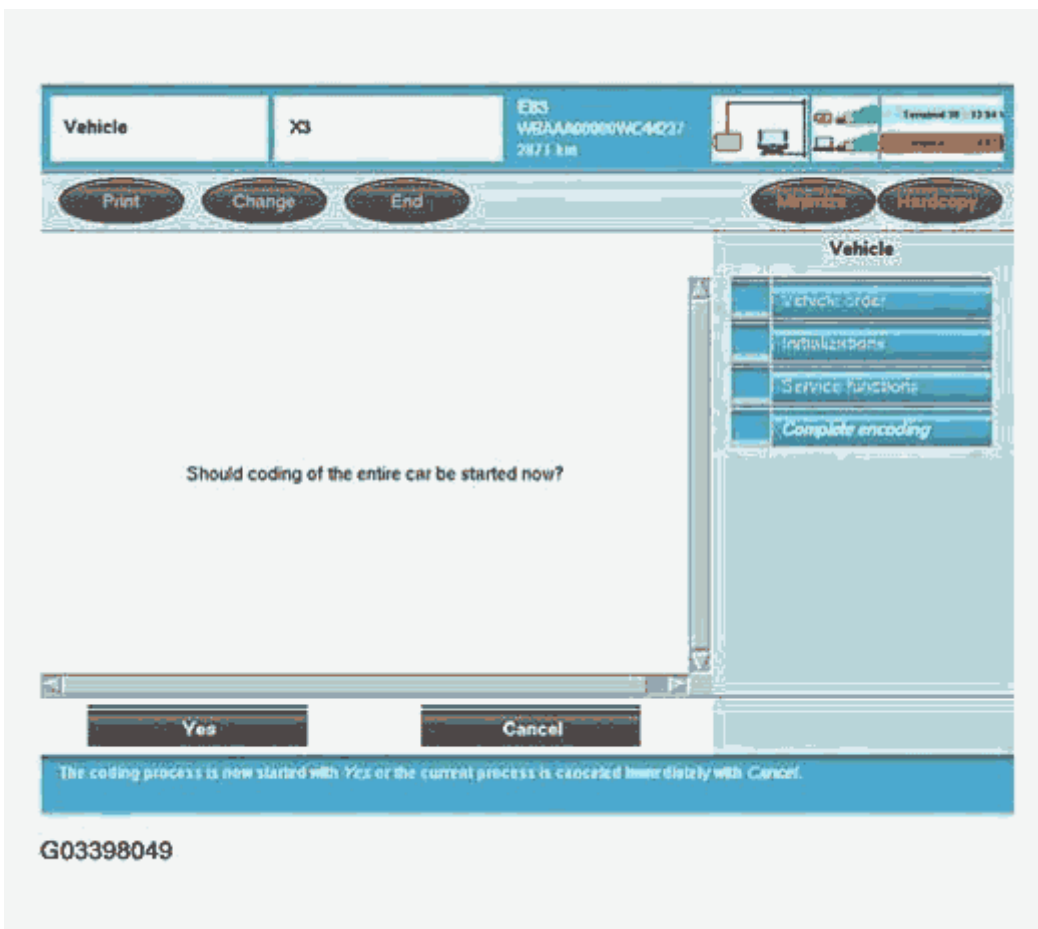

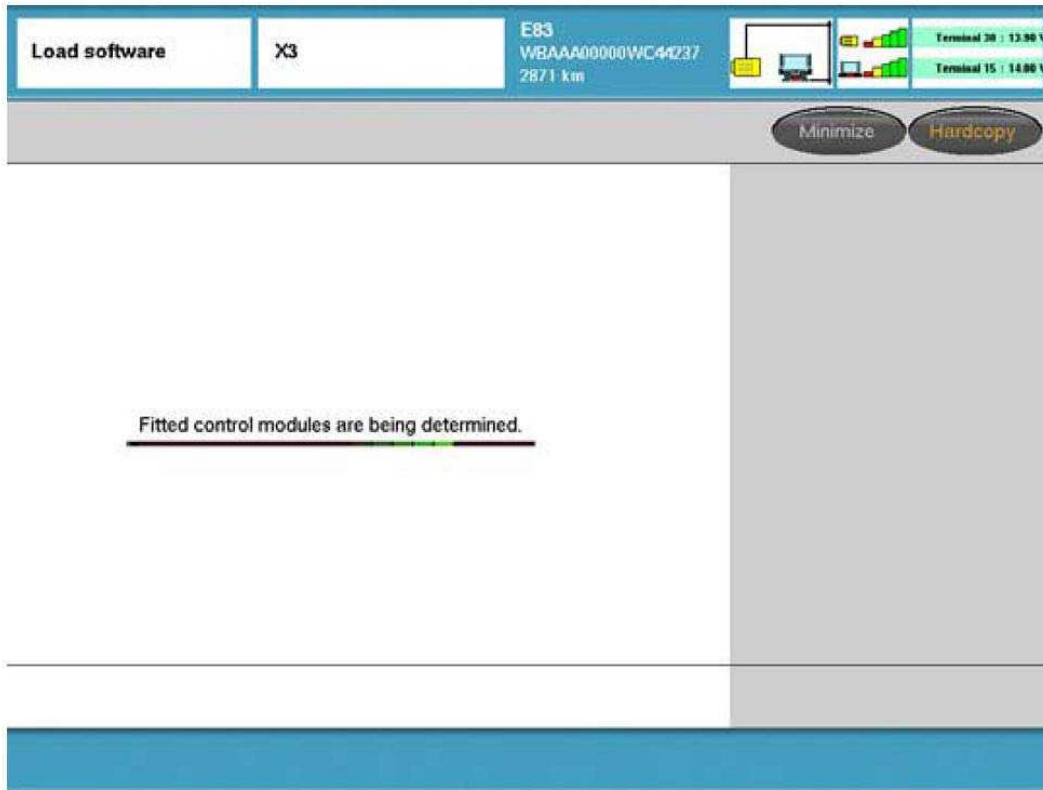

Fig. 195: Selecting YES Button

Courtesy of BMW OF NORTH AMERICA, INC.

CIP FUNCTIONS - IF YES

After selecting "Yes" on the Yes/No selection screen a determination/check of all installed control modules is performed.

G03398050

Fig. 196: Display Fitted Control Modules Determined Message
Courtesy of BMW OF NORTH AMERICA, INC.

Upon completing a check of the installed control modules, a list highlighting the installed control modules is displayed.

Select the control module(s) that were replaced and select continue.

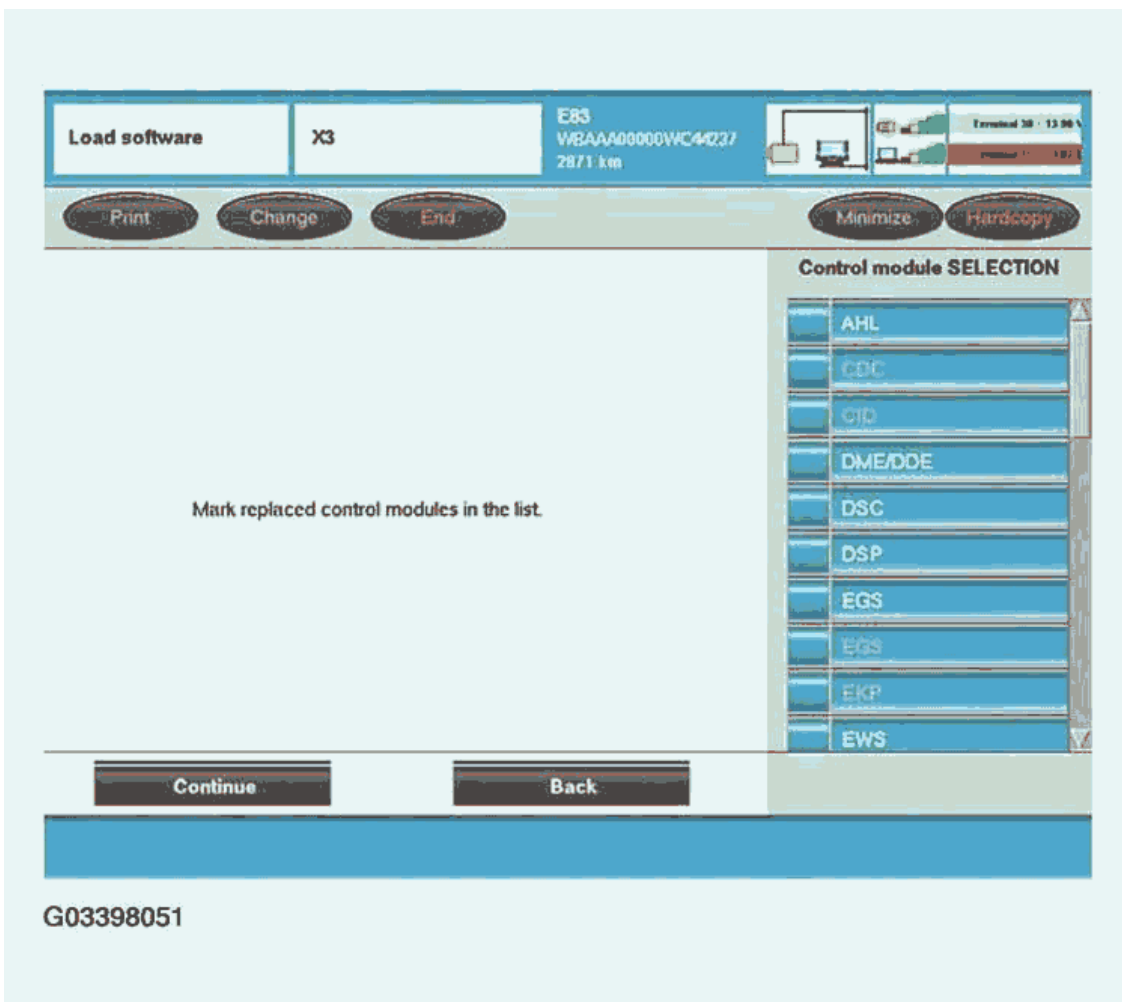

Fig. 197: Display Control Module Selection Screen
Courtesy of BMW OF NORTH AMERICA, INC.

After selecting the replaced module(s) and selecting continue a measures plan will be generated which compares the integration levels (actual vs. target) for not only the modules replaced but for all installed modules as well. If any of the installed control modules do not match the target level they will be updated along with the replacement modules.

CKM - INDIVIDUALIZATION (VEHICLE & KEY MEMORY)

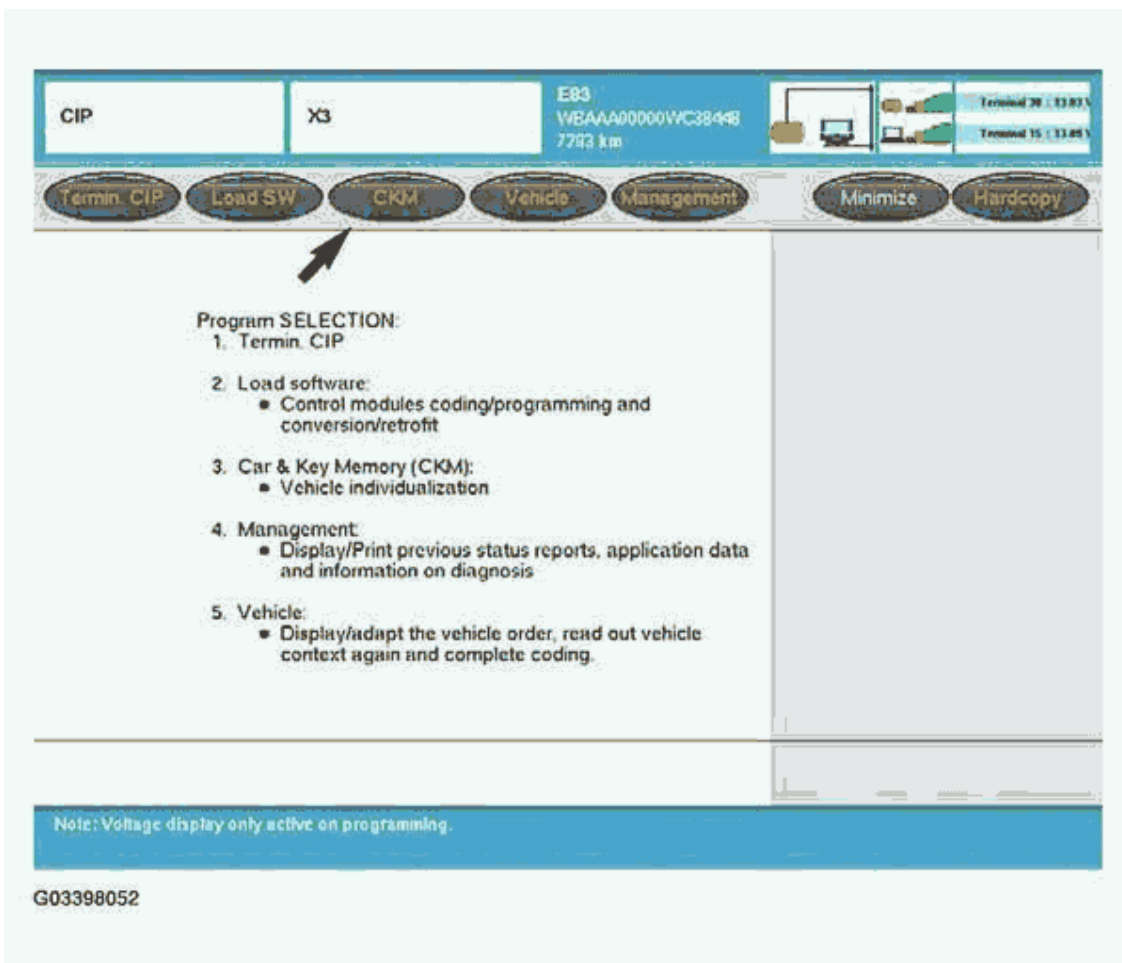

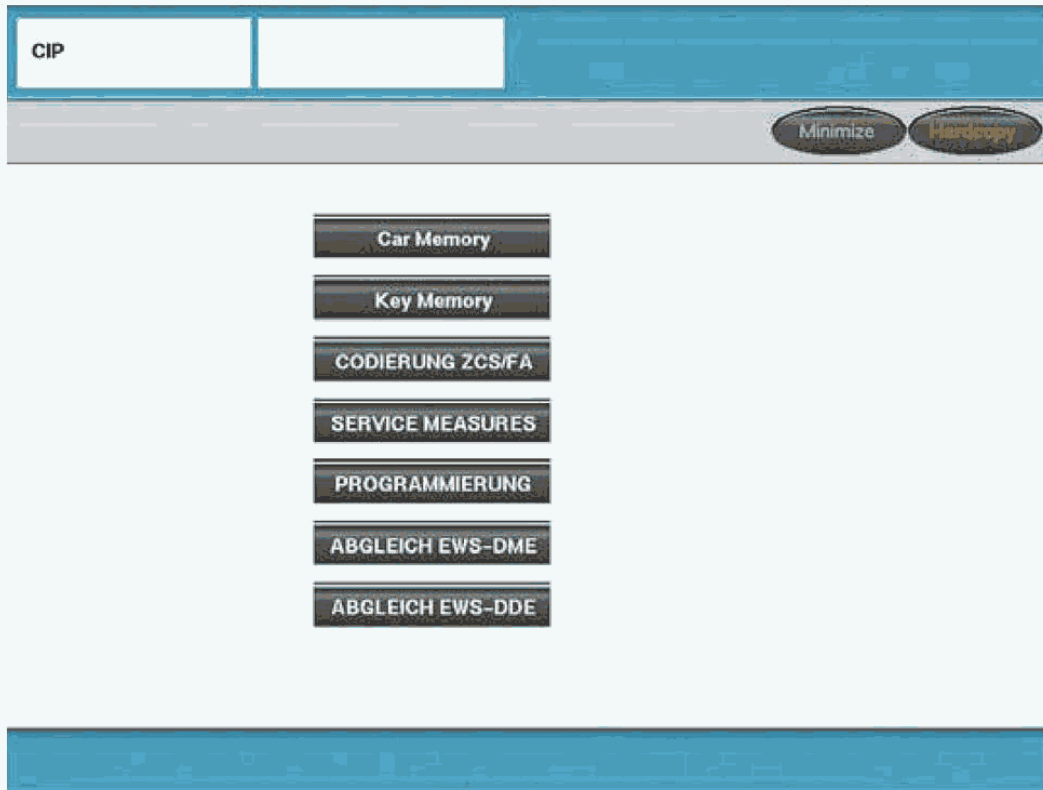

Fig. 198: Selecting CKM Button

Courtesy of BMW OF NORTH AMERICA, INC.

The CKM feature contained in CIP (for models produced as of the E65) provides the ability to "customize" certain vehicle and key functions to meet the specific preferences of the customer. It is important to note that the functions/features that can be "customized" will vary depending on model, equipment level and vehicle software level.

Upon selecting "CKM" a check of the current vehicle and key settings is made and displayed. The displayed settings list should be printed out and provided to the customer in order for them to select how the available functions should be set. The CKM function contained within CIP allows settings for both vehicle and keys to be made directly, the older version separates the key settings from the vehicle setting as different functions.

On older vehicles the Car Memory and Key Memory settings can be accessed via the SGC/UNIX function.

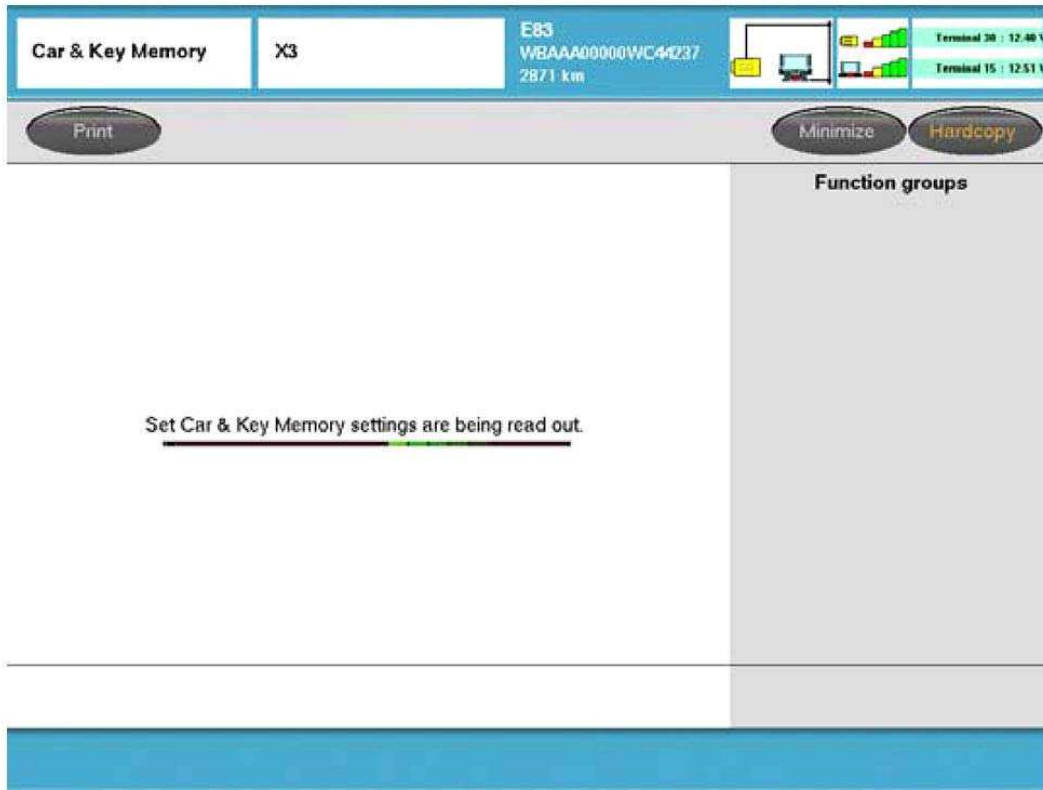

G03398053

Fig. 199: Display Car Memory And Key Memory Settings Button
Courtesy of BMW OF NORTH AMERICA, INC.

Detailed information pertaining to CKM configuration is available in *SI B09 03 98*.

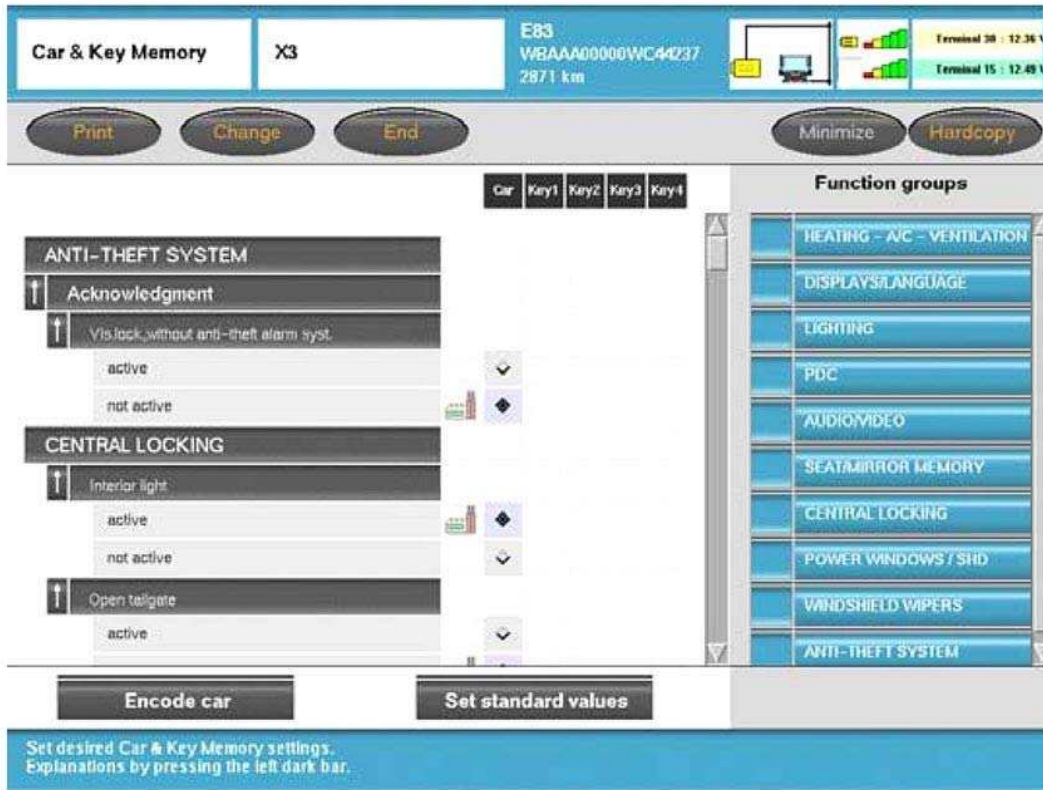

Upon selecting "CKM" a check of the current vehicle and key settings is made.

G03398054

Fig. 200: Selecting CKM Button
Courtesy of BMW OF NORTH AMERICA, INC.

Once the check is complete the current settings are displayed and can be printed out.

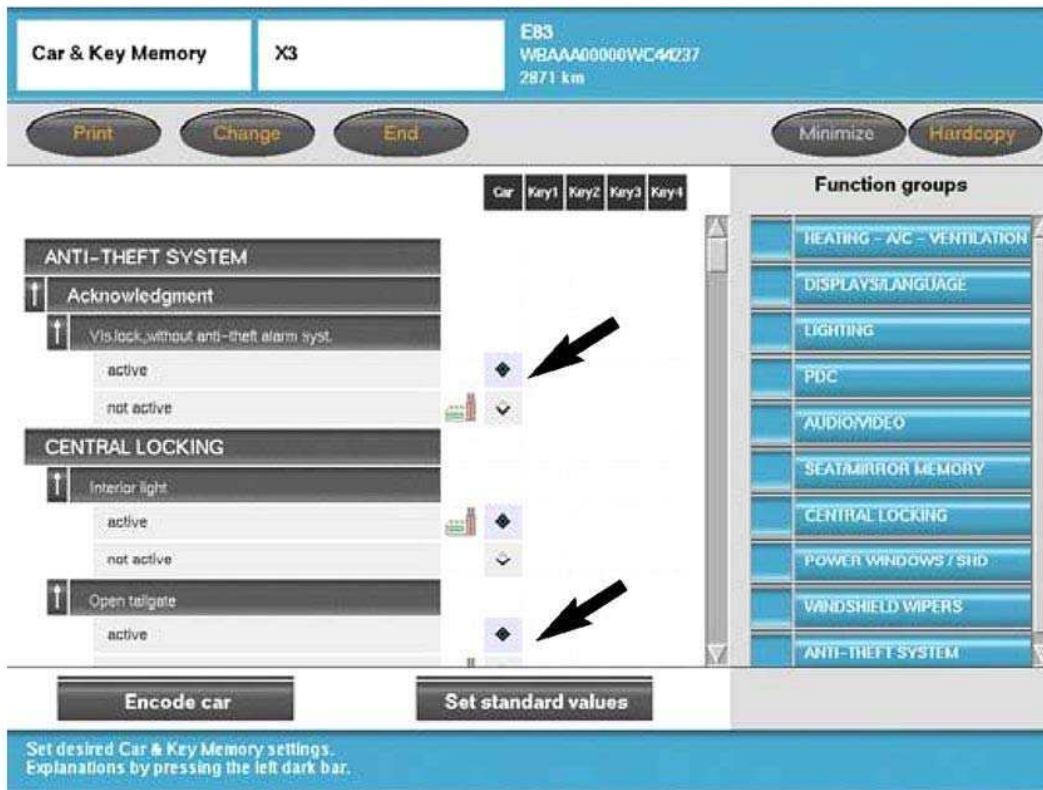

G03398055

Fig. 201: Display Current Setting Screen
 Courtesy of BMW OF NORTH AMERICA, INC.

Changes to the current settings can be made by selecting the preferred function.

NOTE: Some preference settings can be made that are specific to the key being used.

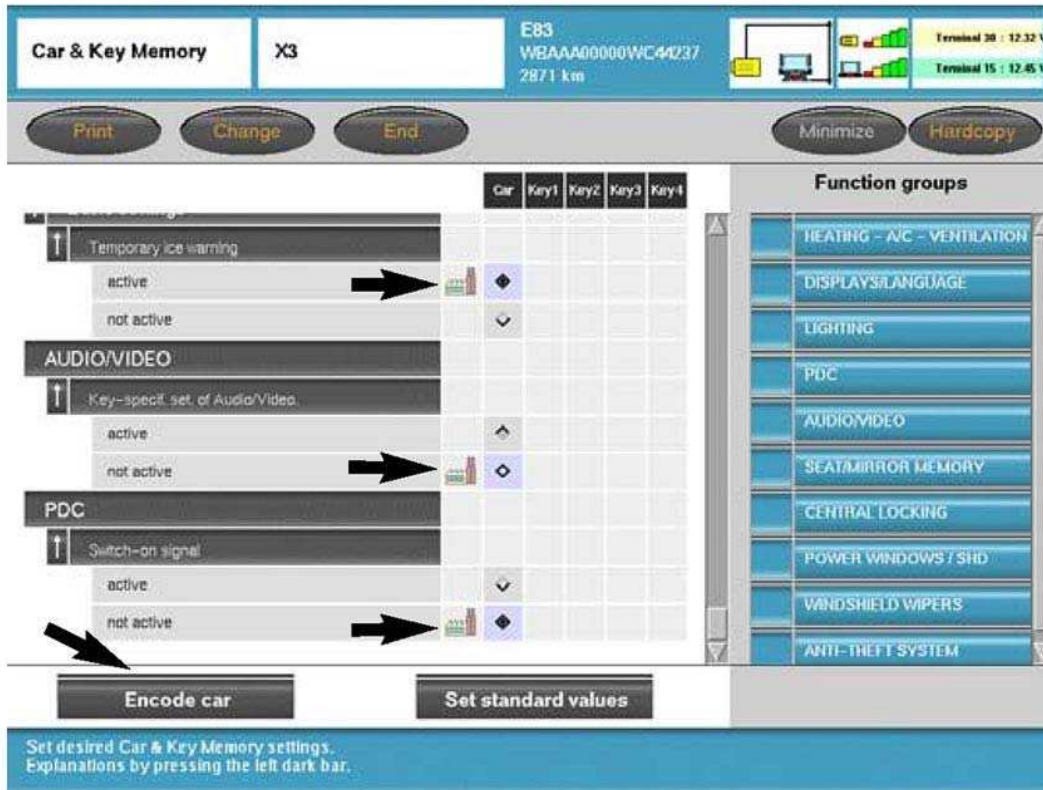

G03398056

Fig. 202: Selecting Preferred Function
 Courtesy of BMW OF NORTH AMERICA, INC.

The factory default settings are identified by a "factory" symbol.

To except/code the new setting to the vehicle or key select "**Encode car**".

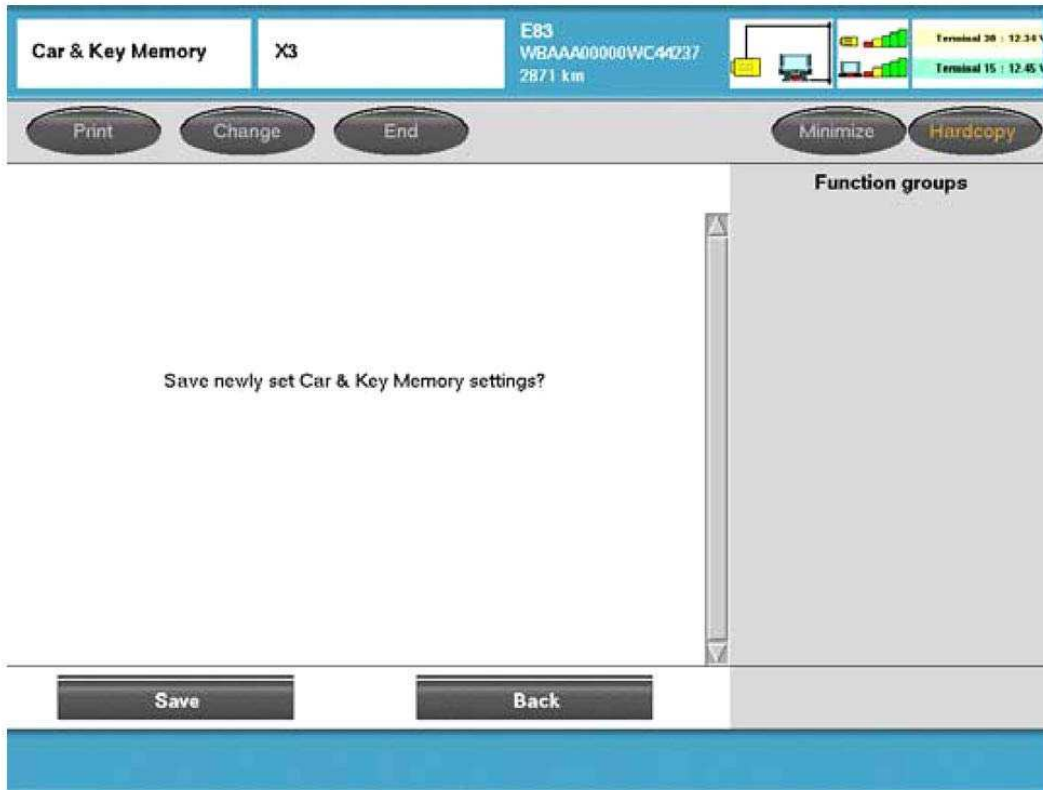

G03398057

Fig. 203: Selecting Encode Car Button
 Courtesy of BMW OF NORTH AMERICA, INC.

To lock the changes to the vehicle and/or keys select "**Save**".

By selecting back additional changes can be selected or the function aborted.

G03398058

Fig. 204: Selecting Save Button

Courtesy of BMW OF NORTH AMERICA, INC.

Once the new values are stored/set a final report showing the new setting will be displayed. The report will also show if the effected modules did or did not accept the changes.

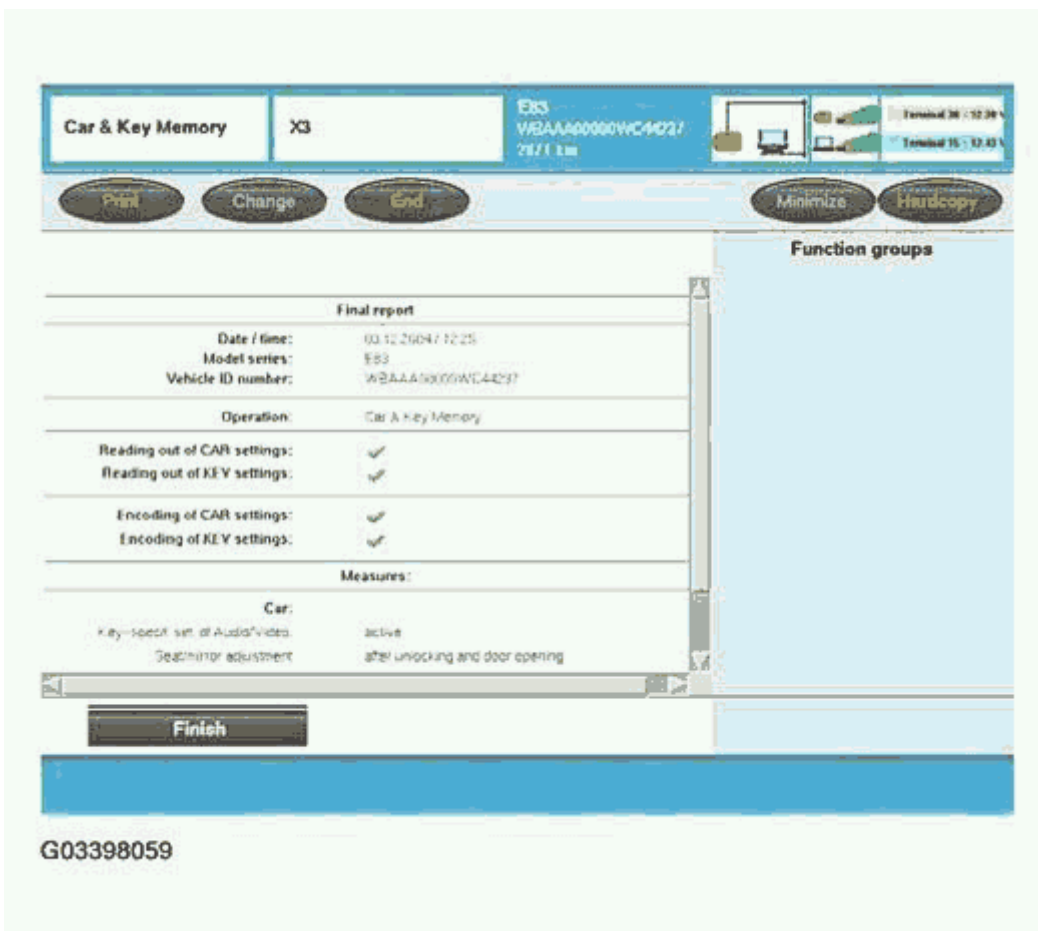

Fig. 205: Display Final Report

Courtesy of BMW OF NORTH AMERICA, INC.

ZCS CODING PROCEDURE

The ZCS coding procedure can currently be performed with the DISplus using DIS CDs until DIS CD 42 is released at which time all SGC/Unix coding and programming functions will be available only via Progman using the GT1 or SSS.

There are two methods of encoding replacement control modules:

- Manual input of ZCS
- Automatic ZCS retrieval and coding

Coding Control Modules That Store The ZCS

On earlier production vehicles when replacing a control module that stores the ZCS code (i.e Kombi/Instrument Cluster) the information must be entered manually in order to code the replacement module. The ZCS code from the label located in the vehicle or a printout of the code stored in the module to be replaced must be entered into the new module.

The control modules that store the ZCS and require manual input are:

- IKE - E38
- EKM - E31
- Instrument Cluster - E32/34 (After 9-91) & E36 (except 318ti and Z3 Roadster)
- EWS II - 318ti & Z3 Roadster

NOTE: As long as the defective EWS II control module can communicate with the coding equipment, automatic encoding is possible.

On later production vehicles where the ZCS information is stored in two modules, redundant data storage, the ZCS information to code the replacement module can be obtained from the second/backup module.

Vehicles which have redundant ZCS data storage are:

- E36 (Z3) - Instrument Cluster & EWS II as of 9/98
- E39 - Instrument Cluster & EWS II
- E46 - Instrument Cluster & LSZ
- E53 - Instrument Cluster & LSZ

NOTE: E46 changed from ZCS to a Vehicle Order (VO/FA) vehicle data structure in 9/01.

Manual Input of ZCS Data

From Progman establish a connection to the interface connected to the vehicle and access CIP.

To perform the procedure from CIP the Model series must be selected (**3 series, 7 series ...**).

Then select the body (**E32, E36 ...**).

G03398060

Fig. 206: Display Model Series Selection Menu
Courtesy of BMW OF NORTH AMERICA, INC.

Select "**Codierung ZCS/FA**".

Then advance screen to the right two times to enter the vehicle series selection screen.

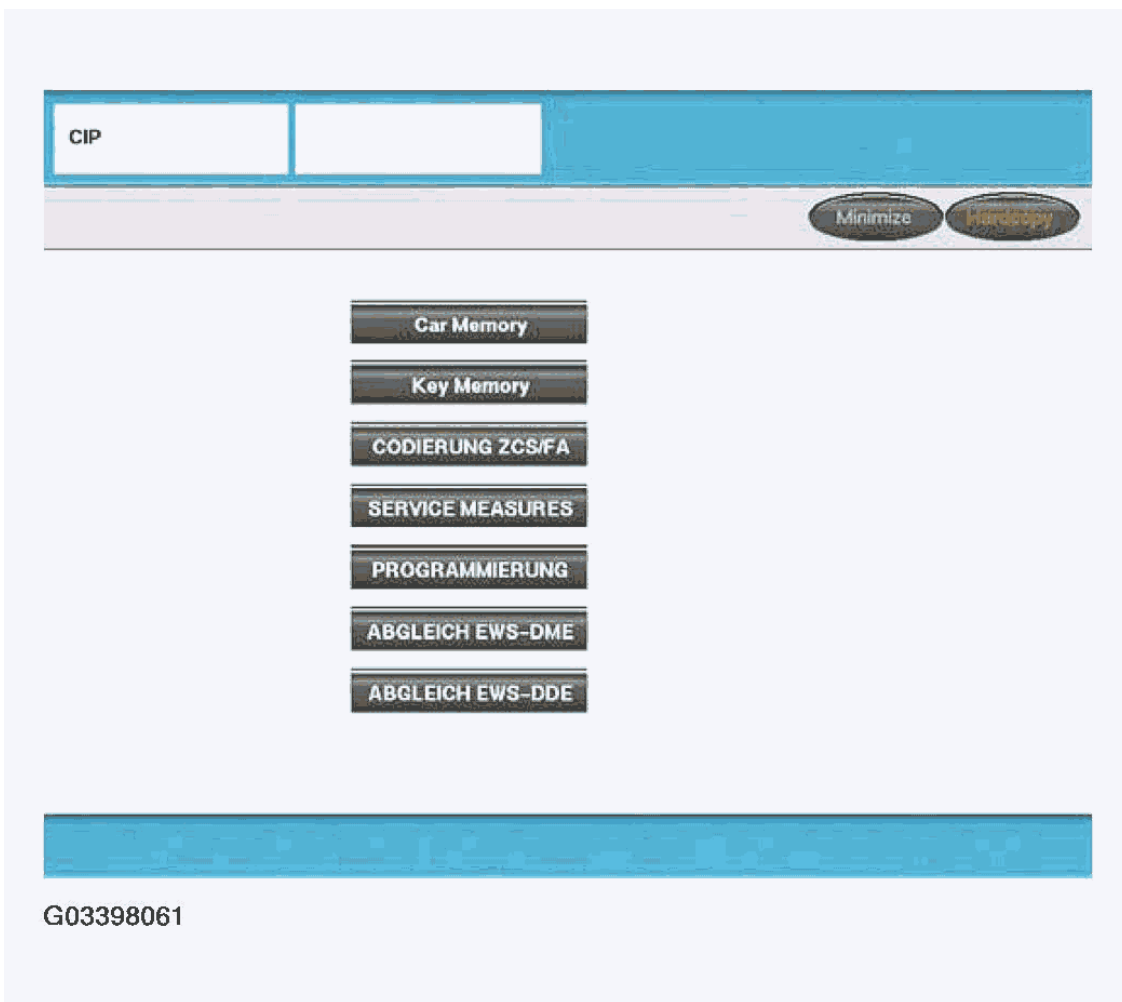

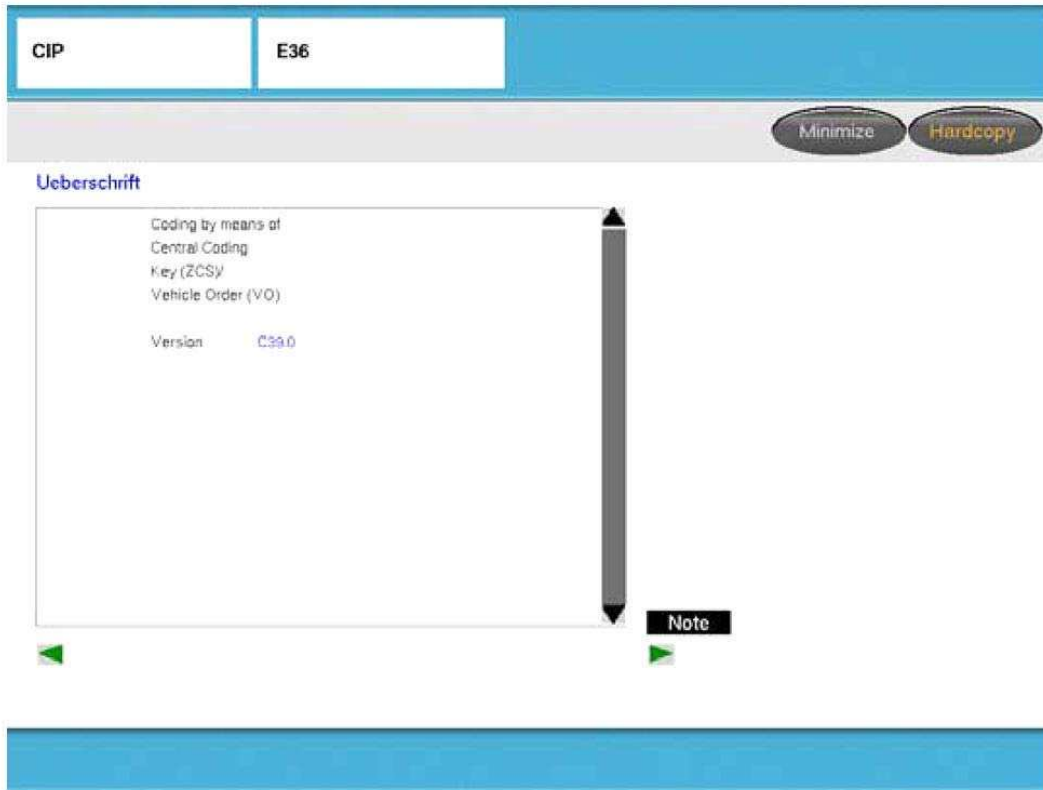

Fig. 207: Selecting Codierung ZCS/FA Button
Courtesy of BMW OF NORTH AMERICA, INC.

The version ID page is displayed.

Make sure it is the most up-to-date version of the software for the encoding procedure.

Press the right arrow.

G03398062

Fig. 208: Display Version ID Page
Courtesy of BMW OF NORTH AMERICA, INC.

Select vehicle series (i.e "E36 Series").

G03398063

Fig. 209: Selecting Vehicle Series
Courtesy of BMW OF NORTH AMERICA, INC.

Select "**Recoding**".

Then advance screen to the right.

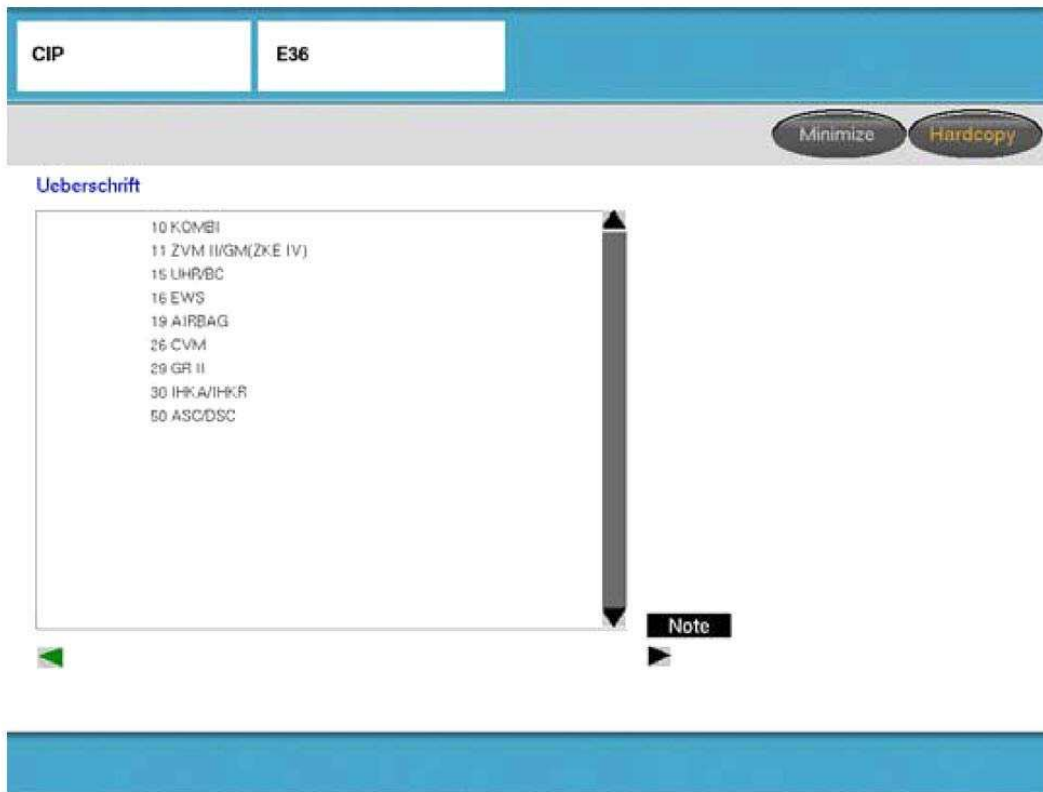

G03398064

Fig. 210: Selecting Recoding Button
Courtesy of BMW OF NORTH AMERICA, INC.

Displays control modules that are ZCS codable.

Example:

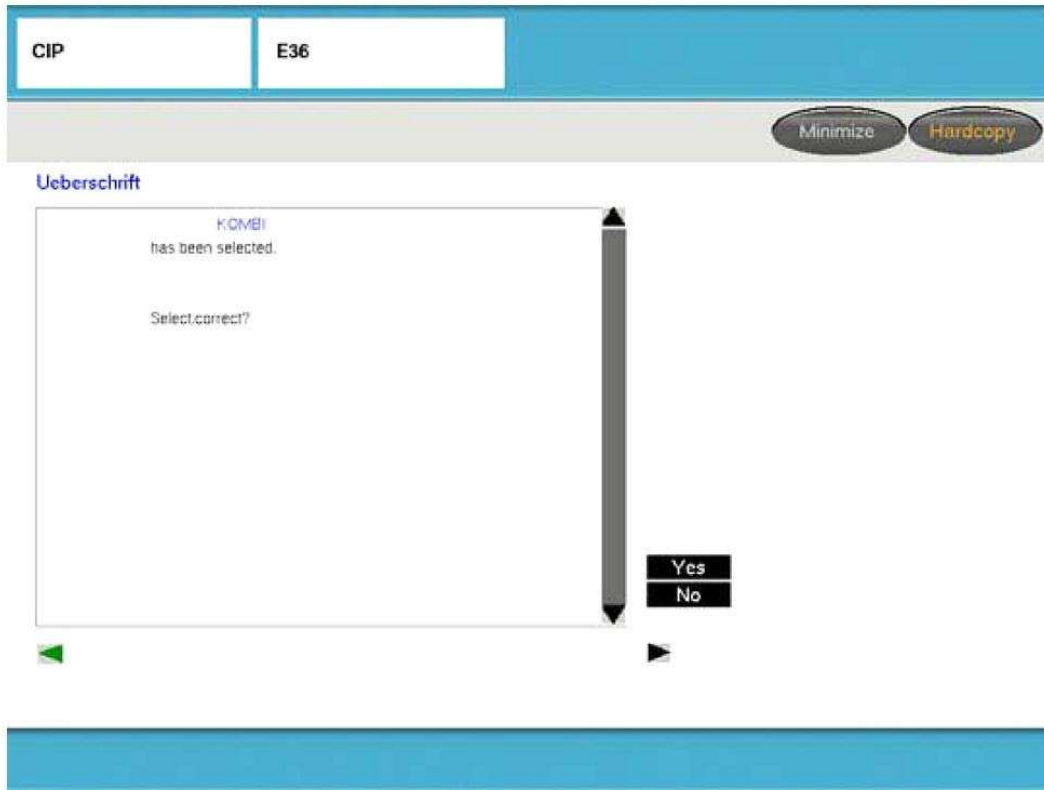

Select "**KOMBI**".

G03398065

Fig. 211: Selecting COMBI Button
Courtesy of BMW OF NORTH AMERICA, INC.

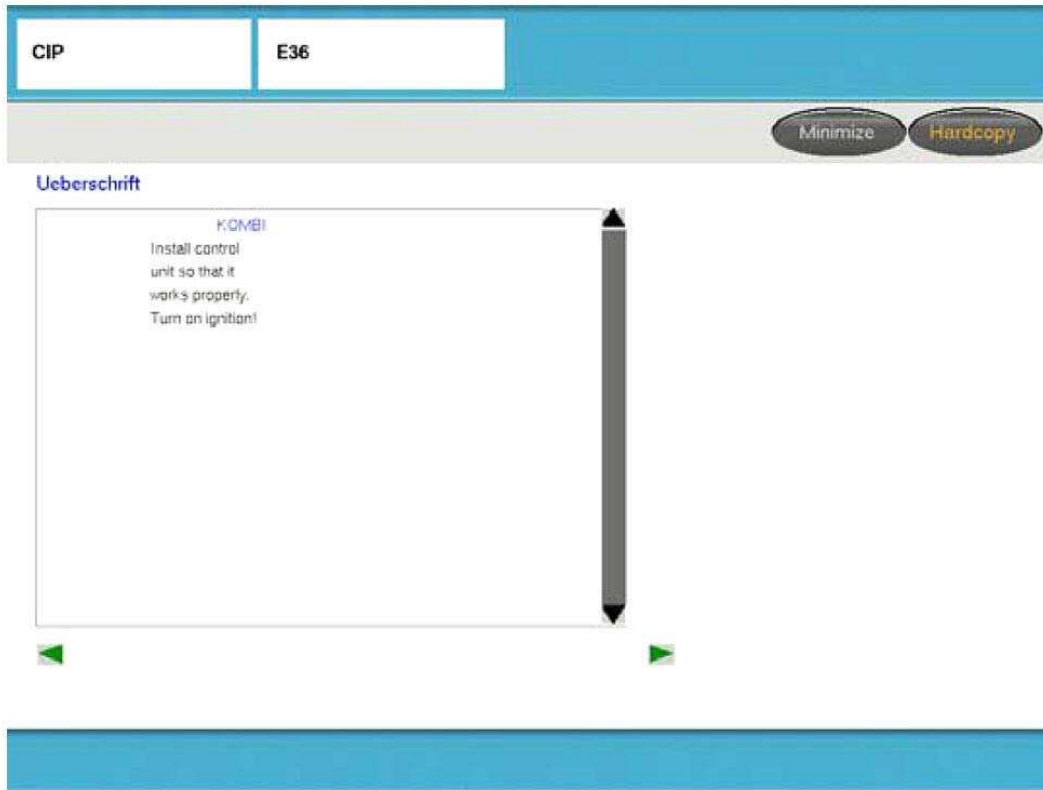

Select "Yes" to recode KOMBI.

G03398066

Fig. 212: Selecting YES Button
Courtesy of BMW OF NORTH AMERICA, INC.

Follow the instructions given on screen.

G03398067

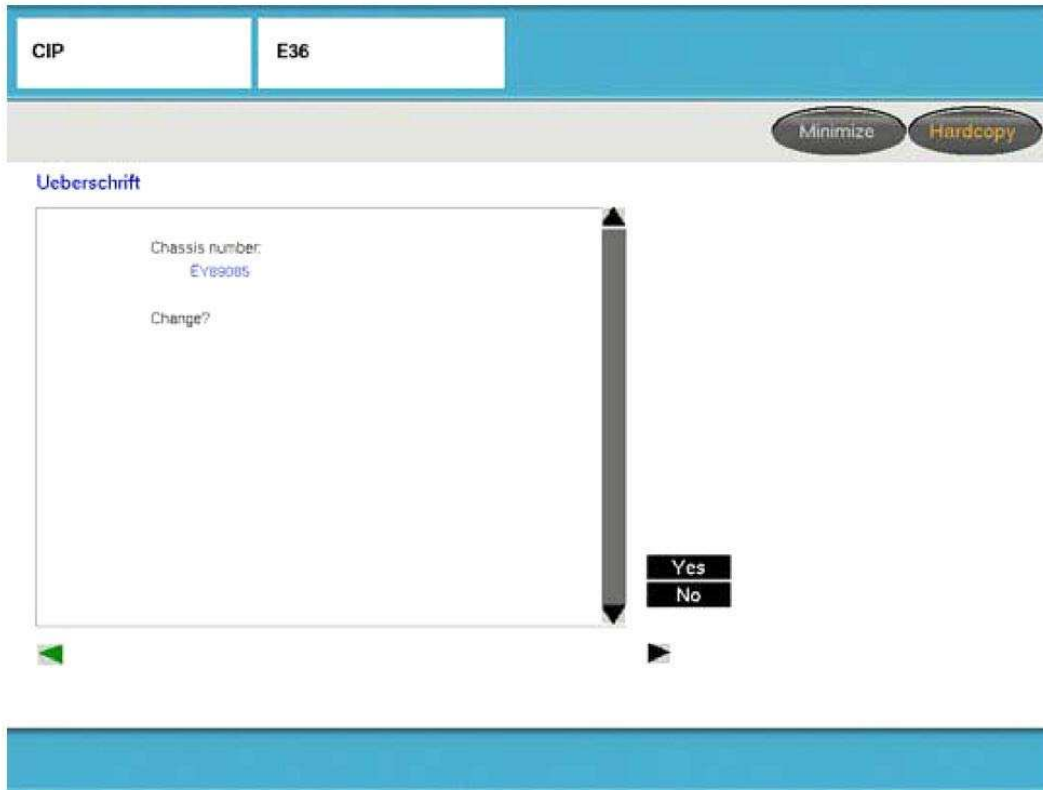

Fig. 213: Display Instructions
Courtesy of BMW OF NORTH AMERICA, INC.

Chassis number of vehicle is displayed.

Select "Yes" to accept VIN.

Select "No" if VIN needs to be changed.

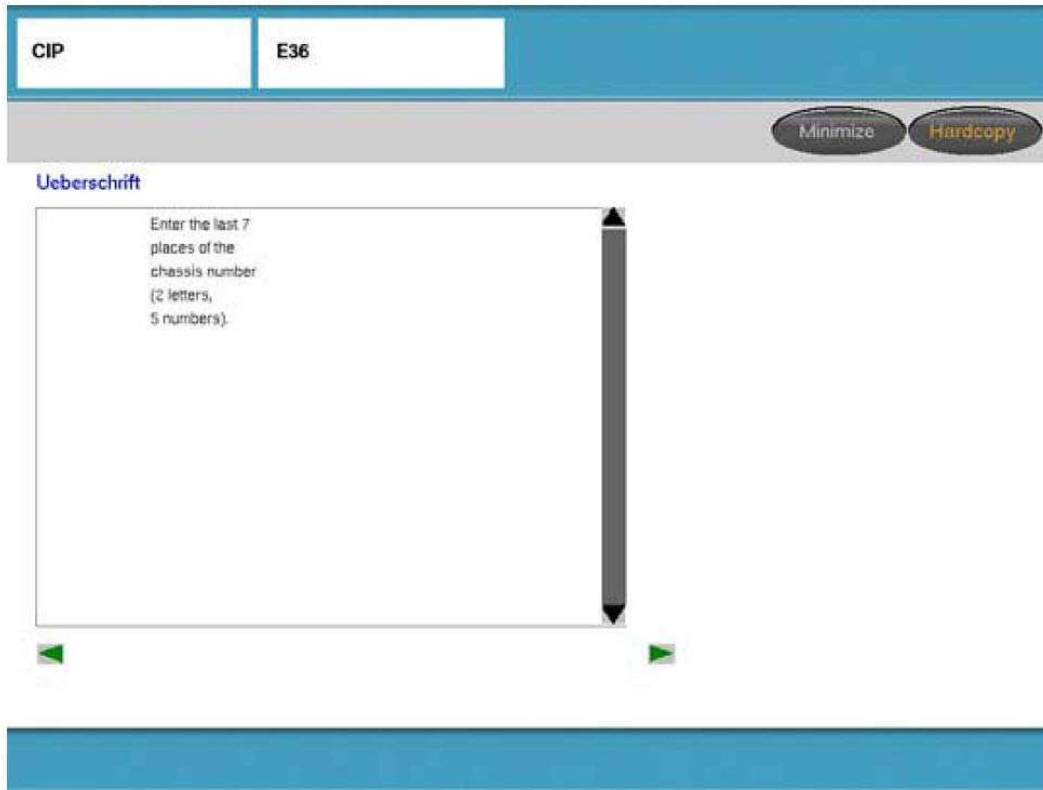

When installing a new module the last 7 digits of the VIN will need to be entered.

G03398068

Fig. 214: Selecting YES Button
Courtesy of BMW OF NORTH AMERICA, INC.

Follow the instructions given on screen.

G03398069

Fig. 215: Display Instructions

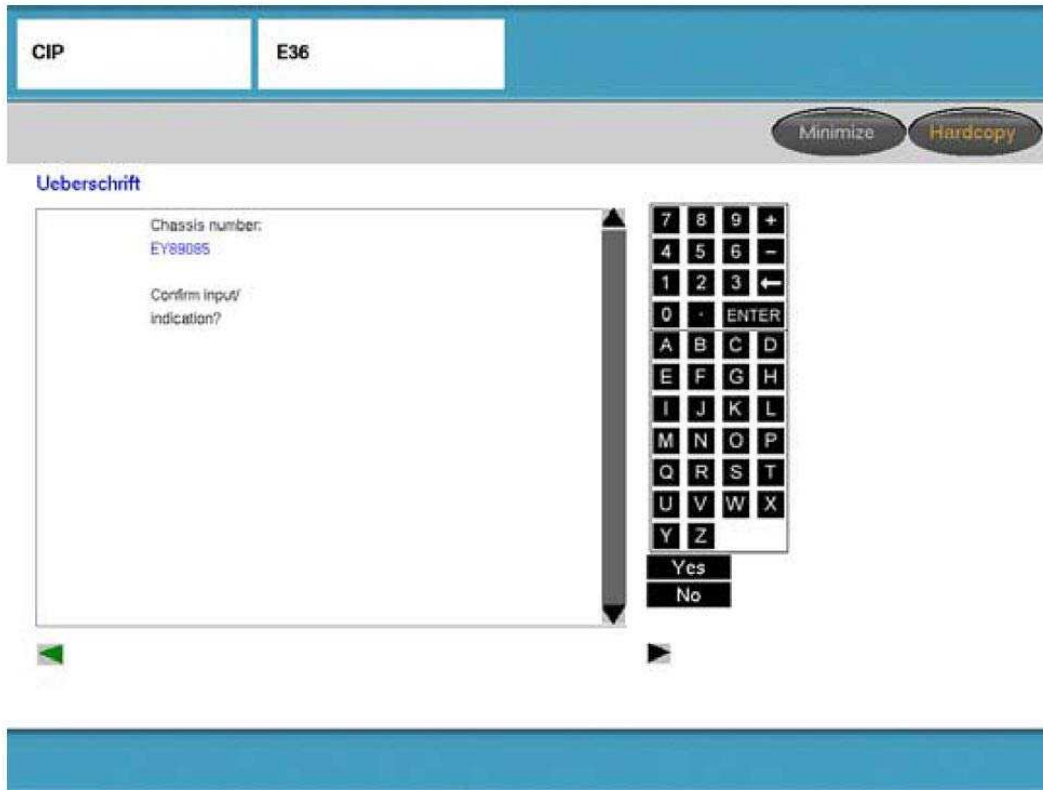

Courtesy of BMW OF NORTH AMERICA, INC.

Chassis number of vehicle is displayed, enter VIN using touch screen pad or the keyboard on an SSS.

Select "Yes" to accept VIN.

Select "No" if VIN needs to be changed/corrected.

When installing a new module the last 7 digits of the VIN will need to be entered.

G03398070

Fig. 216: Display Chassis Number Of Vehicle
Courtesy of BMW OF NORTH AMERICA, INC.

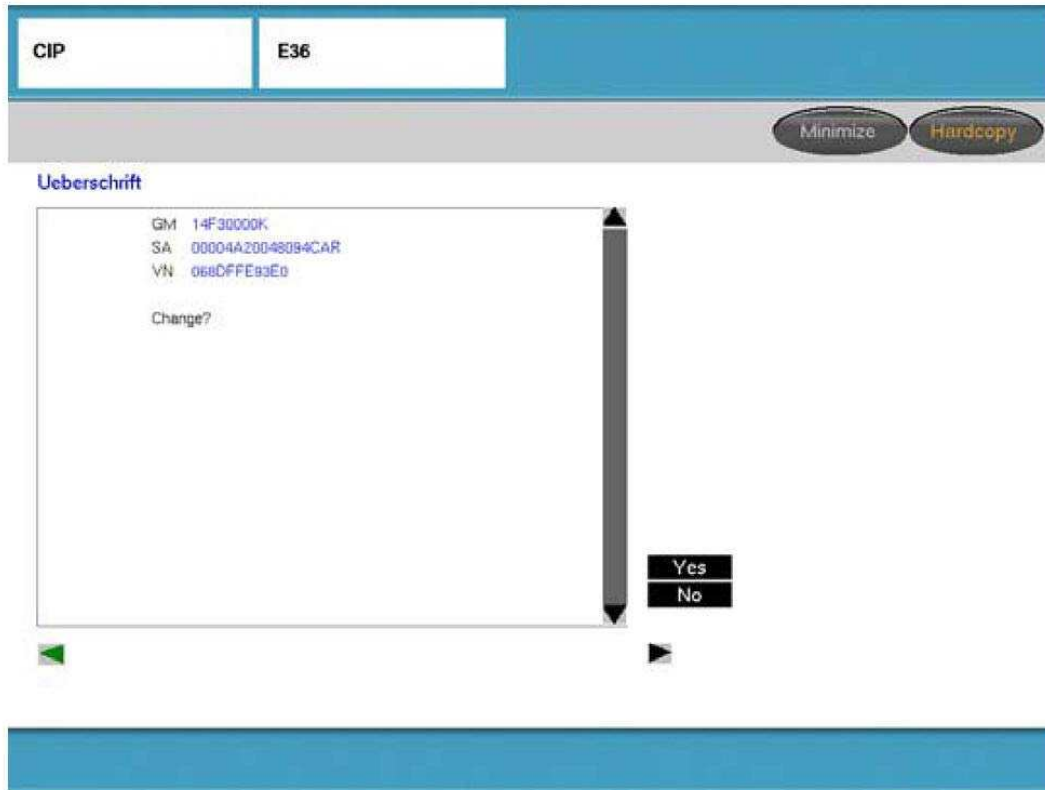

Current ZCS code is displayed

Select **"YES"** to accept current code

Select **"No"** to change the ZCS data

When installing a new module the ZCS code of the vehicle will need to be entered. The information can be obtained from:

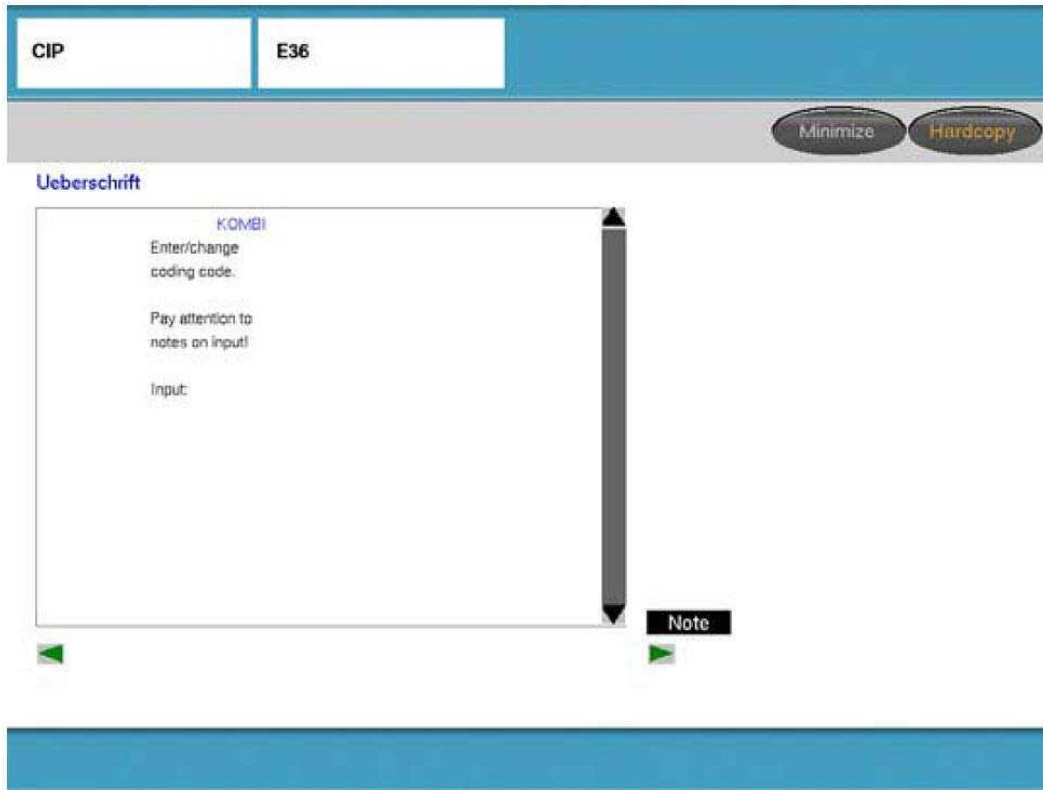

- ZCS print out of old module before removal
- ZCS label located in vehicle

G03398071

Fig. 217: Selecting Yes Button
Courtesy of BMW OF NORTH AMERICA, INC.

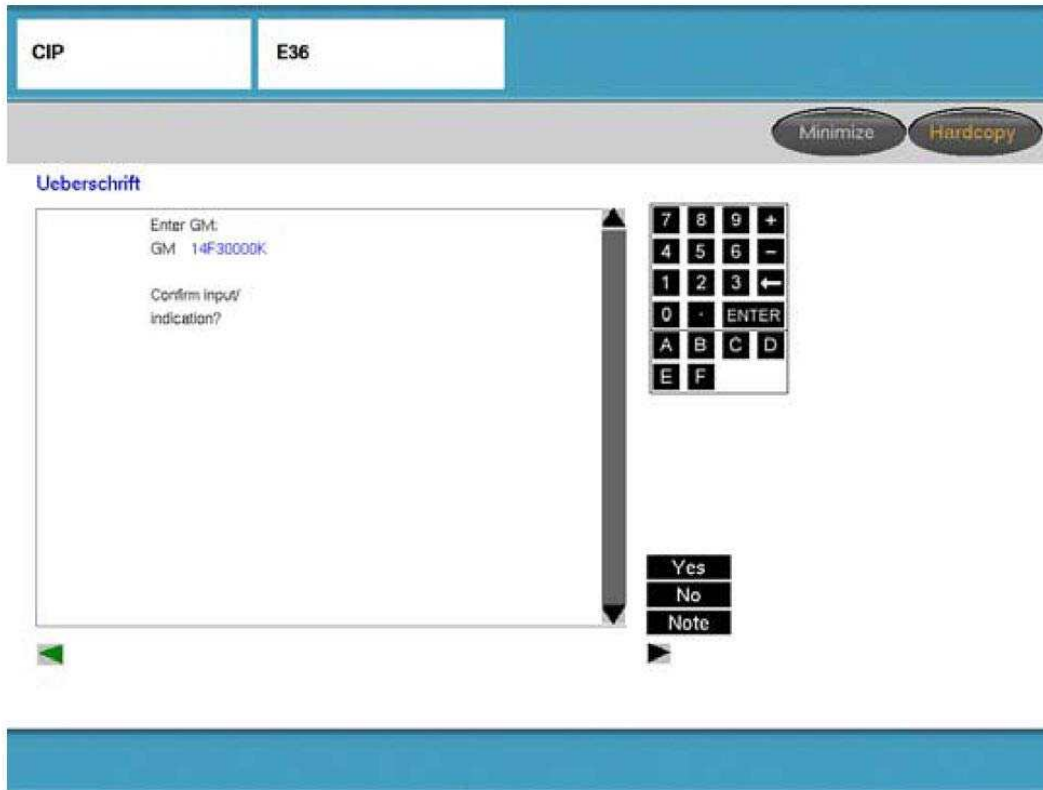

If the ZCS code must be changed follow the instruction given on screen and enter the required information exactly as indicated on the ZCS label or printout of ZCS code before removal of module.

G03398072

Fig. 218: Display Instruction
Courtesy of BMW OF NORTH AMERICA, INC.

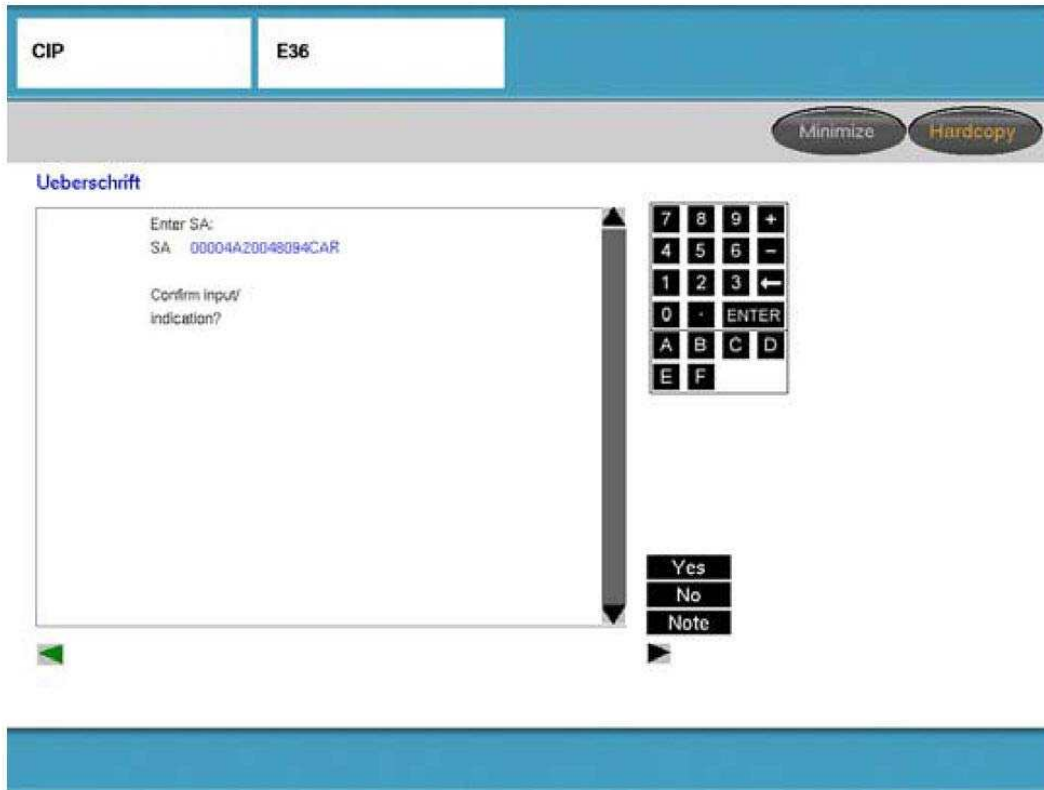

Confirm or enter new GM information.

G03398073

Fig. 219: Entering New GM Information
Courtesy of BMW OF NORTH AMERICA, INC.

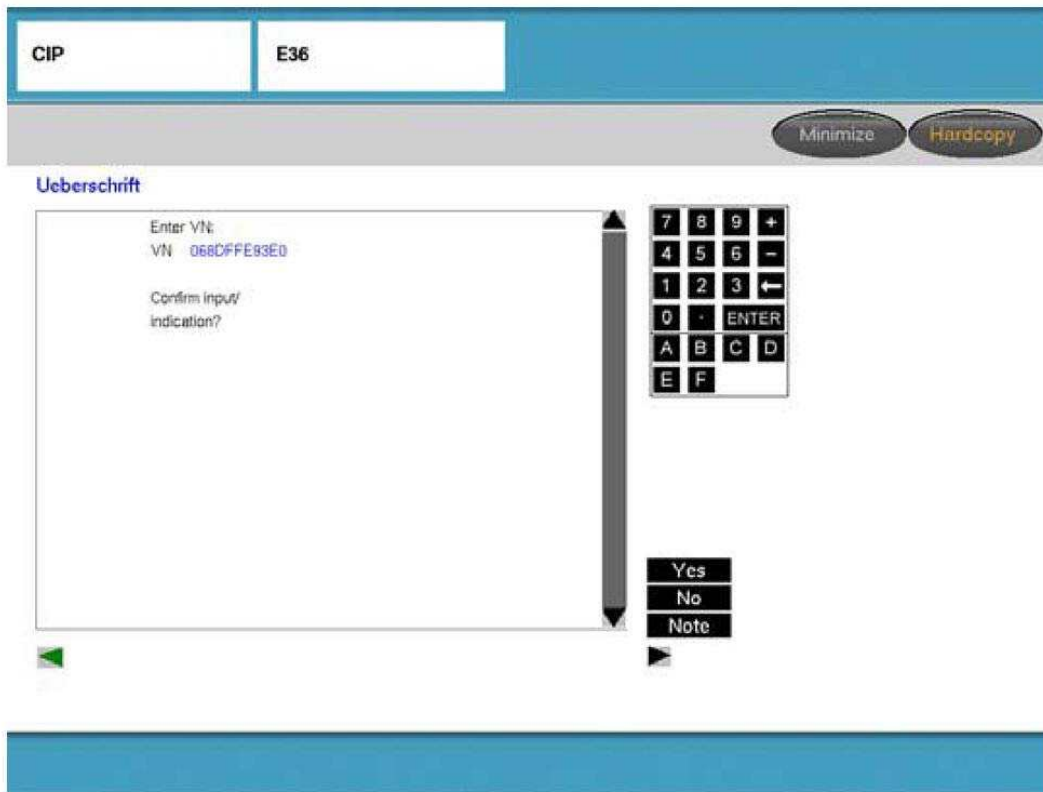

Confirm or enter new SA information.

G03398074

Fig. 220: Entering New SA Information
Courtesy of BMW OF NORTH AMERICA, INC.

Confirm or enter new VN information.

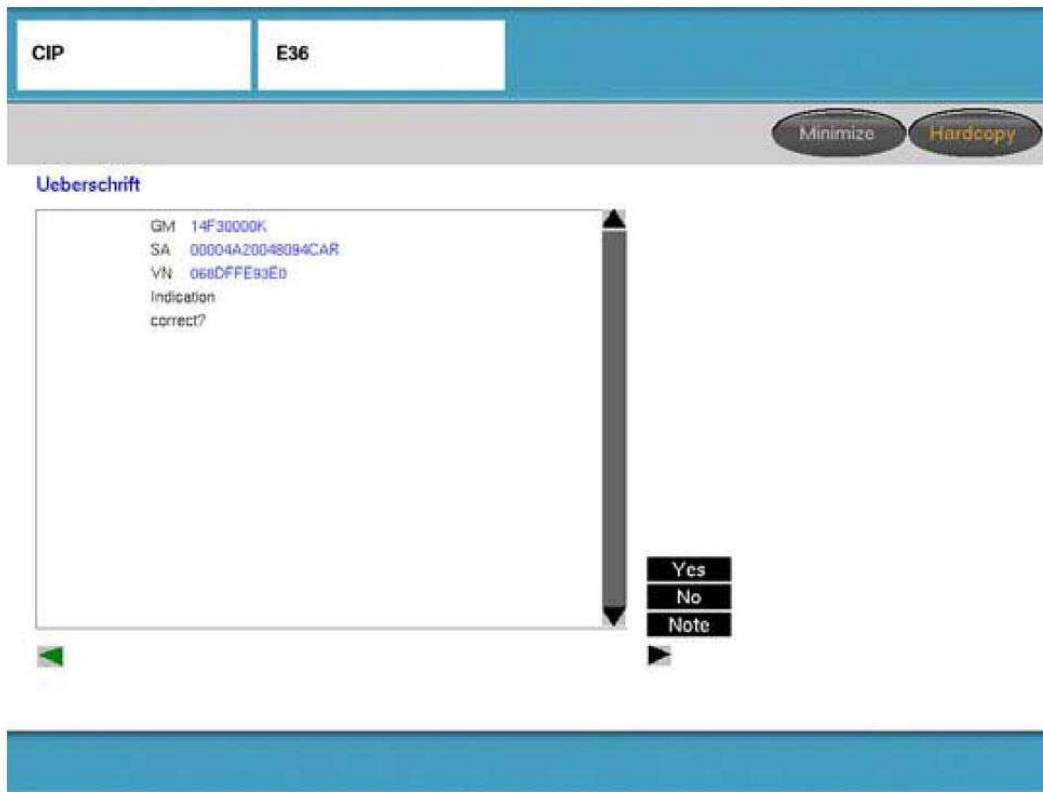

G03398075

Fig. 221: Entering New VN Information

Courtesy of BMW OF NORTH AMERICA, INC.

Confirm or correct ZCS information.

G03398076

Fig. 222: Confirming Correct ZCS Information
Courtesy of BMW OF NORTH AMERICA, INC.

Select "Yes" to begin the coding process for the installed/selected module.

Upon completion of the coding process print out a copy of the ZCS information displayed and attach it to the repair order to be maintained with vehicle file.

Switch ignition off for 10 seconds, then check for proper system operation.

G03398077

Fig. 223: Selecting Yes Button

Courtesy of BMW OF NORTH AMERICA, INC.

Automatic Coding Procedure

When a control module is replaced that does not store the ZCS code, the replacement module is coded automatically using the ZCS code stored in the Kombi, EWS or LSZ.

From Progman establish a connection to the interface connected to the vehicle and access CIP.

To perform the procedure from CIP the Model series must be selected (**3 series, 7 series ...**).

Then select the body (**E32, E36 ...**).

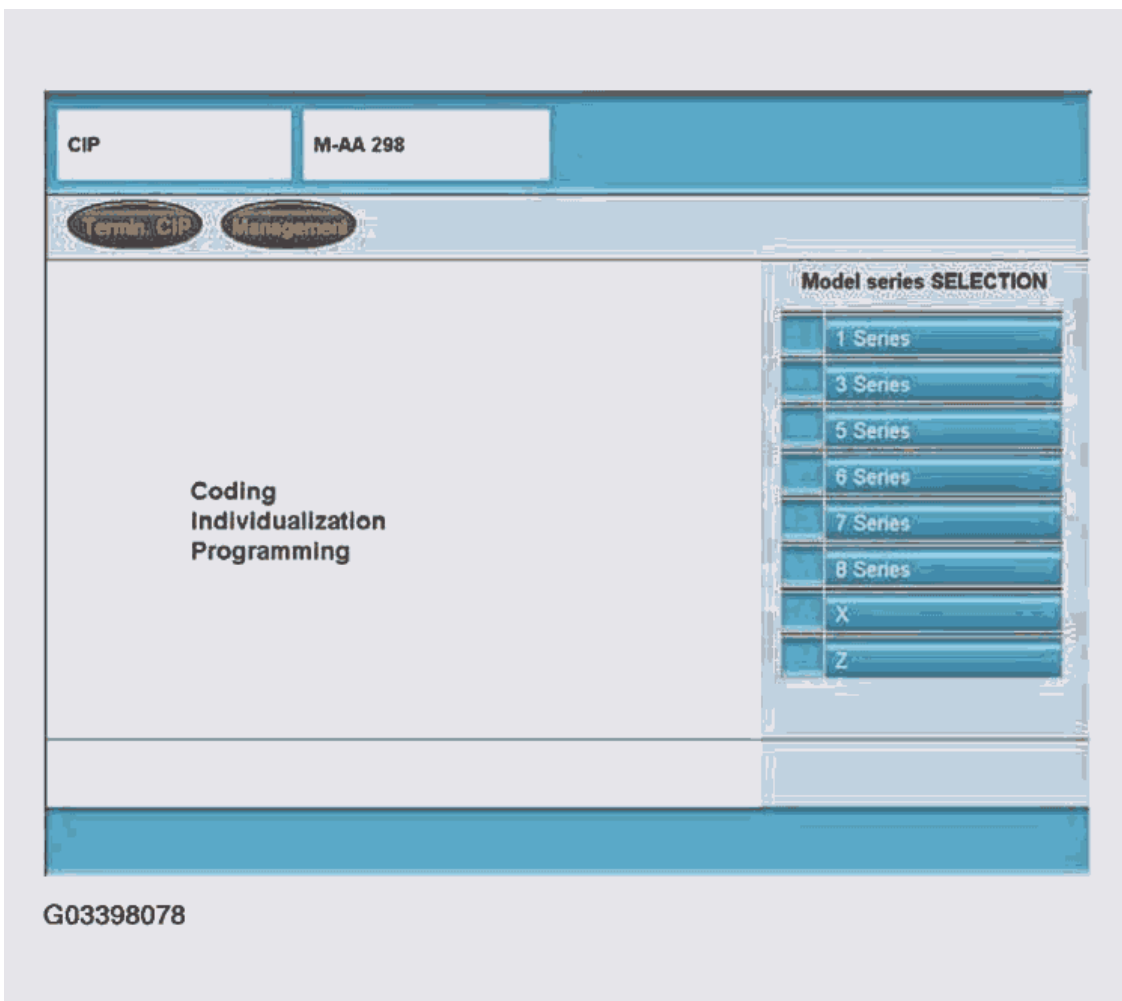

Fig. 224: Display Model Series Selection Screen
Courtesy of BMW OF NORTH AMERICA, INC.

Select "**Codierung ZCS/FA**".

Then advance screen to the right two times to enter the vehicle series selection screen.

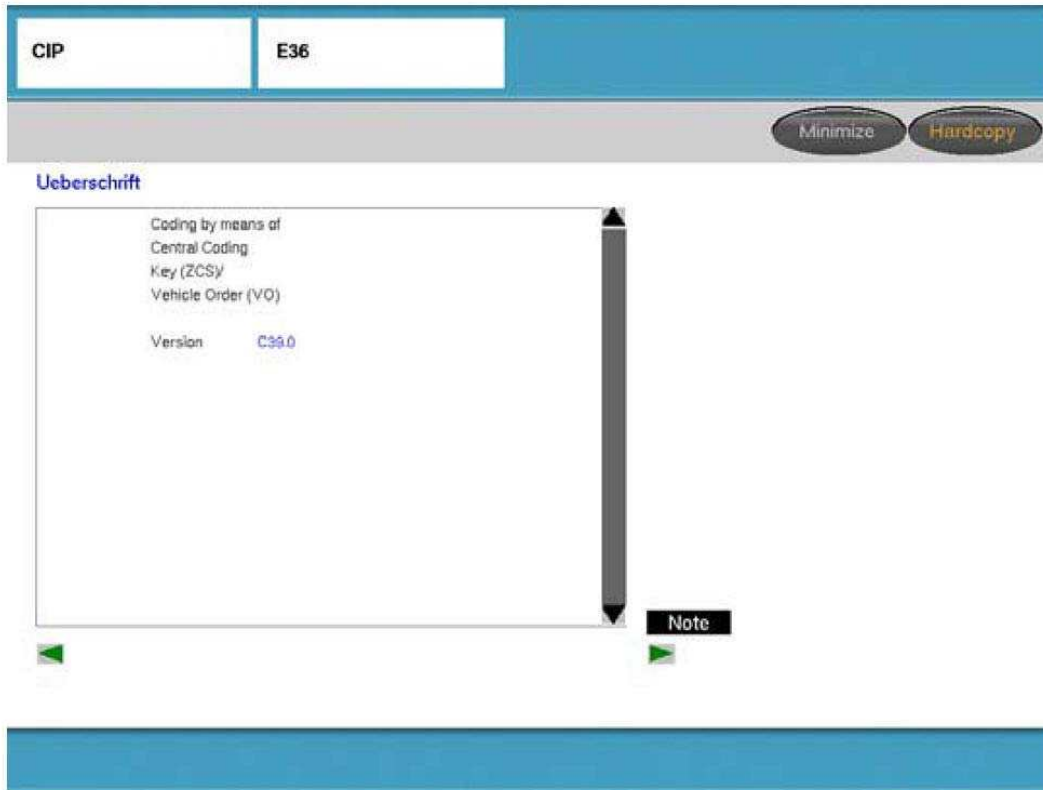

Fig. 225: Selecting Codierung ZCS/FA Button
Courtesy of BMW OF NORTH AMERICA, INC.

The version ID page is displayed.

Make sure it is the most up-to-date version of the software for the encoding procedure.

Press the right arrow.

G03398080

Fig. 226: Pressing Right Arrow
Courtesy of BMW OF NORTH AMERICA, INC.

Select vehicle series (i.e "E36 Series").

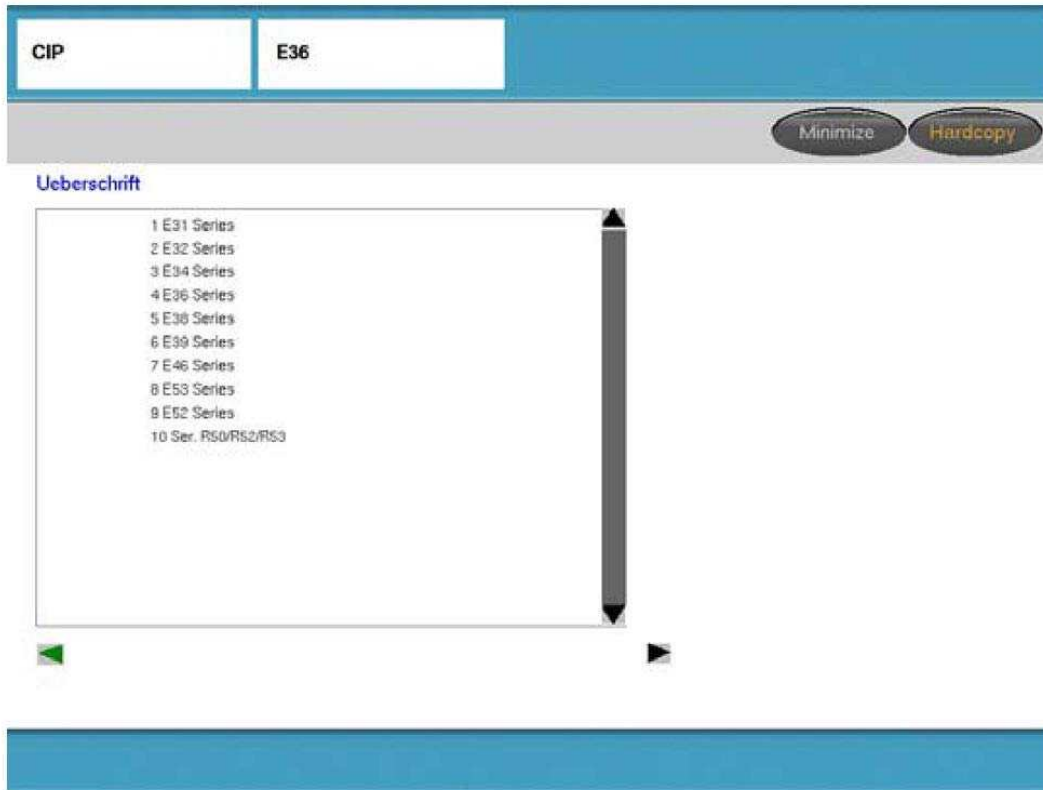

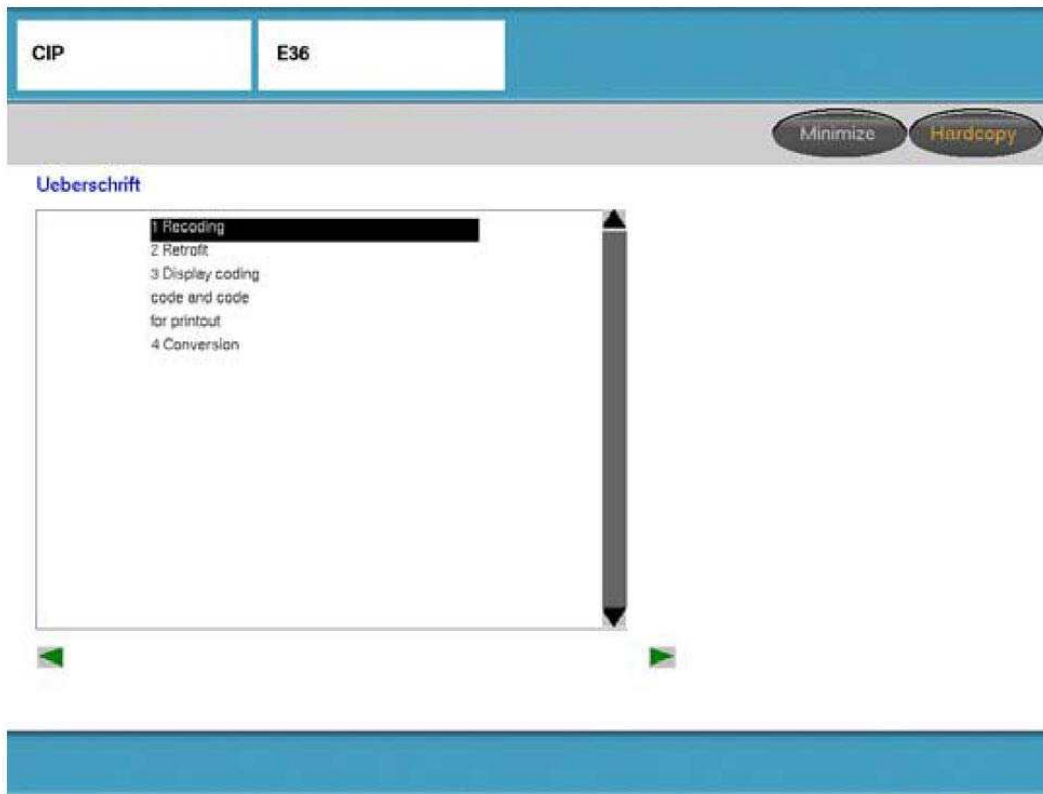

Fig. 227: Selecting Vehicle Series
Courtesy of BMW OF NORTH AMERICA, INC.

Select "**Recoding**"

Then advance screen to the right.

G03398082

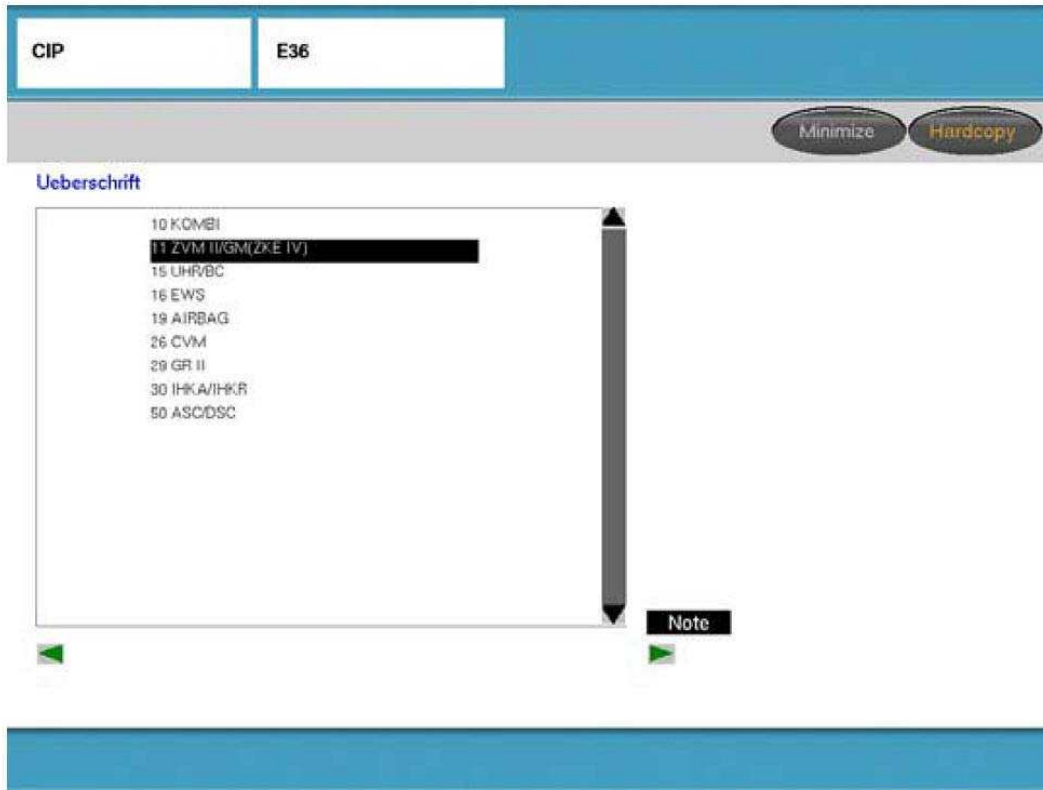

Fig. 228: Selecting Recoding Button

Courtesy of BMW OF NORTH AMERICA, INC.

Displays control modules that are ZCS codable.

Example:

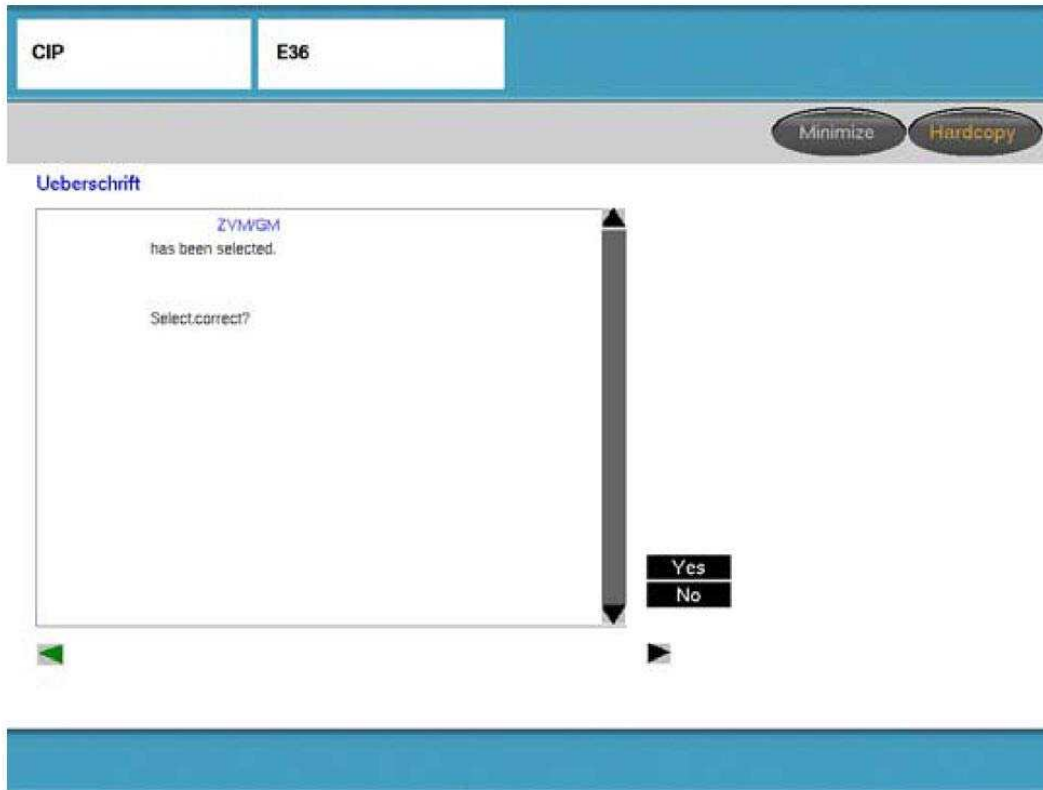

Select "ZVN II/GM (ZKE IV)".

G03398083

Fig. 229: Selecting ZVN II/GM (ZKE IV) Button
Courtesy of BMW OF NORTH AMERICA, INC.

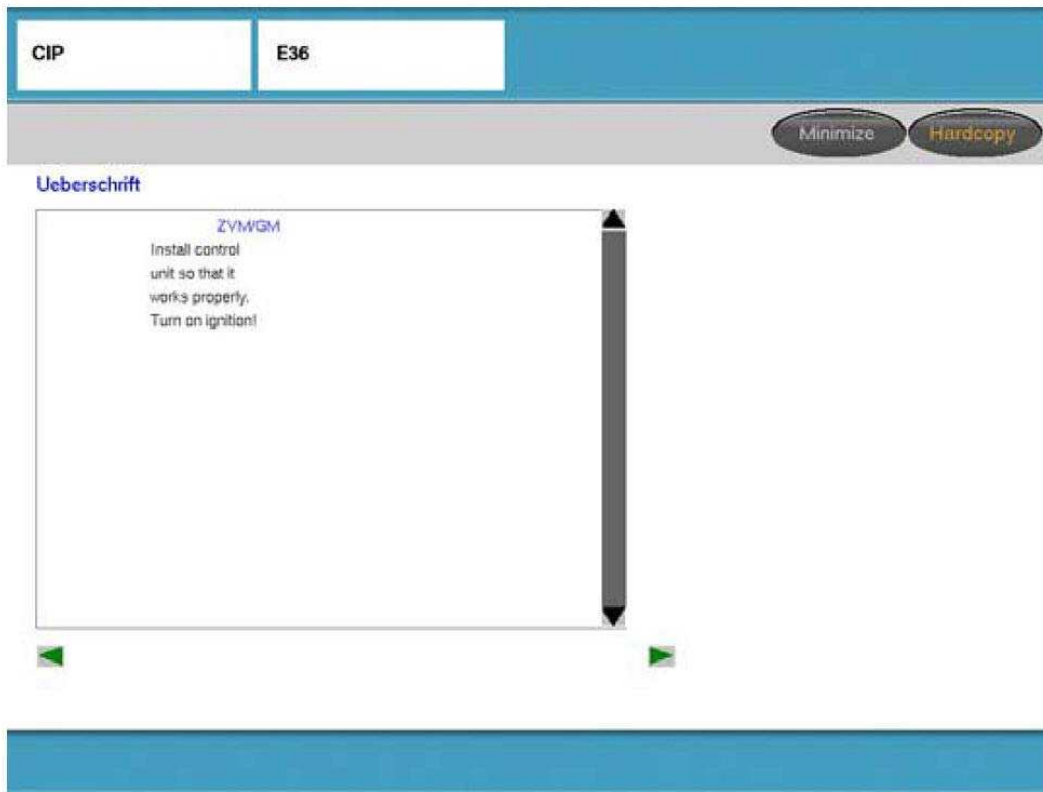

Confirm module selection.

G03398084

Fig. 230: Confirming Module Selection
Courtesy of BMW OF NORTH AMERICA, INC.

If a replacement module is to be installed install it now.

G03398085

Fig. 231: Display ZVM/VM
Courtesy of BMW OF NORTH AMERICA, INC.

Select yes to begin coding or recoding the selected module.

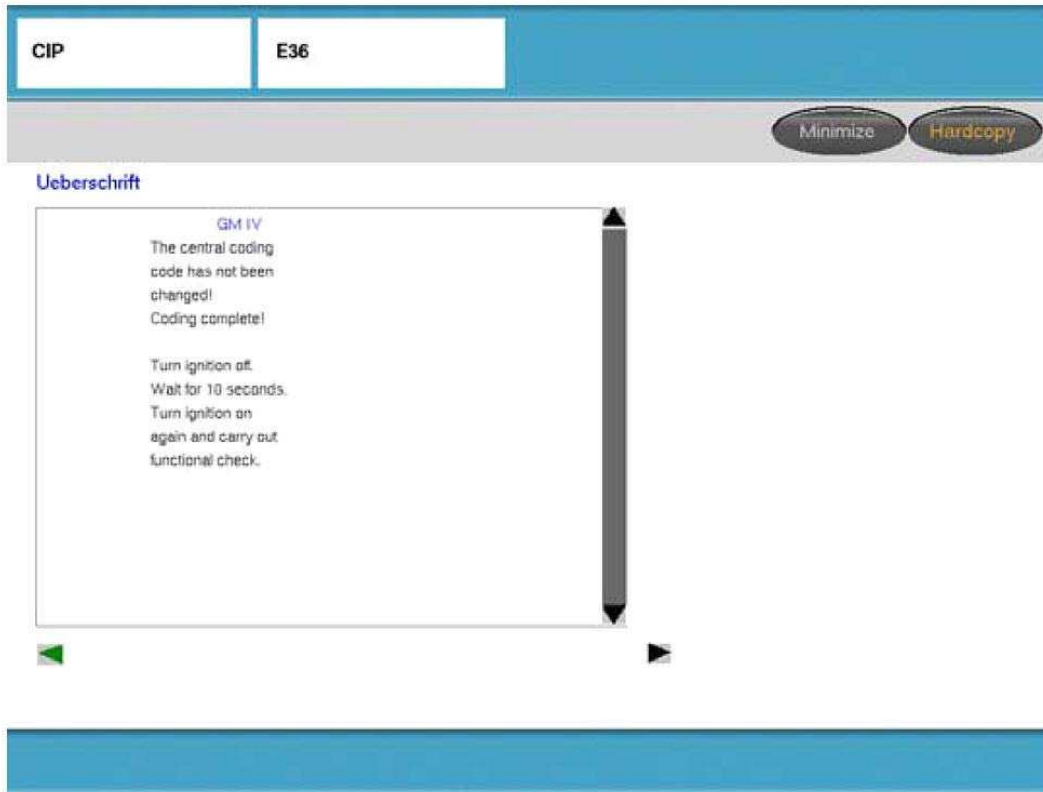

G03398086

Fig. 232: Selecting Yes Button

Courtesy of BMW OF NORTH AMERICA, INC.

Coding/recoding process of selected module is complete, follow the instructions given.

G03398087

Fig. 233: Display Instruction

Courtesy of BMW OF NORTH AMERICA, INC.

Additional ZCS Coding Functions

Fig. 234: Selecting Recoding Button
Courtesy of BMW OF NORTH AMERICA, INC.

Retrofit

The retrofit function allows options or accessory equipment to be added after the vehicle is manufactured.

By selecting to install a new option/accessory from the list of available retrofits for the specific vehicle, the ZCS information will be updated to reflect the addition of the new option or accessory that was installed. Updating of the ZCS information will ensure that the new component is recognized and able to communicate with the other modules in the vehicle.

Conversion

The conversion function allows specific features of certain control modules/systems to be modified, similar to the way Individualization (Vehicle & Key Memory) is used on newer models to "customize" a vehicle.

GENERAL INFORMATION

Complete Vehicle - E83

COMPLETE VEHICLE E83

G03305998

Fig. 1: Viewing Complete Vehicle

Courtesy of BMW OF NORTH AMERICA, INC.

HIGHLIGHTS IN BRIEF

The technical highlights of the BMW X3 are:

- xDrive, the new all-wheel drive system with variable drive torque distribution to the front and rear axles
- a multifunctional Panorama glass sunroof

The general electrical system of the E83 is largely based on the electrical system of the E46.

The E83 also employs state-of-the-art technology in its information and communication systems, based on the systems in the E85.

The following topics are briefly described below:

- **Body**

- Design
- Interior
- Bulkhead
- **Electrics/electronics**
 - Vehicle circuit structure
 - Panorama glass sunroof
 - Adaptive headlights
 - Multiple restraint system
 - Information and communication systems
 - Starter actuation
 - Instrument cluster
 - Service interval indicator
 - Centre console switch cluster
 - General module
- **Suspension**
 - Runflat indicator
 - Wheels and tyres
 - Servotronic
 - Front axle
 - Rear axle
 - Trailer stabilisation control
- **Power plants**
 - xDrive
 - Engine
 - Transmission

Some of the topics are dealt with in detail in the BMW Technical bulletins stated.

Body

○ **Design**

The BMW X3 has unmistakable, typically BMW proportions.

These include:

- the long, striking bonnet
- the roof contour the drops steeply to the rear
- a sloping rear end
- short overhangs

- a long wheelbase

The striking design of the headlights, the broad grille frame and the contoured lines of the bonnet are the defining features of the front end of the BMW X3.

Protruding wheel housing give the vehicle a sporty appearance.

G03305999

Fig. 2: Viewing Front End Of Vehicle
Courtesy of BMW OF NORTH AMERICA, INC.

The lines of the rear side windows are especially conspicuous: The lower edge of the rear side window departs from the waist line and climbs dynamically to the D-pillar.

The large tailgate is made of a single element.

G03306000

Fig. 3: Viewing Rear Side Of Window
Courtesy of BMW OF NORTH AMERICA, INC.

○ **Interior**

The interior is functional and yet sporty. Modern layout, right down to the finest detail make the BMW X3 what it is (e.g. intricate areas on the door handle).

Various materials are employed, from sporty aluminium to elegant full leather and wood.

G03306001

Fig. 4: Viewing Interior Of Vehicle
Courtesy of BMW OF NORTH AMERICA, INC.

○ **Bulkhead**

The bulkhead is bolted and for the first time on a BMW made of a steel/plastic composite.

IMPORTANT: If the bulkhead is damaged in an accident, do not attempt to straighten it but rather replace it.

The rigidity of the bulkhead is only provided in the original condition.

G03306002

Fig. 5: Viewing Bulkhead Of Vehicle
Courtesy of BMW OF NORTH AMERICA, INC.

Electrics/Electronics

- **Vehicle circuit structure**

The control units are networked in a similar manner to the E46. The following data buses are available on the E83:

- **Body bus**

The body bus (K bus) networks the following components:

- Components of the general electrical system
- Components of the information and communication systems
- Components of the passive safety system.

The major part of these systems and components have been taken from other models and

adapted for the E83.

The control units for the Panorama glass sunroof and the multiple restraint system 4 (MRS) are connected to the K bus.

- **Powertrain CAN**

The powertrain CAN (PT-CAN or powertrain controller area network) links the control units for the drive and running gear control systems.

New features of the PT-CAN are: the control unit for the transfer box (VTG) and the control unit for the servotronic.

The transfer box control unit controls the distribution of drive forces between the front axle and the rear axle.

The servotronic control unit controls the speed-dependent power steering.

- **LIN bus**

The LIN bus (Local Interconnect-Network bus) is serial, single-wire bus, standardised for the automotive industry. The LIN bus links the components for the electric exterior mirrors: switch block, base module and exterior mirrors.

The LIN bus also connects the control unit for the adaptive headlights (AHL) with the stepper motor controllers. (The stepper motor controllers control the stepper motors for the headlight-range adjustment and for the AHL).

- **Diagnosis bus**

The diagnosis bus (D-bus) is connected to the entire vehicle electrical system. The individual control units are either connected directly to the D-bus or via the control unit in the instrument cluster.

- **Panorama glass sunroof**

The fully automatic Panorama glass sunroof comprises 2 glass sunroofs: The front glass sunroof works like a sliding/tilt sunroof, the rear glass sunroof is a tilting glass sunroof.

The drive for the Panorama glass sunroof consists of 2 DC motors.

The wind deflector reduces wind noise inside the vehicle interior. The wind deflector is automatically extended, depending on the road speed.

For more information, refer to **PANORAMA GLASS SUNROOF - SI TECHNIQUES - E53, E61, E83, E91**

○ **Adaptive headlights**

The adaptive headlights (AHL) directs the beam of the headlights towards the inside of the curve when cornering - the curve is illuminated better. Visibility is thus improved.

When cornering, the driver is not looking into a "black hole" - instead, the adaptive headlights allow the driver to see the curve of the road. Adaptive headlights is an item of special equipment.

○ **Multiple restraint system**

The new multiple restraint system 4 (MRS) is an advanced development of the current MRS.

MRS consists of a control unit, several external sensors for recording an impact, a seat-occupancy detector and gas generators for triggering the airbags.

The external sensors are:

- 2 airbag front sensors
- Airbag sensor, front left door
- Airbag sensor, front right door
- Airbag sensor, B-pillar left
- Airbag sensor, B-pillar right

US version: Seat-occupancy detector

In the US version, the seat-occupancy detector is able to detect the weight class of the occupant:

- The seat-occupancy detector mat contains pressure-sensitive sensors.
- The pressure generated by the person sitting on the seat-occupancy detector mat is recorded by the sensors.
- The electronic evaluation unit uses the sensor signals to determine the weight class of the person on the front-passenger seat.

For more information, refer to **AUDIO, NAVIGATION AND ANTI-THEFT** .

Information And Communication Systems

The information and communication systems have the following new features/modifications:

- Different telephone systems are employed on the E83.

The permanently installed units use the "Everest" platform, bluetooth mobile phones work with the "universal charging and hands-free facility" (ULF).

- The audio system available are taken from the E85.

The loudspeaker systems are new developments and have been adapted to the acoustic conditions in the E83.

- The CD changer is installed in a user-friendly manner in the front armrest between the driver's and front-passenger seat.
- The hi-fi amplifier in the luggage compartment of the E83 is a modified version of the hi-fi amplifier from the E85 and E46. The 10-channel hi-fi amplifier has been made into a 6-channel hi-fi amplifier through a series of modifications to the internal circuitry.
- Option 209 "Navigation system Professional" includes a folding central information display (CID). The CID is located in the middle of the instrument panel.
- **US version: Satellite Digital Audio Radio Service (SDARS)**

In the USA, BMW uses the SDARS of "Sirius Satellite Radio Inc."

SDARS allows digital signal (audio and information signals) to be transmitted.

Audio signals are, e.g.:

- Music
- Speech

Information signals are, e.g.:

- Radio station
- Artist
- Music track

Signals are transmitted via 3 satellites (by the national radio station "Sirius Satellite Radio Inc." in New York).

The satellites transmit the signals to the mobile SDARS tuner in the vehicle and to stationary aerials on the ground (to enlarge the reception area).

- **Starter actuation**

The E83 employs the EWS3 plus (EWS = electronic immobilizer). With the EWS3 plus system, the information "terminal 50 ON" is not forwarded to the DME / DDE (digital engine electronics / digital diesel electronics) by the starter, but rather directly by the EWS control unit.

- **Instrument cluster**

The E83 instrument cluster differs from the E85 instrument cluster as follows:

The instrument cluster on the E83 has the same software as that on the E85. All other function are identical.

- The reading on the speedometer is restricted to a scale reading of 250 km/h

- Additional warning light for washer fluid level in windscreen washer fluid reservoir
- Additional indicator and warning light for the digital diesel electronics (DDE)

This indicator and warning light fulfils the same functions as the indicator and warning light for the electronic engine output control (EML). The EML warning lamp lights up if a fault develops in the engine electronics.

○ **Service interval indicator**

The service interval indicator (SIA 4) is installed on the E83.

Condition Based Service (CBS) is not employed on the E83.

○ **Centre console switch cluster**

The Centre console switch cluster (SZM) has been taken from the E53.

The SZM button for opening the upper tailgate is not longer fitted as the E83 does not have a 2-section tailgate.

○ **General module**

General module 5 (GM) is introduced with the E85 and on the E83 also controls the exterior mirrors (via the LIN bus).

Suspension

○ **Servotronic**

On the E83, the servotronic (SVT) is integrated in a separate control unit.

The SVT control unit is connected to the powertrain CAN (PT-CAN) and to the body bus (K bus).

For more information, refer to **STEERING AND WHEEL ALIGNMENT - SI TECHNIQUES - E83**.

○ **Front axle**

The front axle is a double pivot spring-strut axle with tension strut, transverse link and rack-and-pinion power-steering.

The E83 front axle differs from the E53 front axle as follows:

- Modified level sensor (identical component as on rear axle) with elongated hole and tab (locking device)
- New bellows on steering track rod, transverse link and tension strut
- Front axle carrier made of high-strength steel tubing and clipped plastic cover as protection against

stone impact

- Screw connection for hinged bracket with different nuts at top and bottom
- Double screw connection for front axle carrier left and right

G03306003

Fig. 6: Viewing Double Pivot Spring Strut Axle E38 Front Suspension
Courtesy of BMW OF NORTH AMERICA, INC.

○ Rear axle

The rear axle is a central-link rear axle with subframe and double-elastic differential mounting.

The E83 rear axle differs from the rear axle of the E46 all-wheel drive as follows:

- Stabilizer mounting on rear-axle member uses clamps
- Front mounting of rear axle with bolts with additional guide washer
- Torque arm with holder for tension strut
- Transverse link made of galvanizes sheet steel plate
- Hinged bracket with ball joint secured directly on the transverse link (without additional bracket)
- Damper bolted to body with 3 bolts (mounting on body)

G03306004

Fig. 7: Viewing Central Link Rear Axle
Courtesy of BMW OF NORTH AMERICA, INC.

○ **Wheels and tyres**

- All-season tyres

The E83 runs as standard on 17 inch aluminium wheels with size 235 all-season tyres. In addition, 18 inch wheels are available in different designs and with several tire sizes.

- Emergency wheel

In series production, all versions are equipped with an emergency wheel (4B x 17 IS18 steel rim with T135/90 R17 104 M tire).

The E83 has an emergency wheel tray for the emergency wheel on the floor of the vehicle, under the luggage compartment. The emergency wheel tray is released and lowered from the luggage

compartment.

The emergency wheel tray has a special service opening. This allows the tire pressure to be checked from the outside, without having to lower the emergency wheel tray.

○ **Runflat indicator**

The E83 is equipped as standard with a runflat indicator (RPA). The RPA monitors the tire pressure throughout the journey. The RPA indicates that a tire has lost a significant amount of pressure relative to the other tyres via an indicator and warning light any an acoustic signal.

The runflat indicator is integrated in the DSC control unit. By comparing the speed signals for all four wheels, the system detects differences in rolling circumference at the individual wheels.

○ **Trailer stabilisation control**

Option 235 "Trailer coupling with detachable ball head" also includes trailer stabilisation control (familiar from the E53).

Trailer stabilisation control is integrated in the Dynamic Stability Control (DSC).

The system provides detects at an early stage when the trailer starts to fishtail and automatically brakes the vehicle as follows:

- Automatic brake application (by DSC)
- Reduced engine torque (by DSC)

Drive Train

○ **xDrive**

xDrive is an innovative all-wheel drive system that comprises the Dynamic Stability Control (DSC) system and an electronically controlled multi-plate clutch in the transfer box.

Drive torque is smoothly distributed between the front and rear axles by an electronically controlled multi-plate clutch according to requirements (controlled by DSC).

xDrive distributes the drive torque to both axles as required, providing the following benefits:

- Superb operating stability up to the limits imposed by the laws of physics
- Optimal forward momentum
- Excellent traction in all road situations

For more information, refer to **XDRIVE (TRANSFER BOX) - SI TECHNIQUES - E53 & E83**.

○ **Engine**

The following familiar engines will be available on market launch:

- 6-cylinder spark-ignition engine M54B25
- 6-cylinder spark-ignition engine M54B30
- 6-cylinder diesel engine M57D30

○ **Transmission**

The following familiar transmission will be available on market launch:

- 6-speed manual transmission, standard
- 5-speed automatic transmission, special equipment (option 205)

Subject to change.

2004-05 GENERAL INFORMATION

Drive - Overview - X3

E83 DRIVE

PURPOSE OF THE SYSTEM

Drive

The E83 is available with the following engine and transmission variants in the US market:

E83 ENGINE AND TRANSMISSION VARIANTS SPECIFICATIONS

Engine	Manual Transmission	Automatic Transmission	Transference	Final Drive
M54B25 M54B30	GS6X37BZ	GA5R390R	ATC400	188K i = 3.64 (man. and auto.)

The vehicles are all fitted with the VAG 174 front axle drive.

Drive Modifications

The following modifications have been made to the engine for use in the E83:

- Modified Belt Drive - the position of the deflection pulley on the alternator (150 A Bosch/Valeo) has been modified slightly.
- M54B25 manual and automatic transmission and M54B30 manual transmission equipped vehicles use Siemens MS45.0 engine management system. This system is LEV emission compliant.
- M54B30 automatic transmission equipped vehicles use Siemens MS45.1 engine management system. This system is ULEV II emission compliant.

Exhaust System

The following exhaust system is used at the start of E83 series production:

Fig. 1: Identifying Exhaust System
Courtesy of BMW OF NORTH AMERICA, INC.

The E83 exhaust system is made of stainless steel. The exhaust system connected to the M54 engine is one piece from the exhaust manifolds to the rear silencer (muffler). However, the system is available in sections for service replacement.

As on current BMW M54 engines, each exhaust manifold is equipped with metal base catalytic converters, 2 pre-catalyst and 2 post catalyst oxygen sensors.

The rear silencer is equipped with an exhaust flap (similar to the E46). It reduces noise in the lower engine RPM range. The exhaust flap is operated by a Diaphragm (4). It is controlled by a solenoid valve, which is controlled in turn by the ECM (DME). The rear silencer has an 18.5 liter volume.

Cooling System

This section describes the cooling module installed in the E83 in conjunction with the M54B25 and M54B30. The following components of the cooling module were adopted from the E46 and E85:

- Module carrier
- Fan
- Transmission oil cooler (oil-water heat exchanger)
- Expansion tank

The following components were physically modified for use in the E83:

- Radiator - performance increased
- Fan shroud
- A/C condenser - performance increased
- PS cooler - performance increased

Cooling Module Components

1. Electric fan (600 W) and shroud
2. Radiator
3. A/C condenser
4. P/S cooler (hose loop)
5. Expansion tank
6. Automatic transmission cooler (heat exchanger)

G03399749

Fig. 2: Identifying Cooling Module Components
Courtesy of BMW OF NORTH AMERICA, INC.

E83 Fuel System Modifications

To comply with ever increasing emissions laws, the E83 fuel system has a further decrease in the number of openings and ports over previous series production. On the E83, the filler valves and service breather valves are completely encapsulated by the fuel tank.

The only ports/openings except the fuel filler neck are located in the two service access cover plates.

Components

The fuel tank is located above the drive shaft in front of the rear axle (similar to E46) and is secured by two tensioning straps. The fuel tank capacity is 67 liters, including 8 liters of reserve fuel. It is made of plastic (multi-layer HDPE) with an intermediate layer (barrier layer).

Access to the fuel filter, pressure regulator, the two fuel level sensors and the electric fuel pump are through the two service access covers. The fuel filler neck is secured to the right hand side of the fuel tank with hose clamps.

1. Activated charcoal filter with DM TL
2. Filler pipe
3. Vent line
4. Right service access cover

5. Left service access cover
6. Evaporative purge line
7. Fuel delivery line

G03399750

Fig. 3: Identifying Fuel System Components
Courtesy of BMW OF NORTH AMERICA, INC.

The fuel delivery unit comprises the following components in the right hand side of the fuel tank:

- Fuel baffle with electric fuel pump and right hand suction-jet pump
- Right hand fuel level sensor
- Fuel filter with pressure regulator.

In the left hand side of the fuel tank:

- Left hand fuel level sensor
- Left hand suction-jet pump

The components are accessible through the two service access covers.

- | | |
|---|---|
| 1. Fuel baffle chamber with electric fuel pump (EKP) | 7. Filler breather valve |
| 2. Fuel filter with pressure regulator (3.5 bar) | 8. Service breather valve |
| 3. Fuel feed (port in the service access cover) | 9. Vent line (port in the service access cover) |
| 4. Return flow from the pressure regulator for the left hand suction-jet pump | 10. Left hand fuel level sensor |

| 6. Return flow from the left hand suction-jet pump into the fuel baffle chamber | |

G03399751

Fig. 4: Identifying Fuel Delivery Unit And Fuel Tank
Courtesy of BMW OF NORTH AMERICA, INC.

The fuel filter and the pressure regulator form one component, the pressure regulator for the M54 engines are 3.5 bar.

The fuel filter is replaced together with the pressure regulator for service repairs.

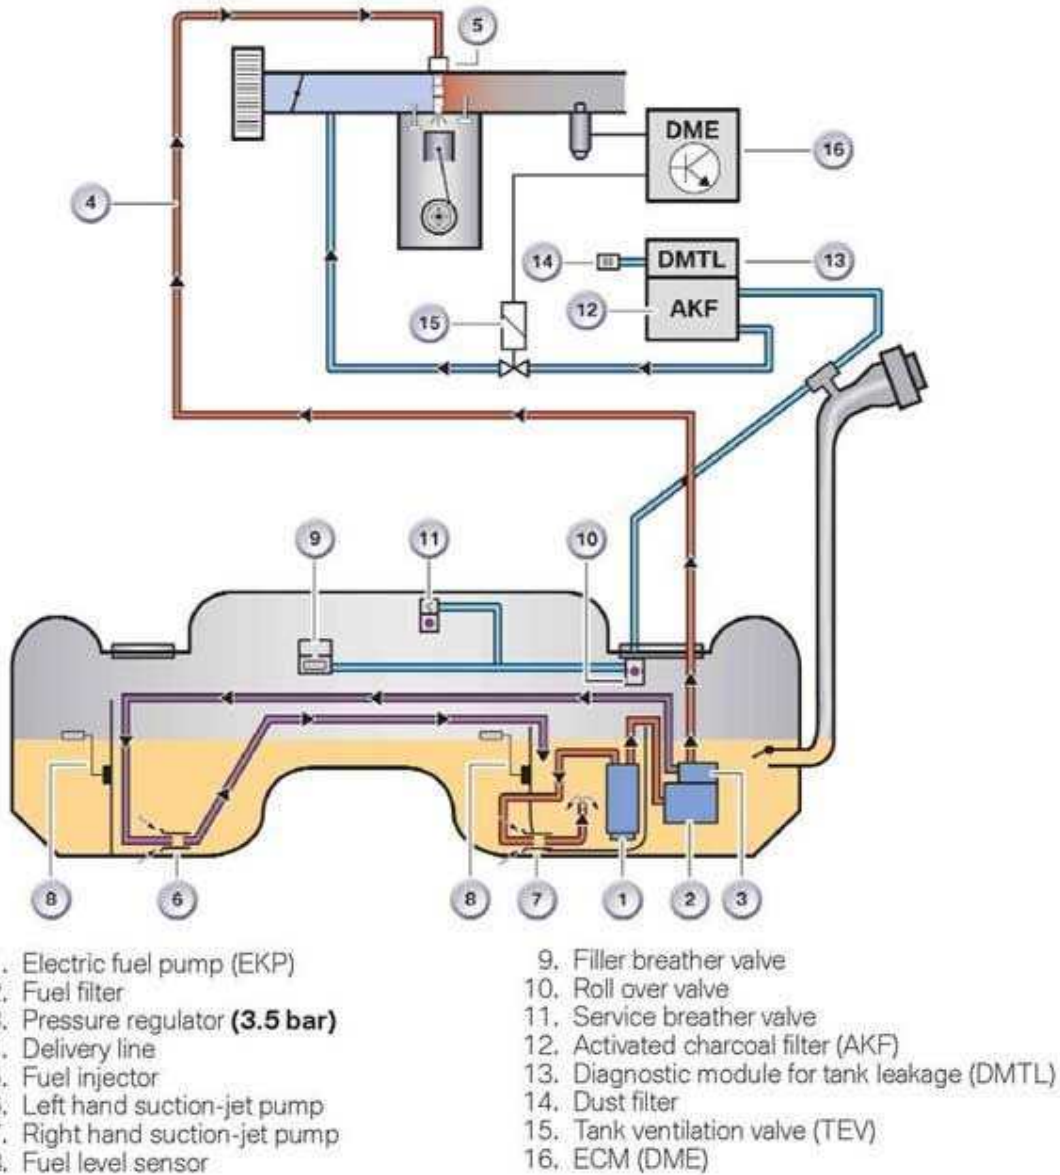

1. Pressure regulator
2. Port for return line
3. Supply from the electric fuel pump (EKP)
4. Fuel filter
5. Supply to fuel rail

G03399752

Fig. 5: Identifying Pressure Regulator
Courtesy of BMW OF NORTH AMERICA, INC.

Fuel System Overview

G03399753

Fig. 6: Identifying Fuel System Overview

Courtesy of BMW OF NORTH AMERICA, INC.

Fuel Delivery

The fuel is supplied to the engine from the fuel tank as follows:

- From the right hand half of the fuel tank
- Through the non-return valve inside the fuel baffle chamber (only for initial filling of the fuel baffle)
- Into the fuel baffle chamber
- Pumped out by the electric fuel pump (EKP)

- Into the fuel filter
- Through the line in the right hand service access cover to the engine
- Pumped out by the electric fuel pump in parallel through a separate fuel line to the right hand suction-jet pump, then from the right hand half into the fuel baffle (level increase)

Fuel Pressure Regulation

With pressure regulation, fuel is fed through the fuel tank as follows:

- Fuel pressure controlled by the pressure regulator (3.5 bar)
- To the suction-jet pump in the left hand half of the fuel tank
- Into the fuel baffle chamber

At the same time, the suction-jet pumps draw the fuel from the right and left hand sides of the fuel tank. This ensures that the fuel baffle and the electric fuel pump are supplied with fuel at all times.

Filler Venting

To provide filler venting, there is a breather unit in the fuel tank consisting of a service breather valve (11) and filler breather valve (9). There is also a roll over valve (10) on the right hand service access cover. The filler breather valve allows air and fuel vapors to escape from the fuel tank when the vehicle is refuelled (venting).

When the vehicle is refuelled, the air and fuel vapors vent via:

- The filler breather valve
- Through the vent line
- To the roll over valve
- Through the T-fitting on the fuel filler neck
- Into the activated charcoal filter

When the maximum capacity is reached, the filler breather valve is closed by the fuel lifting the internal float valve. The fuel level rises in the fuel filler neck and trips the fuel pump nozzle. A vapor barrier (approximately 15 liters) remains in the tank above the filler breather valve after the tank has been filled. This provides internal liquid/vapor separation.

Service Breather Valve

The fuel vapors produced are vented:

- Through the filler breather valve
- Through the service breather valve if the filler breather valve is closed
- To the roll over valve
- Through the vent line
- Through the T-fitting on the fuel filler neck

- Into the activated charcoal filter (AKF)
- Through the evaporative purge line
- Through the evaporative purge valve (TEV)
- To the engine intake manifold

The service breather valve only opens if the filler breather valve is closed (fuel tank full to capacity). The service breather valve location is higher in the tank than the filler breather valve and opens at a pressure of 50 mbar. When the fuel tank is not full, vapors are vented through the filler breather valve.

Notes:

Automatic Transmission

The previously used 5-speed GM5 automatic transmission is used in the E83 and E53 MU.

The transmission designation is GA5R390R.

Modifications have been made to the output shaft and tail housing to accommodate the ATC 400/500 transfer case.

G03399754

Fig. 7: Identifying Automatic Transmission
Courtesy of BMW OF NORTH AMERICA, INC.

AUTOMATIC TRANSMISSION TECHNICAL DATA

Index	Explanation
Type	Automatic gearbox with five forward gears. 5th gear is designed as an overdrive gear.
Power transmission	The maximum torque is 390N.m in 1st/2nd/3rd and 5th gear and 410N.m in 4th gear with the converter clutch closed.
Torque converter	With M54B30 = W245 with controlled converter clutch
Gear ratios	1st gear 3.24 2nd gear 2.22 3rd gear 1.60 4th gear 1.00 5th gear 0.75 Reverse gear 3.03
Selector positions	P-R-N-D and Steptronic
Control	Electrohydraulic with adaptive shift characteristic control
Weight with oil ⁽¹⁾	77 to 78 kg depending on the version
(1) Lifetime oil fill	

Transmission Control

The transmission control has been adopted from the E46. The transmission control unit (GS20 as on E46) is located in the electronics box in the engine compartment and is on the PT-CAN.

Manual Transmission

The 6 speed manual transmission in the E83 and E53 MU was previously used in series production.

The transmission designation is GS6X37BZ (H-gearbox) with the M54 engine.

Modifications have been made to the external gearshift mechanism as well as the output shaft and tail housing to accommodate the ATC 400/500 transfer case.

G03399755

Lifetime oil fill.	

Drive Train

The E83 drive train has been largely adopted from the E46/3-16 (3 Series, Touring, all wheel drive).

Components

1. Transfer case
2. Front drive shaft
3. Rear drive shaft
4. Final drive
5. Rear output shafts
6. Front axle drive
7. Front output shafts

G03399756

Fig. 9: Identifying Drive Train Components
Courtesy of BMW OF NORTH AMERICA, INC.

Rear Driveshaft

The rear drive shaft in the E83 with the M54 engine is a steel universal joint shaft (arrow on the right).

G03399757

Fig. 10: Identifying Rear Driveshaft

Courtesy of BMW OF NORTH AMERICA, INC.

To minimize noise, a constant velocity joint shaft is used in the E53 MU.

1. Flexible coupling
2. Front section of drive shaft (collapsing tube)
3. Center bearing
4. Universal joint
5. Rear section of drive shaft
6. Constant velocity joint

G03399758

Fig. 11: Identifying Constant Velocity Joint Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

Both style rear drive shafts are equipped with a deforming element.

The front section of the drive shaft is designed as a collapsing tube (1).

When the drive shaft is compressed (collapsed) it absorbs a defined force.

After collision or accident repairs, the drive shafts must always be checked for compression of the collapsing tube.

G03399759

Fig. 12: Identifying Front Section Of Drive Shaft (Collapsing Tube)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: When the collapsing tube is deformed, the drive shaft must be replaced.

Front Drive Shaft

The front drive shaft connects the transfer case to the front axle drive. It is designed as a one piece section without a center bearing and has two universal joints.

Rear Axle Final Drive

The 188 K (ring gear size) final drive is known from the previous model series productions. The final drive ratio

varies depending on the engine/gearbox combination. For the US with M54 engines, the ratio is 3.64:1 for both automatic and standard transmissions.

Front Axle Drive

The vehicles are equipped with the familiar VAG 174 front axle drive, regardless of the engine and transmission variant. The front axle ratio is always identical to the final drive ratio (3.64:1 for US with M54 engines).

NOTE: Lifetime oil fill on both axles.

Rear Output Shafts

The rear output shafts have sliding joints for length compensation on both wheel side (1) and axle side (2).

NOTE: There is a difference in shaft tube length of approximately 54 mm between the right and left output shaft.

Fig. 13: Identifying Rear Output Shafts
Courtesy of BMW OF NORTH AMERICA, INC.

Front Output Shafts

The locking angle of wheel side fixed joint (1) is 50°. The axle side joint (4) slides to compensate for differences in length caused by suspension/axle movements.

1. Constant velocity joint (fixed joint), wheel side
2. Front left output shaft
3. Front right output shaft
4. Triple roller joint (sliding joint), axle side

GENERAL INFORMATION

DVOM - Overview

THE DVOM

Model: All

Production Date: All

INTRODUCING THE DVOM

The ability to measure voltage, current flow, and resistance is important in the diagnosing of electrical problems. Without the results of these measurements troubleshooting in an electrical system is a futile process.

The instrument most commonly used to make electrical measurements is called the Digital Voltage-Ohm Meter (DVOM).

Basic DVOM's are capable of measuring:

- AC Voltage.
- DC Voltage.
- Millivolts.
- Resistance.
- Conductance.
- Capacitance.
- Continuity.
- Diode Test.
- Amps/Milliamps.
- Microamps.

Advanced DVOM's add:

- Frequency.
- RPM.
- Duty Cycle.
- Pulse Width.

G03388894

Fig. 1: Identifying DVOM

Courtesy of BMW OF NORTH AMERICA, INC.

The DVOM provides for a method of accurate measurements.

Even though accurate measurements are the key to electrical diagnosis, the following four factors determine the effectiveness of the measurements:

- Accuracy of the measuring instrument.
- Correct installation in the circuit of the measuring instrument.
- Ability of the Technician to read the instrument.
- Skill of the Technician in interpreting the results.

As it is clearly seen, only one of the factors depends on the DVOM (e.g. accuracy), the rest will always depend on the ability of the technician to read and interpret the results.

CHOOSING A DVOM

A good choice of a DVOM is the DISplus or the MoDic, as the measuring system of each contains a highly accurate DVOM.

Choosing a handheld DVOM from a reputable manufacturer, however, leaves the DISplus and MoDic free to perform other tasks that a DVOM can not do (e.g. Retrieval of fault codes).

In choosing a DVOM several factors need to be considered, one of which is **Impedance**.

Impedance is the combined resistance to current created by the resistance, capacitance and inductance of the meter. Impedance is measured in '**Ohms per Volt**'.

Meters with the highest '**Ohms per Volt**' impedance are the most accurate. More importantly using a meter with high impedance will not cause damage to sensitive electronic circuitry.

When a Meter is connected across a circuit to measure voltage, it must be connected in parallel. This adds parallel resistance. The total resistance in a parallel circuit is less than the lowest resistance in that circuit (Ohms Law). Using a Meter with low impedance will reduce the total resistance of the circuit and allow more current to flow.

A meter with low impedance can draw enough current to cause inaccurate measurement, voltage drops or damage sensitive electronic circuit boards. A high impedance meter will draw little current and insure accurate readings.

Using older type meters with low impedance values (20,000 to 30,000 ohms-per-volt) can damage modern electronic circuits and components or give inaccurate readings.

Test lights should be avoided for the same reason. They lower the total resistance of the circuit and cause increased current flow.

Other factors in choosing the proper DVOM are:

- Cost.
- Features.

Basic DVOM's are available reasonably priced. These basic models may be more than sufficient for use in BMW Centers, given the availability of the DISplus and MoDic for advanced measurement and scope functions.

Advanced features and price go hand in hand. The more features added the higher the cost. Some of those features may be worth the increase in cost (e.g. frequency, duty cycle and pulse width). Other features may not (e.g. oscilloscope, graphing).

Choose a DVOM wisely based on personal preference and cost. Like many other tools it is valuable in the diagnosis and repair of BMW's. Experience has shown if the technician is not comfortable with the DVOM or confident in the results of the measurements, the DVOM will not be used. Considering the technology in BMW automobiles, diagnosing with a quality DVOM certainly makes repairing the problem correctly and expediently a more manageable task.

THE FUNCTIONS

Function Selector Rotary Switch

G03388895

Fig. 2: Identifying Function Selector Rotary Switch (Off)
Courtesy of BMW OF NORTH AMERICA, INC.

Power to the meter is turned off.

G03388896

Fig. 3: Identifying Function Selector Rotary Switch (Volts AC)
 Courtesy of BMW OF NORTH AMERICA, INC.

Volts AC.

Measures AC voltage.

Ranges 400mV, 4V, 400V, 1000V.

G03388897

Fig. 4: Identifying Function Selector Rotary Switch (Volts DC, RPM)
 Courtesy of BMW OF NORTH AMERICA, INC.

Volts DC, RPM.

Measures DC Voltage.

Ranges 4V, 40V, 400V, 1000V.

G03388898

Fig. 5: Identifying Function Selector Rotary Switch (mV)
 Courtesy of BMW OF NORTH AMERICA, INC.

mV.

Measures DC Millivolts.

Range: 400mV.

G03388899

Fig. 6: Identifying Function Selector Rotary Switch (Continuity/Ohms)
 Courtesy of BMW OF NORTH AMERICA, INC.

Continuity/Ohms.

Measures Continuity and Ohm.

Ranges: 400ohms,4kohms, 400kohms, 4Mohms, 40Mohms.

G03388900

Fig. 7: Identifying Function Selector Rotary Switch (Diode Test)
 Courtesy of BMW OF NORTH AMERICA, INC.

Diode Test.

Test diode operation.

Range: 3.000V.

G03388901

Fig. 8: Identifying Function Selector Rotary Switch (Amps DC)
 Courtesy of BMW OF NORTH AMERICA, INC.

Milliamp or Amps DC.

Measures DC Milliamps or amps.

Ranges: 40mA or 400mA for mA input 4000mA or 10 A for A input.

G03388902

Fig. 9: Identifying Function Selector Rotary Switch (Amps AC)
 Courtesy of BMW OF NORTH AMERICA, INC.

Milliamps or Amps AC.

Measures AC Milliamps or amps.

Ranges: 40mA or 400mA for mA input 4000mA or 10 A for A input.

PUSH BUTTON FUNCTIONS

SMOOTH

HZ

ms-PULSE

± TRIGGER

G03388903

Fig. 10: Identifying Push Button Functions

Zero (Relative Reading) Function:

Displays difference between the measured value and the stored value.

G03388904

Fig. 11: Identifying Zero (Relative Reading) Push Button
Courtesy of BMW OF NORTH AMERICA, INC.

Minimum (Min), Maximum (Max), Average (AVG) Recording:

Records minimum, maximum and calculates the true average.

G03388905

Fig. 12: Identifying Min/Max, AVG Recording Push Button
Courtesy of BMW OF NORTH AMERICA, INC.

Manual Range or Autorange:

In Manual Range user selects fixed range. Meter stays in that range until user changes it, selects Autorange or turns meter off. In Autorange meter selects range automatically.

G03388906

Fig. 13: Identifying Manual Range or Autorange Push Button
Courtesy of BMW OF NORTH AMERICA, INC.

Touch Hold:

Touch Hold holds last stable reading on display. A new stable reading causes beeper to sound and display to update.

If meter is in MIN MAX Recording, RPM, Duty Cycle, Pulse Width or Hz, Touch Hold interrupts the function. The display is frozen, but recorded readings are not erased.

G03388907

Fig. 14: Identifying Touch Hold Push Button

Courtesy of BMW OF NORTH AMERICA, INC.

RPM / HZ.

RPM 2, RPM 1, or frequency.

RPM 2, 4-cycle engines.

RPM 1, 2-cycle engines.

Hz. counts frequency between 0.5 Hz and 200 kHz.

HZ

G03388908

DISPLAY

G03388913

Fig. 20: View Of Functions Display

Courtesy of BMW OF NORTH AMERICA, INC.

INFINITY DISPLAY

While most displays of DVOMs are standard (i.e. mV means millivolt, mA means milliamp) the display or symbol for infinity or open circuit can be confusing. A display of 0ohms indicates no or little resistance. It means the circuit or portion of the circuit being measured has continuity or is complete. A reading of OL means the circuit is open or not complete, the resistance is said to be "INFINITY". Some meters may use the symbol "INFINITY" for Infinity. Be aware of which reading the meter being used will give for infinity or open circuit.

Meter 1

G03388914

Meter 2

Meter 3

Fig. 21: Infinity Display

Courtesy of BMW OF NORTH AMERICA, INC.

VOLTAGE TESTING

The voltmeter (DVOM) must be connected in parallel with the load or circuit.

The DVOM has a high resistance and taps off a small amount of current.

A voltmeter must be used with the current on and with the correct polarity.

The red lead should be connected to the B⁺ side of the circuit and the black lead to the B⁻ side of the circuit.

If the leads are reversed the reading will be a negative number.

Typical Application of Voltage Testing

- Checking Power Supply.

- Charging System.
- Complete Basic Circuits.
- Control Module Functions (Input/Output).

G03388915

Fig. 22: Identifying Voltage Testing
Courtesy of BMW OF NORTH AMERICA, INC.

Measure at different points checking for change or interruption in the voltage supply.

- Select proper function and range of DVOM.
- Connect (-) lead of meter to battery B- or known good ground.
- Connect (+) lead of meter to test circuit.

DVOM will indicate supply or available voltage at that point.

AMPERAGE TESTING

To measure amperage the meter must be installed in series in the circuit. The current flow of the circuit must flow through the meter itself.

Current must be flowing in the circuit.

Installing the meter in parallel with the circuit may cause damage to the meter, because of the increased current flow in the circuit, due to the low resistance in the meter.

**CAUTION: Most ampere meters or DVOMs are rated for no more than 10 amps.
Current flow above 10 amps will damage the internal fuse of the DVOM and
render it unable to measure amperage.**

Typical Application of Amperage Testing

- Proper Component Operation (Correct Current Draw).
- Parasitic Draw Testing.

G03388916

Fig. 23: Identifying Amperage Testing
Courtesy of BMW OF NORTH AMERICA, INC.

Ensure meter is capable of handling current flow.

Use caution when activating additional consumers.

- Select proper function of DVOM and move leads to proper position.
- Connect meter in series with (+) lead on the B⁺ side of the circuit.
- Connect (-) lead of meter to complete circuit.

NOTE: If the expected load may exceed the range of the meter, use a meter with a higher range (DISplus inductive pick-up) for initial testing. A convenient location to apply meter (e.g. across fuse terminals). DVOM will indicate current flow (Amps) through circuit.

RESISTANCE TESTING

When set for resistance testing (Ohms) the DVOM must never be connected in a live circuit.

The component or portion of a circuit being measured, must be isolated from the power source.

Most modern day DVOM's are self ranging when set to measure resistance, so the meter can not be damaged by out of range measurements.

The test leads may be used without regard for polarity, unless the circuit contains a diode.

The DVOM functions by placing a very small amount of current on the circuit being tested, the red lead must be placed on the anode side of the diode.

Typical Application of Resistance Testing

- Locating a Short to Ground (As Shown).
- Determining Resistance of Components (e.g. Temp Sensors and Injectors).

G03388917

Fig. 24: Identifying Resistance Testing
 Courtesy of BMW OF NORTH AMERICA, INC.

An Ohmmeter uses its internal power to test a circuit or component.

- Select correct function and range (Most meters are self ranging in this function).
- Disconnect power to circuit.
- Disconnect any circuit wired in parallel with circuit being tested.
- Connect test leads.

NOTE: **There must be NO current available to the circuit during the resistance (Ohmic) test. DVOM will indicate resistance (Ohms) of component or circuit being tested.**

CONTINUITY TESTING

The DVOM may have a separate setting for continuity testing.

When set for continuity testing the DVOM must never be connected in a live circuit.

The power source must be disconnected from the circuit being tested. Any circuits wired in parallel with the circuit being tested must also be disconnected.

The DVOM uses its own internal power supply to test the continuity of the circuit.

Continuity testing verifies that circuit connections are intact. The continuity mode is extremely fast and is used to detect either shorts or opens that last as little as 1ms.

When a change is detected the beeper tone is stretched to last at least 1/4 second so both shorts and opens can be audibly detected.

This is a valuable troubleshooting aid when diagnosing intermittent faults associated with wiring, connections, switches and other components of the circuit.

Typical Application of Continuity Testing:

- Circuit Continuity.
- Intermittent Wiring Harness Faults.

G03388918

Fig. 25: Identifying Continuity Testing

Courtesy of BMW OF NORTH AMERICA, INC.

- Select correct function and range of DVOM.
- Disconnect power to the circuit.
- Disconnect any circuits wired in parallel.
- Connect DVOM leads to the circuit to be tested.

NOTE: **There must be NO current available to the circuit during the continuity test. DVOM display will indicate continuity of circuit.**

VOLTAGE DROP TESTING

Voltage Drop Tests determine the resistance of an active circuit, a circuit with current flowing.

Voltage drop tests are preferred over simple resistance measurements because the power source is not removed from the circuit.

By measuring the voltage on both sides of a load, the amount of voltage consumed by the load is measured.

The voltage drops of each part of a series circuit added together must equal the power supply for that circuit while it is active.

Typical Application of Voltage Drop Testing:

- Determine proper component operation.
- Active circuit continuity.
- Active circuit resistance.

G03388919

Fig. 26: Identifying Voltage Drop Testing
 Courtesy of BMW OF NORTH AMERICA, INC.

As a "Dynamic" test with the circuit operational, a voltage drop in any non-resistive part of the circuit indicates a fault in the circuit,

- Select proper function and range of DVOM.
- Connect (+) lead to the B+ side of the circuit or component being tested.
- Connect (-) lead to the B- side of the circuit or component.

NOTE: All consumers of the test circuit should be active during the test. Always include ground circuit as part of voltage drop test. DVOM display will indicate the voltage drop in the circuit tested between the DVOM leads.

GENERAL INFORMATION

E83 Product Overview - X3

E83 LIFE CYCLE IMPULSE

Model: E83 X3 3.0si

Production: from August 2006

INTRODUCTION

The BMW X3 has been available on the market as of the 2004 model year and represents a premium product in the segment of compact luxury SUVs.

As of August 2006 production, the E83 will undergo a redesign in order to maintain its leading position in the market and to fend off the ever increasing number of competitors.

This model redesign, known as LCI (Life Cycle Impulse), includes a pronounced visual upgrade, the introduction of new engines as well as a whole series of improvements in details as well as in the range of interior trim and fittings.

As of September 2006, the E83 X3 3.0i with M54B30 (170 kW/231 bhp) will be replaced with the X3 3.0si with N52B30O1 (191 kW/260 bhp).

Fig. 1: BMW X3 Model

Courtesy of BMW OF NORTH AMERICA, INC.

BODY

Bodyshell

The only technical change is to the openings for the reversing lights in the inner panel of the rear hatch. Due to the higher positioning of these lights, it was also necessary to displace the clearance for their bulbs further upward.

The carrier, sheet metal components and assembly concept remain unchanged. Only the underbody paneling has been adapted to the new engines as part of the model redesign. Modifications to the bodyshell components are solely restricted to details such as the repositioning of threaded connections, pins or securing elements for the adapted wiring harnesses.

All parts of the bodyshell (hood/tailgate, side panels, doors, sills and weatherstrips) remain unchanged. The same also applies to the body connection points.

Front

The redesigned E83 can be immediately distinguished from its predecessor by the partly painted bumpers and the double kidney grill that extends further downward.

The newly designed front bumper which was previously two-piece is now three pieces. A top section painted in the car color and a bottom cover that is also painted are now clipped onto the black-structured, bolted carrier. These painted parts can be individually replaced as required by removing the complete bumper.

Front view - Left: E83 up to 8/06, Right: E83 LCI

Fig. 2: Front View Of BMW - Left E83 Up To 8/06, E83 LCI

Courtesy of BMW OF NORTH AMERICA, INC.

The kidney grills now extend further downward is available only with light titanium bars.

The grill between the double kidney and bumper as well as the lower grill are black on all vehicles.

Rear

The rear bumper on the E83 LCI is also a new design. It is now made up of four main parts (previously one-piece). Two black side panels and one exhaust finisher also in black are fitted on a carrier painted in the car color.

In the same way as the front bumper, the rear bumper can also be dismantled for repairs and paint work (after disassembly).

Two separate reflectors are clipped on to the left and right of the exhaust finisher. The PCD sensors of the rear bumper are located in the painted area and are therefore painted in the car color (unchanged black at the front).

The panel at the lower edge of the rear hatch is now also painted in the car color, thus making a decisive contribution to the overall higher grade impression of the X3's rear end.

Vehicle Exterior Lighting

Headlights

The front headlights retain their outer contour and connection points. However, vehicles with halogen headlights are now equipped with new open-design segments for high beam and low beam reflector. The tube body, cover frame and housing are new. In addition, vehicles with bi-xenon lights now have lights with four light coronas (previously two).

The previous headlight washer system with free-standing water jets has now been replaced by a system with retractable washer jets.

Fog Lights

The new fog lights for the X3 have been modified.

A new cornering light function has been added. This function is controlled by means of signals from the direction indicator and steering angle sensor. When turning, the respective fog light is switched on thus optimally illuminating the turn-off area.

Turn Indicators

The design of the front direction indicator lights has been slightly modified in the same way as the side repeater lights which are white. The vehicle is additionally equipped with side markers.

Taillights

The tail lights have also undergone a facelift. A new chamber arrangement (reversing lights now further up) as well as the use of active light guides for the tail light function (instead of the previous bulbs) give the rear end of the X3 a modern appearance.

The lights on the side panels retain their outer contour and connection points while the contour of the lights on the rear hatch have been modified.

Rear view - Left: E83 up to 8/06, Right: E83 LCI

Fig. 3: Rear View Of BMW - Left E83 Up To 8/06, E83 LCI
Courtesy of BMW OF NORTH AMERICA, INC.

INTERIOR DESIGN

Cockpit

The dashboard has been upgraded by numerous details. The instrument cluster shroud (previously attached) provides for a wider color separation groove and a more harmonious general impression. The dashboard, shroud, and airbag cover also have a new structure finish.

The cover of the glove compartment is positioned slightly lower.

The trim covers for the fresh air grills, the light switch cluster and the cup holder are now coated with soft paint (three different colors - depending on interior color).

Both the basic steering wheel as well as the sports steering wheel now feature a new steering wheel rim and a new cover.

In addition, the sports steering wheel features new spokes and a new backing. Both steering wheels have 3 spokes, the previous 4-spoke basic steering wheel is no longer available.

As in other model series, the interior rear-view mirror in the E83 is available with a digital compass.

Cockpit - Left: E83 up to 8/06, Right: E83 LCI

Fig. 4: Identifying Cockpit - Left E83 Up To 8/06, Right E83 LCI
Courtesy of BMW OF NORTH AMERICA, INC.

Door Panels

The door mirrors have also been distinctly upgraded by new surface structuring and geometry. The connection to the dashboard has been improved while the trim covers for the speakers are now larger due to the installation of new speakers.

Storage compartment shelves integrated in the door trim panel replace the previous netshell combination. The finishers for the power window switches are now smaller.

Door trim panel - Left: E83 up to 8/06, Right: E83 LCI

Fig. 5: Door Trim Panels Left E83 Up To 8/06, Right E83 LCI
Courtesy of BMW OF NORTH AMERICA, INC.

Rear Seat

Modifications to the foam material in the seat and the seat cover of the rear bench seat have raised the front edge by 30 mm thus improving the seating comfort in the rear. A seat heating system will be additionally offered for the rear seat.

DRIVETRAIN

N52 Engine

The N52 engine first offered in the E90 will be reengineered for the September 2006 launch and will then be known as the N52K. The exact engine designation will N52B30O1.

Compared to the M54 6-cylinder engine previously fitted in the E83, the N52K is characterized by lower fuel consumption (12% reduction), reduced weight (10 kg less), 35 hp (30 kW) increase in power output and an increase of 11 lb ft torque.

Fig. 6: N52 Engine Assembly

Courtesy of BMW OF NORTH AMERICA, INC.

The exhaust manifold has been slightly adapted to match the geometry of the E83.

The same also applies to the oil pan with modified underbody area and threaded connection to the front axle.

The shape of the engine support has been modified to accept the N52. The power steering oil reservoir is now mounted on the screw connection for the alternator instead of on the frame side member as previously.

Intake Air Duct

For the first time at BMW, the intake silencer is a fixed part in the engine. The unfiltered air duct is crash-optimized. An unfiltered air resonator and a time chamber filtered air resonator are used in order to satisfy acoustics requirements.

Digital Engine Electronics (DME)

The engine management MSV80 is used in connection with the N52K. This system is a further development of the MSV70 and has been adapted in terms of several details.

Exhaust System

For acoustics reasons, the exhaust system is now mounted at the level of the transfer case instead of at the engine support as previously.

NOTE: For detailed information on this engine please refer to the ST613 " " technical training manual.

Gearbox

6-speed Manual Transmission

The synchromesh of the gearshift mechanism has been newly developed to provide outstanding gearshift comfort both at low as well as elevated shift forces.

1st/2nd gearshift now takes place in double cone synchromesh and single-cone synchromesh for 3rd/4th and 5th/6th gear.

A central selector valve connects the gearshift with a shift gate on the inside for the first time. Another new feature is the passive shift lock that guarantees distinctly greater locking reliability in addition to further optimized smoothness of operation.

The pressure diecast aluminum transmission casing is of 2-piece design similar to that of the 5-speed manual transmission.

6-speed Automatic Transmission GM6 (6L45)

The new automatic transmission GM6 replaces the previous transmission GM5 in the E83. As indicated by its designation, the transmission has 6 forward drive ranges (GM5: 5).

The spread and gear ratio are virtually identical to the GM5.

The power transmission capacity of the transmission weighing 170lbs (76.9 kg), including oil, is 258 lb ft (350 Nm). Its main advantages include a 6 % reduction in fuel consumption and improved gearshift dynamics.

The lower fuel consumption results from the use of the so-called neutral idle control (NIC), low converter slip thanks to the use of a turbine-torsion damper as well as reduced drag losses in the clutches.

The structure of the transmission generally corresponds to that of the 6HP19. The main difference in the GM6 is a one-way clutch to ensure stable shift quality when shifting from 1st to 2nd. Thanks to their high drive percentage with the clutch engaged, converters with turbine-torsion dampers provide a direct connection to the engine.

The transmission control unit is accommodated together with the hydraulic control unit in the transmission (mechatronics concept). This arrangement provides advantages in terms of package space and, due to the smaller number of interfaces, it also ensures increased system reliability.

RUNNING GEAR

Rear Axle Differential (final drive)

A new final drive unit (L-axle drive) has been developed to improve the efficiency of the final drive for the X3. The final drive has adopted the new bearing concept from the BMW 3 Series together with the new double

angular contact ball bearings. This results in a considerable reduction in the operating temperature of the final drive, having a positive effect on operation and service life.

At the same time, oil flow losses have been substantially reduced while adapting and optimizing the efficiency of the gearing in terms of the displacement characteristics.

The torque capacities of the final drive units HAG168L and HAG188L have been increased by 10 % making these final drive units heavier. For acoustics reasons, their casings are still made from spheroidal cast iron.

The table below identifies the differential usage and ratio by vehicle equipment options:

DIFFERENTIAL SPECIFICATION

Model/equipment	Differential (ratio)
X3 3.0si manual	HAG188L (3.73 :1)
X3 3.0si automatic	HAG168L (4.44:1)

Two-stage Disc-type Vibration Absorber

For effective acoustic decoupling of the drive train, a two-stage disc-type vibration absorber is fitted between the propeller shaft and transfer case that becomes harder as the applied torque increases.

CHASSIS

Various modifications to the chassis of the E83 have been necessary to accommodate the higher performance N52K engine. Most of these modifications, however, are restricted to geometric adaptations (steering system and heat shields).

Mounts

The engine and transmission mounts are new.

DXC+

The driving dynamics system DXC+ in the E83 features additional functions.

In addition to the known features such as ABS, ASC, CBC, DSC and HDC, the following will be added:

- Dynamic Traction Control (DTC) for ensuring maximum traction irrespective of the driving surface
- Hill starting assistance (Hill-holder)
- Dry brakes in rain
- Brake standby/brake travel reduction
- Brake fading assistance

RDC

All E83 vehicles will be equipped with the tire pressure monitoring system RDC which was introduced in

March 2006.

Power Steering Cooling

The DSC control unit has an additional program module for the power steering cooling. This function increases the fan speed to secure the required cooling capacity under high load conditions (e.g. uphill/downhill driving) at low speed. The signals relating to the driving speed, power output (via HFM) and steering angle lock are used as the control data for this purpose.

ELECTRICAL SYSTEMS

EWS 4.4

The E83 will be equipped with the EWS 4.4 already known from other model series. Thanks to improved logic of the vehicle immobilizer, this electronic control provides increased anti-theft protection, resulting in a more favorable insurance classification of the E83.

Lights Module 2

The lights module 2 replaces the previous light switch cluster in the E83 LCI; it combines its functionality with that of the AHL control unit.

Rear Seat Heating

Rear seat heating will be offered in all X3 models.

Oil Level Indicator

The oil level indicator is now integrated in the instrument cluster.

Radio, CD

The new radio platform of all E83 features a double tuner and station list expansion.

An AUX-In jack is provided on the center console for the connection of external audio sources.

The Random function in the CD changer now only refers to the selected CD and no longer to all (up to six) CDs in the magazine of the changer. This reduced number of selection options substantially shortens the pauses between the music tracks.

Navigation

The computer hardware is now lead-free and therefore recyclable.

SPECIFICATIONS

SPECIFICATIONS

Engine	N52B3001

2005 GENERAL INFORMATION

Electronic Signals - Overview - All Models

ELECTRONIC SIGNALS

Model: All

Production Date: All

PURPOSE OF SIGNALS

Electronic signals move information much like cars move passengers down the highway. It would be difficult to get to work without transportation, and there would be no transportation without signals.

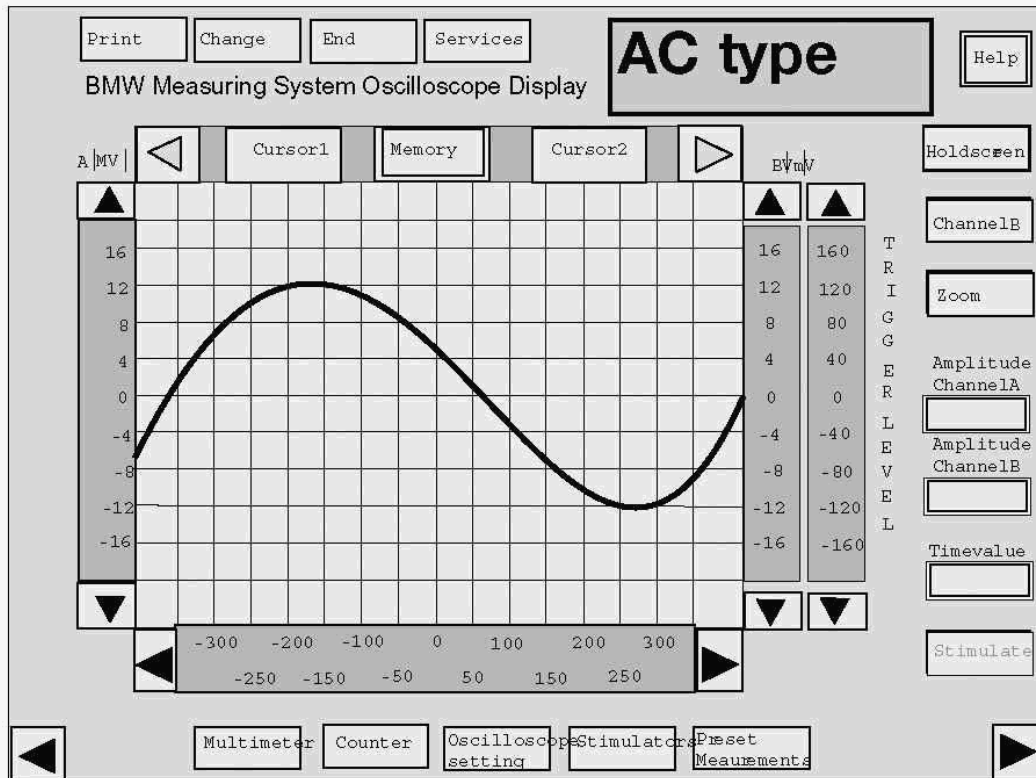

Signals allow devices (e.g. sensors or switches) to communicate with control modules (either complicated processors or simple relays) which in turn perform or request (through more signaling) other functions to be carried out.

Signals inform the Climate Control of the outside air temp or tell the brake lights the right time to illuminate.

The use of electronic signals goes far beyond the basic application of electron flow to control components, enabling complex information to be passed from one component to another.

The data (input or output) is conveyed through various forms of changing voltages, resistances, current or frequency modulation.

1. AC Voltage Signals:
 - A. Inductive Signals.
 - B. Phase Shifted Signals.

G03389064

Fig. 1: Identifying AC Voltage Signals
 Courtesy of BMW OF NORTH AMERICA, INC.

2. DC Voltage Signals:
 - A. Analog Signals.
 - B. Digital Signals:
 1. Switched (High/Low) Signals.
 2. Modulated Square Wave Signals:
 - a. Frequency Controlled Signals.
 - b. Pulse Width Controlled Signals.
 - c. Duty Cycle Controlled Signals.
 - C. Designated Value Signals.
 - D. Coded Ground Signals.
 - E. Transistor Signals:
 1. Modulated B+/B- Signals.
 2. Momentary B+/B- Signals.

3. Constant B+/B- Signals.

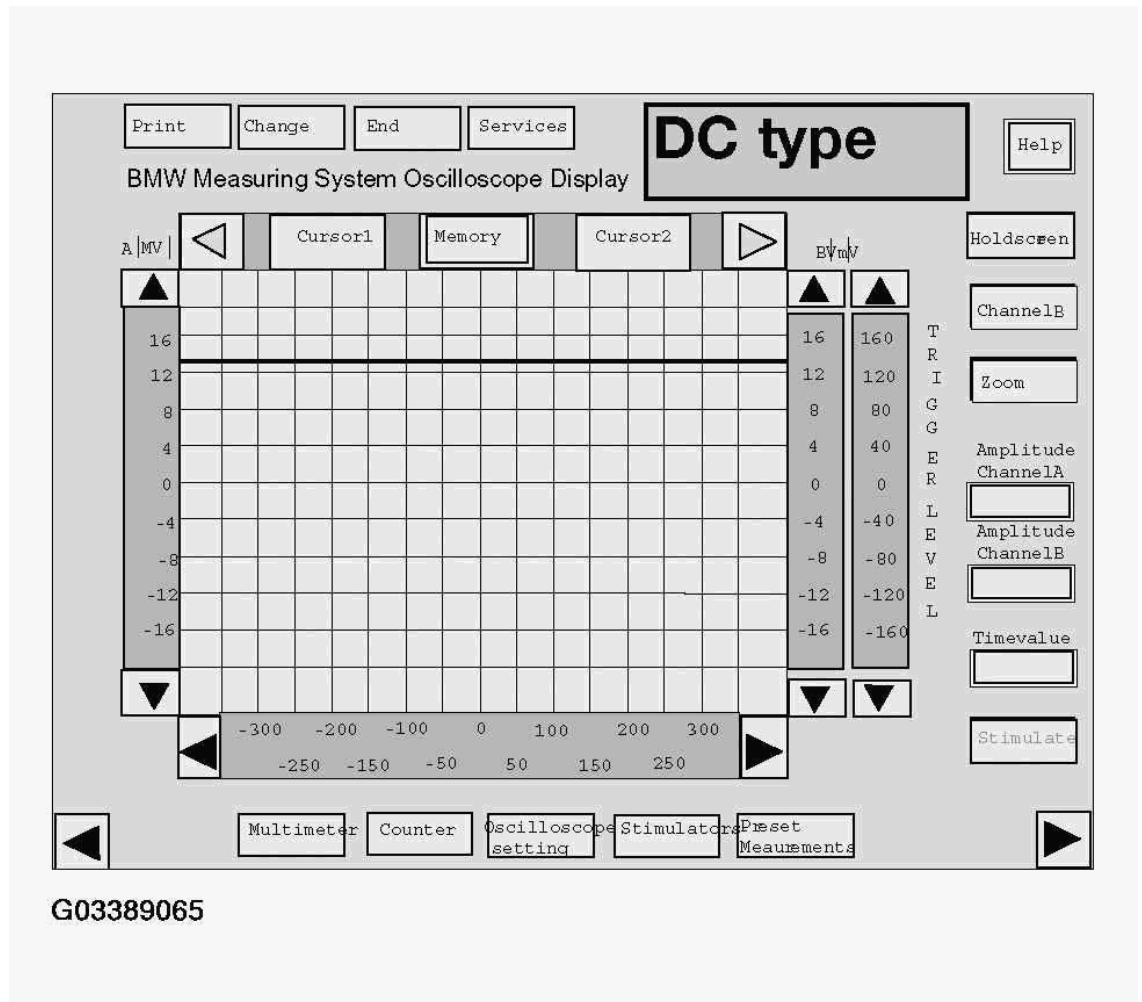

Fig. 2: Identifying DC Voltage Signals
Courtesy of BMW OF NORTH AMERICA, INC.

AC VOLTAGE SIGNALS

Two types of AC Voltage signals are used:

- Inductive Signals (Induced Voltage).
- Phase Shifted Signals (Angle Pulse Generator).

INDUCTIVE SENSORS

Inductive sensors produce an AC Sine Wave signal. The AC voltage is induced by the shifting of a magnetic field. The sensor consists of an impulse wheel (the moving part) and a coil wound magnetic core (the stationary part).

As each tooth of the impulse wheel approaches the sensor tip, the magnetic field of the sensor shifts toward the

impulse wheel and induces a voltage pulse in the windings.

As the teeth move away from the sensor, the magnetic field shifts back inducing a voltage pulse in the opposite direction.

This shifting of the magnetic field produces an alternating current (positive to negative).

Control modules which receive this alternating current, count the impulses (shifts from positive to negative) and interpret the speed of rotation of the impulse wheel.

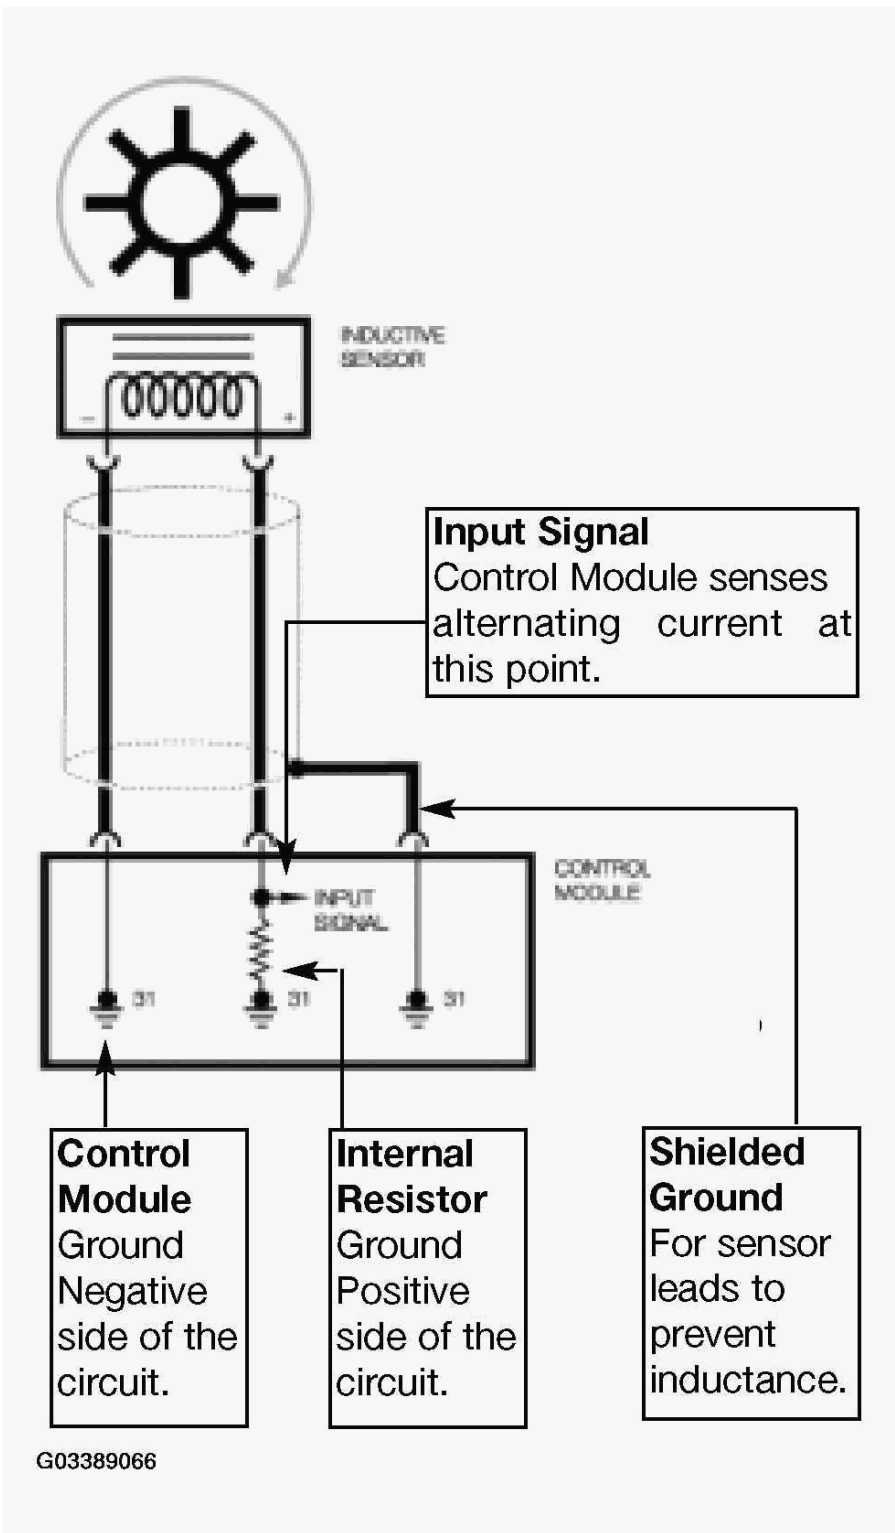

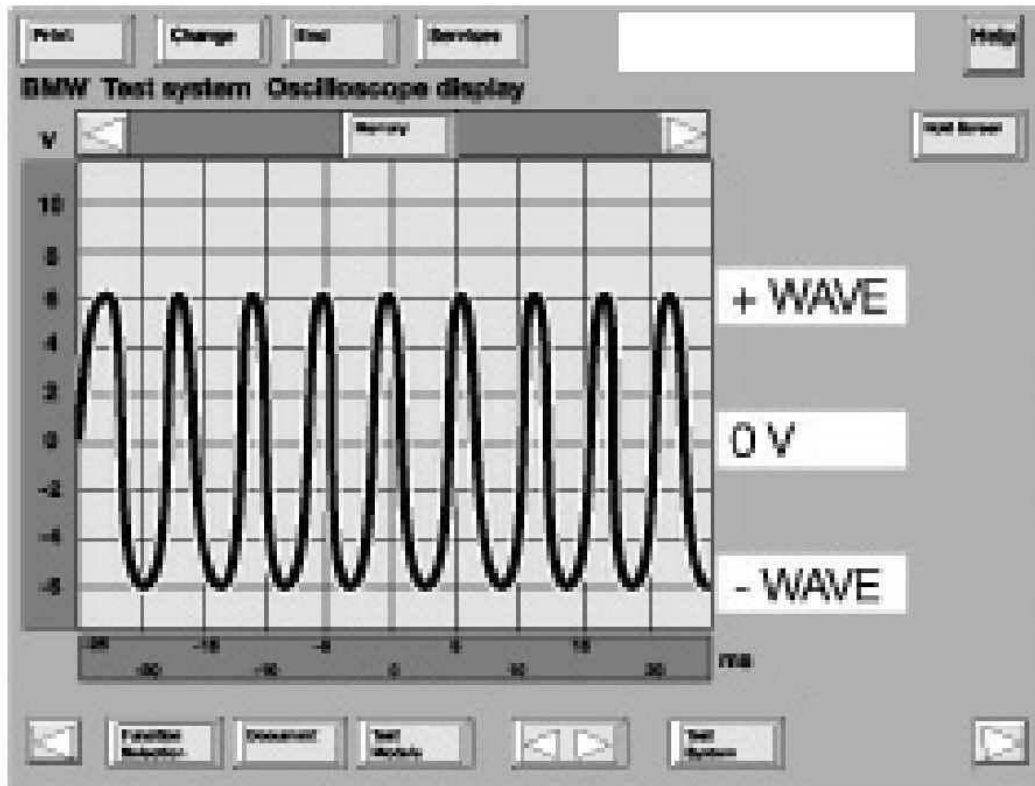

Fig. 3: Inductive Sensor Circuit Diagram

Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Inductive Sensors:

- Crankshaft Speed Sensor.
- Camshaft Speed Sensor.
- Transmission Input/Output Speed Sensor.
- Wheel Speed Sensor.

G03389067

Fig. 4: Identifying AC Sine Wave Signal
 Courtesy of BMW OF NORTH AMERICA, INC.

Voltage levels are dependent on sensor design.

Not all inductive sensors produce 12 volts.

ANGLE PULSE GENERATOR

An Angle Pulse Generator Sensor acts on an existing AC voltage signal rather than produce a new one.

The sensor consists of two windings (primary and secondary) that are connected together at one end and a magnetic iron core (stationary) along with a trigger wheel (movable).

G03389068

Fig. 5: Checking Angle Pulse Generator
 Courtesy of BMW OF NORTH AMERICA, INC.

The primary winding (coil) is supplied with a 120kHz AC signal by the control module. The magnetic coupling (core) causes a voltage at the same frequency to be induced in the secondary winding. The induced frequency

has a slight phase shift due the induction time delay.

The trigger wheel influences the magnetic field of the sensor and causes the phase shift to increase as the disc of the wheel moves closer to the sensor.

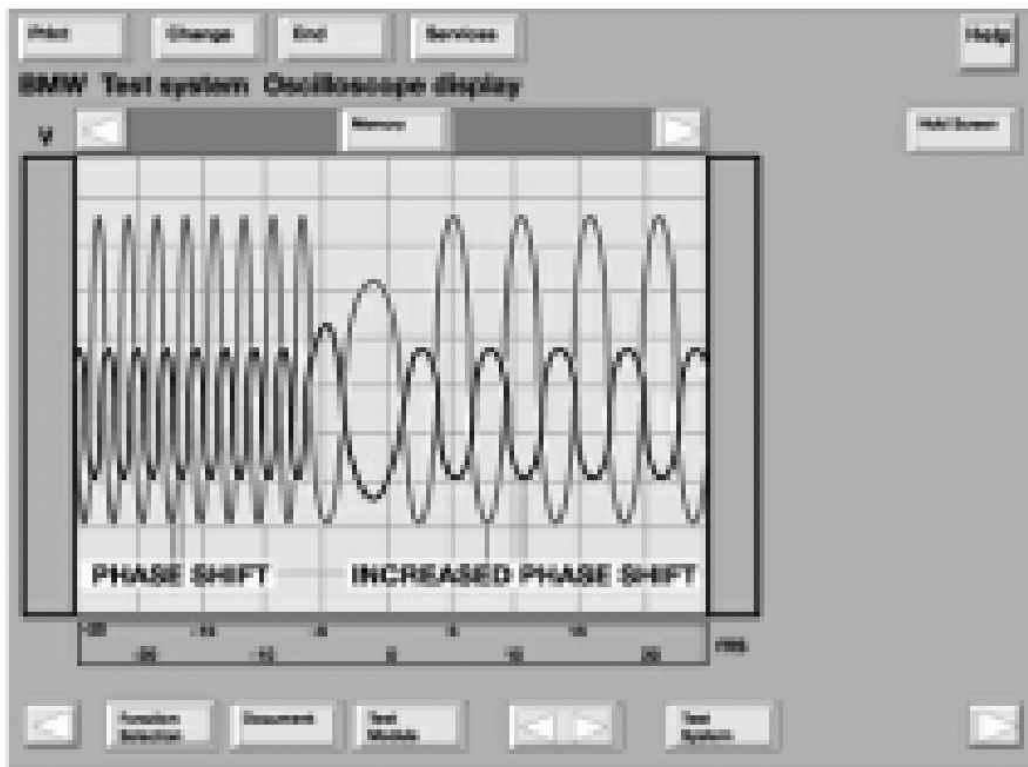

This changing of the phase shift (time delay) from a smaller time period to a larger time period and back again provides the control module with trigger wheel position.

The angle pulse generator provides position information regardless of movement. Trigger wheel position is established with the application of an output frequency from the control module and the return of the phase shifted signal.

Typical Application of Angle Pulse Generator

- Camshaft Sensor MS41.1.
- Pedal Request Sensor EML.

(a bank of three)

G03389069

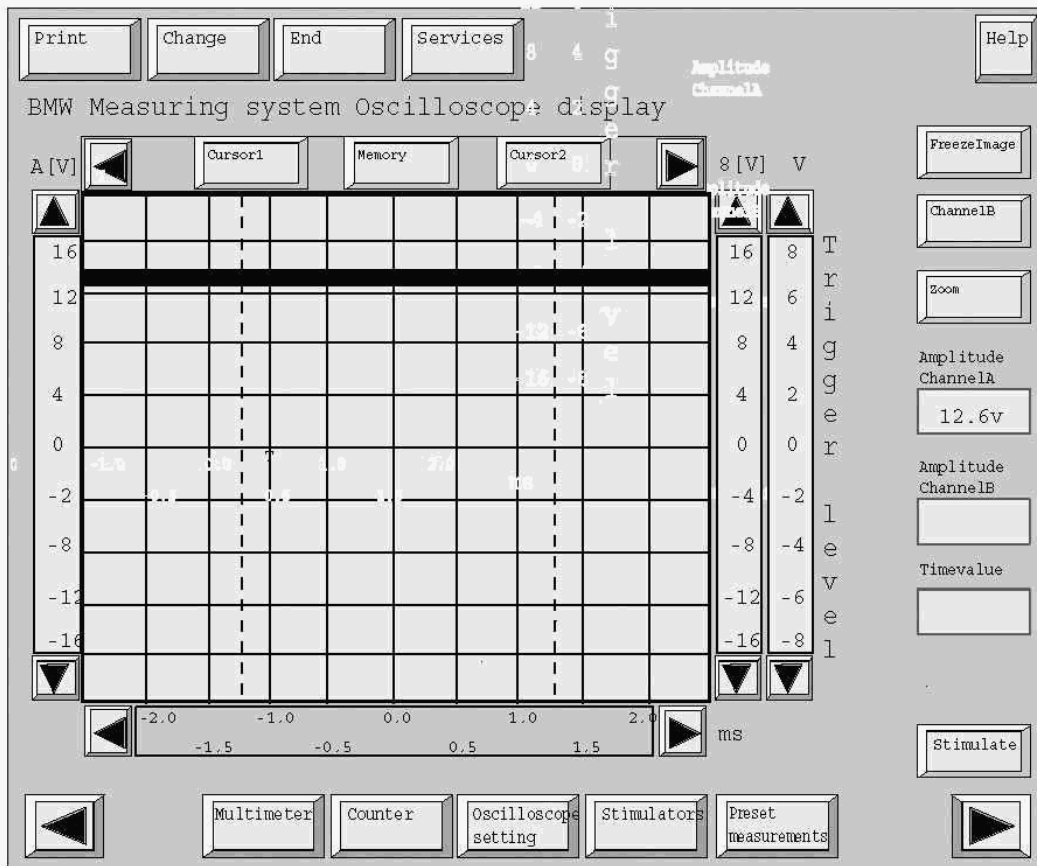

Fig. 6: Angle Pulse Generator Wave Signal
Courtesy of BMW OF NORTH AMERICA, INC.

DC VOLTAGE SIGNALS

Five Types of DC Voltage Signals Are Used:

- Analog Signals.
- Digital Signals.
- Designated Value Signals.
- Coded Ground Signals.
- Transistor Signals.

DC voltage signals are based on either 5 volts or 12 volts.

G03389070

Fig. 7: Identifying DC Voltage Signals

Courtesy of BMW OF NORTH AMERICA, INC.

ANALOG SIGNALS

Analog signals transmit information through an electrical circuit by regulating or changing the current or voltage.

The voltage of the signal has no fixed value. The value may be anywhere in the operating range of the signal.

Three sources of analog signals are:

- NTC Sensors.
- PTC Sensors.
- Potentiometers.

G03389071

Fig. 8: Identifying Analog Signals

Courtesy of BMW OF NORTH AMERICA, INC.

NTC SENSORS

NTC (Negative Temperature Coefficient) sensors change resistance based on temperature. As the temperature

goes up the resistance goes down. This decrease in resistance causes the voltage drop across the sensor to decrease and the input signal voltage at the control module decreases.

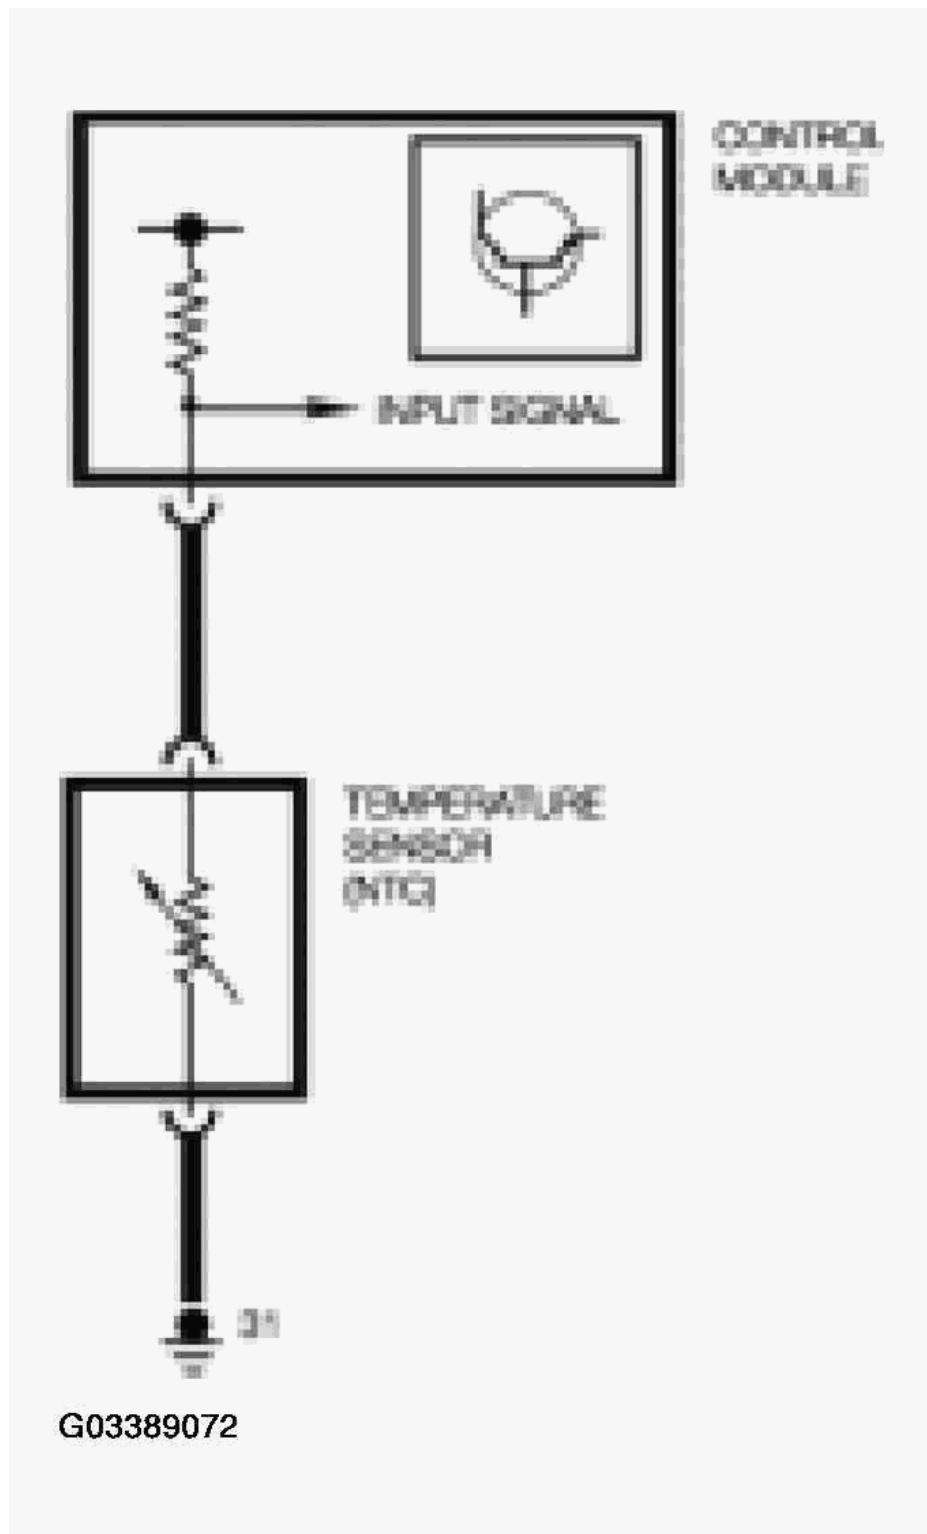

Fig. 9: NTC Sensor Circuit Diagram

Courtesy of BMW OF NORTH AMERICA, INC.

Examples Of NTC Sensors

Intake Air Temperature Sensor

The intake air temp sensor provides a 0--5 volt analog signal to the DME indicating temperature of the incoming air.

The intake air temp sensor is located either in the intake manifold or integrated in the mass air flow meter.

Fig. 10: Checking Intake Air Temperature Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

Engine Coolant Temperature Sensor

A dual sensor is used for engine temp. Operation is the same as other NTC sensors, 0-5 volt operating range, except that two independent sensors are housed in one assembly.

One is for the engine temperature input to the DME.

The other sensor is used to input engine temp to the instrument cluster.

G03389074

Fig. 11: Checking Engine Coolant Temperature Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

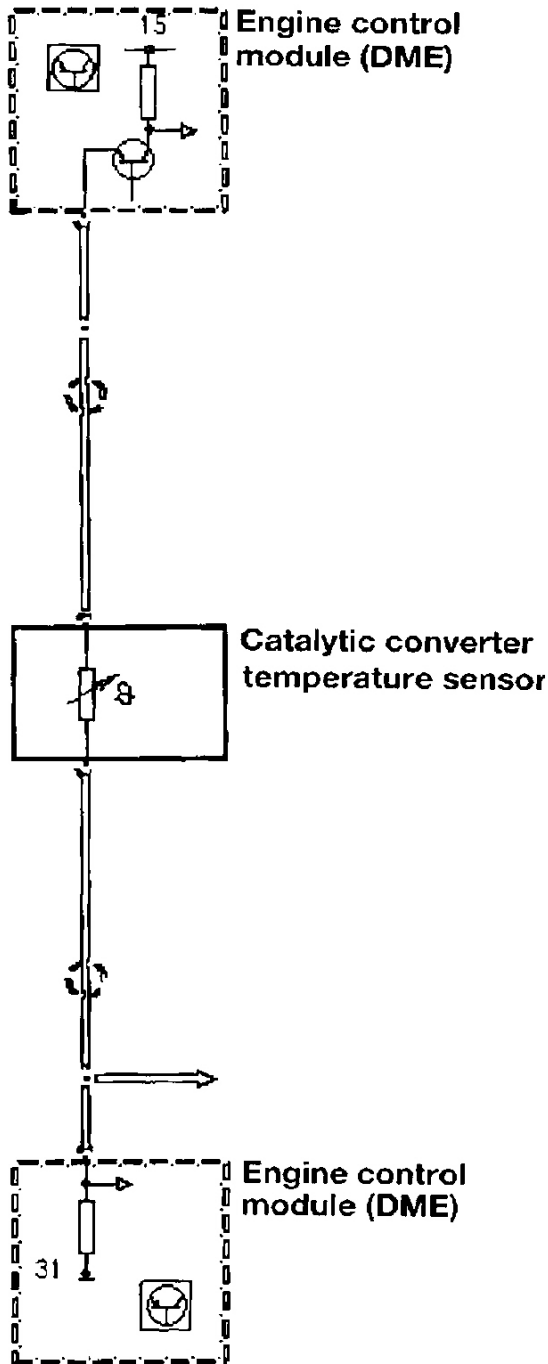

Typical Application of NTC Type sensor:

- Engine Coolant Temp Sensor.
- Intake Air Temp Sensor.
- Transmission Temp Sensor.

PTC SENSOR

PTC (Positive Temperature Coefficient) sensors also change resistance based on temperature. In a PTC sensor

as the temperature goes up the resistance also goes up. The increase in resistance causes the voltage drop across the sensor to increase and the input voltage signal at the control module increases.

G03389075

Fig. 12: PTC Sensor Circuit Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of A PTC Type Sensor:

- Exhaust Temp Sensor.
- Transmission Temp Sensor.

Example of PTC Sensor

A M5 Catalytic Converter uses a PTC type sensor to monitor exhaust temperature.

A 0-12v signal is supplied to the DME indicating catalyst temperature.

Workshop Hints NTC/PTC Sensors:

When troubleshooting a faulty input display, the input signal must be verified as "good" BEFORE the control module is replaced.

When checking a NTC Sensor look for these voltages and problems:

0 volts = no supply voltage or shorted to ground.

2v = sensor is indicating a warm condition for system being measured.

4v = sensor is indicating a cold condition for system being measured.

5v = sensor or wiring harness is open.

Remember a PTC type sensor will indicate opposite results on intermediate readings (i.e. 4 volts = warm).

POTENTIOMETERS

A Potentiometer produces a gradually changing voltage signal to a control module. The signal is infinitely variable within the operating range of the sensor.

This varying voltage reflects a mechanical movement or position of the potentiometer wiper arm and its related components.

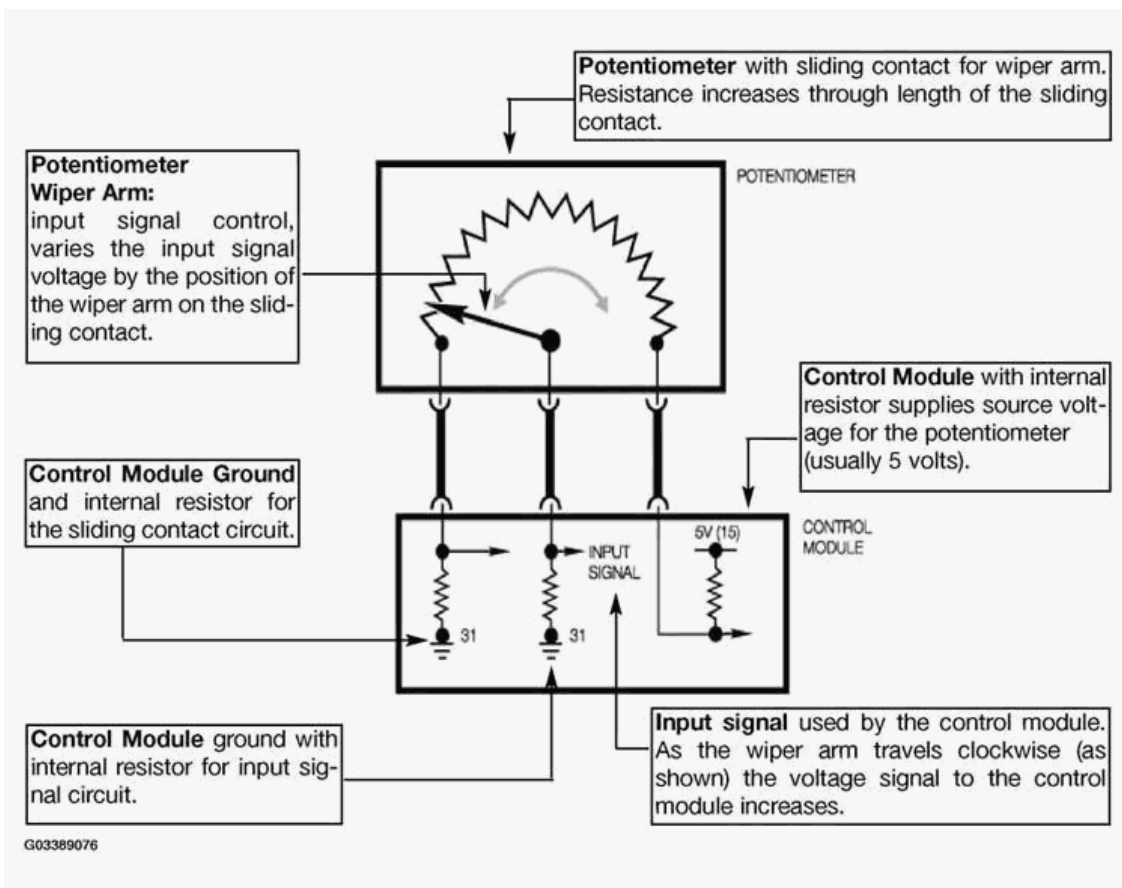

Fig. 13: Identifying Potentiometer
 Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Potentiometers:

- Air Flow Meter.
- Pedal Position Sensors.
- Seat and Mirror Memory Position.
- Throttle Position Sensors (Also Feedback Potentiometers).

DIGITAL SIGNALS

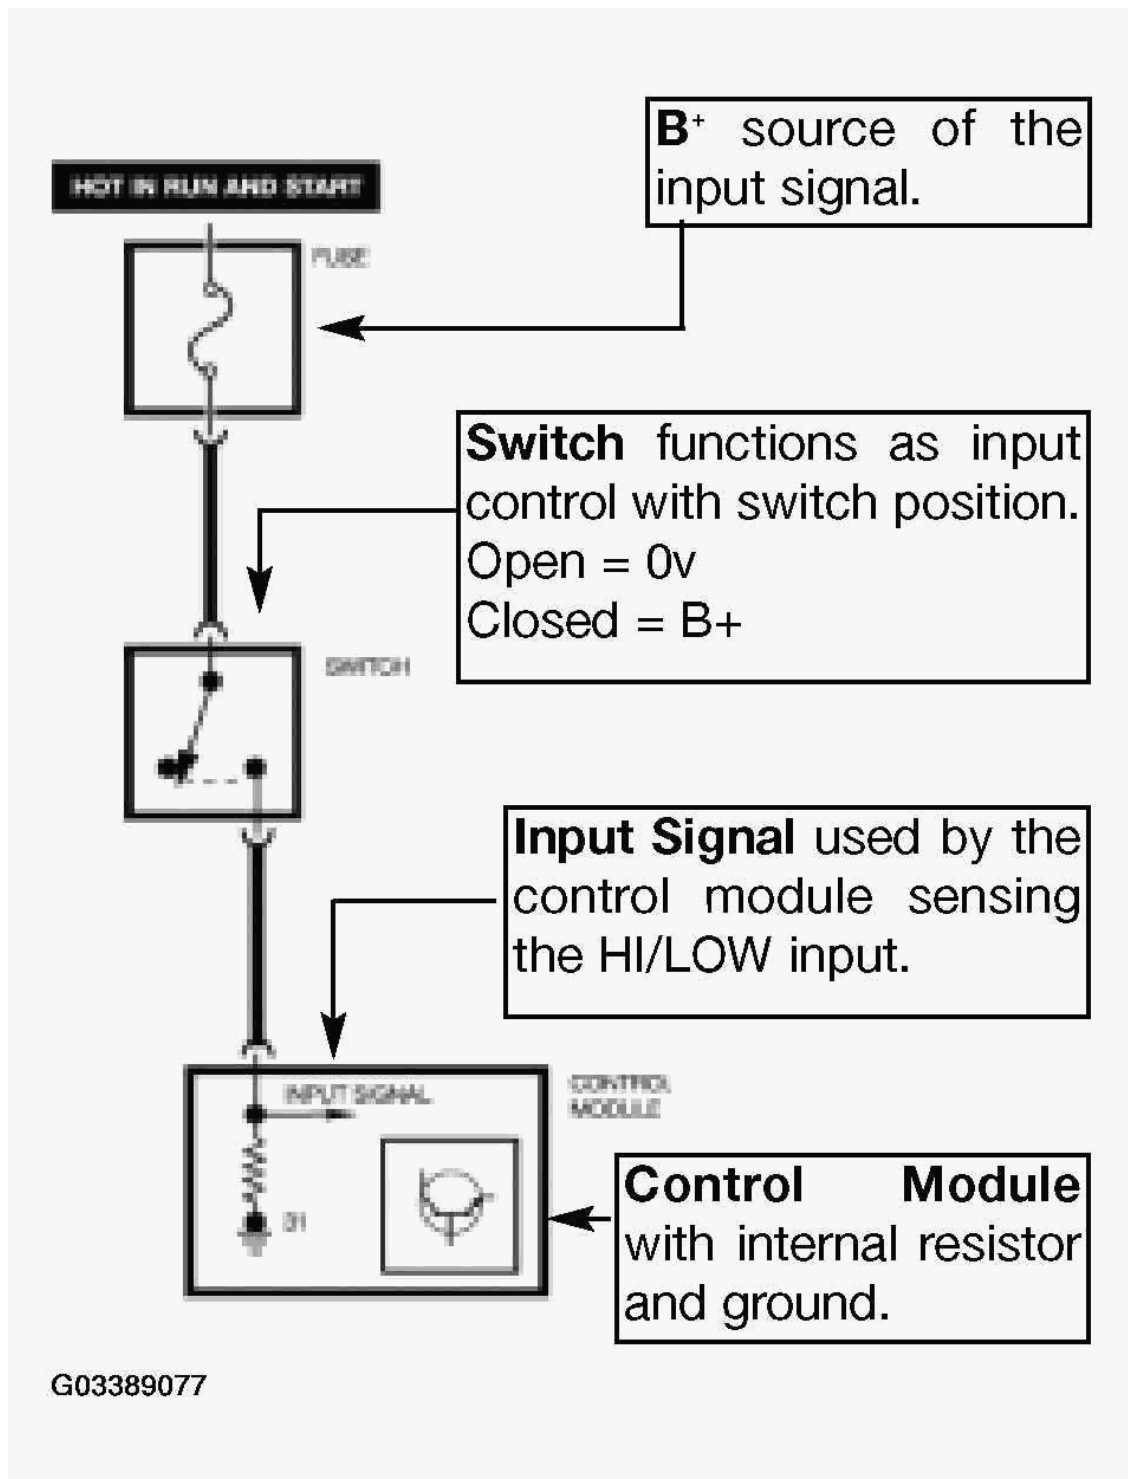

Digital Signals transfer information through an electrical circuit by switching the current on or off. Unlike analog signals which vary voltage, a digital signal has only two possible states, control voltage or 0 voltage.

Two types of Digital Signals:

- Switched (High/Low) Signals.
- Modulated Square Wave signals.

SWITCHED B+ SIGNAL

This DC voltage signal produces a YES/NO type input to the control module. The voltage level will indicate a specific operating condition.

G03389077

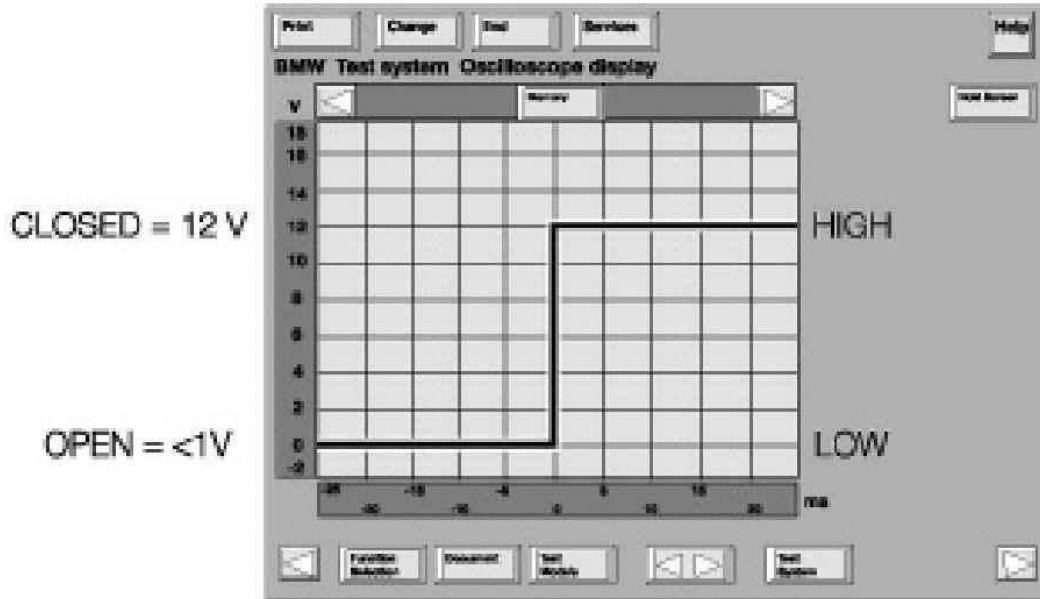

Fig. 14: Digital Signals Transfer Information Chart

Hall effect Brake Light Switch

G03389079

Fig. 16: Identifying DC Voltage Signal
Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Switched B+:

- Ignition Switch.
- Seat Belt Switch.
- Light Switch.
- Hall Effect Switch (e.g. Brake Light Switch).
- Reed Switch.

SWITCHED B- SIGNAL

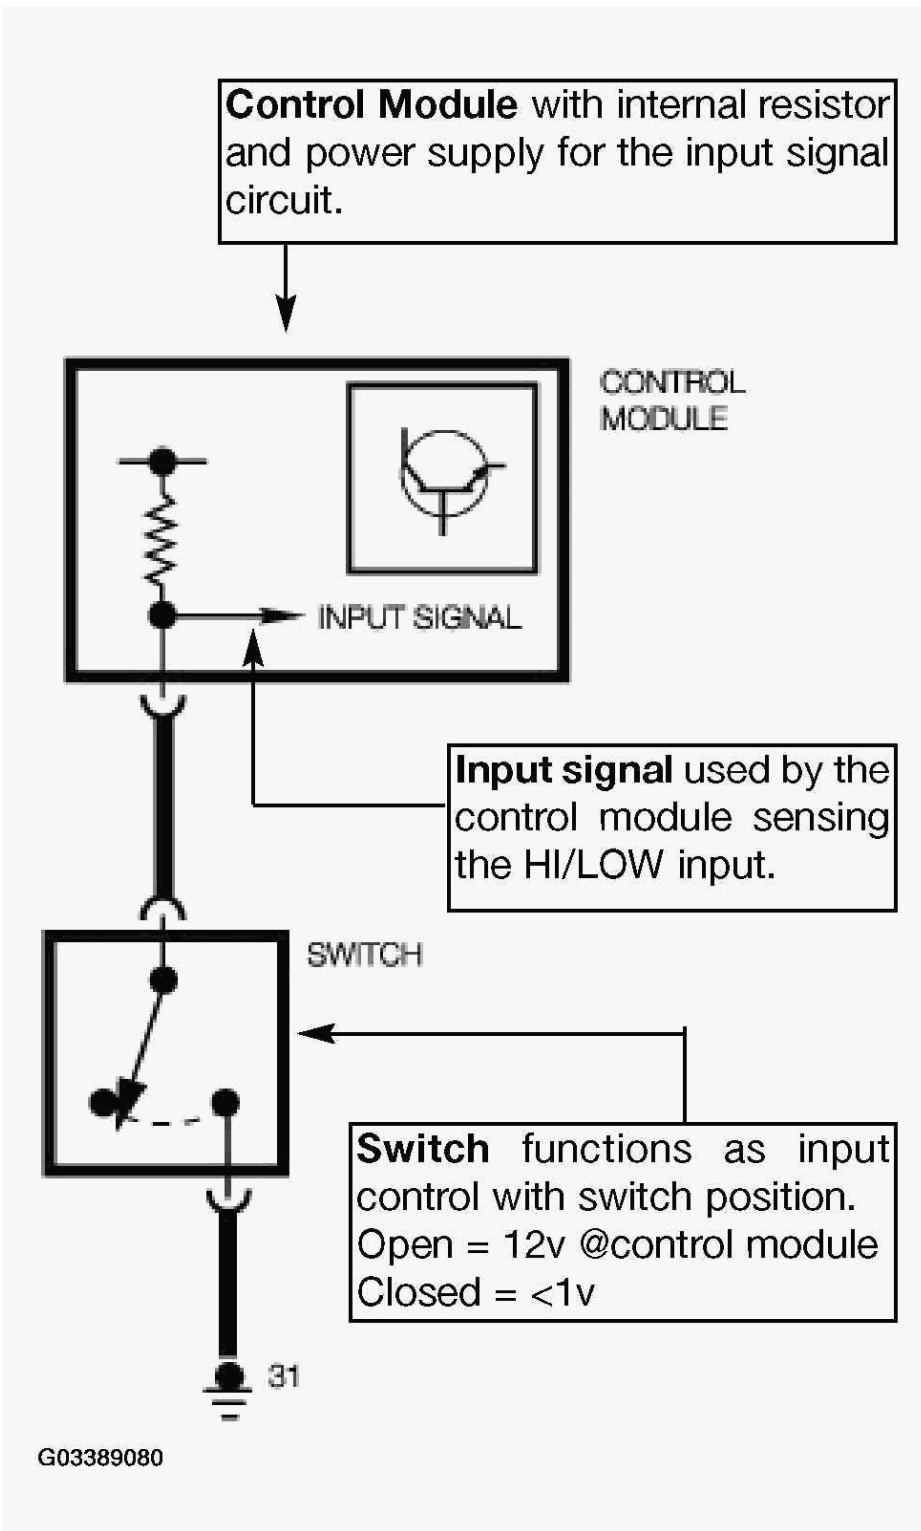

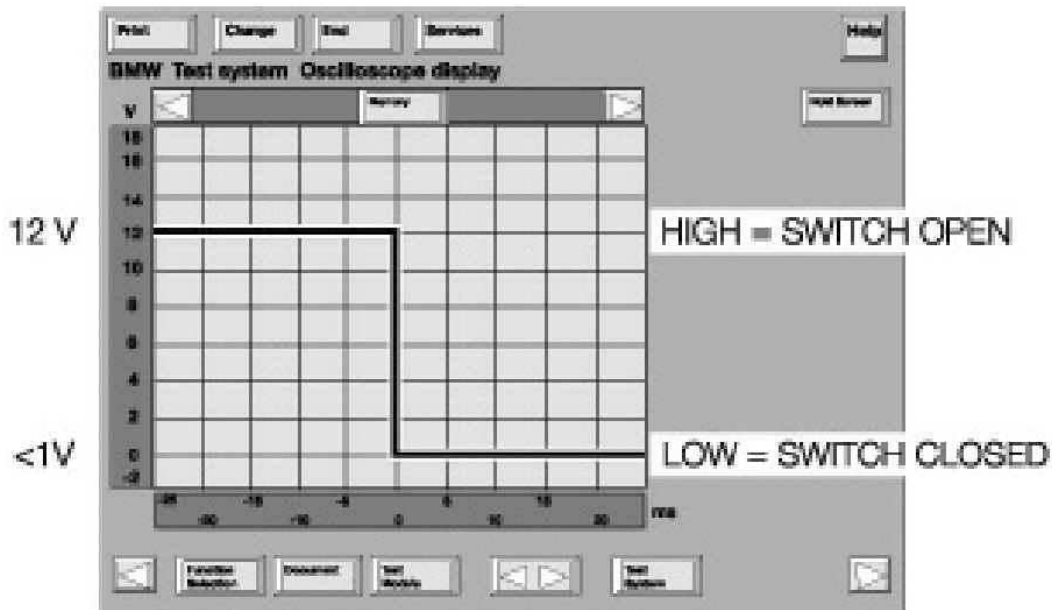

Fig. 17: Identifying (High/Low) Signal
 Courtesy of BMW OF NORTH AMERICA, INC.

This Ground Signal produces a YES/NO type input to the control module. The voltage level will indicate a specific operating condition.

G03389081

Fig. 18: Identifying Ground Signal

Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Switched B-

- Door Position Switch.
- Kickdown Position Switch.
- A/C Pressure Switch.

MODULATED SQUARE WAVE

A Modulated Square Wave is a series of High/Low signals repeated rapidly.

Like the switched signals (B+, B-) the square wave has only two voltage levels.

A high level and a low level.

A Modulated Square Wave appears as a High/Low signal repeated rapidly over and over.

G03389082

Fig. 19: Identifying Modulated Square Wave

Courtesy of BMW OF NORTH AMERICA, INC.

A modulated square wave has 3 characteristics that can be modified to vary the signal:

- Frequency.
- Pulse Width.
- Duty Cycle.

Frequency

The frequency of a modulated square wave signal is the number of complete cycles or pulses that occur in one second. This number of cycles or frequency is expressed in **Hertz (Hz)** . 1Hz = 1 complete cycle per second.

An output function may use a fixed or varied frequency.

Fig. 20: Identifying Modulated Square Wave Signal
 Courtesy of BMW OF NORTH AMERICA, INC.

Pulse Width

The Pulse Width of a square wave is the length of time one pulse is ON. Vehicle systems may use fixed or varied ON times or pulse width. Pulse width is expressed in **milliseconds** (ms).

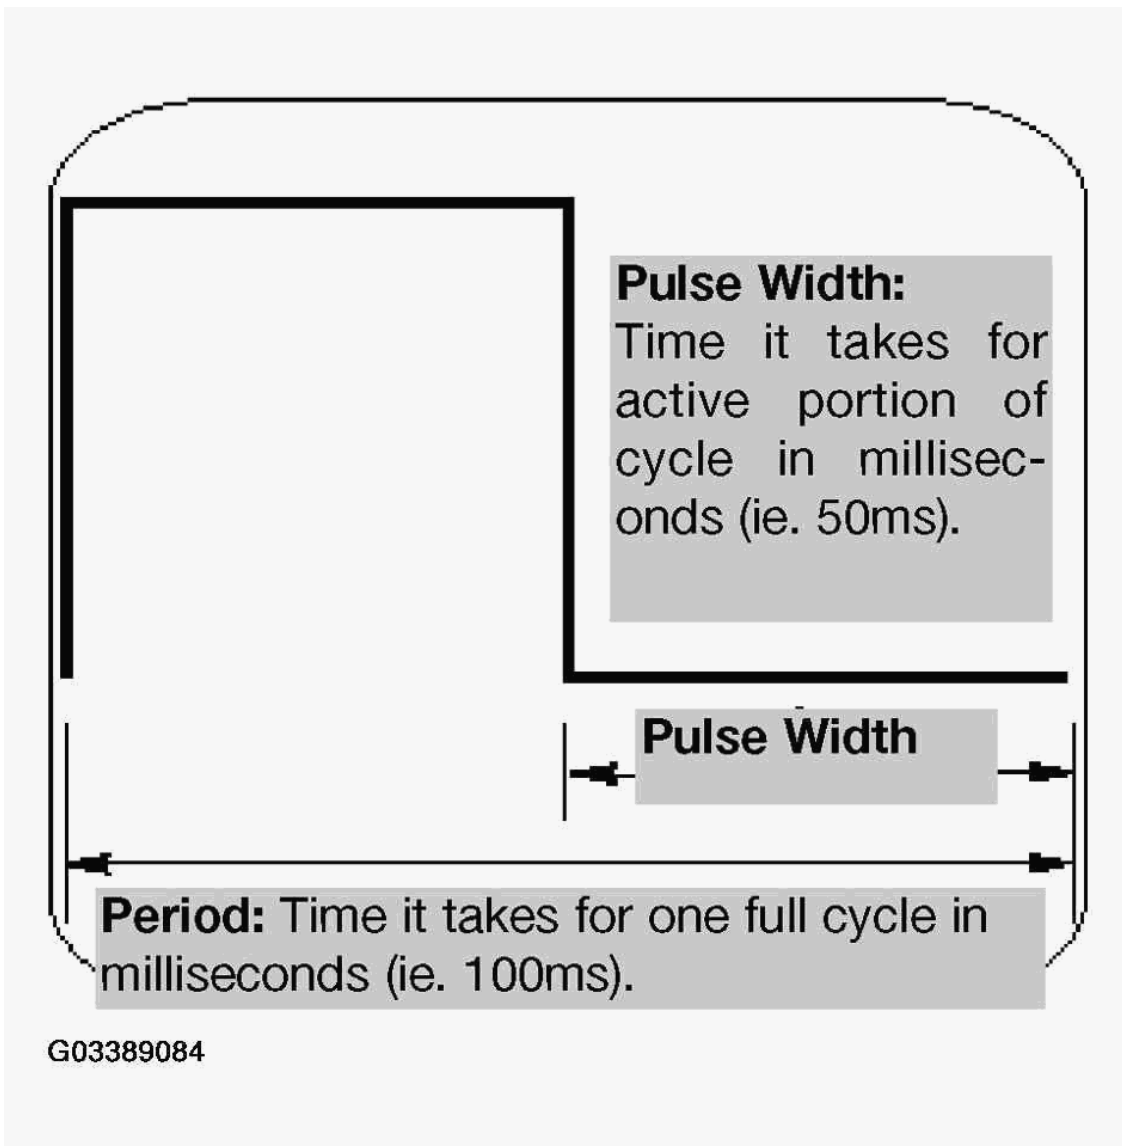

Fig. 21: Identifying Pulse Width Display

Courtesy of BMW OF NORTH AMERICA, INC.

Duty Cycle

The Duty Cycle of a square wave is the ratio of ON time to OFF time for one cycle.

Duty cycle is expressed in %.

Vehicle systems use both fixed duty cycle signals and variable duty cycle signals.

Fig. 22: Identifying Duty Cycle (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

G03389086

Fig. 23: Identifying Duty Cycle (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Time

1 second = 1000 milliseconds (ms).

1/2 second = 500 milliseconds.

1/4 second = 250 milliseconds.

1/10 second = 100 milliseconds.

1/100 second = 10 milliseconds.

1/1000 second = 1 milliseconds.

HALL-EFFECT SENSORS

Hall Effect Sensors produce a modulated square wave.

Hall Effect Sensors are electronic switches that react to magnetic fields to rapidly control the flow of current or voltage ON and OFF.

The Hall Sensor consists of an epoxy filled non-magnetic housing containing a hall element and a magnet, and a trigger wheel.

G03389087

Fig. 24: View Of Hall Effect Sensors

Courtesy of BMW OF NORTH AMERICA, INC.

The Hall element is a thin non-magnetic plate which is electrically conductive. (Voltage will flow through the plate.) Electron flow is equal on both sides of the plate.

Since everything between the magnet and the hall element is non-magnetic the magnet (magnetic field) has no effect on the current flow.

As a metal disk or solid area of a toothed wheel, flywheel or other trigger device approaches the sensor, a magnetic field is created between the magnet and the disk.

G03389088

Fig. 25: Identifying Magnetic Field
 Courtesy of BMW OF NORTH AMERICA, INC.

The magnetic field cause the electron flow to stop on one side of the plate. Electrons continue to flow on the other side of the plate.

The Hall Sensor Signal is a measurement of the voltage drop between the two sides of the plate or element.

When the magnetic field increases (disc or solid toothed area in front of sensor) the voltage drop across the two sides of the element increases. High voltage on one side, little on the other. The signal output from the sensor is High.

As the disc moves away from the sensor the magnetic fields weakens and is lost. The loss of the magnetic field (blank toothed or open area of the wheel in front of the sensor) produces very little voltage drop across the two sides of the element. The output signal is Low.

This rapid switching of the voltage ON/OFF produces a HIGH/LOW signal that the control module uses to recognize speed and position.

Examples of Hall Effect Sensors

Motor Position Hall Sensors

Hall sensors are used on many electric motors to monitor speed and position. (i.e. electric window motors and sunroof motors.)

The Hall Effect principal is the same except the magnet is placed on the shaft of the motor.

The magnet is aligned to rotate in a precise position in front of the element. The polarization of the magnetic ring causes a polarity switch in the Hall element to occur as it rotates. The square wave produced provides speed and position information to the control module.

Fig. 26: Identifying Motor Position Hall Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

Wheel Speed Hall Effect Sensors

Hall Effect sensors are used to indicate wheel speed.

Conventional Hall Effect Sensors use three wires, power supply (usually 5v or 12v) a ground wire and a signal wire back to the control module.

The Hall Effect sensors used as wheel speed sensors are unique in that they are two wire Hall Effect Sensors.

The two wire sensors eliminate the separate ground wire and the signal wire functions as the ground also.

G03389090

Fig. 27: Identifying Wheel Speed Hall Effect Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

The unique two wire arrangement provides the control module with a HIGH/LOW signal having a low voltage of .75 volts and a high voltage of 2.5 volts.

Typical Application of Hall Effect sensors

- Crankshaft Sensors.
- Motor Position and Speed Sensors (e.g. Window Motor, Sunroof Motor).
- Camshaft Sensors.
- Wheel Speed Sensors.

MAGNETORESISTIVE SENSORS

The active sensing of the Magnetoresistive Sensor is particularly suitable for advanced stability control applications in which sensing at zero or near zero speed is required.

A permanent magnet in the sensor produces a magnetic field with the magnetic field stream at a right angle to the sensing element.

1. Metal Pulse Wheel
2. Magnet
3. Sensor Element
4. Evaluation Module
5. Support for Sensor Element

6. Sensor Wiring With Weather Boot
7. Ground Contact Ring
8. Fastening Element
9. Sensor Housing
10. Pick-Up Surface

G03389091

Fig. 28: Exploded View Of Magnetoresistive Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

The sensor element is a ferromagnetic alloy that changes its resistance based on the influence of magnetic fields.

As the high portion of the pulse wheel approaches the sensing element a deflection of the magnetic field stream is created. This creates a resistance change in the thin film ferromagnetic layer of the sensor element.

Fig. 29: View Of Sensor Element
Courtesy of BMW OF NORTH AMERICA, INC.

The sensor element is affected by the direction of the magnetic field, not the field strength. The field strength is not important as long as it is above a certain level. This allows the sensor to tolerate variations in the field strength caused by age, temperature, or mechanical tolerances.

The resistance change in the sensor element affects the voltage that is supplied by the evaluation circuit. The small amount of voltage provided to the sensor element is monitored and the voltage changes (1 to 100mv) are converted into current pulses by the evaluation module.

Fig. 30: Identifying High And Low Current Pulses
 Courtesy of BMW OF NORTH AMERICA, INC.

- Signal Low-7mA .
- Signal High-14mA .

The sensor is supplied 12V by the control unit. Output voltage from the sensor is approximately 10V. The control unit counts the high and low current pulses to determine the wheel speed.

Typical Application of Magnetoresistive Sensor:

- Found Currently on E46 with Teves DSCIII MK-60.

DESIGNATED VALUE SIGNALS

Designated values are produced through fixed resistance positions of a multi-position switch. As the switch is

operated the voltage drop across the resistor(s) of each switch position causes the voltage level of the input signal to change to a predetermined voltage value.

These predetermined (designated) voltages signal the control module to perform specific functions.

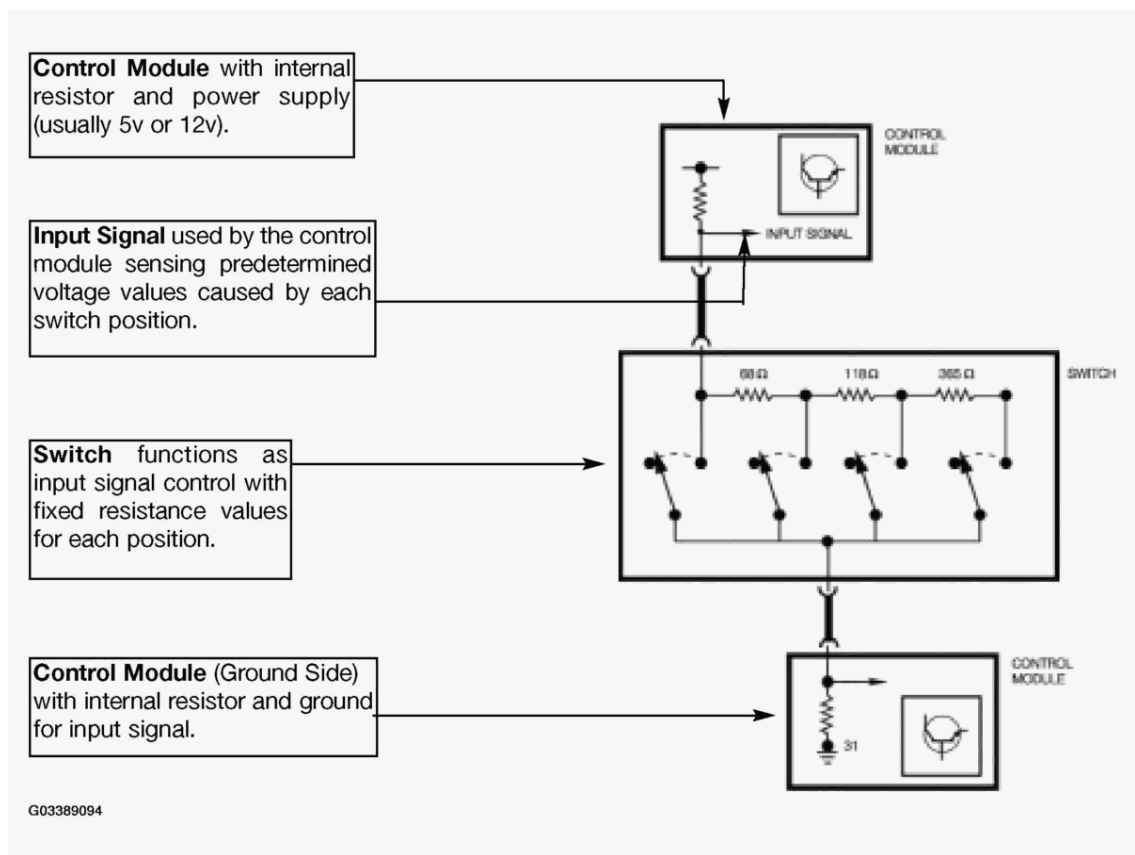

Fig. 31: Identifying Designated Value Signals
 Courtesy of BMW OF NORTH AMERICA, INC.

Voltage Values seen as input by control module.

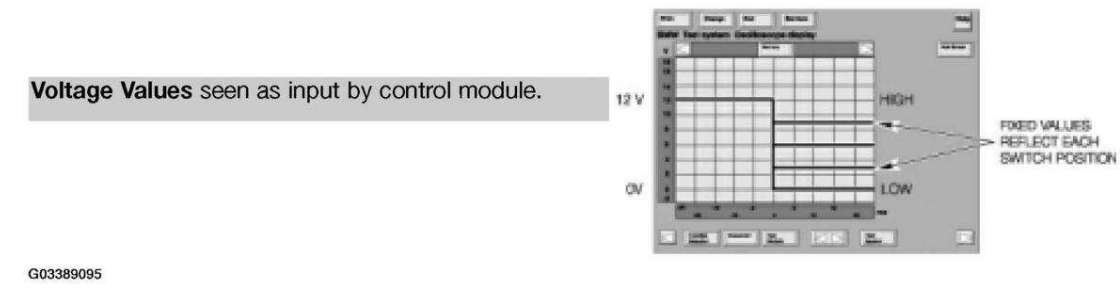

Fig. 32: Voltage Values Display
 Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Designated Values:

- Cruise Control Switch On E 32.
- Seat and Mirror Memory Position Buttons.

Coded Ground Signals

Coded ground signals produce a set of High/Low requests, the combination (pattern) of which is interpreted by the control module to perform a specific function. Coded ground signals are generated through a switch or series of switches signaling the control module requests for operation.

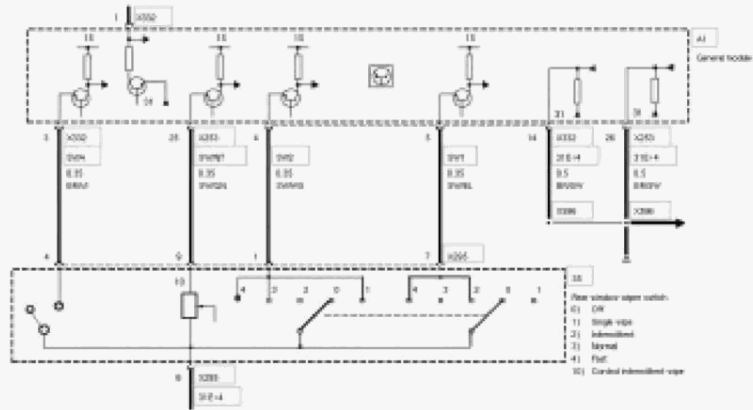

E 36 Wiper Circuit
 3 Circuits to wiper switch provide coded ground signals to Wiper Module for operation requests.

TRANSISTOR FUNCTION

The transistor takes on a number of applications that must be understood to effectively analyze a circuit.

The transistor in operation functions as two parts much like a relay. Both the relay and the transistor control high currents with a low current signal.

G03389098

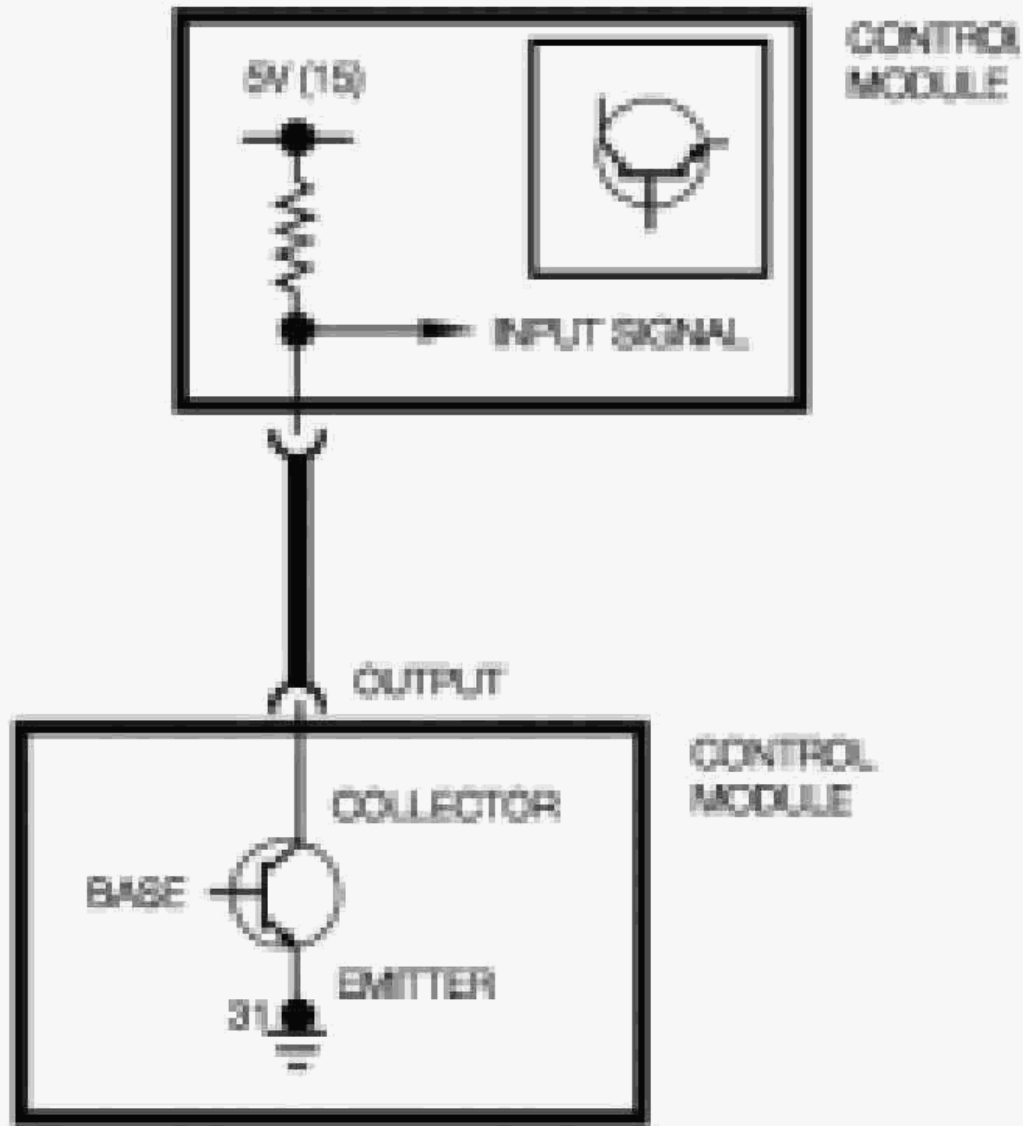

Fig. 35: Identifying Transistor Final Stage Function (1 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

The base/emitter path functions as the control circuit activated by the control module to oversee or control the work.

The collector/emitter path functions as the work side of the circuit, supplying power or switching on the work.

In operation the transistor can be switched ON momentarily, or supply a constant power or ground.

The transistor can also be modulated or pulsed to supply a modulated square wave signal.

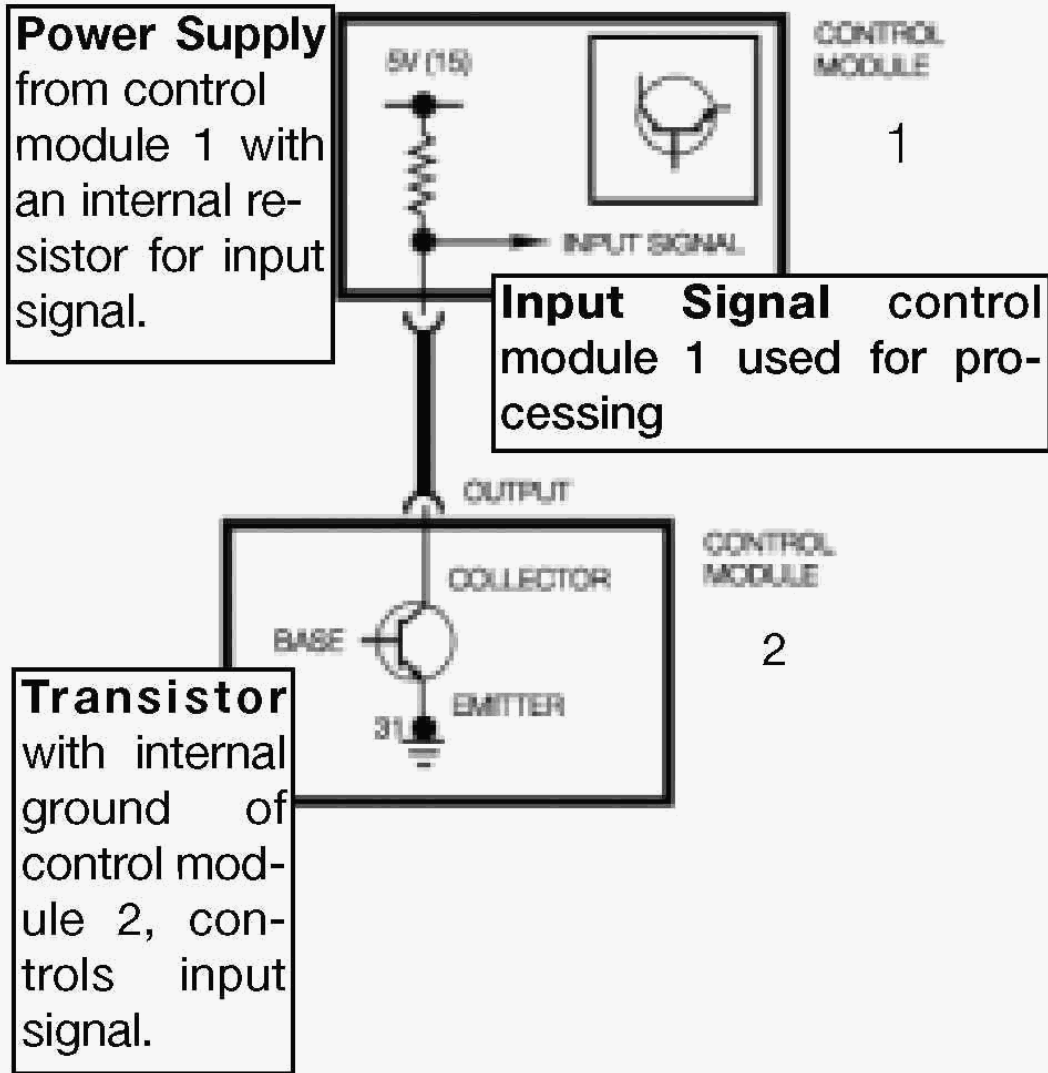

G03389099

Fig. 36: Identifying Transistor Final Stage Function (2 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

Modulated, Momentary, Constant B- as Input/Output

The input signal of control module 1 is an output signal of control module 2.

Control module 2 through activation of its internal transistor provides a ground input for control module 1.

G03389100

Fig. 37: Identifying Modulated, Momentary, Constant B- As Input/Output Function
 Courtesy of BMW OF NORTH AMERICA, INC.

The input signal at control module 1 is either a momentary/constant signal (i.e torque convertor signal from TCM to DME) or a modulated signal (i.e. vehicle speed signal ASC to DME).

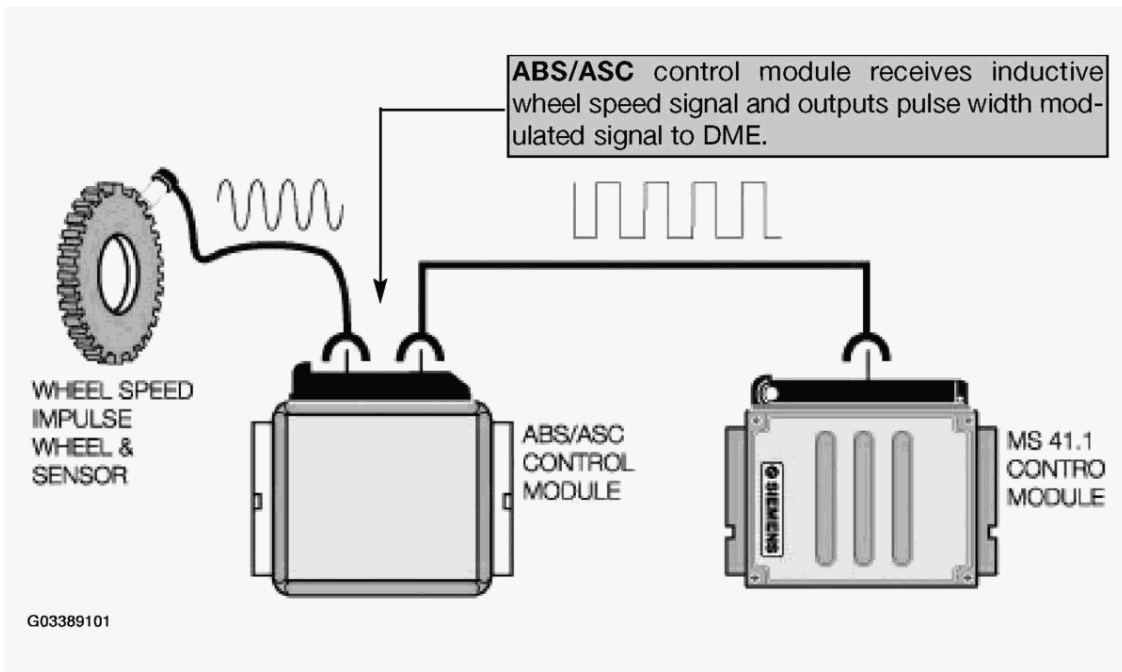

Fig. 38: Identifying Wheel Speed Signal And Output Pulse
 Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Modulated, Momentary, Constant B- as Input/Output Signal:

- A/C KO Signal.
- Speed Signal From ABS/ASC.
- TI/TD Output Signal From DME.

Momentary/Constant B⁺ as an Input/Output Signal

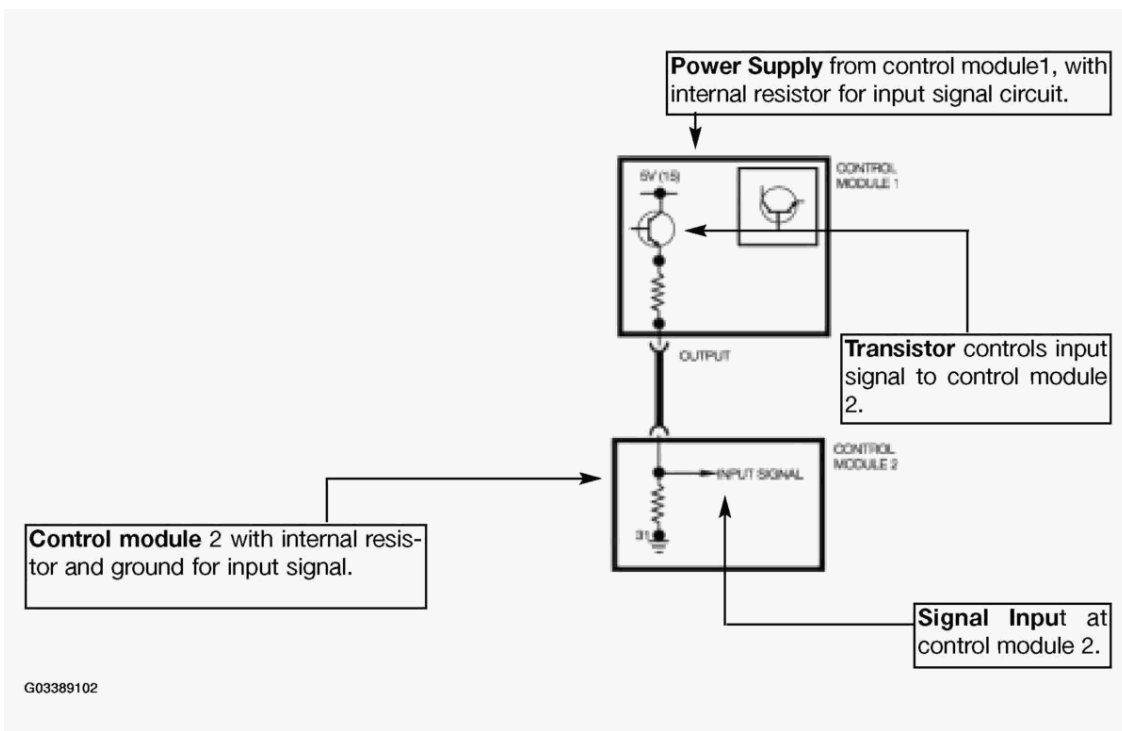

Fig. 39: Identifying Momentary/Constant B As An Input/Output Signal Function
 Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of Momentary/Constant B⁺ as an Input/Output Signal:

- OBC Code Signal to DME.
- A/C Signal to DME.

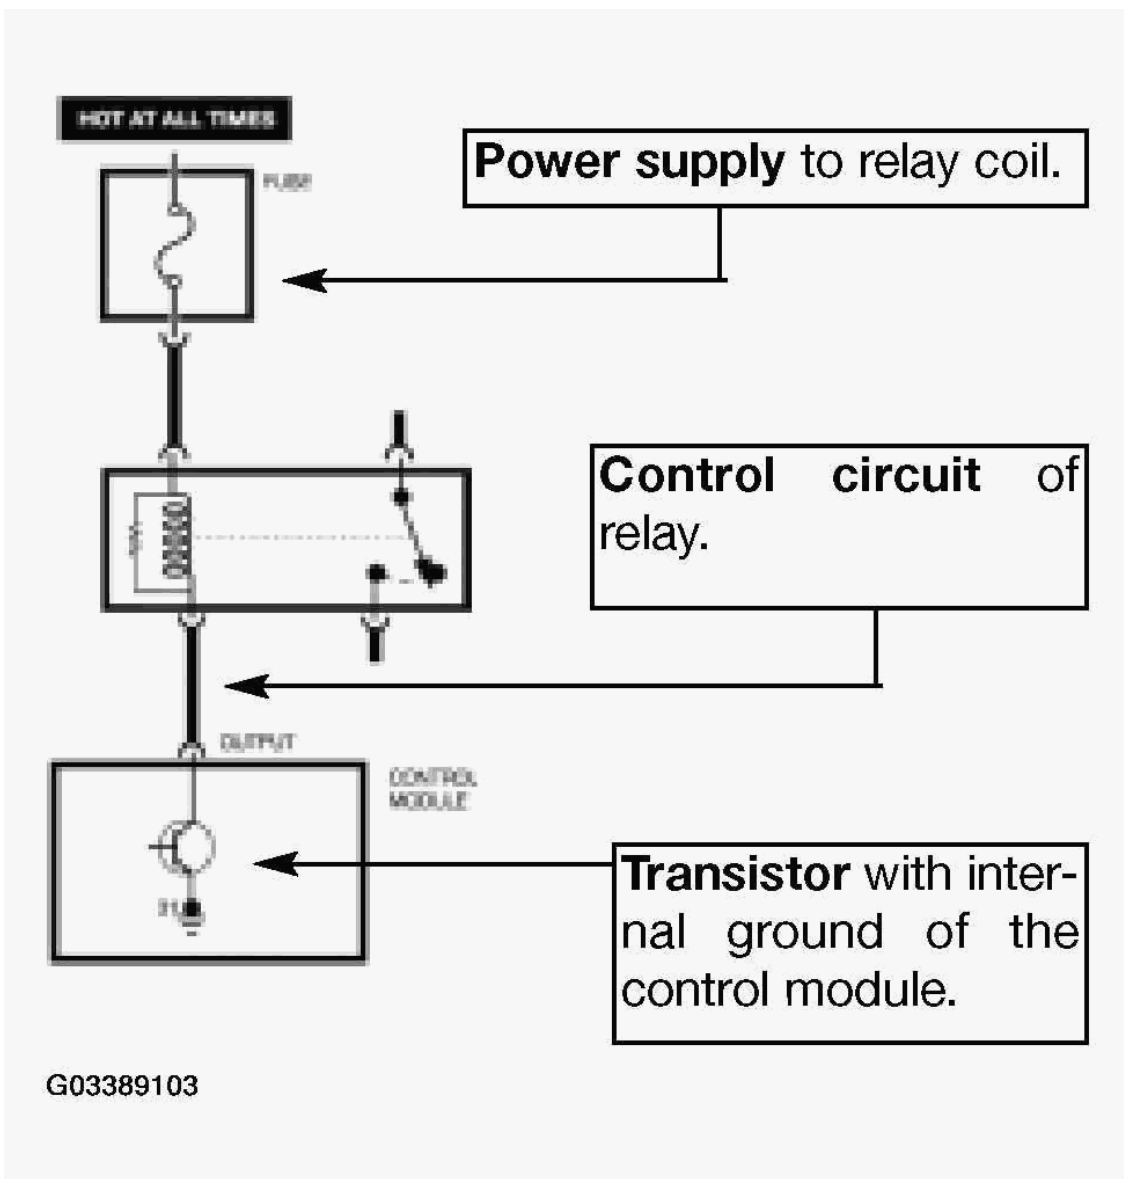

Constant B-/B+ To Energize a Component

Constant B-

Output function to energize a component.

Relay is energized by control module.

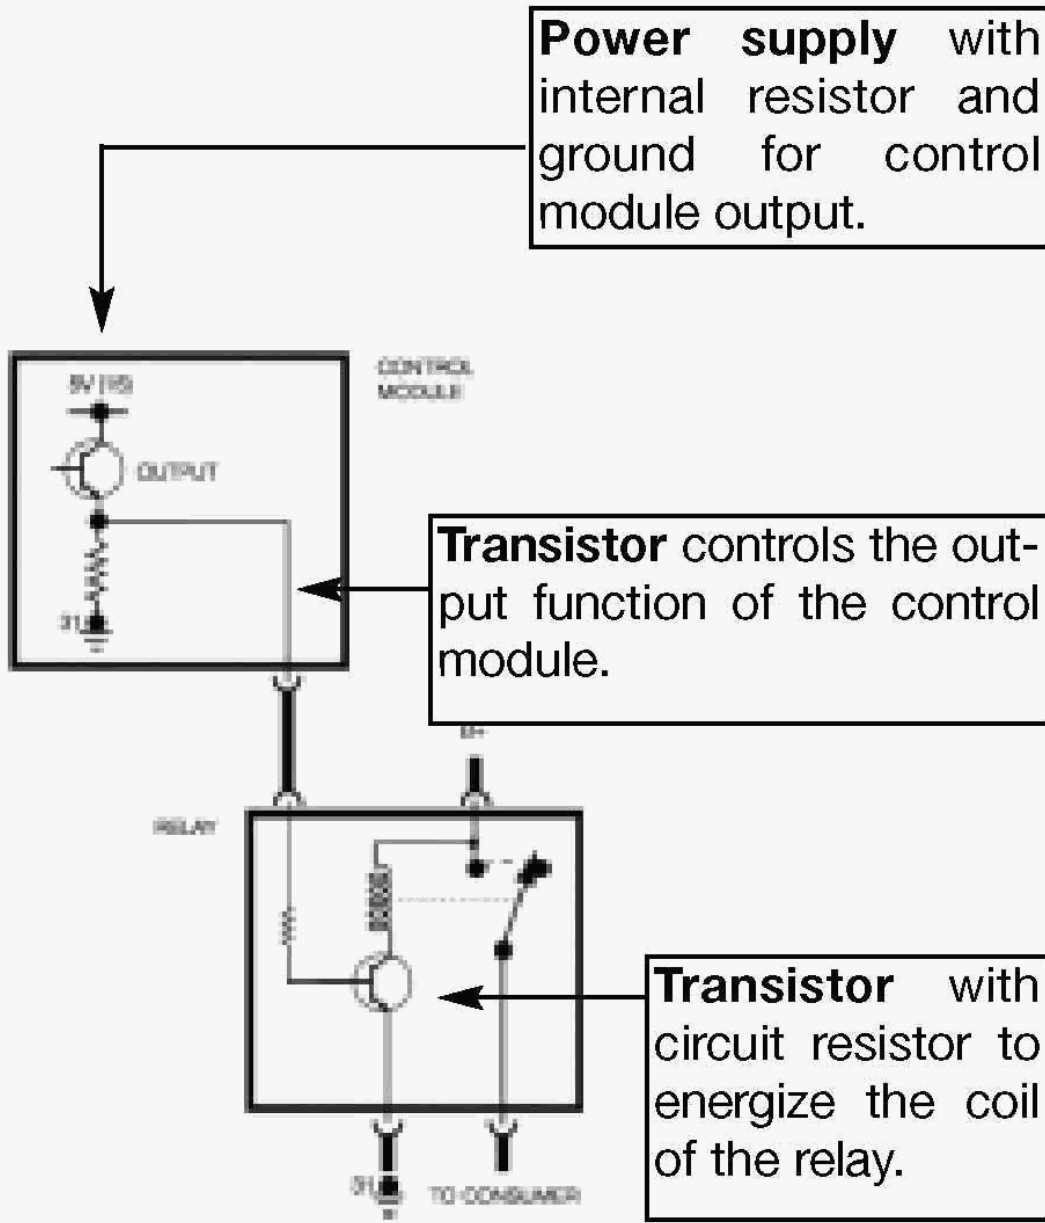

Internal activation of the transistor provides a ground for the relay coil.

G03389103

Fig. 40: Identifying Output Function To Energize Component (Constant B-)
 Courtesy of BMW OF NORTH AMERICA, INC.

Constant B+

G03389104

Fig. 41: Identifying Output Function To Energize Component (Constant B+)
 Courtesy of BMW OF NORTH AMERICA, INC.

Control module output function to energize a component.

Transistor controls output function of the control module.

Control module supplies power to the relay. The relay is activated by the control module through internal activation of the transistor which provides a ground for the relay coil.

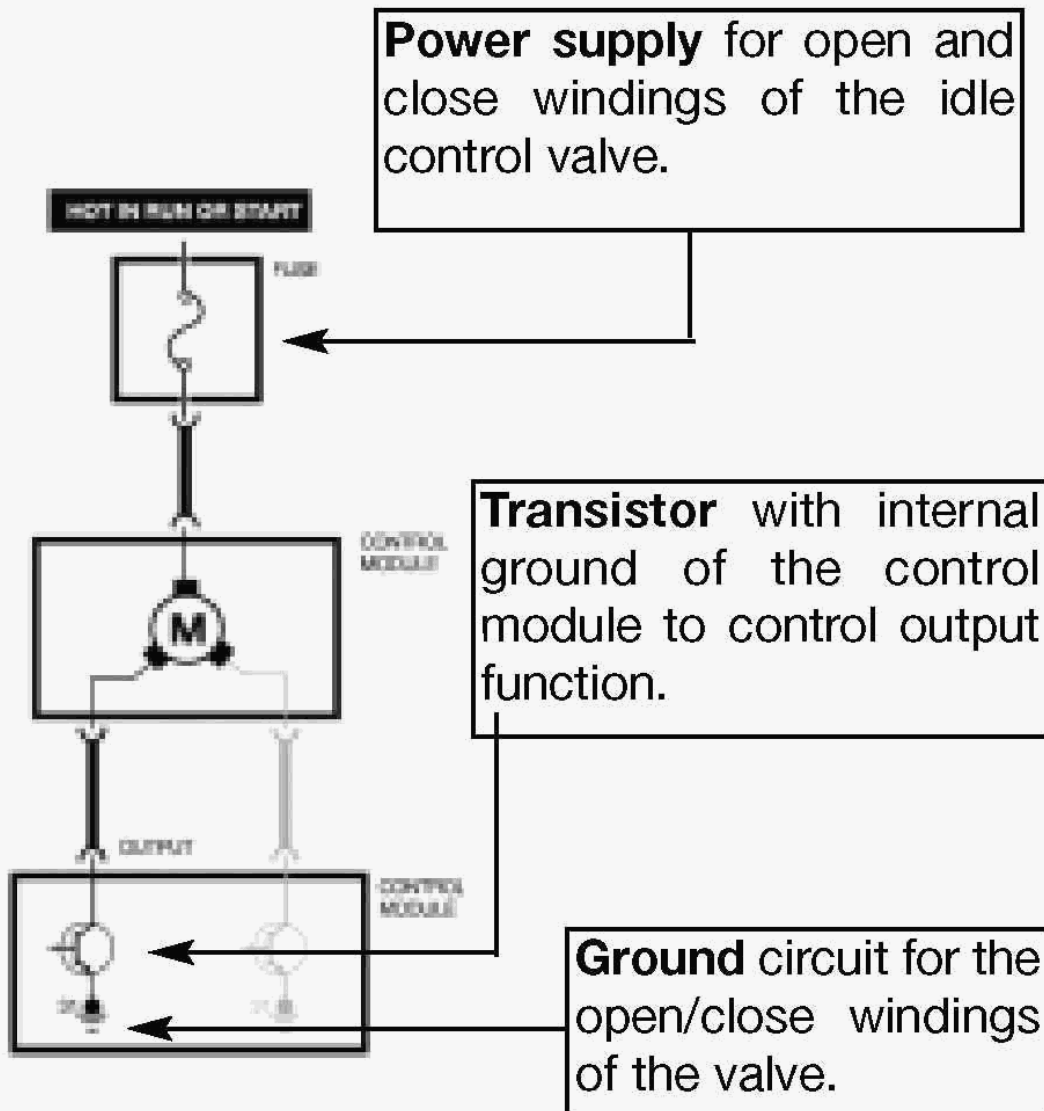

Modulated B-/B+ To Operate A Component

Modulated B-

Output function to operate a component.

The idle valve motor is operated by the control module through internal activation of the transistor which provides a ground for the open winding of the valve.

The idle control valve is operated by regulation of the duty cycle at a specific frequency.

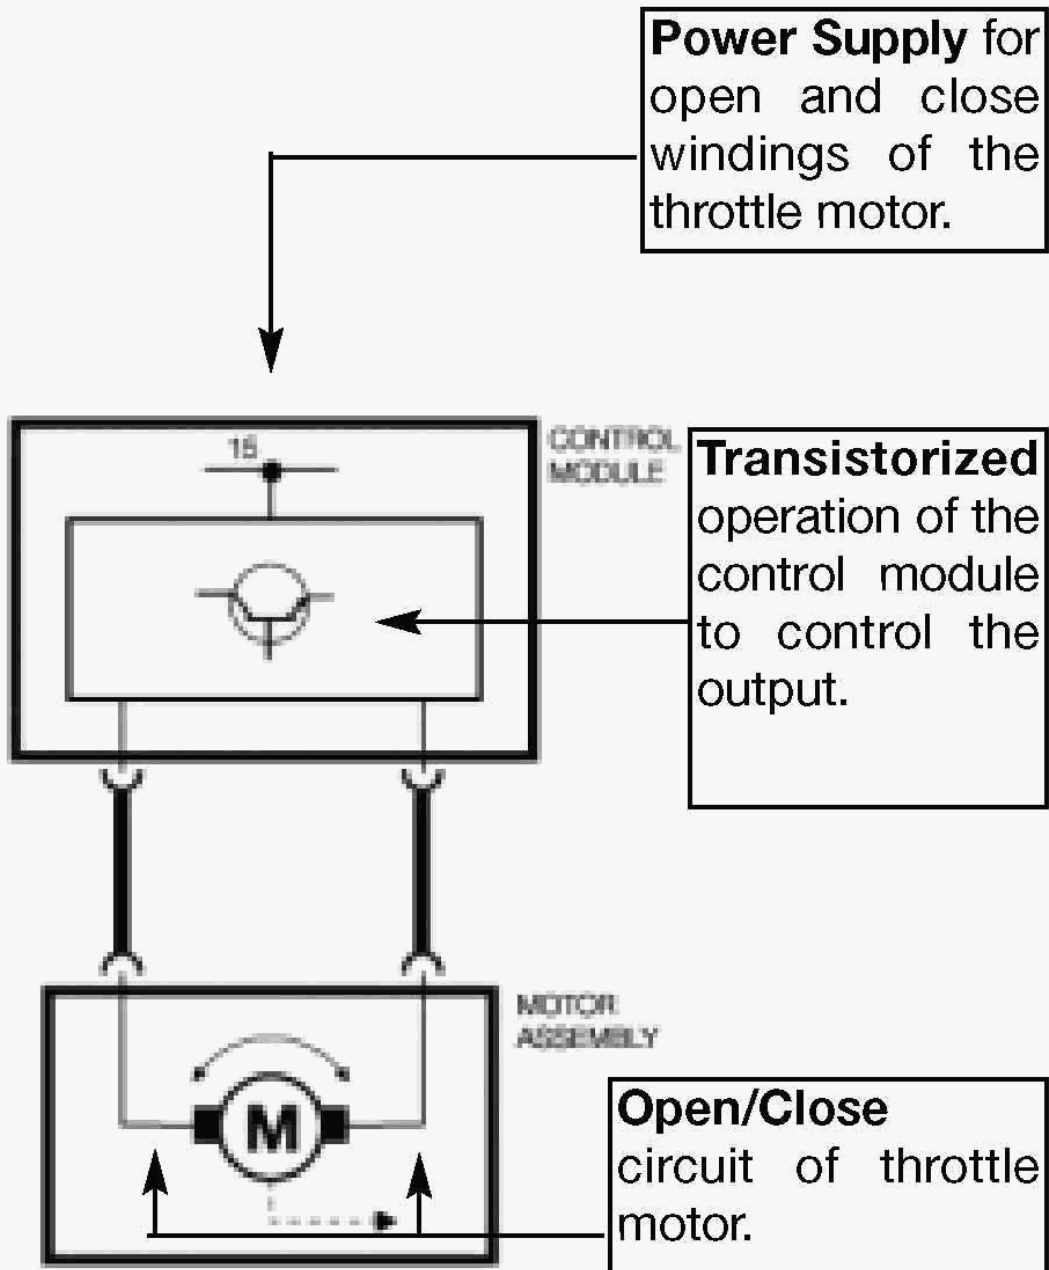

G03389105

Fig. 42: Identifying Output Function To Operate Component (Modulated B-)
 Courtesy of BMW OF NORTH AMERICA, INC.

Typical Application of modulated B-

- Idle Control Motor.
- Purge Valve.
- Injector.
- Ignition Coil.

G03389106

Fig. 43: Identifying Output Function To Operate Component (Modulated B+)
Courtesy of BMW OF NORTH AMERICA, INC.

Output function to operate a component.

The motor is controlled by a transistorized function of the control module, which provides a modulated voltage at a specific frequency to the motor. The throttle position is changed by altering the Duty Cycle of the pulses.

GENERAL INFORMATION

Emissions - Overview

EMISSION OVERVIEW

Models: All Equipped with OBD II

Production Date: 1995 to Present

Manufacturer: Bosch and Siemens Engine Control Modules

Pin Connector: 88 and 134 Pins

EMISSIONS OVERVIEW

What Is OBD?

Today many of the engine's control systems such as throttle opening, fuel injection, ignition, emissions and performance are controlled by an electronic control module and the related sensors and actuators. The first on-board diagnostic (OBD) systems were developed by the manufacturer as a way to detect problems with the electronic systems.

Beginning with 1994 model year, requirements for OBD systems have been established by the EPA and CARB. The purpose of the OBD system is to assure proper emission control system operation for the vehicle's lifetime by monitoring emission-related components and systems for deterioration and malfunction. This includes also a check of the tank ventilation system for vapor leaks.

The OBD system consists of the engine and transmission control modules, their sensors and actuators along with the diagnostic software. The control modules can detect system problems even before the driver notices a driveability problem because many problems that affect emissions can be electrical or even chemical in nature.

What Happens If A Problem Is Detected?

When the OBD system determines that a problem exists, a corresponding "Diagnostic Trouble Code" is stored in the control module's memory.

The control module also illuminates a yellow dashboard Malfunction Indicator Light indicating "Check Engine" or "Service Engine Soon" or displays an engine symbol.

Have you seen this light?

A short introduction to OBD

G03394780

Fig. 1: Identifying OBD System

Courtesy of BMW OF NORTH AMERICA, INC.

This light informs the driver of the need for service, NOT of the need to stop the vehicle. A blinking or flashing dashboard light indicates a rather severe level of engine misfire.

After fixing the problem the Fault code is deleted to turn off the light. If the conditions that caused a problem are no longer present the vehicle's OBD system can turn off the dashboard light automatically. If the OBD system evaluates the component or system three consecutive times and no longer detects the initial problem, the dashboard light will turn off automatically.

What Is The Most Common Problem Detected By OBD?

Fuel Filler Cap

If the fuel filler cap is not properly closed after refueling, the OBD system will detect the vapor leak that exists from the cap not being completely tightened.

If you tighten the cap subsequently, the dashboard light should be extinguished within a few days or after deleting the Fault code. This is not an indication of a faulty OBD system. The OBD system has properly diagnosed the problem and accordingly alerted the driver by illuminating the dashboard light.

Please check the fuel filler cap first when the dashboard light comes on to avoid unnecessary diagnostic time. To check the fuel filler cap turn the cap to the right until you hear a click or the cap reaches the full stop. Make sure that the retaining strap is not caught between the filler pipe and the fuel filler cap. If the light should stay on further in depth evaporative leak diagnosis is required.

Misfire Detection

As part of the CARB/OBD II regulations the Engine Control Module must determine if misfire is occurring and also identify the specific cylinder(s). The ECM will determine severity of the misfire event, and whether it is emissions relevant or catalyst damaging. In order to accomplish these tasks the ECM monitors the crankshaft for acceleration losses during firing segments of cylinder specific firing order. If the signal is implausible an erroneous reference mark can be obtained by the ECM which will result in a misfire fault being set.

Possible causes of cylinder misfire faults (actual field findings):

- Vehicle ran low or out of fuel
- Poor fuel quality (ex. water in fuel, customer uses an additive, etc.)
- Low/high fuel pressure
- Ignition coil
- Fouled spark plug(s)
- Restricted/contaminated fuel injector(s)
- Crankshaft position sensor
- Poor combustion due to low compression or high leakage
- Blocked/restricted catalyst

ENGINE MISFIRE DIAGNOSIS

Engine Misfire is the result of inefficient combustion in one or more cylinders. The causes of Engine Misfire are extensive but can be grouped into the following sub-systems. Consider the charts below as an additional diagnostic aid once the DISplus/ModIC is connected, the correct fault symptom has been chosen and the fault memory has been interrogated. Follow the Test Module as displayed by the DISplus/ModIC.

- COMPONENT
- POSSIBLE CONDITION
- TEST
- CORRECTION
- **Spark Plug:**
 - Incorrect spark plug installed
 - Electrode gap closed or too small
 - Electrode(s) missing
 - Oil or fuel fouled spark plug
 - Ceramic insulation cracked
- Secondary Ignition DISplus Preset Measurement
 - Verify correct spark plug
 - Replace if necessary
 - Swap with another cylinder
- **Secondary circuit: (wiring, M73-cap, rotor)**

- Wet or moist due to water infiltration.
- High resistance due to corrosion.
- Check water ingress, repair, replace
- Check resistance value, replace
- **Ignition Coil(s):**
 - Secondary/Primary Circuits open or shorted.
 - Housing cracked, damaged.
- Secondary and Primary
 - Inspect and replace if necessary
 - Swap with another cylinder
- **Ignition Coil & Engine Harness Connectors**
 - Power supply, Primary control and ground (shunt signal) circuits impaired.
- Primary Ignition & Term 4A feedback Preset Measurements
 - Look for open, loose connector, corrosion, crossed or backed out pins (also consider ignition unloader or ECM relay on MY97 and newer cars).
 - Determine defective condition, repair or replace.
 - A secondary ignition oscilloscope display provides vital information about the ignition system's condition.
 - Follow the precautions in group 12 of the Repair Instructions.
 - Use the following scope patterns as a guideline for ignition system diagnosis. Use the preset measurement function of DISplus.

Evaluation of secondary signal amplitude at idle speed.

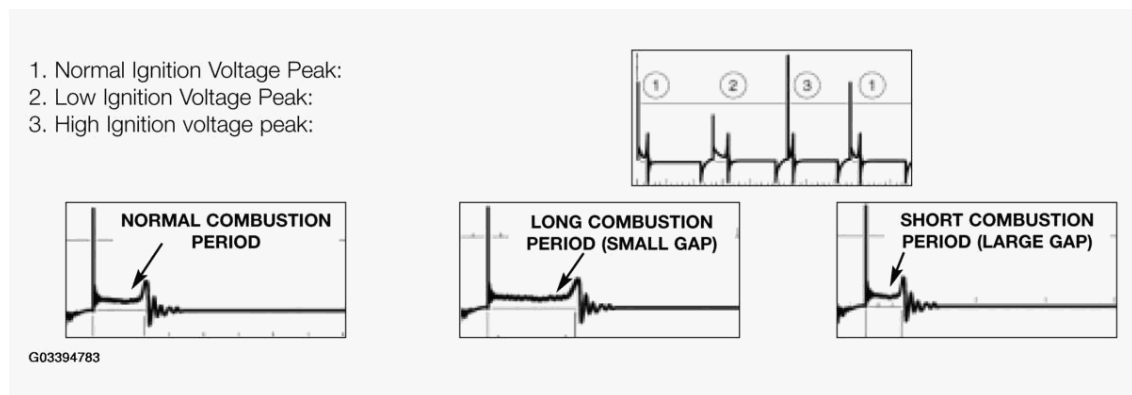

Fig. 2: Identifying Evaluation Of Secondary Signal Amplitude At Idle Speed
 Courtesy of BMW OF NORTH AMERICA, INC.

- COMPONENT
- POSSIBLE CONDITION
- TEST
- CORRECTION

- **Pistons, Rings, Valves, Camshaft:**
 - Hole in piston crown, ring(s) broken, valve(s) not seating, valve(s) bent, valve spring(s) broken, camshaft lobe cracked, etc.
 - Idle Quality - Rough Running Preset.
 - Cylinder compression & leakdown tests.
 - Correct condition as required.
- **Hydraulic Valve Actuator (HVA):**
 - HVA oil bore restricted or blocked.
 - Engine oil pressure builds up too slow.
 - **Intermittent Misfire Fault** - Not Currently Present.
 - HVA binding/sticking in bore.
 - Idle Quality - Rough Running Preset.
 - Listen to HVA
 - Check Oil Pressure
 - Cylinder leakdown
 - Always consider mechanical components when diagnosing misfire.
 - Inspect for scoring.
- **Vacuum Leaks:**
 - Unmetered vacuum leaks causing a "**lean**" operating condition. Possible "**Excessive Mixture Deviation**" fault codes.
 - Idle Quality - Rough Running Preset. Test for vacuum leaks.
 - Interpret Add. & Multipl. adaptation values
 - Correct condition as required
 - COMPONENT
 - POSSIBLE CONDITION
 - TEST
 - CORRECTION
- **Fuel (quality):**
 - Contaminated fuel, (water, other non combustible).
 - Clean fuel system, replace fuel.
- **Fuel Delivery:**
 - Fuel pump delivery pressure low, restriction in fuel line to fuel rail or running loss valve.
 - Fuel filter restricted (clogged).
 - Low fuel in tank.
 - Check fuel pressure & volume.
 - Check fuel pump power and ground
 - Determine restriction/flow reduction, replace component as necessary.
 - Interpret Additive and Multiplicative adaptation values.

- **Running Loss Valve:**
 - Valve stuck in "small circuit" position.
 - Check valve
 - Display "diagnosis requests" in DISplus and test valve for proper function, replace valve as necessary.
- **Fuel Injectors:**
 - Leaking fuel injector pintle seats cause rich engine starts with hot ambient temperatures.
 - Blocked (dirty) injector(s).
 - Ti Preset & status page.
 - Sec Ign scope pattern.
 - Check injectors for leakage.
 - Swap suspect injector with another cylinder.
 - Inspect injector, replace if necessary.
- **Fuel Pressure Regulator:**
 - Regulator defective, causes fluctuation in the injected quantity of fuel causing mixture adaptation faults.
 - Fuel pressure
 - Check nominal fuel pressure value with engine operating under varied speeds.
- **Evaporative System:**
 - Defective evaporative system vent causing fuel tank collapse and fuel starvation.
 - DISplus status, EVAP test with pressure tool, purge valve func. test.
 - Check the fuel tank condition and vent line.
 - Check Fresh Air Valve on TLEV E36 vehicles or LDP/DM TL and filter on ORVR vehicles for proper system "breathing".
 - COMPONENT
 - POSSIBLE CONDITION
 - TEST
 - CORRECTION
- **Crankshaft Position Sensor or Increment Wheel:**
 - Implausible signal for misfire detection.
 - Increment wheel loose or damaged (internal on M44, M52 and M54, external on M62 & M73).
 - Air gap between sensor and wheel.
 - Noticeable at higher RPM.
 - DISplus preset measurement.
 - Determine defective sensor or increment wheel and replace.
- **Catalyst Damaged:**
 - Excessive exhaust back pressure (bank specific fault present, more noticeable under heavy load and high RPM).

- DISplus preset measurement of oxygen sensor.
- Back pressure test per SIB with Special Tool.
- Determine catalyst condition, replace or repair as necessary.
- **Oxygen Sensor:**
 - Excessive mixture deviation, **possible vacuum leaks.**
 - Monitor oxygen sensor signal via DIS preset.
 - Swap sensor from other bank (if applicable) and see if fault transfers to other bank.
- **Engine Control Module**
 - Internal control module fault.
 - Misfire Reprogramming.
 - Check fault memory.
 - Highly unlikely but must be considered.
 - Check Model/Prod range - reprogram

When diagnosing a Misfire fault code, Remember:

"Misfire" is caused by a defect in the internal combustion engine or a defect in the control of the engine operation.

"Misfire" is the result of improper combustion (variation between cylinders) as measured at the crankshaft due to:

- Engine mechanical defects; breakage, wear, leakage or improper tolerances.
- Excessive mixture deviation; air (vacuum leaks), fuel and all the components that deliver air/fuel into the combustion chambers.
- Faulty ignition; primary, secondary including spark plugs.
- Faulty exhaust flow; affecting back pressure.
- Tolerance parameters; ECM programming.

A Misfire fault code(s) is the "symptom" of a faulty input for proper combustion. When diagnosing a misfire, review the charts to assist you in finding the faulty input.

OBD HISTORY

As a result of low fuel costs, together with a high standard of living and a dense population, the state of California was affected particularly heavily by air pollution. This spurred the state to pass the most comprehensive and stringent emissions and consumption laws in the world. The automobile manufacturers were reminded of their obligations and this drove them on to comply with the new regulations at enormous expense.

- In continuing efforts to improve air quality, the Environmental Protection Agency (EPA) amended the Clean Air Act in 1990. The Clean Air Act was originally mandated in 1970. The Clean Air Act has a direct impact on automobile manufactures whereby they are responsible to comply with the regulations set forth by the EPA. The 1990 amendment of the Clean Air Act set forth all of the changes currently

being introduced on vehicles sold in the United States today.

- In 1967, the State of California formed the California Air Resources Board (CARB) to develop and carryout air quality improvement programs for California's unique air pollution conditions. Through the years, CARB programs have evolved into what we now know as ON Board Diagnostics and the National Low Emission Vehicle Program.
- The EPA has adopted many of the CARB programs as National programs and laws. One of these earlier programs was OBD I and the introduction of the "CHECK ENGINE" Light.
- BMW first introduced OBD I and the check engine light in the 1987 model year. This enhanced diagnosis through the display of "flash codes" using the check engine light as well as the BMW 2013 and MoDIC. OBD I was only the first step in an ongoing effort to monitor and reduce tailpipe emissions.
- By the 1989 model year all automotive manufactures had to assure that all individual components influencing the composition of exhaust emissions would be electrically monitored and that the driver be informed whenever such a component failed.
- Since the 1996 model year all vehicles must comply with OBD II requirements. OBD II requires the monitoring of virtually every component that can affect the emission performance of a vehicle plus store the associated fault code and condition in memory.

If a problem is detected and then re-detected during a later drive cycle more than one time, the OBD II system must also illuminate the "CHECK ENGINE" Light in the instrument cluster to alert the driver that a malfunction has occurred. **However, the flash code function of the Check Engine Light in OBD I vehicles is not a function in OBD II vehicles.**

- This requirement is carried out by the Engine Control Module (ECM/DME) as well as the Automatic Transmission Control Module (EGS/AGS) and the Electronic Throttle Control Module (EML) to monitor and store faults associated with all components/systems that can influence exhaust and evaporative emissions.

OBD I

The essential elements here are that electrical components which affect exhaust emissions are monitored by the motor-electronics system and an optical warning signal (CHECK ENGINE Light) is issued in the event of an OBD I-relevant malfunction. The corresponding fault can be read out via a flashing code without the aid of a testing device.

OBD II

Since January 1996, OBD II has been compulsory on all vehicles in the US market. The main difference from OBD I is that not only are the purely electrical components monitored but also all the systems and processes that affect exhaust emissions and fuel system evaporative emissions.

The operational reliability of the exhaust-treatment system must be guaranteed for 5 years and/or 100,000 miles; this is maintained by emission certification. In this case, the data relevant to exhaust/evaporative emissions are read out via a standardized interface with a universal "diagnosis device". If a violation is identified, the vehicle manufacturer in question is legally bound to eliminate the fault throughout the entire vehicle series.

Objectives Of OBD II

- Permanent monitoring of components relevant to exhaust emissions in all vehicles.
- Immediate detection and indication of significant emission increases over the entire service life of each vehicle.
- Permanently low exhaust emissions in the field.

Fig. 3: Identifying Objectives Of OBD II
 Courtesy of BMW OF NORTH AMERICA, INC.

OVERVIEW OF THE NATIONAL LOW EMISSION VEHICLE PROGRAM

Emission Reduction Stages:

While OBD II has the function of monitoring for emission related faults and alerting the operator of the vehicle, the National Low Emission Vehicle Program requires a certain number of vehicles produced (specific to manufacturing totals) *currently* comply with the following emission stages;

TLEV : Transitional Low Emission Vehicle

LEV: Low Emission Vehicle

ULEV: Ultra Low Emission Vehicle.

Prior to the National Low Emission Vehicle Program, the most stringent exhaust reduction compliancy is what is known internally within BMW as **HC II** . The benefit of exhaust emission reductions that the National Low Emission Vehicle Program provides compared with the HC II standard is as follows:

TLEV- 50% cleaner.

LEV- 70% cleaner.

ULEV -84% cleaner.

- Compliance Level
- NMHC Non Methane Hydrocarbon
- CO Carbon Monoxide
- NOx Oxide(s) of Nitrogen

SYSTEM MONITORING

Within the framework of OBD II, certain components/systems must be monitored once per driving cycle while other control systems (e.g. misfire detection) must be monitored permanently. A *"driving cycle" consists of engine startup, vehicle operation (exceeding of starting speed), coasting and engine stopping.*

Permanent Monitoring

Permanently monitored systems are monitored according to temperature immediately after startup. In the event of malfunctions (e.g. oxygen sensor), the Malfunction Indicator Light will illuminate immediately.

The following are monitored permanently:

- Misfire Detection
- Fuel System (duration of injection)
- All emission related electrical circuits, components and systems of the ECM, TCM and EML (if equipped).

Cyclic Monitoring

Systems monitored once per driving cycle will only result in a fault being registered after the corresponding operating conditions have been completed. Therefore, there is no possibility for checking when the engine is started up briefly and then shut down.

The following are monitored once per driving cycle:

- Oxygen Sensor Function
- Secondary Air Injection System
- Catalytic Converter Function (efficiency)
- Evaporative Vapor Recovery System

Due to the complexity involved in meeting the test criteria within the defined driving cycle, all tests may not be completed within one "customer driving cycle". The test can be successfully completed within the defined criteria, however customer driving styles may differ and therefore may not always monitor all involved components/systems in one "trip".

Drive Cycle

The following diagram shows how a drive cycle is set (test drive) in order for all the systems to be monitored once. The test conditions can be created in any desired order after startup.

Fig. 5: Identifying Drive Cycle Graph

Courtesy of BMW OF NORTH AMERICA, INC.

1. Engine cold start, idling, approximately 3 minutes. Evaluated:
 - **Secondary Air System**
 - **Evaporative Leak Detection (LDP Equipped Vehicles)**
2. Constant driving at 20 to 30 MPH, approximately 4 minutes. Evaluated:
 - **Oxygen Sensors - Achieved "Closed Loop" Operation**
 - **Oxygen Sensors - Response Time and Switching Time (Control Frequency)**
3. Constant driving at 40 to 60 MPH, approximately 15 minutes (sufficient vehicle coasting phases included). Evaluated:
 - **Catalytic Converter Efficiency**
 - **Oxygen Sensors - Response Time and Switching Time (Control Frequency)**
4. Engine idling, approximately 5 minutes. Evaluated:
 - **Tank-Leak Diagnosis (DM TL Equipped Vehicles after KL 15 is switched OFF)**

NOTE: The diagnostic sequence illustrated above will be interrupted if:

- **The engine speed exceeds 3000 RPM.**
- **The driving speed exceeds 60 MPH.**
- **Large fluctuations in the accelerator pedal position.**

THE "MALFUNCTION INDICATOR LIGHT" (MIL) WILL BE ILLUMINATED UNDER THE FOLLOWING CONDITIONS

- Upon the completion of the next consecutive driving cycle where the previously faulted system is monitored again and the emissions relevant fault is again present.
- Immediately if a "Catalyst Damaging" fault occurs (Misfire Detection).

The illumination of the light is performed in accordance with the Federal Test Procedure (FTP) which requires the lamp to be illuminated when:

Fig. 6: Identifying Malfunction Indicator Light
 Courtesy of BMW OF NORTH AMERICA, INC.

- A malfunction of a component that can affect the emission performance of the vehicle occurs and causes emissions to exceed 1.5 times the standards required by the (FTP).
- Manufacturer-defined specifications are exceeded.
- An implausible input signal is generated.
- Catalyst deterioration causes HC-emissions to exceed a limit equivalent to 1.5 times the standard (FTP).
- Misfire faults occur.
- A leak is detected in the evaporative system, or "purging" is defective.
- ECM fails to enter closed-loop oxygen sensor control operation within a specified time interval.
- Engine control or automatic transmission control enters a "limp home" operating mode.
- Ignition is on (KL15) position before cranking = **Bulb Check Function**.

Within the BMW system the illumination of the Malfunction Indicator Light is performed in accordance with the regulations set forth in CARB mail-out 1968.1 and as demonstrated via the Federal Test Procedure (FTP). The following page provides several examples of when and how the Malfunction Indicator Light is illuminated based on the "customer drive cycle".

TEXT NO.	DRIVE CYCLE # 1			DRIVE CYCLE # 2			DRIVE CYCLE # 3			DRIVE CYCLE # 4			DRIVE CYCLE # 5			* DRIVE CYCLE # 43

G03394788

Fig. 7: Checking Bulb Function

Courtesy of BMW OF NORTH AMERICA, INC.

1. A fault code is stored within the ECM upon the first occurrence of a fault in the system being checked.
2. The "Malfunction Indicator Light" will not be illuminated until the completion of the second consecutive "customer driving cycle" where the previously faulted system is again monitored and a fault is still present or a catalyst damaging fault has occurred.
3. If the second drive cycle was not complete and the specific function was not checked, the ECM counts the third drive cycle as the "next consecutive" drive cycle. The "Malfunction Indicator Light" is illuminated if the function is checked and the fault is still present.
4. If there is an intermittent fault present and does not cause a fault to be set through multiple drive cycles, two complete consecutive drive cycles with the fault present are required for the "Malfunction Indicator Light" to be illuminated.
5. Once the "Malfunction Indicator Light" is illuminated it will remain illuminated unless the specific function has been checked without fault through three complete consecutive drive cycles.
6. The fault code will also be cleared from memory automatically if the specific function is checked through 40 consecutive drive cycles without the fault being detected or with the use of either the DIS, MODIC or Scan tool.

NOTE: In order to clear a catalyst damaging fault (see MISFIRE DETECTION) from memory, the condition must be evaluated for 80 consecutive cycles without the fault reoccurring.

With the use of a universal scan tool, connected to the "OBD" DLC an SAE standardized DTC can be obtained, along with the condition associated with the illumination of the "Malfunction Indicator Light". Using the DISplus or MODIC, a fault code and the conditions associated with its setting can be obtained prior to the illumination of the "Malfunction Indicator Light".

READINESS CODE

The readiness code provides status (Yes/No) of the system having completed all the required monitoring functions or not. The readiness code is displayed **with an aftermarket Scan Tool or the DISplus/MoDIC** . The code is a binary (1/0) indicating;

- 0 = Test Not Completed or Not Applicable - six cylinder vehicles (not ready - V8 and V12)
- 1 = Test Completed - six cylinder vehicles (ready - V8 and V12)

A "readiness code" must be stored after any clearing of fault memory or disconnection of the ECM. A readiness code of "0" will be stored (see below) after a complete diagnostic check of all components/systems, that can turn on the "Malfunction Indicator Light" is performed.

The readiness code was established to prevent anyone with an emissions related fault and a "Malfunction Indicator Light" on from disconnecting the battery or clearing the fault memory to manipulate the results of the emissions test procedure (IM 240).

Interpretation of the Readiness Code by the ECM(s) (SAE J1979)

The complete readiness code is equal to "one" byte (eight bits). Every bit represents one complete test and is displayed by the scan tool, as required by CARB/EPA. For example:

0 = EGR Monitoring (=0, N/A with BMW)

1 = Oxygen Sensor Heater Monitoring

1 = Oxygen Sensor Monitoring

0 = Air Condition (=0, N/A with BMW)

1 = Secondary Air Delivery Monitoring

1 = Evaporative System Monitoring

0 = Catalyst Heating

1 = Catalyst Efficiency Monitoring

G03394789

Fig. 8: Identifying Secondary Air Delivery Monitoring
 Courtesy of BMW OF NORTH AMERICA, INC.

Drive the car in such a manner that all tests listed above can be completed (refer to the **DRIVE CYCLE**). When the complete "readiness code" equals "1" (ready) then all tests have been completed and the system has established its "readiness".

Readiness Code Using DISplus/MoDIC

The readiness code can be checked with the DISplus/MoDIC. This is particularly helpful in verifying that "drive cycle" criteria was achieved. **A repair can be confirmed before returning the vehicle to the customer by a successfully completed drive cycle.**

Using an MS43 system for example, the readiness code is found under "**Service Functions**"

BMW Diagnosis Test plan

OB2 II Function Check, Knowledge

The DME control unit cannot completely check the engine management system before certain operating conditions have been achieved. For this purpose, a test drive should be carried out under the specified criteria.

The following preconditions must be met to ensure that all tests are conducted:

- No problems defined before test drive
- Any stored fault codes were worked through beforehand
- Fault code memory of engine control unit has been deleted

Test drive procedure:

- Start test drive with vehicle cold (for secondary air system test)
- Drive vehicle at a constant speed within the range between 55 and 95 km/h in 4th gear/selector lever position 4 for about 10 minutes (for oxygen sensors, oxygen sensor heating and catalytic converter monitoring)

OB2 II OB2 II / Message 00

Certain operating conditions must be reached before checking the engine management system. For this purpose, clear fault memory before test drive. Carry out test drive and observe diagnostic function on following pages. The DME system is OK when all diagnostic functions are carried out and no fault codes are stored in the fault memory.

Examples of functions/components checked are shown below:

Diagnosis of:

- Oxygen sensor heating: 1
- Oxygen sensors: 1
- Secondary air: 1
- Fuel tank leak diagnosis: 1
- Catalytic converter: 1

Evaluation:

- 0: not completed
- 1: completed

Monitoring of:

- Remaining components: 1
- Fuel supply: 1
- Combustion misfiring: 1
- Oxygen sensor heating: 1
- Oxygen sensors: 1
- Secondary air: 1
- Fuel tank leak diagnosis: 1
- Catalytic converter: 1
- Evaluation: 0: not supported; 1: supported

OBD II DIAGNOSTIC TROUBLE CODES (DTC)

The Society of Automotive Engineers (SAE) established the Diagnostic Trouble Codes used for OBD II systems (SAE J2012). The DTC's are designed to be identified by their alpha/numeric structure. The SAE has designated the emission related DTC's to start with the letter "P" for Powertrain related systems, hence their *nickname* "P-code".

For example:

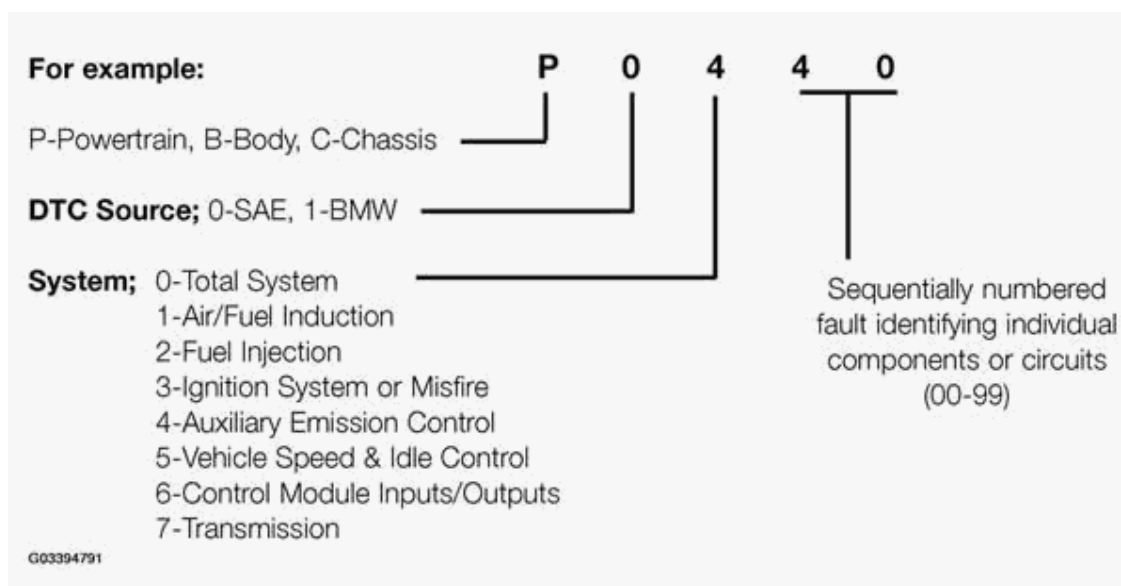

Fig. 10: Identifying Obd II Diagnostic Trouble Codes (DTC)
Courtesy of BMW OF NORTH AMERICA, INC.

- DTC's are stored whenever the "Malfunction Indicator Light" is illuminated.
- A requirement of CARB/EPA is providing universal diagnostic access to DTC's via a standardized Diagnostic Link Connector (DLC) using a standardized tester (scan tool).
- DTC's only provide one set of environmental operating conditions when a fault is stored. This single "Freeze Frame" or snapshot refers to a block of the vehicles environmental conditions for a specific time when the fault first occurred. The information which is stored is defined by SAE and is limited in scope. This information may not even be specific to the type of fault.

SCAN TOOL CONNECTION

Starting with the 1995 750iL, soon after on all 1996 model year and later BMW vehicles, a separate OBD II Diagnostic Link Connector (DLC) was added.

The DLC provides access for an aftermarket scan tool to all emission related control systems:

- ECM - Engine Management Monitored Emissions Functions/Components
- TCM (AGS/EGS) -Transmission Control
- EML - Electronic Throttle Control

This diagnostic communication link uses the existing TXD II circuit in the vehicle through a separate circuit on

the DLC when the 20 pin cap is installed.

Fig. 11: Identifying Scan Tool Connection
Courtesy of BMW OF NORTH AMERICA, INC.

The DLC Connector bridging cap is marked "OBD II" and is found:

G03394793

Fig. 12: Identifying DLC Connector Bridging Cap

- **E38 Center Console (next to cup holder)**

G03394794

Fig. 13: Identifying E38 Center Console
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: E38 and older models have a cosmetic cover and a secured DLC cover.

20 Pin Diagnostic Socket Deletion

Model And Production Date: E46 From 6/00 E39, E52, E53 From 9/00

For model year 2001 the E39, E46 and E53 will eliminate the 20 pin diagnostic connector from the engine compartment. The 16 pin OBD II connector located inside the vehicle will be the only diagnosis port.

The E38 and Z3 will continue to use the 20 pin connector until the end of production.

The 16 pin OBD II connector has been in all BMWs since 1996 to comply with OBD regulations requiring a standardized diagnostic port.

Previously before 2001, only emissions relevant data could be extracted from the OBD II connector because it did not provide access to TXD (D-bus).

The TXD line is connected to pin 8 of the OBD II connector on vehicles without the 20 pin diagnostic connector.

G03394795

Fig. 14: Identifying 20 Pin Diagnostic Socket
Courtesy of BMW OF NORTH AMERICA, INC.

The cap to the OBD II connector contains a bridge that links KL 30 to TXD and TXD II. This is to protect the diagnostic circuit integrity and prevent erroneous faults from being logged.

The OBD II connector is located in the driver's footwell to the left of the steering column for E39, E46 and E53 vehicles.

Special tool 61 4 300 is used to connect to the 20 pin diagnostic lead of the DIS until the introduction of the DISplus.

G03394796

BMW FAULT CODE (DISPLUS/MODIC)

- BMW Codes are stored as soon they occur even before the "Malfunction Indicator Light" comes on.
- BMW Codes are defined by BMW, Bosch and Siemens Engineers to provide greater detail to fault specific information.
- **Siemens systems** - one set from four fault specific environmental conditions is stored with the first fault occurrence. This information can change and is specific to each fault code to aid in diagnosing. A maximum of ten different faults containing four environmental conditions can be stored.
- **Bosch systems** - a maximum of four sets from three fault specific environmental conditions is stored within each fault code. This information can change and is specific to each fault code to aid in diagnosing. A maximum of ten different faults containing three environmental conditions can be stored.
- BMW Codes also store and displays a "time stamp" when the fault last occurred.

- A fault qualifier gives more specific detailed information about the type of fault (upper limit, lower limit, disconnection, plausibility, etc.).
- BMW Fault Codes will alert the Technician of the current fault status. He/she will be advised if the fault is actually still present, not currently present or intermittent.

The fault specific information is stored and accessible through DISplus/MoDIC.

- BMW Fault Codes determine the diagnostic output for BMW DISplus/MoDIC.

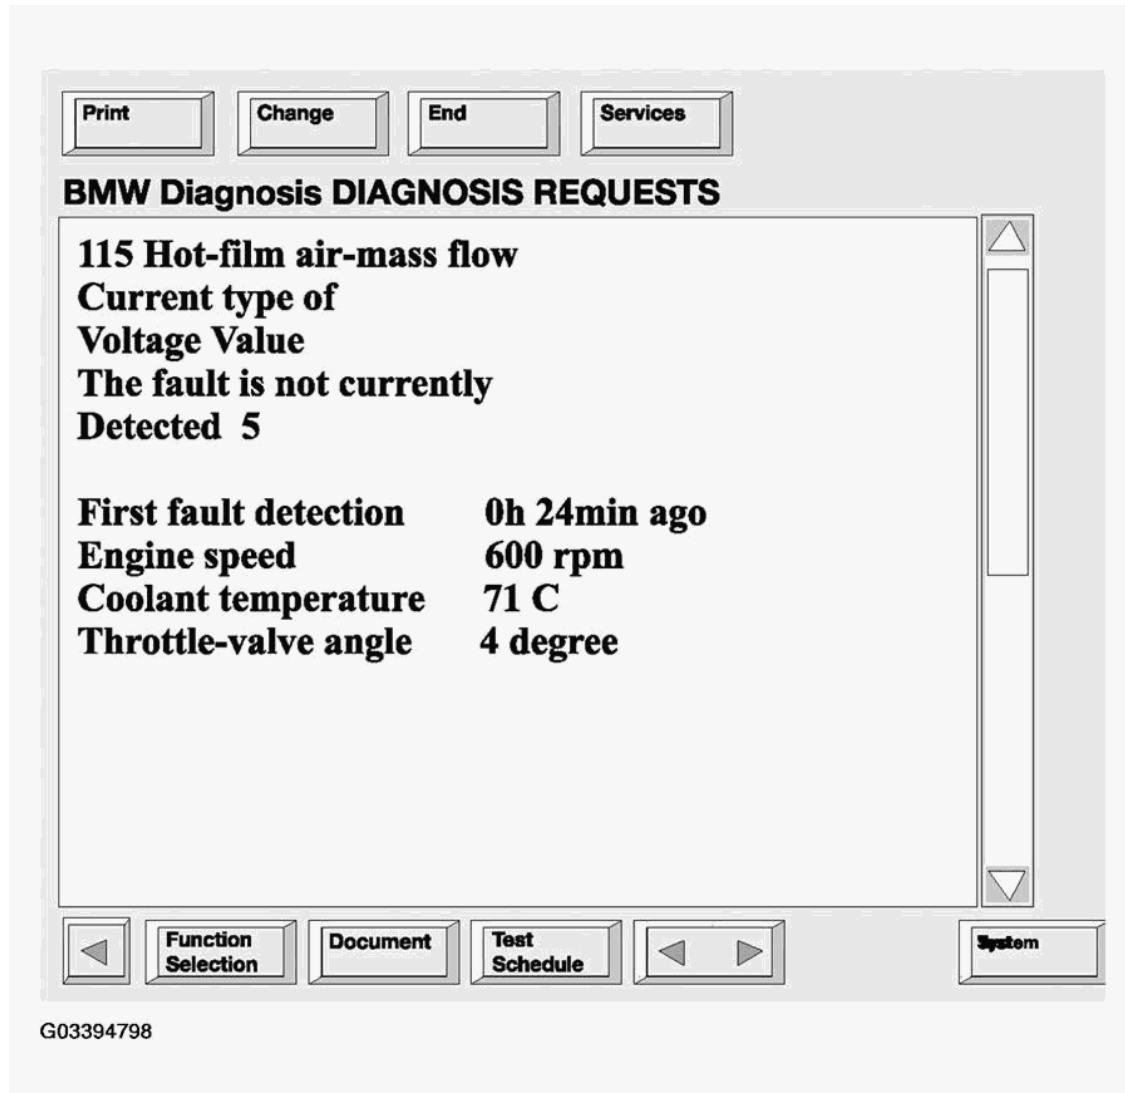

Fig. 17: Identifying BMW Diagnosis Requests
 Courtesy of BMW OF NORTH AMERICA, INC.

OBD II Fault Memory and Fault Codes

Within the framework of OBD II, a diagnosis of all emission-related components/functions must take place during driving. Faults will be stored and displayed if necessary. For this purpose, the ECM includes OBD II

memory. The standardized P codes for malfunctions are stored in this memory. The memory can be read out with the DISplus/ModIC or a Scantool.

Emission Control Function Monitoring & Comprehensive Component Monitoring

OBD II regulations are based on section 1968.1 of Title 13, California Code of Regulations (CCR), The law set forth in section 1968.1 requires an increased scope of monitoring emission related control functions including:

- Catalyst Monitoring
- Heated Catalyst Monitoring (currently used on BMW 750iL vehicles)
- Misfire Monitoring
- Evaporative System Monitoring
- Secondary Air System Monitoring
- Air Conditioning System Refrigerant Monitoring (Not applicable for BMW vehicles)
- Fuel System Monitoring
- Oxygen Sensor Monitoring
- Exhaust Gas Recirculation (EGR) System Monitoring (Not applicable for BMW vehicles)
- Positive Crankcase Ventilation (PCV) System Monitoring (Not required at this time).
- Thermostat Monitoring (if equipped)

Monitoring these emission requirements is a function of the ECM which uses "data sets" while monitoring the conditions of the environment and the operation of the engine using existing input sensors and output actuators.

The data sets are programmed reference values the ECM refers to when a specific monitoring procedure is occurring. If the ECM cannot determine the environmental and/or engine operating conditions due to an impaired or missing signal, it will set a fault and illuminate the "Malfunction Indicator Light".

This input or control signal monitoring falls under another category called "***Comprehensive Component Monitoring***". The ECM must recognize the loss or impairment of the signal or component. The ECM determines a faulted signal or sensor via three conditions:

1. Signal or component shorted to ground.
2. Signal or component shorted to B+.
3. Signal or component lost (open circuit).

Specific fault codes are used to alert the diagnostician of these conditions.

GENERAL INFORMATION

Engine Diagnosis - Overview

ENGINE DIAGNOSIS

ENGINE DIAGNOSIS

When attempting to diagnose driveability complaints, always consider the basics. Regardless of the level of technology employed on an engine, it still needs a few basic things to occur in order to run properly. Whether the engine is very basic or uses so-called "New Generation" technology always refer to the basic principles first.

Any engine using four-cycle spark-ignition principles must meet the same fundamental conditions to run properly. Most engine related driveability problems fall into a few basic categories:

- No Start/No Crank
- Extending cranking before engine start
- Rough Running Cold Idle
- Rough Running Warm Idle
- Rough Running Under Load
- Lack of Power
- Check Engine Light (MIL)

G03395217

Fig. 1: Sectional View Of Engine
Courtesy of BMW OF NORTH AMERICA, INC.

When referring to engine basics, all engines need fuel, air and spark to run. However, in order for a spark-ignition engine to run properly, a few things must be taken into consideration. The fuel, air, spark principle can be broken down further into the following categories:

- Sufficient engine compression with a leak-free combustion chamber.
- Sufficient amount of ignition voltage (spark) at the correct time.
- Proper fuel pressure and volume.
- Properly functioning fuel injection system (Engine management).

- Properly functioning air management system (Electronic throttle systems).
- Correct valve timing (VVT and VANOS).

Fig. 2: Operation Of Valvetronic
 Courtesy of BMW OF NORTH AMERICA, INC.

Compression Testing

In order for an engine to run smoothly and efficiently, the combustion chamber must be free of leakage. An engine with low compression in one or more cylinders is inefficient and will run rough or lack in performance. Low compression may or may not cause the MIL to illuminate.

Low compression can be caused by the following:

- Leaking valves caused by burned valves or seats. The valve guide can also be worn causing the valve not to seat properly. Valves can also be bent from piston contact (from over-rev).
- Piston Rings which can be worn from high mileage or poor maintenance. Also, the rings can be damaged from foreign material or improper installation.
- Cracks in cylinder head or engine block. Cracks can be caused by overheating resulting in misfires or rough running.
- Defective cylinder head gasket. The cylinder head gasket can fail due to overheating which can cause

cylinder leakage resulting in misfire, low compression and rough running.

- Bent connecting rod. A connecting rod can be bent from a defective fuel injector or water ingress into the combustion chamber causing hydrostatic lock.

Compression testing can be performed using a conventional compression gauge. There are some preliminary tasks and safety precautions that must be carried out before starting the compression test:

- Remove the fuel pump fuse and or relay, start the vehicle and allow vehicle to stall out on residual fuel
- Disable ignition by unplugging all ignition coils and remove **ALL** sparkplugs.
- Connect battery charger to vehicle
- Ensure that the throttle is wide open during cranking
- Crank engine until compression gauge stops increasing. Be sure to crank engine equally between cylinders.
- Continue compression test on **ALL** cylinders so comparisons can be done. Record readings.
- If necessary, re-check cylinders with suspect readings.
- If some cylinder readings come up low, add a few drops of oil and re-check. This can differentiate between valves/rings.

Cylinder Leakage Testing

Once a problem cylinder is detected via a compression test or by other means, a cylinder leakage test is used to pinpoint the problem area.

The leakage test uses a gauge and compressed air to indicate the percentage of air loss. By listening and observing at key points, the problem can be narrowed down before the engine needs to be disassembled.

The piston (one or more) should be brought to TDC, compressed air should be introduced into the cylinder using the cylinder leakage tester. Be sure the engine does **NOT** rotate, if the engine rotates, the engine was not at true TDC.

Check the gauge on the tester, it should read in percentage of leakage. Check the engine specification for permissible leakdown. A general rule of thumb is 15 % or less for a good cylinder. However, some engine have a tighter tolerance. Most BMW engines should be at 8 % or less.

G03395219

Fig. 3: Testing Cylinder Leakage
Courtesy of BMW OF NORTH AMERICA, INC.

If any cylinder shows excessive leakdown, check for leakage by listening or observing the following points:

- Listen for air (hissing) at the tailpipe. This would indicate leakage at the exhaust valves on that cylinder.
- Listen for air (hissing) at the throttle. This would indicate leakage at the intake valves on that cylinder. (Be sure throttle is wide open and listen at throttle opening)
- Open the oil cap and listen for air. This would indicate air leakage into the crankcase. This would be piston rings or cylinder bore concerns.
- Observe the coolant reservoir and or remove the radiator cap. Bubbles in the coolant would most likely indicate head gasket leakage or cracked block/head.

Workshop Hints on Cylinder Leakage Testing

When performing cylinder leakage tests, the following tips might be helpful:

Remove all spark plugs to allow easier rotation of the engine. (If this test is done after a compression test, the plugs should already be out).

- Perform the leakage test on all cylinders, not just the problem cylinder. This would indicate any other problems which can be rectified. This eliminates any repeat repairs and wasted diagnostic time.
- Perform the leakage test in cylinder firing order starting with cylinder #1. It takes two revolutions of the engine to complete the leakage test. Start at cylinder #1 and rotate the engine to the next cylinder in the firing order. Divide the number of cylinders into 720, the result is the number of degrees that each cylinder fires. For example, if you divide a 6 cylinder into 720, this equals 120 degrees. If you start at cylinder 1 and rotate the engine 120 degrees in the direction of rotation, you can check the next cylinder in the firing order. This process eliminates the need to rotate the engine an excessive amount.

G03395220

G03395221

Fig. 5: Identifying Firing Order

Courtesy of BMW OF NORTH AMERICA, INC.

The ignition system on modern BMW engines consist of one ignition coil per cylinder. This arrangement is known as RZV, or Direct Stationary Ignition. The ignition coil receives fused power usually from the DME main relay or IVM (N62).

The ignition coil primary circuit is controlled (triggered) by the engine control module (ECM). The ECM controls dwell and ignition timing on all cylinders individually. Electrical circuit faults on the primary circuit are recorded in the ECM and can be read out using the DISplus or GT-1.

Most new engines use the "pencil" type coil. This design houses the coil windings for the primary and secondary circuit as well as the spark plug boot which includes the secondary circuit resistance.

043395223

Fig. 6: Identifying Pencil Coil
Courtesy of BMW OF NORTH AMERICA, INC.

Due to the compact design of the ignition coil, much of the diagnosis is simplified. Misfire faults and/or ignition related faults can be easily diagnosed by swapping the coils between cylinders. If the fault moves with the coil, then it is obvious that the coil is at fault. If the fault stays in the cylinder, then the spark plug can be moved etc.

This greatly simplifies engine diagnosis. However sometimes, the diagnosis is not always as simple as swapping parts.

G03395224

Fig. 7: Ignition Diagnosis Cyclic Diagram

Courtesy of BMW OF NORTH AMERICA, INC.

This is where the oscilloscope function of the DISplus/GT-1 can aid in diagnosis. A good knowledge of fundamental ignition diagnosis can be helpful. The illustration above is broken down as follows.

1. This point represent the start of the ignition process, also known as "transistor off". The ECM turns off the primary circuit causing the magnetic field to collapse. This begins the production of the secondary voltage needed to fire the spark plug.
2. The is called the firing line as it represents the voltage needed to overcome the secondary resistance and cross the spark plug electrode gap. This voltage level will increase as secondary circuit resistance increases. Also lean mixture will cause this line to increase as well. On RZV ignition systems, this line should be around 3-5kV.
3. This line indicates the start of the combustion process. This is also referred to as the spark line. The line should start relatively level and should be about 1/3 to 1/2 of the height of the firing line. Also, there should be no rapid upward or downward slope.
4. This period of time represented here is the combustion period. This area indicates the integrity of the

combustion event. Problems such as low compression, lean or rich mixture problem would be indicated here.

5. This line represent the voltage present during the combustion period. This line should be mostly level. Upward or downward sloping can indicate mixture or engine compression problems.
6. This point represents the end of the combustion process. Combustion has ended and the remaining voltage available is the coil will start to dissipate.
7. This is known as the coil or decay oscillation period. Any excess voltage not used in the combustion process will "decay" and dissipate. The number and pattern of the oscillations is dependent on the coil type. Different types of coils and different coil manufacturers will be a factor on this pattern. Anywhere from 2 to 6 oscillations may be seen here. If no oscillations are present, this would indicate ignition coil internal problems.

Most newer engine use a "multiple spark" discharge when the ignition coil is triggered. This is to aid in startup. When diagnosing these ignition systems, the additional peaks do not need to be factored into your diagnosis.

Referring to the illustration below, the relevant portion of the scope pattern is at point 1.

Fig. 8: Identifying Scope Pattern
Courtesy of BMW OF NORTH AMERICA, INC.

Fuel System Testing

Fuel systems need to be checked for proper fuel pressure as well as sufficient volume. When diagnosing fuel system complaints, you must take into account the type of fuel system and how the fuel is delivered to the engine.

Malfunctions in the fuel system can cause driveability complaints which include:

- No start condition
- Hard start/extended cranking time
- Lack of power
- Check Engine (MIL) Light along with mixture related faults
- Excessive exhaust emissions (High CO and/or HC)

When a no start condition is experienced, it is important to start with the basics. Does the vehicle have any fuel in the tank? Don't assume that there is fuel, the fuel gauge or sender circuit may be faulty. Also, the siphon jet system may be defective. Check the fuel level using the instrument cluster test steps if necessary. Check to be sure that there is fuel available on the right side of the fuel tank.

Fig. 9: Checking Fuel System

Courtesy of BMW OF NORTH AMERICA, INC.

Once it has been determined there is fuel in the tank. The fuel system can be tested for proper pressure. Fuel pressure specifications vary between vehicles. Until recently, most fuel systems used a pressure of 3.5 bar. Some of the new systems use up to 5 or 6 bar. Direct injection systems use 6 bar for the fuel supply system and up to 120 bar pressure to the fuel injectors.

The fuel supply system should be tested using the appropriate fuel pressure gauge. Depending upon the vehicle, the testing methods and connections for the fuel pressure testing equipment differ.

Some vehicles have testing ports with a Schrader valve for easy hookup. Earlier vehicles did not have a test port. Testing fuel pressure required the use of a "T" connector to connect into the fuel system.

Most recently, M56 equipped (SULEV) vehicles have a sealed fuel system which require the use of a special tool.

Fig. 10: Identifying "T" Connector
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Always observe all safety regulations when working on fuel systems. Obey all local and state fire safety laws regarding fuel handling. Always have the proper fire extinguisher on hand when performing testing and/or repair to the fuel system.

Once it has been determined that what the fuel pressure is, compare your reading to the proper specification. If the fuel pressure is low or zero, the fuel circuit must be checked over.

See if the fuel pump is energized. Check the voltage supply and ground to the fuel pump using proper electrical testing procedures (i.e voltage drop etc.). Make sure that you analyze the fuel pump circuit. Check the fuses, connections and appropriate relays.

Also, understand the operation of the fuel pump circuit. Older vehicles were somewhat straightforward, on the other hand, the newer vehicles are using more elaborate circuits for fuel pump operation.

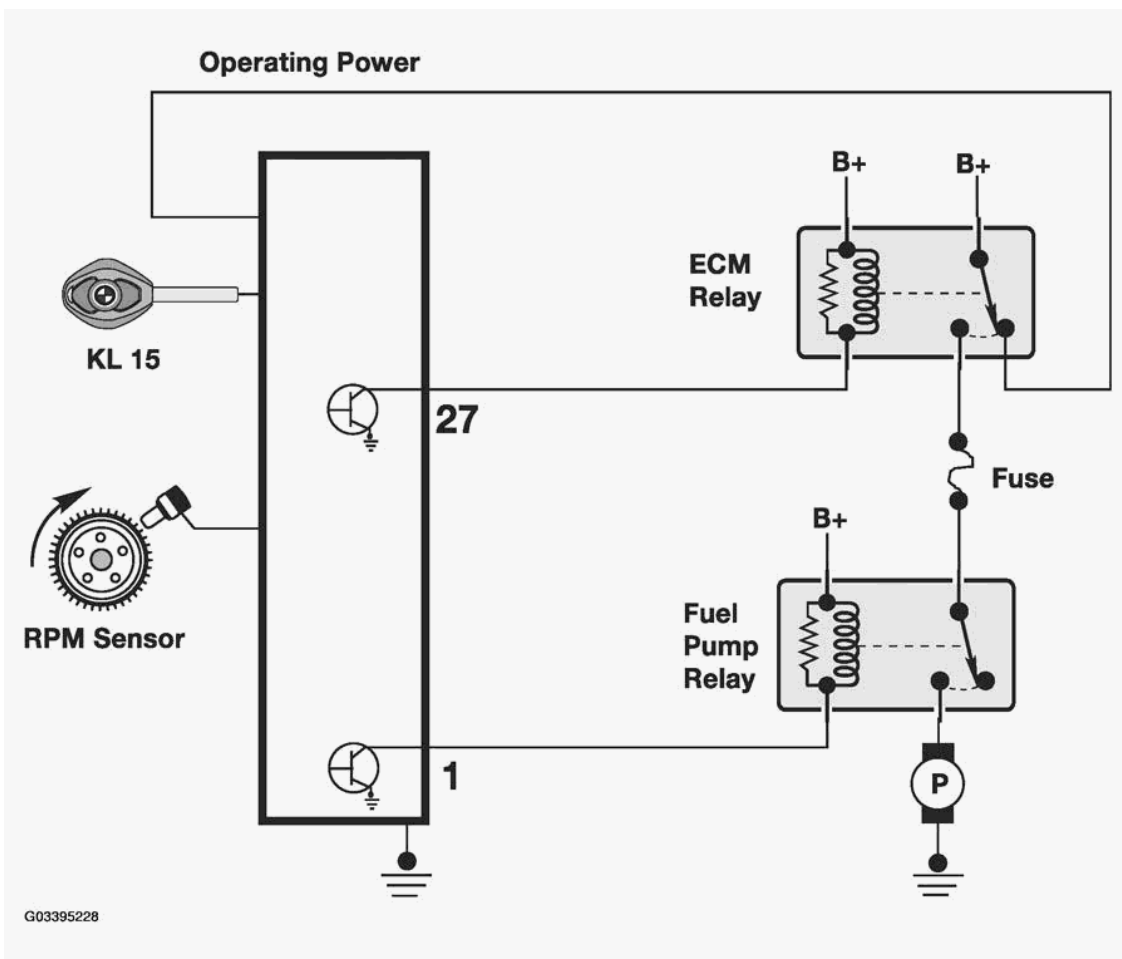

Fig. 11: Operating Power Circuit Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

Some vehicles, now use a control module to control the speed and flow rate of the fuel pump. The M3, M5 and vehicles equipped with the M56 engine use a fuel pump control module. The E65/E66 uses the SBSR to control the fuel pump. Take this into consideration when performing diagnosis on these vehicles.

Fig. 12: Fuel Pump Control Module Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

Always use available resources such as wiring diagrams, SI Bulletins and training material to better understand circuit operation.

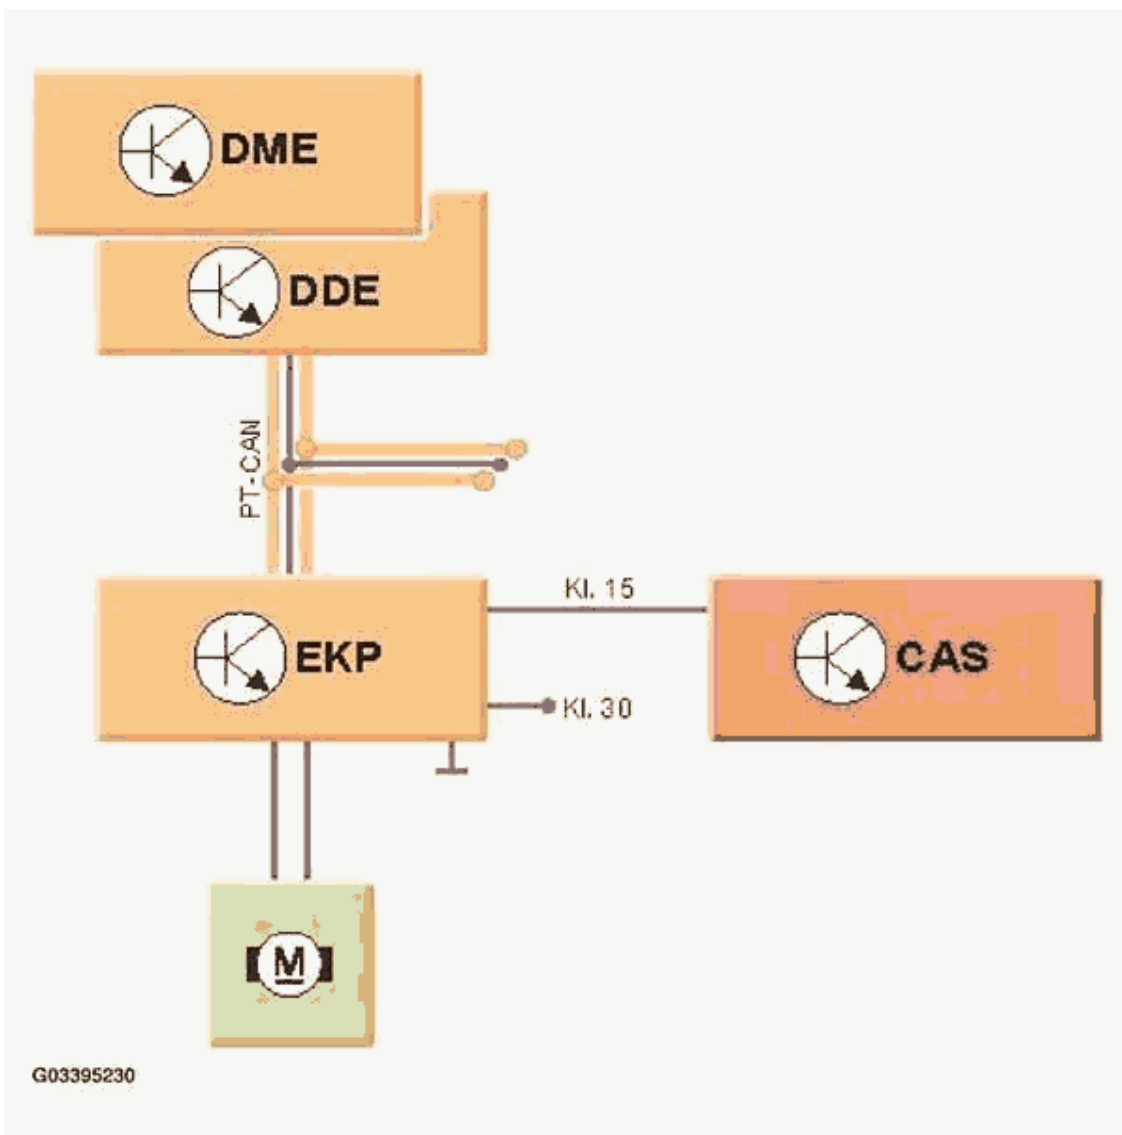

Fig. 13: Fuel System Circuit Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

Fuel Volume Testing

Some driveability concerns are related to incorrect fuel volume. Vehicles with lack of power complaints and mixture related fault codes may have insufficient fuel volume supplied to the fuel injection system. These vehicles may actually pass a fuel pressure test.

Fuel volume issues can be caused by faulty fuel pumps, fuel pressure regulators, clogged or restricted fuel filters and/or fuel lines.

If these driveability concerns are present, then a fuel volume test should be performed. A fuel volume test measures the amount of fuel delivered in a specific time frame.

The fuel pump is activated during this test using the proper test leads to ensure no arcing sparks are present. The

fuel feed line is directed to a non-breakable (fuel-proof plastic) measuring can that has graduations for measurement.

G03395231

Fig. 14: Checking Fuel Volume Using Measuring Can
Courtesy of BMW OF NORTH AMERICA, INC.

A general specification for fuel volume would be approximately one liter in 30 seconds.

Residual Pressure

Fuel injection systems require a residual pressure to present after the engine is switched off. This allows the engine to start immediately after the vehicle has been parked.

If the residual fuel pressure diminishes after the vehicle has been shut off. Upon restart, there will be an extended cranking period before engine start. This is due to the fuel pump attempting to supply enough fuel for startup.

When the fuel system is at rest, there are three components which allow the fuel system to retain sufficient residual pressure. These items are, the fuel pump check valve, the fuel pressure regulator and the fuel injectors.

Fuel System - E32 with M60

Fig. 15: Identifying Fuel System - E32 With M60 Components
 Courtesy of BMW OF NORTH AMERICA, INC.

If any of these items are leaking and fail to hold pressure in the fuel rail, the vehicle will be difficult to start. The cranking time will be excessive and possibly not start at all. For example, If the fuel injectors are leaking, the vehicle will exhibit black smoke on startup.

Diagnosis of these concerns requires a fuel pressure gauge. The residual pressure is monitored on the fuel pressure gauge when the engine is shutoff. Diagnosis is determined by watching the drop in fuel pressure over time. The fuel pressure should not drop more than .5 bar in 30 minutes. If the pressure drops more than .5 bar, the concern should be investigated.

Fuel System - E39/E46 with M54

G03395233

Fig. 16: Identifying Fuel System - E39/E46 With M54 System Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

Depending on the type of fuel system used, diagnosis will vary. On older fuel systems, diagnosis is simplified due to the ability to clamp off certain components to determine, the origin of the leakdown.

Fuel System - E60

Index	Explanation	Index	Explanation
1	Fuel Filler Pipe	4	Fuel Filter
2	Outlet Protection Valve	5	Feed Line
3	Electric Fuel Pump	6	Fuel Injectors/Fuel Rail

G03395234

Fig. 17: Identifying Fuel System - E60 Components
Courtesy of BMW OF NORTH AMERICA, INC.

Newer fuel systems use a non-return type fuel system with some components mounted externally. Most recently, many of the new vehicles have most of the fuel system components mounted in the fuel tank. This includes the fuel pump, fuel filter and fuel pressure regulator. The only fuel system component outside the fuel tank is the fuel feed line, fuel rail and fuel injectors.

This makes the diagnosis of residual pressure concerns more difficult. Diagnosis of this type of system sometimes requires a process of elimination.

If one or more of the fuel injectors is suspected as the cause of the loss in residual fuel pressure, they can be tested using a special tool to "bubble test" the injectors.

G03395235

Fig. 18: Testing Bubbles In Injectors Using Special Tool
 Courtesy of BMW OF NORTH AMERICA, INC.

First the injectors are connected to the test fuel rail supplied with the tool. Then, the fuel injectors are subjected to compressed air. The injectors are then triggered by the test harness to "blow out" any residual fuel.

The test harness is disconnected and the tips of the injectors are immersed in water. The injector tips are observed for any bubbles over time. Any excessive bubbles indicate a defective injector.

Engine Adaptation Values

Engine adaptation values can be broken down into two categories:

- **Additive Mixture Adaptation** - additive adaptation refers to "long term fuel trim". These adaptation are made by the ECM (DME) at idle during "closed loop" fuel control. These values are measured in milliseconds and are expressed in negative and positive values.
- **Multiplicative Mixture Adaptation** - multiplicative adaptation occurs during part load conditions and are performed by the ECM during "closed loop" fuel control. These values are measured in percent and are also expressed as negative and positive values. This is also referred to as "short term fuel trim".

Additive mixture adaptation corrects for variations in idle mixture. The ECM monitors the oxygen sensor signals to evaluate the exhaust mixture. When a lean (or rich) mixture is detected, the ECM increases (or

decreases) the injector "on-time" to correct accordingly.

As long as the fuel trim correction is not excessive, the ECM will not register a fault code. The ECM will correct in increments of +/- .1 ms. When the fuel trim correction exceeds a predetermined threshold value, the check engine light (MIL) will illuminate and store appropriate fault codes for additive mixture adaptation.

Additive values which are excessively positive, would indicate a lean condition. This can be caused by:

- Un-metered air leaks - such as broken vacuum lines or a leaky intake manifold or gasket.
- Faulty crankcase ventilation system - crankcase vent valve stuck open.
- Low fuel pressure - Faulty fuel pressure regulator or fuel pump.
- Faulty HFM - can be sending erroneous load signal information which would cause the ECM to falsely enrich the mixture.

Additive values which are excessively negative, would indicate a rich condition. This can be caused by:

- An air restriction - any restriction to airflow such as a clogged air filter would create a rich fuel mixture. (this may also be indicated by negative multiplication values)
- Faulty crankcase ventilation system - crankcase vent valve stuck closed.
- High fuel pressure - Possible faulty fuel pressure regulator or restricted return line
- Faulty HFM - can be sending erroneous load signal information which would cause the ECM to falsely lean out the mixture.

NOTE: Some newer engine management systems use the term mg/stroke or milligrams per stroke. Treat these values as you would millisecond values.

Multiplicative mixture adaptation corrects for variations in fuel mixture under part load conditions. The ECM monitors the oxygen sensor signals to evaluate the exhaust gas mixture. When a lean (or rich) mixture is detected the ECM adjusts the injector "on-time" accordingly over a "short term" period to adapt for the existing situation.

Multiplicative values are expressed in percent and can be negative or positive. Negative values indicate a rich mixture and positive values indicate a lean mixture. When the Multiplicative values exceed a predetermined threshold value, the check engine light (MIL) will illuminate and store relevant fault codes for Multiplicative adaptation.

When multiplicative values are excessively positive, a lean condition exists. The ECM is attempting to add fuel to maintain the proper fuel mixture (close to lambda value 1). This situation can be caused by a faulty HFM, low fuel volume, restricted fuel filter or faulty fuel pressure regulator.

When the values are negative, the ECM is attempting to lean out (remove fuel) the fuel mixture to compensate for a rich condition. This can be caused by:

- Excessive fuel pressure - from a faulty fuel pressure regulator or restriction in the return line.
- A faulty HFM - the HFM can be sending erroneous load signal information which would cause the ECM

to falsely enrich the mixture.

- An Air restriction - any restriction to airflow such as a clogged air filter would create a rich fuel mixture.
- Any system failure which would cause the mixture to be falsely enriched. This could be caused by erroneous signal information from sensors such as the engine coolant temperature sensor or intake air temperature sensor.

Engine Misfire Diagnosis

Engines which have been produced since 1996 are OBDII compliant. The CARB/OBD regulations require the ECM to be capable of detecting misfires. Also, the ECM must be able to determine if the misfires increase engine emissions and/or are catalyst damaging.

The ECM detects engine misfires by monitoring crankshaft speed. The ECM receives the input from the crankshaft sensor and determines if there is a misfire present by comparing crankshaft speed variations between combustion events on each cylinder.

The crankshaft must rotate 720 degrees (2 rotations) to fire all of the cylinders in an engine regardless of the number of cylinders. Therefore each firing event is spaced apart and occurs at a specific time. By monitoring the crankshaft signal the ECM can determine which cylinder is misfiring and also the severity of the misfire.

Misfires are classified in 2 levels of severity:

- Misfires which increase emission levels - These misfires occur within an interval of 1000 crankshaft revolutions. The ECM counts and adds the detected misfire events for each cylinder. If the sum of all cylinder misfire incidents exceeds the predetermined value, a fault code will be stored and the "MIL" will be illuminated.

If more than one cylinder is misfiring, all misfiring cylinders will be specified and the individual fault codes will be stored. The "MIL will be illuminated".

- Misfires which are catalyst damaging - These misfires are determined when the sum of the misfiring events occurs within 200 crankshaft revolutions. These misfires are considered catalyst damaging and the "MIL" will be illuminated.

The ECM will take the following measures - the oxygen sensor control will be switched to "open loop", a cylinder selective fault code will be stored for one or more cylinders and the relevant fuel injector(s) will be deactivated.

**SMOOTH RUNNING ENGINE
(NOTE SQUARE WAVE SIGNAL)**

(2 systems monitoring same crankshaft)

Fig. 20: Displaying Smooth Running Engine Waves

Courtesy of BMW OF NORTH AMERICA, INC.

The causes of engine misfires include:

- Ignition System - spark plugs, ignition coils, secondary circuit components and primary/secondary circuit wiring.
- Engine Mechanical - piston, piston rings, valves, camshaft and any valvetrain related components including Valvetronic. Valvetronic components include eccentric shaft, intermediate levers etc.

The crankcase ventilation system should also be considered. This includes the crankcase ventilation valve and if applicable, the hose connections as well.

- Fuel System - fuel injectors, fuel pump, fuel filter and pressure regulator etc. This includes fuel quality as well. Other fuel system components include fuel tank vent valve (purge) as well as running losses components such as the 3/2 valve etc.
- Engine Electronics - any implausible input from a sensor such as the crankshaft sensor and camshaft sensor. Also any sensor which affects fuel mixture including HFM, coolant/intake air temperature sensors etc.
- Other items include the catalyst which could be restricted and/or the muffler.

Fig. 21: Displaying Engine Misfire Waves

Smooth Running Measurement

The DISplus/GT-1 are helpful in pinpointing the cause of an engine misfire. Once the short test is completed, the fault memory of the ECM can be read out to determine which cylinder or cylinders have set misfire faults. There may or may not be any faults present. The engine could be running rough, however no misfire thresholds may have been exceeded.

Engine smoothness can be further evaluated by looking at the smooth running values. In the "Control Unit Functions" screen under "Diagnosis Requests" there is a value indicated for each cylinder which can be compared for each cylinder. This value is an indication of crankshaft speed variations in each cylinder.

Diagnosis Control unit functions

Valvetronic N62

In addition to the usual valvetrain diagnosis, the Valvetronic system has some additional components which need to be taken into consideration during diagnosis. The tolerances on the eccentric shaft and intermediate levers are critical in maintaining proper cylinder filling especially at idle. Any deviations in tolerances of these components will contribute to rough running complaints.

The intermediate levers are available in 5 classifications, the classification numbers are marked on the levers. On the N62, each cylinder head must use intermediate levers with the same classification. It is not necessary to have the same classification between cylinder heads.

G03395240

Fig. 23: Identifying Valvetronic N62
Courtesy of BMW OF NORTH AMERICA, INC.

Depending on the engine/vehicle, the minimum valve lift can be set from .3 to .8 mm. At these low valve lifts,

any variation in tolerance will affect idle quality. When a diagnosis determines that there is a problem in the Valvetronic system, the components need to be inspected. The intermediate levers or eccentric shaft can be worn. The intermediate levers could be of the wrong classification.

The illustration below shows a worn eccentric shaft. The areas shown should be inspected for any wear. Grooves and scoring indicate a worn eccentric shaft which should be replaced.

Fig. 24: Identifying Camshaft Grooves

Courtesy of BMW OF NORTH AMERICA, INC.

The following pages contain testing information which will assist in the diagnosis of idle quality concerns on the N62.

N62 Engine Testing

The N62 engine features Valvetronic which requires some specialized diagnostic procedures. Due the variable valve lift feature, there are some additional steps regarding engine and compression testing.

MKA Adapter

The Multi-Channel Adapter (MKA) tool is used in conjunction with the DISplus to diagnose ignition and injection system concerns on the N62 engine. The MKA adapter is installed (in series) between the ECM and the engine harness at connectors 1, 3 and 5. In addition the four cables of MFK 2 are plugged into the MKA as

well.

G03395242

Fig. 25: Identifying MKA Adapter
Courtesy of BMW OF NORTH AMERICA, INC.

The MKA test module is found under the path > Service Functions > Drive > Engine Management ME9 > Test Runs > Ignition and Injection diagnosis N62.

The MKA engine test checks the integrity of the ignition system by looking at the primary ignition voltage on each cylinder.

The injection system is also checked by examining the voltage pattern of the injection circuit.

Compression Test N62

The compression can be tested on the N62 using the DISplus. The DISplus can perform a relative compression test and provide a comprehensive engine analysis report.

The compression test can be done at minimum valve lift as well as at maximum valve lift. This difference between these reading can assist in determining the root cause such as wear in Valvetronic components.

G03395243

Fig. 26: Identifying DIS

Courtesy of BMW OF NORTH AMERICA, INC.

When performing this test the following connections/cables are needed:

- Diagnostic head (can be hardwired or wireless)
- TD Cable connection to diagnostic head
- 25 Bar Pressure transducer connected to pressure connection #2.
- Compression adapter (quick disconnect)
- 1000 Amp clamp

The test module will prompt you to warm up the engine to 90°C. Once warmed up, you will be directed to run the engine at idle to set the minimum valve lift. Follow the on screen prompts. Once the minimum valve lift has been obtained (0.2 to 0.4 mm), disconnect both VVT motors to lock in the minimum adjustment.

Once this step is completed, shut the engine off and remove the #1 spark plug. Install the compression adapter into the spark plug hole. (Note: any cylinder can be used as long as the DISplus is set to the cylinder in use).

Follow prompts until test is completed.

G03395244

Fig. 27: Identifying Compression Adapter
Courtesy of BMW OF NORTH AMERICA, INC.

G03395245

Fig. 28: Identifying TD Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 29: Absolute Compression Bar Graph
 Courtesy of BMW OF NORTH AMERICA, INC.

Once the test is completed, perform the same steps for the maximum valve lift. Compare the results, the results from the test at maximum valve lift should be slightly higher. Any cylinders that show low results on the minimum valve lift test which show improvements when the maximum valve lift test is performed should be checked for Valvetronic wear concerns.

During the final analysis portion of this test module, there may be on screen recommendations of repairs involving eccentric shaft or intermediate lever replacement. There may be a recommendation of changes to the classification of intermediate levers as well.

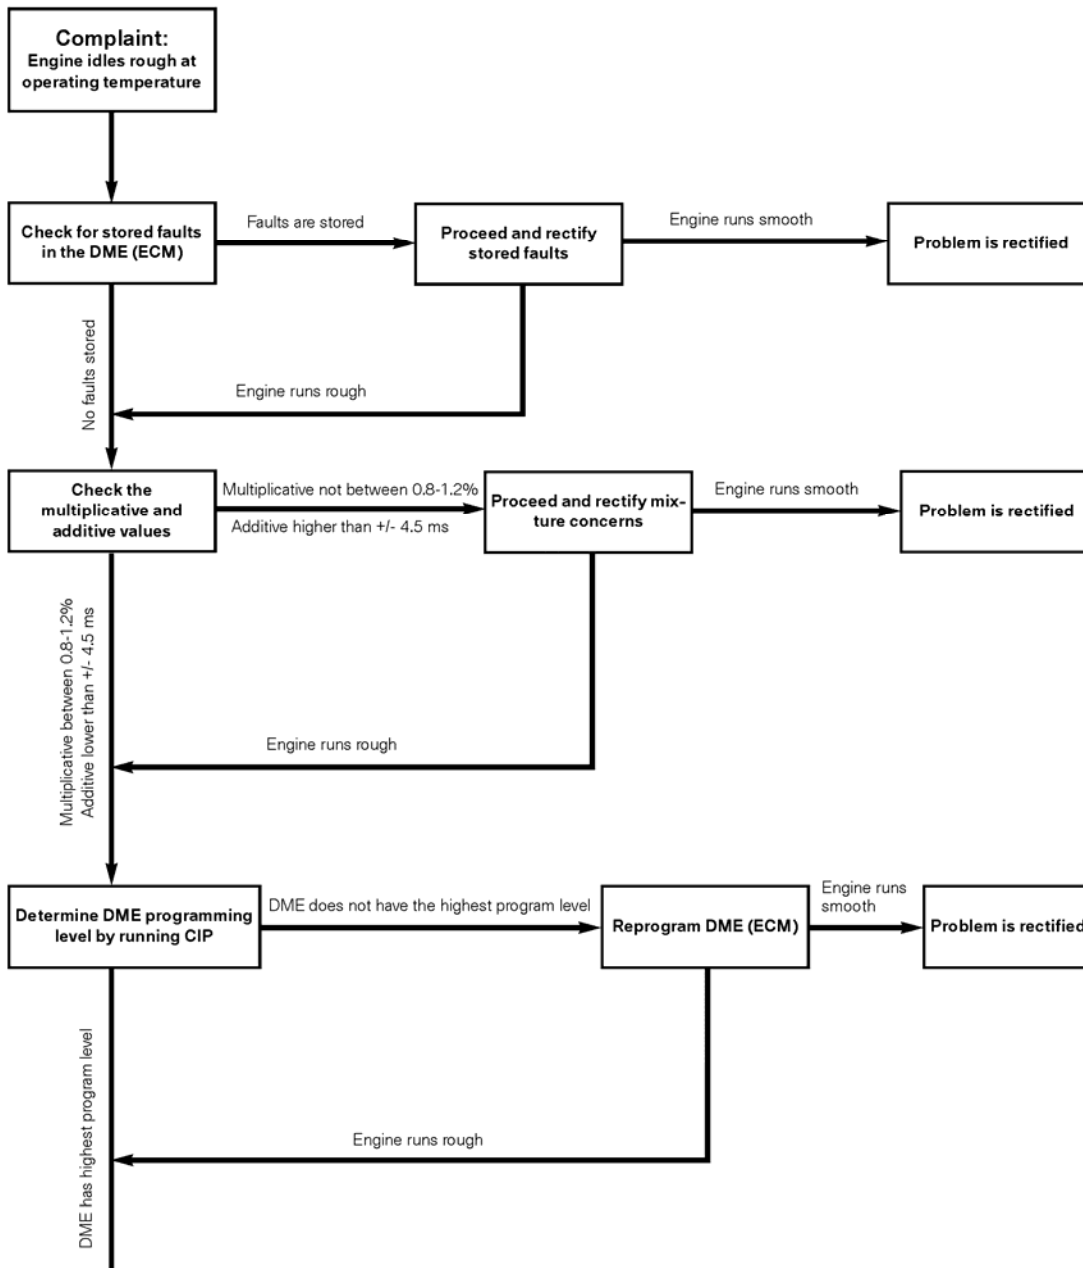

Manual Compression Test (N62)

Manual compression testing can also be done on the N62. However, the DISplus must still be used to set the minimum/maximum valve lift. To access the test module for manual compression testing, go to path > Service Functions > Drive > Engine Management ME9 > Test Runs > Compression Test.

Rough Running Diagnosis (N62)

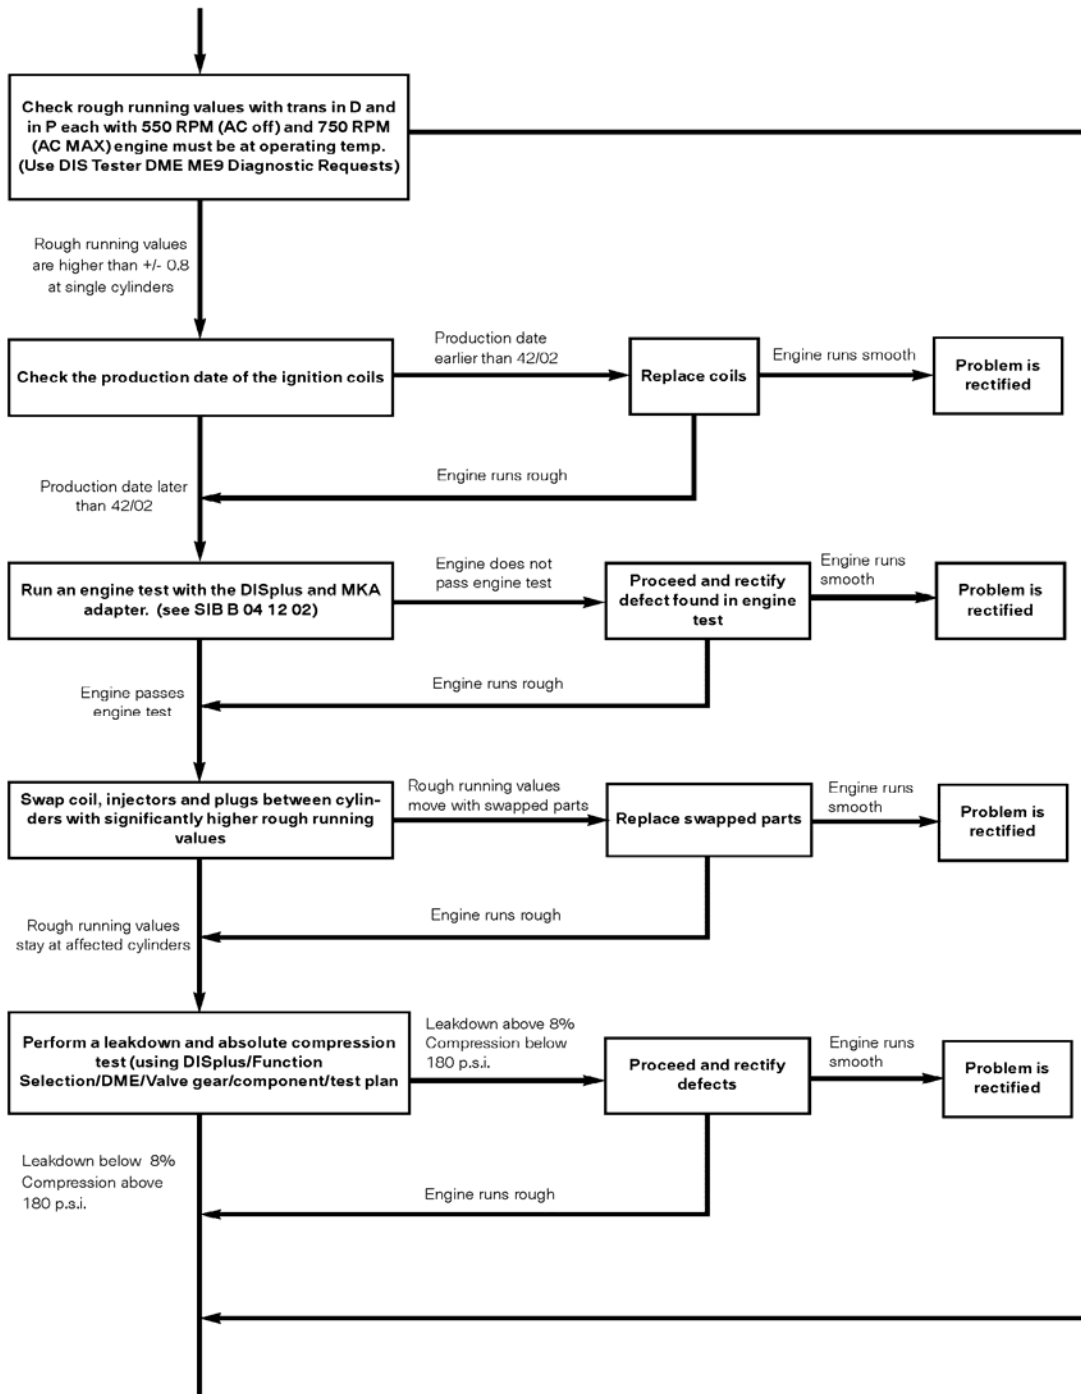

Due to the design of the Valvetronic system, there are special diagnostic considerations when diagnosing rough running concerns on vehicles equipped with the N62 engine.

The following diagnostic flow chart should be used as a diagnostic aid when attempting to rectify idle quality complaints when the engine is at operating temperature.

GENERAL INFORMATION

Engine Service Information - 328i, 328xi, 335i, 335xi, X3, X5

2007 NG6 ENGINE

Model: All with NG6-cylinder from 2007

Production: from 9/2006

NG6 ENGINE

Previously in 2005, BMW introduced the beginning of a new generation of six cylinder engines with the N52. Now, for the 2007 model year, BMW has 3 new variations of the NG6 engine family.

The first of the new engines is the N54, which will debut in the new 3-series coupe in September 2006. The N54 engine is turbocharged and uses the second generation of direct injection (DI 2). This engine will power the new 335i coupe in the fall of 2006.

N54 Engine

Fig. 1: Identifying Engines - N54

Courtesy of BMW OF NORTH AMERICA, INC.

The N52 will eventually be replaced by the new N52KP. The N52 KP engine is an improved and cost optimized version of the N52. The N52 KP will be available in the 328i and xi coupe from September and will replace the

N52 in various models.

N52 Engine
(N51 similar in appearance)

Fig. 2: Identifying Engine - N52

Courtesy of BMW OF NORTH AMERICA, INC.

Finally, the N51 which is a SULEV II compatible engine, will be phased into selected production models from 9/06. The N51 features many of the same features of the previous SULEV engine (M56) including a "Zero EVAP" system.

New Engine Designations

Along with the new engines for 2007, there is a new system for engine designations. The first few digits such as "N54B30" are familiar from the past, however the suffix has been changed.

The former "TU" designation has been dropped in favor of two additional digits.

The breakdown is as follows:

N52B30O1

Index	Designation	Code	Description
1	Engine Generation	M	BMW Engines up to 2001
		N	BMW Engines from 2001 (New Generation)
		S	BMW M GmbH
		W	External Engines (i.e. Tritec MINI)
2	Engine Type	4	4-cylinder in-line engine
		5	6-cylinder in-line engine
		6	8-cylinder "V" engine
		7	12-cylinder "V" engine
		8	10-cylinder "V" engine
3	Engine System	0	Basic engine
		1	SULEV or PZEV
		2	Valvetronic
		3	Gasoline direct injection
		4	Gasoline direct injection with turbocharger
		5	Double VANOS with Valvetronic
4	Fuel type/ operating mode	7	Diesel direct injection with turbocharger
		B	Gasoline
		D	Diesel
		E	Electric
		G	Gas (natural)
5	Displacement in 1/10 liter	H	Hydrogen
		30	3.0 liter (example)
6	Power output class	T	Top
		O	Upper output class (standard)
		M	Medium output class
		U	Lower output class
		K	Lowest output class
		0	New development
7	Version	1-9	Redesign/facelift version (TU etc.)

Fig. 3: Identifying Engine Identification Numbers (1 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

Crankcase Identification

The engine identification numbers are stamped on the block near the high pressure pump.

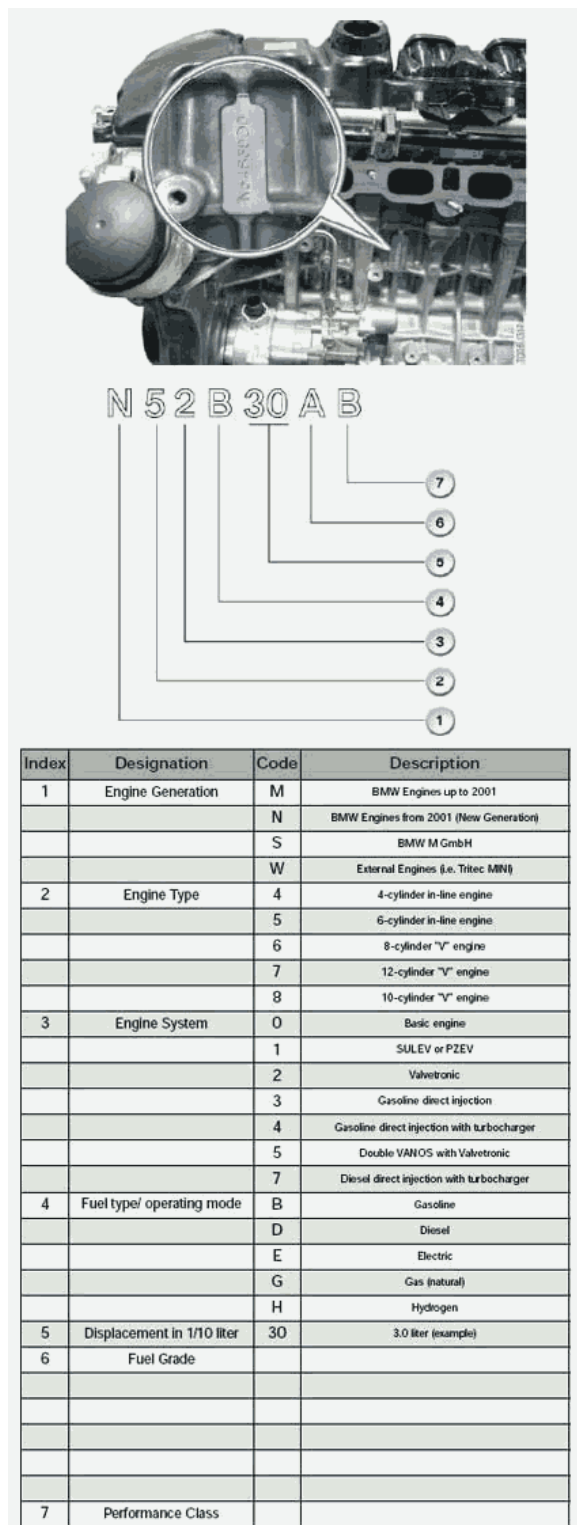

Fig. 4: Identifying Engine Identification Numbers (2 Of 2)
 Courtesy of BMW OF NORTH AMERICA, INC.

New NG6 Versions

The new N54 engine is designated the "N54B3000". The "O" in the engine designation indicates the "upper" output range.

The last digit, which is a "0", indicates the first version in this range of engines (N54). If the N54 engine is updated, then the last digit will change to a "1" rather than the former "TU" suffix.

The N52KP, which replaces the N52, will have three possible variants as shown below:

N52B30O1

N52B30M1

N52B30U1

Fig. 5: Identifying NG6 Versions

Courtesy of BMW OF NORTH AMERICA, INC.

All of the N52KP engines have a last digit of "1", which indicates that "KP" engines are an updated version of the N52. There are three variants, the upper output (O), the medium output (M) and the lower output (U). Each engine has specific characteristics and power output. The "O" engine has 260 horsepower, while the "M" version has about 230 horsepower. The "U" engine is a possible future variant with 215 horsepower.

The N51 engine uses the designation - "N51B30M0". This engine is SULEV II compliant with 230 horsepower.

New Vehicles for 2007

The new engine variants will be initially installed into some new and updated vehicles for 2007. The new E92 coupe will be available with the N54B30O0 (335i) and the N52B30M1 (328i).

Fig. 6: Identifying Vehicles For 2007
Courtesy of BMW OF NORTH AMERICA, INC.

The N52B3001 will be initially available in the E83 LCI (X3 3.0 si) from 9/2006 and the new E70 (X5 3.0 si) from SOP.

Fig. 7: Identifying E70 (X5)
Courtesy of BMW OF NORTH AMERICA, INC.

ENGINE MECHANICAL OVERVIEW

Crankcase

As far as the physical appearance and dimensions, the crankcase on the N54 is the same as the N52. The main change is in the materials, the N54 uses an all aluminum alloy crankcase. There is also cast iron cylinder liners similar to the previous M54 engine.

The reason for using the all aluminum configuration is to be more compatible with the increased torque output and cylinder pressure in the N54.

N54 crankcase - all aluminum alloy

Fig. 8: Identifying Aluminum Alloy Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

The N54 engine continues to use the "two-piece" crankcase featuring the "bedplate" design.

The N52KP and N51 engines continue to use the composite magnesium/aluminum alloy engine from the existing N52.

Fig. 9: Identifying "Two-Piece" Crankcase
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The N54 engine has a different bolt pattern on the transmission mounting (bellhousing) area.

Therefore, a new special tool is needed to mount the engine to an engine stand. The new tool has slots which will accommodate all NG6 engines

Fig. 10: Identifying Bolt Pattern On Transmission Mounting
Courtesy of BMW OF NORTH AMERICA, INC.

Bolts

Although, the N54 engine has an all aluminum crankcase, many of the bolts are still aluminum as on the N52. This is to reduce any potential confusion between steel and aluminum bolts. Some bolts, for example, are steel

such as the cylinder head cover bolts. This is possible, due to the plastic cylinder head cover.

Fig. 11: Identifying Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

The N52KP and N51 engines use the same aluminum bolt configuration as the N52 engine, with little change. The cylinder head cover bolts are like the N54 - steel, due to the plastic cylinder head cover.

The same rules apply to the handling of aluminum bolts as in the past.

Strict adherence to repair instructions is required to ensure proper connections.

Be sure to follow the proper torque/tightening angle sequence as outlined in the "tightening torques" section of TIS.

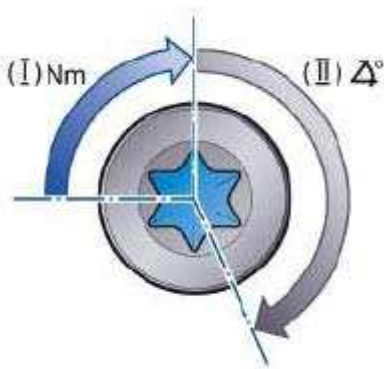

Fig. 12: Identifying Aluminum Bolt

Courtesy of BMW OF NORTH AMERICA, INC.

Cylinder Head Cover

As stated before, the cylinder head cover used on all of the new NG6 engines is made from plastic. However, the design differs between the engines due to engine equipment.

For example, the N54 engine does not use Valvetronic and therefore does not need the accommodation for the VVT motor. Also, the crankcase ventilation system is different on the N54. Some of the crankcase venting components are integrated into the cylinder head cover such as the cyclone separator.

The N52KP and N51 engines have the same cylinder head cover. The cover also includes some of the crankcase venting system components.

Fig. 13: Identifying Cylinder Head Cover
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Some engines with plastic cylinder head covers may have aluminum bolts.

Cylinder Head

Each of the new NG6 engines has a unique cylinder head design. Due to some of the technical requirements, the cylinder heads are not interchangeable between these engines. The cylinder head from the N52KP is carried over from the N52 with little change.

The cylinder head from the N54 engine does not have Valvetronic. The design of the engine also requires accommodation of the "direct" fuel injector in the combustion chamber. Most of the external dimensions are the same as the N52 to accommodate accessories and ancillary components.

The N51 engine is a SULEV II compliant design which has a lower compression ratio. The combustion chamber design has been modified to work in conjunction with the N51 piston to achieve the required emission goals.

Fig. 14: Identifying Fuel Injector In Combustion Chamber
Courtesy of BMW OF NORTH AMERICA, INC.

Valvetrain

The valvetrain on the N52 introduced in 2006, used 5 mm valve stems on both the intake and exhaust. To increase durability, the exhaust valve stems were increased to 6 mm from 6/06 production.

All of the new NG6 engine have adopted the 6 mm valve stem for the exhaust, the intake stem remains at 5 mm. The valves are of the "solid" type design (not Sodium filled). The diameter of the valve head is engine specific.

Camshafts

The lightweight hydroformed camshaft will still be used on the NG6 engines. Be aware that some engines may use the "cast" camshaft design. This is for supply and production reasons.

Cast and hydroformed camshafts are completely interchangeable. For example, a replacement camshaft may differ from the original. This is no problem, they will fit and work properly without any modifications.

Fig. 15: Identifying Camshaft Diameter
Courtesy of BMW OF NORTH AMERICA, INC.

VANOS

The infinitely variable Bi-VANOS system is still in use on all NG6 engines. The VANOS system still retains the use of the lightweight VANOS adjusting units introduced on the N52. The only change to the system is that the N54 engine uses different spread ranges for compatibility with turbocharged engine operation.

Index	Explanation	Index	Explanation
1	VANOS unit, exhaust	4	Exhaust camshaft sensor
2	VANOS unit, intake	5	VANOS solenoid valve
3	Intake camshaft sensor	6	VANOS solenoid valve

Fig. 16: Identifying Compatibility With Turbocharged Engine Operation
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Do not mix up the intake and exhaust VANOS units. They appear similar, but have different spread ranges. Improper installation can result in valvetrain damage.

Valvetronic

The N51 and N52KP engines retain the already proven Valvetronic system from the N52. The only change for 2007 is an optimized VVT motor which has already been in production from 5/06.

The N54, on the other hand, does not use the Valvetronic system. Valvetronic is designed to reduce pumping losses and improve engine efficiency. The turbocharging system on the N54 is also designed to reduce pumping losses and increase engine efficiency.

Therefore, there is no need to have both systems on one engine. In summary, the efficiency of the N54 is gained through exhaust turbocharging and direct injection rather than Valvetronic.

Valvetronic II - used on N52, N52KP and N51

Fig. 17: Identifying Injection Rather Valvetronic
Courtesy of BMW OF NORTH AMERICA, INC.

Gaskets and Seals

Head Gasket

The head gasket design on the N54 is unique to that engine.

It features a multi-layer steel design. There is no silicone rubber perimeter "shelf" as on the N52. This is not needed due to the aluminum block on the N54.

The N52KP and N51 engines are still using the head gasket that is familiar from N52.

Fig. 18: Identifying Head Gasket

Courtesy of BMW OF NORTH AMERICA, INC.

Oil Pan Gasket

All of the new NG6 engine use the same oil pan gasket as introduced on the N52.

The oil pan gasket design is compatible with the N54, therefore it was not necessary to create an additional part.

Fig. 19: Identifying Oil Pan Gasket

Courtesy of BMW OF NORTH AMERICA, INC.

Bedplate Sealing

The N54 continues to use the injected sealant method for the bedplate.

Crankshaft Drive Components

Crankshaft

The crankshaft on the N52KP and N51 remains a cast iron design. This crankshaft is carried over from the N52.

The additional torque generated by the N54 requires the use of a forged steel crankshaft.

Piston and Connecting Rods

Due to the design requirements of each of the new NG6 engines, the piston design is unique to each version. For instance, the N54 is turbocharged and direct injected and requires a piston which meets the design requirements for compression and mixture formation.

The N51 engine need a piston which has lower compression and meets the SULEV II requirements for emission compliancy.

The N52KP and N52 engines both use the same piston design.

The connecting rods on the new engines use a thicker beam design which has been in production on the N52 since 6/06. The N54 has a special connecting rod with M9 bolts instead of the M8 bolts on the other engines.

Torsional Vibration Damper

The vibration damper has been updated to improve the damping of first order vibrations. The damper is secured with new bolts and has a revised tightening procedure. The procedure differs from the N52 and should therefore not me mixed up. Damage to the belt drive can result from improper tightening procedures.

Intake Manifold

The plastic intake manifold from the N52 is carried over to the new NG6 engines. However, the 3-Stage DISA version of the intake manifold is only used on the "O" version (high output).

The current N51 engine is designated as a medium output "M" version at 230 hp and does not require the 3-stage DISA. The same applies to the "M" version of the N52KP engine as well.

There are small modifications to these intake manifolds due to the fact that the crankcase ventilation system has been updated.

As far as the N54 engine is concerned, the intake manifold is designed specifically for the turbocharging system. The N54 does not require DISA as turbocharging supplies the necessary torque increase when needed.

3-Stage DISA Intake Manifold

Fig. 20: Identifying 3-Stage DISA Intake Manifold
Courtesy of BMW OF NORTH AMERICA, INC.

Intake Manifold - N54

Fig. 21: Identifying Intake Manifold N54

Crankcase Ventilation

One of the major changes on the new NG6 engines is that the crankcase ventilation system has been upgraded and improved. This applies to all of the new NG6 versions (N52KP, N51 and N54).

There are two distinct versions of crankcase ventilation. One type is unique to the N54 and the other applies to N51 and N52KP.

The N52, which is still in production continues to use the "external" crankcase ventilation system with the electrically heated crankcase ventilation valve/cyclone separator.

Crankcase Ventilation System on N52

Fig. 22: Identifying Crankcase Ventilation System
Courtesy of BMW OF NORTH AMERICA, INC.

Crankcase Ventilation (N51 and N52KP)

The crankcase ventilation system on the N51 and N52KP has been modified as compared to the N52. The system is integrated into the plastic cylinder head cover.

The crankcase gases are regulated by a crankcase ventilation valve similar to the design used on the N62. The crankcase vent valve is currently part of the cylinder head cover and is not replaceable as a separate component.

Oil separation is carried out via a "labyrinth" system and two cyclone separators which are incorporated into the cylinder head cover. By having the system components integrated into the cylinder head cover, the crankcase gases are heated by the engine rather than an electric heater as on the N52. However, there is still one electric

heating element at the manifold inlet.

Once the liquid oil is separated from the crankcase vapors, the oil is allowed to drain back through check valves back into the engine.

Fig. 23: Cylinder Head Cover Components Location
Courtesy of BMW OF NORTH AMERICA, INC.

Crankcase Ventilation (N54)

Since the N54 is a turbocharged engine, the crankcase ventilation system has to meet certain design requirements. For example, when the engine is in turbocharged mode, the increased manifold pressure should not have an adverse effect on the crankcase venting. This is why, there is no crankcase ventilation valve in the system.

The system consists of four small cyclone separators which are integrated into the plastic cylinder head cover. The flow of crankcase gases is metered through a series of restrictions which control the ultimate crankcase pressure.

Cyclone Separator Operation

Fig. 24: Cyclone Separator Operation
Courtesy of BMW OF NORTH AMERICA, INC.

One of the main operating principles behind the crankcase venting system on the N54 is that there are two strategies - one for the turbocharged mode and one for "non-turbocharged" operation such as decel. These strategies are dependent upon the intake manifold pressure.

AIR MANAGEMENT

Air Management N52KP and N51

As far as the air management system on the N52KP and N51 engines is concerned, the previous intake manifold system on the N52 is carried over. Depending upon application, the engines will use the 3-stage DISA or the single stage (No DISA) intake manifold.

For more information on the DISA system refer to the previous training material in the training course "ST501 - New Engine Technology".

Fig. 33: Identifying Intake Manifold System
Courtesy of BMW OF NORTH AMERICA, INC.

Throttle Valve

All variants of the new NG6 engines receive the new EGAS 08 throttle by Siemens/VDO. The new throttle uses a plastic throttle valve and magneto-resistive feedback to the ECM.

The previous system used a potentiometer, whereas the new throttle uses a "contactless" system featuring magneto-resistive technology which is familiar from the eccentric shaft sensor on Valvetronic systems.

Fig. 34: Identifying Throttle Valve

Courtesy of BMW OF NORTH AMERICA, INC.

The magneto-resistive sensors are integrated into the housing cover. The sensors are also non-wearing.

For plausibility, the one sensor outputs the analog signal in the range from 0.3 to 4.6 V and the other sensor inverts it again from 4.6 to 0.3 V.

Consequently, the contact force is 10 times greater than that of a conventional plug connector.

NOTE: It is possible to twist the connector before plugging it in. This can cause damage to the harness and connector.

Air Intake Ducting

With regard to the N54 engine, the air intake ducting plays a significant role due to the requirements of a turbocharged engine.

In principle, the energy of the escaping exhaust gases is utilized to "pre-compress" the inducted fresh air and thus introduce a greater air mass into the engine. This is only possible if the air intake ducting is "leak-free" and installed properly.

Index	Explanation	Index	Explanation

Fig. 35: Identifying Air Intake Ducting Components
 Courtesy of BMW OF NORTH AMERICA, INC.

It is important to note, when carrying out work on the air-intake ducting, it is important to ensure that the components are installed in the correct position and that all pipes are connected with tight seals.

A leaking system may result in erroneous boost pressure. This would be detected by the engine management system and will ultimately result in "limp-home" operation. There would also be a noticeable reduction in

engine power.

For some of the duct work, there are special tools to ensure proper connections.

Courtesy of BMW OF NORTH AMERICA, INC.

The fresh air is drawn in via the air cleaner (10) and the charge-air suction lines (6 + 18) by the compressors of turbochargers (23 + 24) and compressed.

Because the turbochargers can get very hot during operation, they are connected with the engine's coolant and engine-oil circuits. The charge air is greatly heated when it is compressed in the turbocharger, making it necessary for the air to be cooled again in an intercooler (16).

The compressed and cooled charge air is routed from the intercooler via the throttle valve (12) into the intake manifold.

The system is equipped with several sensors and actuators in order to ensure that the load of fresh air is optimally adapted to the engine's respective operating conditions. How these complex interrelationships are controlled is discussed in the following sections.

Fig. 37: Identifying Air Intake Ducting
Courtesy of BMW OF NORTH AMERICA, INC.

Exhaust Gas Turbocharging

The turbocharger is driven by the engine's exhaust gases, i.e. exhaust gases under pressure are routed by the

turbocharger turbine and in this way delivers the motive force to the compressor, which rotates on the same shaft.

It is here that the induction air is precompressed in such a way that a higher air mass is admitted into the engine's combustion chamber. In this way, it is possible to inject and combust a greater quantity of fuel, which increases the engine's power output and torque.

The turbine and the compressor can rotate at speeds of up to 200,000 RPM. The exhaust inlet temperature can reach a maximum of 1050°C. Because of these high temperatures, the N54 engine's turbochargers are not only connected with the engine-oil system but also integrated in the engine-coolant circuit.

It is possible in conjunction with the N54 engine's electric coolant pump even after the engine has been switched off to dissipate the residual heat from the turbochargers and thus prevent the lube oil in the bearing housing from overheating.

Bi-turbocharging

Utmost importance is attached to turbocharger response in the N54 engine. A delayed response to the driver's command, i.e. the accelerator-pedal position, is not acceptable. The driver therefore must not experience any so-called "turbo lag".

This requirement is met in the N54 engine with two small turbochargers, which are connected in parallel. Cylinders 1, 2 and 3 (bank 1) drive the first turbocharger (5) while cylinders 4, 5 and 6 (bank 2) drive the second (2).

The advantage of a small turbocharger lies in the fact that, as the turbocharger runs up to speed, the lower moment of inertia of the turbine causes fewer masses to be accelerated, and thus the compressor attains a higher boost pressure in a shorter amount of time.

Boost-pressure Control

The boost pressure of the turbochargers is directly dependent on the flow of exhaust gas which reaches the turbocharger turbines. Both the velocity and the mass of the exhaust-gas flow are directly dependent on engine speed and engine load.

The engine-management system uses wastegate valves to control the boost pressure. These valves are operated by vacuum-pressure actuators, which are controlled by the electro-pneumatic pressure transducers via the engine-management system.

Index	Explanation	Index	Explanation

Fig. 40: Identifying Boost-Pressure Control
 Courtesy of BMW OF NORTH AMERICA, INC.

The vacuum pressure is generated by the permanently driven vacuum pump and stored in a pressure accumulator. The system is designed to ensure that these loads and consumers do not have a negative influence on the brake-boost function.

The exhaust-gas flow can be completely or partially directed to the turbine wheel with the wastegate valves. When the boost pressure has reached its desired level, the wastegate valve begins to open and direct part of the exhaust-gas flow past the turbine wheel.

This prevents the turbine from further increasing the speed of the compressor. This control option allows the system to respond to various operating situations.

In the idle phase, the wastegate valves of both turbochargers are closed. This enables the full exhaust-gas flow available to be utilized to speed up the compressor already at these low engine speeds.

When power is then demanded from the engine, the compressor can deliver the required boost pressure without any noticeable time lag. In the full-load situation, the boost pressure is maintained at a consistently high level when the maximum permissible torque is reached by a partial opening of the wastegate valves. In this way, the compressors are only ever induced to rotate at a speed which is called for by the operating situation.

The process of the wastegate valves opening, removes the drive energy from the turbine such that no further increase in boost pressure occurs, which in turn improves overall fuel consumption.

At full-load the N54 engine operates at an overpressure of up to Index Explanation Index Explanation 0.8 bar in the intake manifold.

Blow-off Control

The blow-off valves in the N54 engine reduce unwanted peaks in boost pressure which can occur when the throttle valve closes quickly. They therefore have an important function with regard to engine acoustics and help to protect the turbocharger components.

A vacuum pressure is generated in the intake manifold when the throttle valve is closed at high engine speeds. This leads to a build-up of high dynamic pressure after the compressor which cannot escape because the route to the intake manifold is blocked.

Index	Explanation	Index	Explanation
1	Blow-off valves	4	Throttle valve
2	Air cleaner (ambient pressure)	5	Control line, blow-off valves
3	Intake manifold	6	Charge air pressure line

Fig. 41: Identifying Turbocharger Components
 Courtesy of BMW OF NORTH AMERICA, INC.

This leads to a "pumping up" of the turbocharger which means that:

- a clearly noticeable, disruptive pumping noise can be heard,
- and this pumping noise is accompanied by a component-damaging load being exerted on the turbocharger, since high-frequency pressure waves exert axial load on the turbocharger bearings.

The blow-off valves are mechanically actuated spring-loaded diaphragm valves which are activated by the intake-manifold pressure as follows:

In the event of a pressure differential before and after the throttle valve, the blow-off valves are opened by the intake-manifold pressure and the boost pressure is diverted to the intake side of the compressor. The blow-off valves open starting from a differential pressure of 0.3 bar. This process prevents the disruptive and component-damaging pumping effect from occurring.

The system design dictates that the blow-off valves are also opened during operating close to idle (pressure differential $P_{charger}/P_{suction} = 0.3$ bar). However, this has no further effects on the turbocharging system.

The turbocharger is pressurized with the full exhaust-gas flow at these low speeds and already builds up a certain level of induction-air precharging in the range close to idle.

If the throttle valve is opened at this point, the full boost pressure required is very quickly made available to the engine.

One of the major advantages of the vacuum pressure-actuated wastegate valves is that they can be partially opened in the mid-range in order not to allow excessive induction-air precharging to the detriment of fuel consumption. In the upper load range, they assume the required control position corresponding to the necessary boost pressure.

Charge-air Cooling

Cooling the charge air in the N54 engine serves to increase power output as well as reduce fuel consumption. The charge air heated in the turbocharger by its component temperature and by compression is cooled in the intercooler by up to 80°C.

This increases the density of the charge air, which in turn improves the charge in the combustion chamber. This results in a lower level of required boost pressure. The risk of knock is also reduced and the engine operates with improved efficiency.

Fig. 42: Identifying Charge-Air Cooling Operations Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

Load Control

Load control of the N54 engine is effected by means of the throttle valve and the waste gate valves.

The throttle valve is the primary component in this process. The wastegate valves are actuated to bring about a fine tuning of the boost pressure. At full load the throttle valve is completely open and load control is undertaken by the wastegate valves.

Fig. 43: Identifying Load Control Operations Diagram
 Courtesy of BMW OF NORTH AMERICA, INC.

Controlled Variables

The following variables, among others, influence control of the N54 engine's boost pressure:

- Intake-air temperature
- Engine speed
- Throttle-valve position
- Ambient pressure
- Intake-manifold pressure
- Pressure before the throttle valve (reference variable)

The electro-pneumatic pressure transducers are activated by the engine control unit on the basis of these variables. The result of this activation can be checked from the boost pressure achieved, which is measured before the throttle valve.

There follows a comparison of the boost pressure achieved with the set point data from the program map, which can if necessary give rise to an activation correction. The system therefore controls and monitors itself during operation.

Limp-home Mode

In the event during operation of malfunctions, implausible values or failure of any of the sensors involved in turbocharger control, activation of the wastegate valves is shut down and the valve flaps are thus fully opened. Turbocharging ceases at this point.

The list below sets out those components or functional groups of the N54 engine in which a failure, a malfunction or implausible values result in boost-pressure control being deactivated.

The driver is alerted to a fault of this type via an EML indication.

- High-pressure fuel system
- Inlet VANOS
- Exhaust VANOS
- Crankshaft sensor
- Camshaft sensor
- Boost-pressure sensor
- Knock sensors
- Intake-air temperature sensor

One principle of vehicle repair is particularly important in this respect:

It is important to focus on the causes rather than the effects.

With regard to diagnosis of the turbocharging system, always check the basics first. Look at such items as the vacuum hoses, the solenoids and the vacuum reservoir.

Don't overlook the fundamentals. Check compression, fuel system pressure (low and high), secondary ignition components etc.

The turbochargers are usually the last item to fail, but often one of the first items to be replaced.

Turbocharger Diagnosis

There are three "Golden Rules" to adhere to when diagnosing concerns on the N54 engine:

1. When diagnosing cases of smoke from the exhaust, it is important to avoid unnecessary replacement of the turbochargers. Smoke can be caused by oil consumption such as the crankcase ventilation system. Always evaluate the crankcase venting system completely before condemning any turbocharger components. Also, any engine is also subject to the usual causes such as valve guide wear or piston ring issues as on non-turbocharged engines.
2. Turbocharger damage is usually caused by -
 - Insufficient lubrication and subsequent bearing and seal failure.
 - Foreign bodies can damage the turbine and/or impeller.
 - Oil contamination
 - Restricted air filter

- Ensure that all duct work connections are tight and "leak-free". This situation can also result in engine noise.
3. Do not make any alterations or modifications to the turbocharger. Do not make any adjustments to the boost control linkage or any part of the turbocharger. Higher than normal boost pressure may have adverse and detrimental effects on the engine. Any modification will cause the engine management to enter in the "limp-home" program and will reduce performance and engine reliability.

Fig. 44: Identifying Modifications To Turbochargers

Hot-Film Air Mass Meter

Some new NG6 engines use a digital HFM. The output of the sensor is converted to a digital signal. This eliminates the need for signal conversion in the ECM. The signal corresponds proportionally to changes in air mass. The N54 engine uses a virtual HFM. The signal is "calculated" in the ECM from various parameters such as engine speed, intake air temperature, throttle position etc.

FUEL SUPPLY AND MANAGEMENT

N52KP and N51 Fuel System

The N52KP and N51 engine continue to use the conventional "manifold injection" system carried over from the N52. The fuel supply components are also carried over with regard to the EKP module, fuel pump etc.

Fig. 50: Identifying Fuel Supply System
Courtesy of BMW OF NORTH AMERICA, INC.

N54 Engine

The N54 engine uses the new High Precision Injection (HPI) system. The HPI system is a "direct" fuel injection system which represents the second generation "DI" system from BMW. The first generation was on the N73 engine from 2003.

The N73 engine used a "wall guided" method of injection which used a recess in the piston to aid in mixture formation. The HPI system on the N54 uses a "spray guided" process which allows the mixture to form and ignite without the aid of any "walls" (i.e piston, cylinder wall etc.).

The spray guided system allows for more efficiency by cooling the cylinder charge without excessive cooling of the associated engine components. The wall guided system cools the piston crown which reduces thermal efficiency.

The HPI system also uses the new "piezo-electric" fuel injectors which are a vital components of the spray guided process. These new injectors open in an outward direction, which forms a precise tapered spray pattern.

With the aid of high system pressure (200 bar), the HPI system is now capable of providing new levels of efficiency which were not achievable with previous manifold injection systems.

Fig. 51: Identifying Manifold Injection Systems

4	High pressure sensor	9	High pressure line (pump to rail)
5	Feed line from in-tank pump		

Fig. 52: Identifying HPI Function Systems
 Courtesy of BMW OF NORTH AMERICA, INC.

HPI Function

The fuel is delivered from the fuel tank by the electric fuel pump via the feed line (5) at an "feed" pressure of 5 bar to the high pressure pump. The feed pressure is monitored by the low-pressure sensor (6). The fuel is delivered by the electric fuel pump in line with demand.

If this sensor fails, the electric fuel pump continues to run at 100% delivery with terminal 15 ON.

The high pressure pump is driven "in-tandem" with the vacuum pump which is driven by the oil pump chain drive assembly.

The fuel is compressed in the permanently driven three-plunger high-pressure pump (8) and delivery through the high-pressure line (9) to the rail (3). The fuel accumulated under pressure in the rail in this way is distributed via the high-pressure lines (1) to the piezo injectors (2).

The required fuel delivery pressure is determined by the engine-management system as a function of engine load and engine speed. The pressure level reached is recorded by the high-pressure sensor (4) and communicated to the engine control unit.

Control is effected by the fuel-supply control valve (7) by way of a setpoint/actual-value adjustment of the rail pressure. Configuration of the pressure is geared towards best possible consumption and smooth running of the N54 engine. 200 bar is required only at high load and low engine speed.

High Pressure Pump Function and Design

The fuel is delivered via the supply passage (6) at the admission pressure generated by the electric fuel pump to the high-pressure pump. From there, the fuel is directed via the fuel supply control valve (4) and the low-pressure non-return valve (2) into the fuel chamber (14) of the plunger-and-barrel assembly. The fuel is placed under pressure in this plunger-and-barrel assembly and delivered via the high pressure non-return valve (9) to the high pressure port (7).

Index	Explanation	Index	Explanation

6	Supply from electric fuel pump (in-tank)	13	Oil filling, high pressure pump
7	High pressure port to fuel rail	14	Fuel chamber (x 3)

Fig. 53: Identifying High Pressure Pump Function & Design
 Courtesy of BMW OF NORTH AMERICA, INC.

The high-pressure pump is connected with the vacuum pump via the drive flange (11) and is thus also driven by the chain drive, i.e. as soon as the engine is running, the three plungers (12) are permanently set into up-and-down motion via the pendulum disc (10).

Fuel therefore continues to be pressurized for as long as new fuel is supplied to the high-pressure pump via the fuel-supply control valve (4). The fuel-supply control valve is activated by means of the engine management connection (3) and thereby admits the quantity of fuel required.

Pressure control is effected via the fuel-supply control valve by opening and closing of the fuel supply channel. The maximum pressure in the high-pressure area is limited to 245 bar.

If excessive pressure is encountered, the high-pressure circuit is relieved by a pressure-limiting valve via the ports (8 and 5) leading to the low-pressure area.

This is possible without any problems because of the non-compressibility of the fuel, i.e. the fuel does not change in volume in response to a change in pressure. The pressure peak created is compensated for by the

liquid volume in the low-pressure area.

Volume changes caused by temperature changes are compensated for by the thermal compensator (1), which is connected with the pump oil filling.

Pressure Generation in High-pressure Pump

The plunger (2) driven by the pendulum disc presses oil (red) into the metal diaphragm (1) on its upward travel. The resulting change in volume of the metal diaphragm thereby reduces the available space in the fuel chamber. The fuel thereby placed under pressure (blue) is forced into the rail.

The fuel-supply control valve controls the fuel pressure in the rail. It is activated by the engine management system via a pulse-width modulated (PWM) signal.

Depending on the activation signal, a restrictor cross-section of varying size is opened and the fuel-mass flow required for the respective load point is set. There is also the possibility of reducing the pressure in the rail.

Limp-Home Mode

If a fault is diagnosed in the system, such as e.g. failure of the high-pressure sensor, the fuel-supply control valve is de-energized; the fuel then flows via a so-called bypass into the rail.

In the event of HPI limp-home mode, turbocharging is deactivated by an opening of the wastegate valves.

Causes of HPI limp-home mode can be:

- Implausible high-pressure sensor values
- Failure of the fuel-supply control valve
- Leakage in the high-pressure system
- Failure of the high-pressure pump
- Failure of the high-pressure sensor

Fuel System Safety

Working on this fuel system is only permitted after the engine has cooled down. The coolant temperature must not exceed 40°C. This must be observed without fail because otherwise there is a danger of fuel sprayback on account of the residual pressure in the high-pressure system.

When working on the high-pressure fuel system, take particular care to ensure conditions of absolute cleanliness and follow the work sequences described in the repair instructions. Even the tiniest contaminant's and damage to the screw connections on the high-pressure lines can cause leaks.

Piezo Fuel Injectors

It is the outward-opening piezo-injector that renders possible spray-directed direct injection and thus the overall innovations of the N54 engine. Due to the fact that only this component ensures that the injected fuel spray cone remains stable, even under the prevailing influences of pressure and temperature in the combustion chamber.

This piezo-injector permits injection pressures of up to 200 bar and extremely quick opening of the nozzle needle. In this way, it is possible to inject fuel into the combustion chamber under conditions released from the power cycles limited by the valve opening times.

The piezo-injector is integrated together with the spark plug centrally between the inlet and exhaust valves in the cylinder head. This installation position prevents the cylinder walls or the piston crown from being wetted with injected fuel. A uniform formation of the homogeneous air/fuel mixture is obtained with the aid of the gas movement in the combustion chamber and a stable fuel spray cone.

Fig. 59: Identifying Piezo Fuel Injectors
Courtesy of BMW OF NORTH AMERICA, INC.

The gas movement is influenced on the one hand by the geometry of the intake passages and on the other hand by the shape of the piston crown.

The injected fuel is swirled in the combustion chamber with the boost air until a homogeneous mixture is available throughout the compression space at the point of ignition.

NOTE: When working on the fuel system of the N54 engine, it is important to ensure that the ignition coils are not fouled by fuel. The resistance of the silicone material is significantly reduced by heavy fuel contact. This can cause secondary ignition misfires.

- Before performing any repairs to the fuel system, remove the ignition coils without fail and protect the spark-plug slot against the ingress of fuel with a cloth.
- Before refitting the piezo-injector, remove the ignition coils and ensure conditions of absolute cleanliness.
- Ignition coils heavily fouled by fuel must be replaced.

Injector Design and Function

The piezo-injector essentially consists of three sub-assemblies. The expansion of the energized piezo-element lifts the nozzle needle outwards from its valve seat. To be able to counter the different operating temperatures with comparable valve lifts, the injector has a thermal compensating element.

The nozzle needle is pressed outwards from its tapered valve seat. This opens up an annular orifice. The

pressurized fuel flows through this annular orifice and forms a hollow cone, the spray angle of which is not dependent on the backpressure in the combustion chamber.

Index	Explanation
1	Outward opening nozzle needle
2	Piezo-element
3	Thermal compensator

Fig. 60: Identifying Injector Design & Function
 Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 61: Identifying Outward Opening Injector Nozzle Needle
 Courtesy of BMW OF NORTH AMERICA, INC.

The spray cone (1) of a piezo-injector can diverge during operation (2). Due to the formation of soot inside the engine, such divergence is perfectly normal and acceptable to a certain extent.

If, however, spray divergence reaches the stage where it begins to spray the spark plug wet, the spark plug may incur damage.

Index	Explanation
1	Ideal "spray" cone
2	Permitted divergence of spray cone
3	Non-permitted divergence of spray cone

Fig. 62: Identifying Spray Piezo-Injector Operation

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Do not attempt to clean the injectors in any way.

This may result in damage which can effect the spray pattern. Any divergence in the spray pattern can cause damage to the spark plug or the engine itself.

NOTE: Replace the Teflon sealing ring when fitting and removing the piezo-injector. This also applies when an injector that has just been fitted has to be removed again after an engine start. A piezo-injector provided with a new Teflon sealing ring should be fitted as quickly as possible because the Teflon sealing ring could swell up. Please observe the repair instructions and follow without fail.

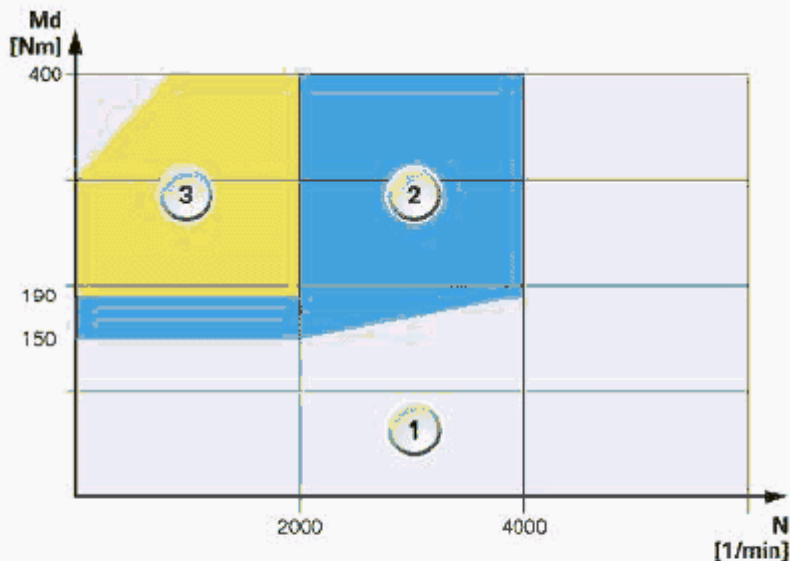

When fitting, make sure that the piezo injector is correctly seated. The hold-down element for securing the piezo-injectors must rest on both injector tabs, otherwise the necessary force is not applied to the piezo-injector.

Injection Strategy

Injection of the fuel mass required for the operating situation can take place in up to three individual injections. Which option is used in the relevant operating situation is dependent on engine load and speed. Here, the actual time resulting from the engine speed available for metering the fuel is an important framework quantity.

A special situation during the operation of any engine is the range in which a high load occurs at low engine speed, so-called "Low End Torque" operation. In this operating situation, the required fuel mass is metered to the engine in three individual injections.

This results in a highly effective mixture formation which in the final analysis has the effect of both increasing power output and saving fuel.

Index	Explanation
1	Single injection event
2	Double injection event
3	Triple injection event

Fig. 63: Identifying Injection Strategy
 Courtesy of BMW OF NORTH AMERICA, INC.

In order to bring the catalytic converters up to operating temperature as quickly as possible, the N54 engine has a catalyst-heating mode for when the engine is started from cold. In this mode, combustion heat is intentionally introduced into the exhaust train and not used first and foremost to develop power output.

The point of ignition is moved to 30° (crankshaft degrees) after TDC. The main quantity of the required fuel is injected before TDC and mixed with the boost air. The piston is situated after TDC in its downward travel such that the air/fuel mixture is already expanding again, which reduces the ignitability of the mixture.

In order to ignite the mixture reliably, a small residual quantity of fuel is injected 25° after TDC and this guarantees an ignitable mixture at the spark plug. This small fuel quantity therefore provides for ignition of the residual charge in the combustion chamber.

This operating mode is set by the engine-management system after a maximum period of 60 seconds from engine starting but is terminated if the catalytic-converter response temperature is reached earlier.

Piezo Element

The movement of the nozzle needle in the injector is generated no longer by a solenoid coil but rather by a piezo-element.

A piezo-element is an electromechanical converter, i.e. it consists of a ceramic material which converts electrical energy directly into mechanical energy (force/travel). A familiar application is the piezo cigarette lighter - when a piezo-crystal is pressed, voltage is generated until a spark flashes over and the gas ignites.

Fig. 64: Identifying Piezo Element
Courtesy of BMW OF NORTH AMERICA, INC.

In the case of the piezo-actuator, voltage is generated so that the crystal expands. In order to achieve greater travel, it is possible to design a piezo-element in several layers.

The actuator module consists of layers of the piezo-ceramic material connected mechanically in series and electrically in parallel. The deflection of a piezo-crystal is dependent on the applied voltage up to a maximum deflection; the higher the voltage, the greater the travel.

Injector Adjustment

When the injectors are manufactured, a multitude of measurement data is recorded at specific points in the factory. In this way, the tolerance ranges for injector-quantity adjustment are determined and specified in a six-digit number combination.

Information on the lift performance of the injector is also added for injector voltage adjustment. Injector adjustment is required because of the individual voltage demand of each piezo actuator. An allocation is made to a voltage demand category, which is included in the number combination on the injector.

These data items are transmitted to the ECM. During engine operation, these values are used to compensate for deviations in the metering and switching performance.

NOTE: When replacing an injector, it is absolutely essentially to carry out an injector adjustment.

Fig. 65: Identifying Tolerance Range Numbers
Courtesy of BMW OF NORTH AMERICA, INC.

Injector Control and Adaptation

The fuel mass required for the operating situation is injected by the piezo-injector into the combustion chamber. This mass can be influenced by three correcting variables:

- the rail pressure
- the injector opening time
- and the injector opening lift

The injector opening time and the injector opening lift are activated directly at the piezo injector. The opening time is controlled via the ti signal and the opening lift via the energy quantity in the activation of the piezo-injector.

Injector Adaptation

The fuel masses and injection cycles determined from the load/speed map are included in a pilot-control program map. Here, while further framework parameters are taken into consideration, the energy quantities and injector opening times required to activate the injectors are determined.

The N54 engine can be safely and reliably operated with these program-map values.

Optimization

For optimization of:

- Emission values

- Smooth running
- Fuel consumption
- Power output

The controlled variables of energy quantities and injector opening times are continuously monitored. This occurs on a bank-selective basis by way of lambda closed-loop control.

The residual oxygen in the exhaust gas is measured in each case for cylinder bank 1 and cylinder bank 2. This measurement result is compared with the values expected from the set correcting variables. The result of a deviation is that the injector opening signal is adapted. This adaptation is stored in the control unit and is therefore available for subsequent engine operation.

However, these stored values are lost when the system is flashed and must be relearned. A further adaptation of the injector activation takes place depending on time and use. This cylinder-selective adaptation involves a check of the residual-oxygen content with a conclusion as to the cylinder causing the situation. To this end, it is necessary for part of the exhaust-gas flow not to be swirled in the turbocharger. For this reason, the flap of the wastegate valve must be fully opened, i.e. swung out of the exhaust-gas flow.

This wastegate-flap position extends beyond its normal opening position in engine operation. Based on the result of this cylinder-selective monitoring, the energy quantity is adapted if necessary to activate the injectors.

Furthermore, the cylinder-selective adaptation includes if necessary an adaptation of the injector opening signal based on smooth running monitoring of the N54 engine. Overall adaptation of the injectors is limited to a 15% additional quantity.

IGNITION MANAGEMENT

Most of the ignition system components have remained the same for all NG6 engines for 2007. There are some minor changes to the ignition coils that apply to all versions. The coils have been optimized for more durability.

Spark Plugs

The spark plugs for the N51 and N52KP remain the same as N52. However, the N54 uses a completely new spark plug from Bosch. The spark plug design consists of a 12 mm thread which contrasts from the 14 mm design on the N52 which prevents any possibility of improper installation.

The hex on the spark plug is also a 12 point design which requires a special tool. The tool (socket) has a "thinwall" design to facilitate access in the confined area of the N54 cylinder head.

Fig. 69: Identifying Spark Plugs
Courtesy of BMW OF NORTH AMERICA, INC.

Spark Plug Diagnosis (N54)

Due to the proximity of the spark plug to the fuel injector nozzle, any divergence in the fuel spray may cause possible spark plug damage. This makes spark plug diagnosis an important part of N54 service concerns. Information gained by the spark plug diagnosis may indicate possible fuel injector faults. Spark plug replacement interval has been reduced to 45,000 miles for the N54.

The **Fig. 70** below can be used to assist in diagnosis:

Spark plug showing normal wear pattern for low mileage

Spark plug showing normal wear pattern for high mileage

Spark plug showing abnormal wear pattern - look for possible fuel spray diversion

Spark plug showing abnormal wear pattern - look for possible fuel spray diversion

Fig. 70: Identifying Spark Plug Wear Pattern

EMISSIONS MANAGEMENT

The N54 and N52KP meet ULEV II requirements for 2007. There are not many changes to the emission systems on these engines. The N54 engine has 2 underbody catalysts in addition to the "near engine" catalysts already in use from the N52.

The N51 engine, however, is a SULEV II compliant engine which meets the 2007 requirements. In addition to the 5 existing SULEV states of California, New York, Maine, Massachusetts, and Vermont - four states have been added for 2007. These states include, Connecticut, Rhode Island, Oregon and Washington State.

The N51 emissions measures include:

- Secondary Air System with mini-HFM
- Radiator with "Prem-air" coating
- Lower compression ratio (10:1) via modified combustion chamber and pistons
- Underbody catalyst in addition to "near engine" catalyst
- Activated carbon air filter in air filter housing
- Steel fuel lines with threaded fittings and sealed fuel tank

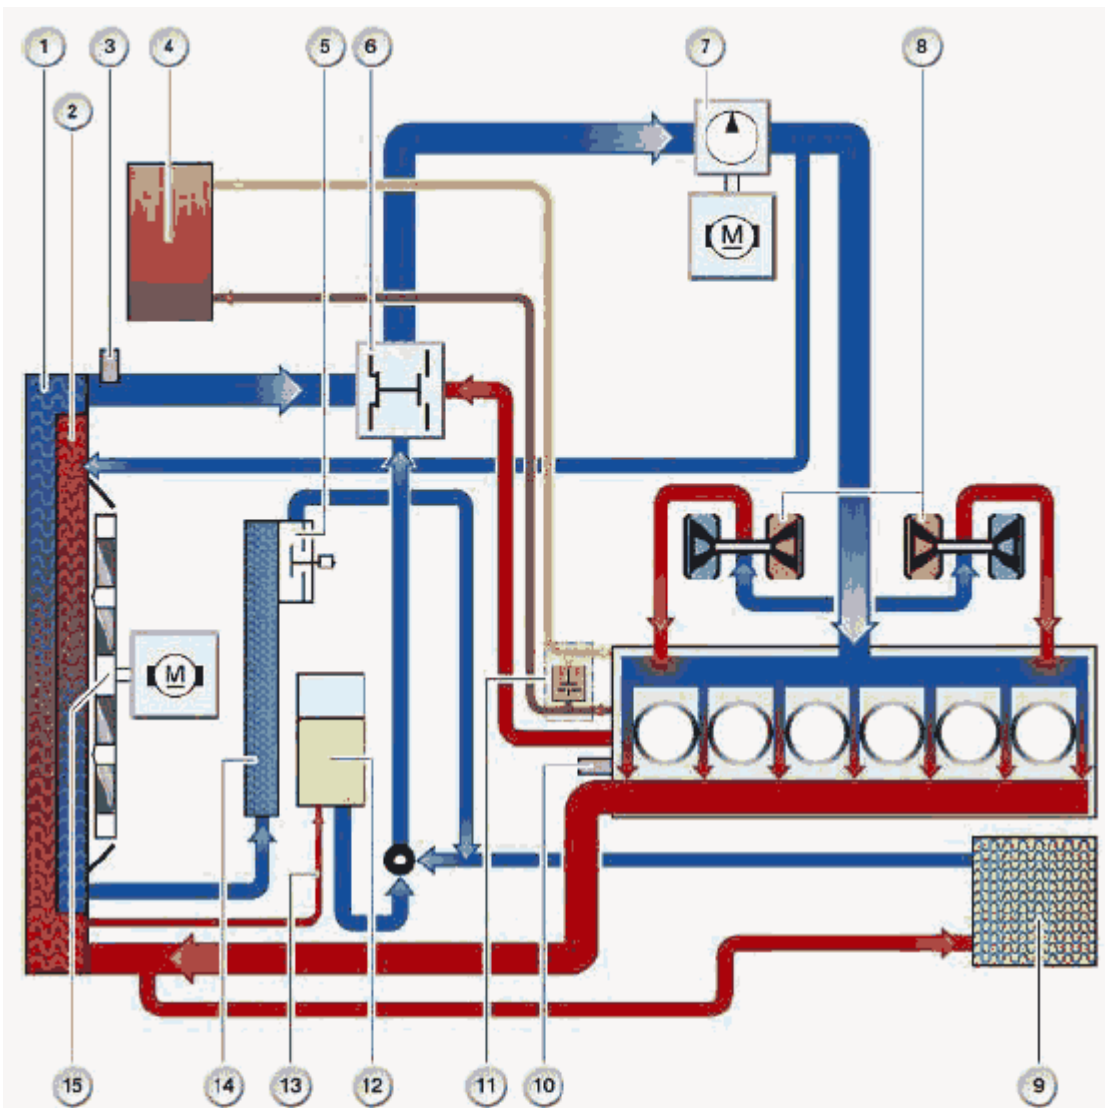

- Crankcase ventilation system integrated into cylinder head cover
- Purge system piping made from optimized plastic

NOTE: The SULEV II information above is only preliminary and is accurate as of 8/06. Additional information will be released as it becomes available.

PERFORMANCE CONTROLS

Cooling System

The cooling system of the N54 engine consists of a radiator circuit and an isolated oil cooling circuit. The fact that there is an isolated oil-cooling circuit ensures that heat is not introduced via the engine oil into the engine's coolant system.

Index	Explanation	Index	Explanation
1	Radiator	9	Heat exchanger
2	Gear-box oil cooler	10	Outlet temperature sensor, cylinder head
3	Outlet temperature sensor	11	Thermostat, engine oil cooler
4	Engine oil cooler	12	Coolant expansion tank
5	Thermostat for gearbox oil cooler	13	Vent line
6	Map thermostat	14	Gearbox oil cooler
7	Electric coolant pump	15	Fan

Fig. 71: Identifying Cooling System Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

There is a significantly greater quantity of heat on account of this engine's increased power of 75.5 kW/l in comparison with other 3-liter spark-ignition engines.

This boundary condition is satisfied by the engine cooling system with its increased performance. This increase in power was to be realized in spite of some factors less advantageous to cooling.

Factors to be mentioned here are:

- Approximately 15% less flow area is available on account of the intercooler located below the radiator.
- The already small amount of space provided by the engine compartment is further limited by the accommodation of further components.
- Because the exhaust turbochargers are cooled by the coolant, an additional quantity of heat is introduced into the system via these turbochargers.

Measures for increasing cooling-system performance:

- Coolant pump with increased power - 400 W/9000 l/h
- Separation of water and engine-oil cooling
- Radiator with increased power
- Electric fan with increased power 600W for all gearbox variants

The structure of the coolant circuit is the same as that of the N52 engine. The engine is flushed through with coolant in accordance with the cross-flow concept. Cooling output can be influenced as a function of load by activating the following components:

- Electric fan
- Electric coolant pump
- Map thermostat

It is also possible that an N54 engine equipped with an automatic gearbox to utilize the lower area of the radiator to cool the gearbox by means of the gearbox oil cooler. This is achieved as in the N52 engine with control sleeves, which are introduced into the radiator tank.

Engine-oil Cooling

The N54 engine is equipped with a high-performance engine oil cooler. The pendulum slide pump delivers the oil from the oil sump to the oil filter. A thermostat flanged to the oil filter housing admits the oil to the engine-oil cooler. The engine oil cooler is located in the right wheel arch in the E92. The thermostat can reduce the resistance opposing the oil by opening the bypass line between the feed and return lines of the engine oil cooler. This ensures that the engine warms up safely and quickly.

Radiator

Design measures have been used to increase the performance of the radiator itself. The performance of a radiator is dependent on its radiation surface. However, the intercooler location had to be underneath the radiator, and this meant that it was necessary to compensate for the smaller flow area available.

Compared with the N52 engine, the radiator used in the N54 engine has a block depth which has been increased to 32 mm. In addition, the water pipes are situated closer together than in previously used radiators. The upshot of this is an increase in the utilizable radiation surface.

Electric Coolant Pump

The coolant pump of the N54 engine is an electrically driven centrifugal pump with a power output of 400W and a maximum flow rate of 9000 l/h. This represents a significant increase in power of the electric coolant pump used in the N52 engine, which has a power output of 200 W and a maximum flow rate of 7000 l/h.

The power of the electric wet-rotor motor is electronically controlled by the electronic module (3) in the pump. The electronic module is connected via the bit-serial data interface (BSD) to the MSD80 engine control unit.

The engine control unit uses the engine load, the operating mode and the data from the temperature sensors to calculate the required cooling output.

Based on this data, the engine control unit issues the corresponding command to the electric coolant pump. The electric coolant pump regulates its speed in accordance with this command.

The system coolant flows through the motor of the coolant pump, thus cooling both the motor as well as the electronic module. The coolant lubricates the bearings of the electric coolant pump.

Index	Explanation
1	Pump
2	Pump motor
3	Electric Water Pump module

Fig. 72: Identifying Engine-Oil Cooling Diagram

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The same rules apply to all electric coolant pumps. The pump must be filled with coolant when removed for service to prevent any corrosion. Also, the pump impeller must be turned by hand before installation to ensure the pump is not seized.

GENERAL INFORMATION

New Engine Technology - Overview

BASIC MEASURING TECHNIQUES

Model: All

BASIC ENGINE MEASUREMENTS

During the course of engine repairs some basic engine measurements are required to verify engine diagnosis as well as to complete proper repairs. These measurements are made by precision measuring tools such as micrometers, Vernier calipers, cylinder bore gauges and dial indicators.

Fig. 1: Identifying Basic Engine Measurements
Courtesy of BMW OF NORTH AMERICA, INC.

Also, a working knowledge of the metric system is also a vital skill that is needed by the technician. All BMW engine measurements consist of metric specifications. Some of the routine engine measurements performed include:

- Valve Guide Wear (Tilt Angle K)
- Cylinder Bore Measurements (Taper and Out-of-Round)
- Cylinder Head Warpage and Thickness

- Axial and Radial Endplay Measurements (Crankshaft/Camshaft etc).

Among all of the skills possessed by a modern technician, basic measuring techniques are perhaps the most overlooked and least used. This is why it is important to review these skills from time to time as a refresher.

Also, it is necessary to access technical data to obtain the proper specifications for these measurements. This course is designed to review measuring techniques to assist in engine diagnosis.

Vernier Measurement

The Vernier scale is used on various measuring tools such as the Vernier caliper and the Depth Gauge. The Vernier scale can be used with Fractional (US) and Metric systems. For the purposes of this training module we will always refer to the Metric Vernier scale.

The Vernier scale consists of a fixed scale and a sliding scale. The fixed scale is divided with graduations in 1 millimeter increments. The sliding scale has 10 graduations in increments of .5.

Fig. 2: Identifying Depth Gauge With Vernier Scale
Courtesy of BMW OF NORTH AMERICA, INC.

In order to read a measurement, use the zero mark on the left end of the vernier scale to use as a guide to read a measurement on the fixed scale.

In the example shown at the right, the zero mark is resting between 26 and 27 mm. Therefore the base measurement is 26 mm.

Next, the decimal measurement must be taken. For this, find a line on the Vernier that most closely matches any line on the fixed scale.

Using the example drawing, the "4" on the Vernier scale is lining up directly with a line on the fixed scale.

Combining the previous reading with this reading, the result would be 26.4 mm.

Fig. 3: Identifying Read Measurement, Zero Mark On Left End Of Vernier Scales
Courtesy of BMW OF NORTH AMERICA, INC.

The designations on the Vernier scale are in increments of .5. For example, if a reading on the Vernier scale falls on the .5 (i.e. 2.5, 3.5 etc) designation this would indicate 5/100th's of a millimeter.

Micrometer Measurements

Another valuable measuring tool is the micrometer, which can be used for measurements such as bearing journal diameter, cylinder head thickness, valve shim thickness and brake rotor thickness etc. Micrometers also come in configurations for inside measurements as well.

The micrometer scale comes in both fractional and metric varieties. We will cover only the metric micrometer scale in this course.

First you must familiarize yourself with the construction of the micrometer in order to understand how measurements are made.

Metric Micrometer Construction

The micrometer is constructed of a few basic parts. The actual item to be measured is placed between the anvil and the spindle. The micrometer can be adjusted to the approximate size using the thimble. The thimble should only be used for the coarse adjustment. In order to make the actual measurement, the micrometer should only be turned using the ratchet (a.k.a. the friction stop). Do not attempt to make a measurement using the thimble. This will give an inaccurate measurement and ultimately damage the micrometer.

Fig. 4: Identifying Metric Micrometer Construction And Spindle
Courtesy of BMW OF NORTH AMERICA, INC.

Micrometers are available in various sizes for outside as well as inside measurements. The more common variation is the outside micrometer. They are usually available in 25 millimeter increments such as 0-25 mm, 25-50 mm, 50-75 mm etc.

The metric micrometer can measure in increments of one hundredth of a millimeter (.01mm). One hundredth of a millimeter is equal to 0.0003937 inch which is less than one thousandth of an inch.

The measurement area of the micrometer consists of the sleeve scale and the thimble scale. The sleeve scale is used to read whole and half millimeters. The thimble scale (which rotates) reads in hundredths (.01) of a millimeter from zero to fifty. Two complete revolutions of the thimble equals one millimeter.

On the sleeve scale, each scale mark above the center line indicates whole millimeters. Below the center line, half of a millimeter (or .5mm) increments are indicated.

Fig. 5: Identifying Sleeve Scale

Courtesy of BMW OF NORTH AMERICA, INC.

Using the example shown above, the micrometer is a 125-150mm micrometer. To read this micrometer, first take the basic reading from the sleeve scale. The thimble is past the 139 mm mark. Therefore the reading is a least 139 mm. Next, look at the thimble scale and note the reading on the centerline. The "10" on the thimble scale is lined up with the centerline. This indicates a reading of .10 mm. If you add the two readings; $139 + .10 = 139.10$ mm.

Dial Indicator Measurements

The dial indicator is used to measure the travel or movement of a specific item. It can also be used to measure axial and radial runout. In engine measurement applications, the dial indicator can be used to measure valve guide wear, axial movement of the crankshaft (thrust), and runout of flywheels and harmonic balancers.

First, it is important to familiarize yourself with Dial Indicator construction. The face of the dial indicator consists of a moveable bezel which is also attached to the large measuring scale. This allows the tool be brought to the "zero point" when needed.

The main measuring device is the contact point. The contact point (1) is placed against the object to be measured. Usually, the contact point is rounded or has a ball bearing. This allows for a more accurate measurement.

The measuring face of the dial indicator consists of 2 scales. The smaller scale is for the "coarse" measurement which is in graduations of 1 millimeter. One revolution of the small scale is 10 millimeters.

The large scale is in graduations of .01 millimeter and the scale goes from zero to one hundred. Therefore, one revolution of the large scale is one millimeter.

Fig. 6: Identifying Device Is Contact Point
Courtesy of BMW OF NORTH AMERICA, INC.

The dial indicator also needs to be held in place when taking a measurement. This requires a stand or base. Depending upon the application, these stands can be a clamp type, magnetic or a threaded base.

When taking a measurement, place the contact point on the object to be measured. The dial indicator must be pre-loaded slightly to prevent the measurement from bottoming out.

When reading the scale, be sure to "zero" the dial indicator first. If the readings to be taken are less than 1 millimeter, you do not need to use the small scale. If the readings are larger than 1 millimeter, be sure to factor the small scale into your measurement.

ADDITIONAL ENGINE MEASUREMENTS

During engine repair procedures it is sometimes necessary to assess engine wear to make determinations on parts replacement. Also, some engine measurements are needed to verify a previous diagnosis.

For example, a cylinder leakdown test could indicate a cylinder sealing concern. Once the engine is disassembled, it would be necessary to verify this condition by checking the piston and piston ring condition. If OK, the next step would be to determine the condition of the cylinder bore. At this point, the cylinders should be checked for taper (conicity) and for out-of-round. The correct measurements could mean the difference between just replacing the rings and/or pistons or replacing the engine block. This is why it is necessary to make accurate measurements when needed.

Some of the other routine engine measurements include:

- Cylinder head warpage
- Cylinder head thickness (on some applications)
- Piston rings - end gap and axial clearance

* Cylinder bore - including out-of-round and taper

Cylinder Head Measurement

If a repair requires removal of the cylinder head, a few basic measurements can be performed to save time and unnecessary machine shop costs. If an engine has been overheated or has an internal or external fluid leakage (coolant/oil), it is a good idea to check the cylinder head for warpage.

This can be done by using a commercially available machinists straight edge and a feeler gauge. by sliding the

feeler gauge under the straight edge in various locations, it can determine if there are any low spots or warpage. The specifications for warpage are found in WebTIS under Technical Data. Usually, the specification is about .05 mm.

Fig. 12: Checking Cylinder Head Warpage
Courtesy of BMW OF NORTH AMERICA, INC.

Also, check to see if the cylinder head has a specification for machining limit. If so, it may be possible to have the cylinder head re-surfaced. Depending on the amount of material removed during the machining process, it may be necessary to install a thicker head gasket. There are some "service" head gaskets available through the parts department.

The cylinder head can be checked for minimum thickness. This is done using a micrometer or a vernier caliper. This is not possible on all engines, the example shown below is a 6-cylinder (M52TU/M54).

If the minimum thickness is not met, the head will need to be replaced.

50 11 104 H

Fig. 13: Identifying Cylinder Head Minimum Thickness
Courtesy of BMW OF NORTH AMERICA, INC.

Piston Measurements

When replacing pistons and/or piston rings, there are some basic measurements that need to be made. When fitting a piston to a cylinder bore, the piston diameter should be checked to ensure a proper fit.

The piston diameter is measured using a micrometer. The measurement is taken at a specified point (A) which is 90 degrees from the piston pin axis. Each engine has a specific location to measure piston diameter. For example, the illustration below shows measuring Point A. The specification for this engine (N62) is 18 mm. So the piston diameter is measured 18 mm from the bottom of the piston skirt.

88 11 051 U

Fig. 14: Checking Piston Diameter Is Measured Using Micrometer
Courtesy of BMW OF NORTH AMERICA, INC.

The piston diameter, when subtracted from the cylinder bore equals the cylinder wall to piston clearance. If the clearance measurement obtained is not correct, re-check your readings.

Piston Ring Measurements

There are some important specifications to check when installing piston rings. One of the measurements is axial clearance. Axial clearance is the distance between the piston ring and ring land. This prevents the rings from binding in the ring land at operating temperature. Axial clearance is measured using a feeler gauge.

Fig. 15: Checking Piston Ring Of Feeler Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

Also the piston ring end gap has to be checked. This measurement is checked using a feeler gauge.

This clearance is critical in order to prevent the end gaps from contacting each other when the engine is at operating temp.

When installing the piston rings, always stagger the end gaps as per the repair instructions.

Fig. 16: Identifying Piston Ring End Gap
Courtesy of BMW OF NORTH AMERICA, INC.

Cylinder Bore

In order for the cylinder bore to be considered acceptable, it must not be excessively tapered or out-of-round. Once the cylinder has been checked for obvious damage and the surface finish is OK, the integrity of the bores must be verified. If cylinder wear is suspected, it must be checked using the proper cylinder bore gauge.

Each cylinder must be checked at three position in the bore - top, middle and bottom. Also there must be two opposing dimensions that should be checked. The difference between the top and bottom measurements will indicate the taper of the bore. The opposing dimensions will indicate the out-of-round specification.

If these measurements are out of specification, the cylinder bore must be re-finished or overbored. New pistons and rings must be fitted as well.

Fig. 17: Measuring Proper Cylinder Bore Gauge
Courtesy of BMW OF NORTH AMERICA, INC.

METRIC SYSTEM

All BMW specifications are metric. Therefore, a thorough knowledge of those areas on the metric system which apply to BMW vehicles is vital to a BMW Service Technician.

The unit of length, and the basis for all other metric units of measurement is the meter. The meter (1 meter), as a point of reference, is slightly longer than a yard (39.37 inches).

The divisions of a meter are hundredths and thousandths. One hundredth of a meter is called a centimeter, and is equal to .3937 inch or about half the diameter of a nickel.

One thousandth of a meter is called a millimeter. The small marks between the centimeter increments are each one millimeter, or one tenth of a centimeter. And as a point of reference, a standard paper clip is about one millimeter thick.

Metric System Denominations

Throughout the metric system, common to all units of measurement, are prefixes which designate multiples or fractions of the unit.

For automotive applications, the most common prefixes are centi; designating one-hundredth; milli; for one thousandth and kilo-for one thousand.

There are letters uniformly used throughout the system to label the divisions or multiples of each unit of measurement. The letter "m" represents milli, "c" is for centi and "k" is for kilo. These are then combined with the letter representing the unit of measurement.

For example, mm is millimeter, cm is centimeter and km is kilometer. The same applies to liter which is the unit of volume and gram which is the unit of weight.

One kilogram is equal to one thousand grams which is equal to 2.2 pounds.

All metric measurements are directly related. For example, one thousand cubic centimeters, or 10cm x 10cm x 10cm of water weighs one kilogram. The volume of those one thousand cc's is one liter.

GENERAL INFORMATION

Passive Safety System

INTRODUCTION TO PASSIVE SAFETY

Model: All with Passive Safety Systems

Production: All

INTRODUCTION

History of BMW Safety Systems

BMW has a long history of being at the forefront of passenger safety technology. Before the introduction of airbag systems, seatbelts provided the primary restraint for protection of the occupants during an impact. Three point seatbelts provided the greatest level of occupant safety at that time.

Many other safety innovations were already in use before airbag systems were introduced. Energy absorbing body structures with "crumple zones" uphold the integrity of the passenger safety cell. Some of the other features are "breakaway" engine and transmission mountings, collapsible steering column, door mounted impact beams and a hood that is designed to fold on impact rather than penetrate the windshield.

There are many other safety innovations which are transparent to the driver, but are crucial to providing a safe environment for the vehicle occupants.

Fig. 1: Identifying History Of BMW Safety Systems
Courtesy of BMW OF NORTH AMERICA, INC.

Since 1986, when BMW first introduced the Supplementary Restraint System (SRS) to their US model line, BMW has continuously improved the level of occupant protection.

The driver's side airbag was standard on all US production models from 1986. Later, the passenger side airbag became standard on the 1992 models.

These first systems were made by Cipro and Siemens and consisted of mechanical crash sensors located on the inner fenders. An airbag was mounted on the steering wheel and a control unit containing a mechanical safing sensor was located in the passenger compartment. The vehicle wiring harness was modified to accommodate these systems.

Later versions included a standard passenger side airbag from 9/91 production. These system were designated Siemens 2C. These systems were replaced by ZAE.

Beginning with the 1994 model year, the ZAE system was introduced on US models. The E31, E34, E36 and E38 all used the ZAE I system. ZAE I used crash sensors which were integral to the control unit and eliminated the mechanical fender mounted sensors on previous models. Also the passenger seat occupancy detection system (SBE) was introduced at this time. ZAE 2 was introduced later and now included the detection of rear impacts.

The Multiple Restraint System (MRS) addressed the need for side impact protection. Starting with the E39, door mounted side airbags were added on the front driver and passenger side. The MRS system also utilized side impact sensors which were externally mounted near the b-pillar. In combination with the MRS control unit, the side impact sensors allowed the MRS system to differentiate between front, rear and side impacts.

Fig. 2: Identifying Multiple Restraint (MRS) System
Courtesy of BMW OF NORTH AMERICA, INC.

Subsequent versions of MRS introduced new technology and enhancements to MRS I. MRSII utilized the new head protection system (HPS) and also the new Safety Battery Terminal.

MRS III has new features including the 2-stage airbag and the rear head protection system. Also, the MRS III control unit was now connected to the K-bus for diagnosis, improved crash signalling and for the fuel pump cut-off feature.

The only changes to MRS IV were improved software and triggering algorithms. It was introduced in 4/01 production on the E46 and E53 and later phased into E38 and E39.

The latest version of MRS is the MRS4RD system. The "RD" designation indicates a redesign over the previous MRSIV system. Numerous modifications include additional crash sensors mounted in the front of the vehicle and pressure sensors mounted in the front doors. Also, the new passenger seat occupancy detection system (OC-3) which is capable of determining the approximate size of the occupant based on weight distribution. To accommodate these changes, the MRS control unit was increased to 75 pins from the previous 50 pin control

unit.

E83 with MRS4RD

Fig. 3: Identifying Latest Version Of MRS MRS4RD System
Courtesy of BMW OF NORTH AMERICA, INC.

The introduction of the E65 brought about a new era in passive safety technology.

The new passive safety system on the E65 was a departure from the MRS philosophy. Instead of having the triggering electronics located centrally in the MRS module. The new method was to decentralize the triggering electronics by locating the trigger circuits in the satellite sensors which are closer to potential impact points.

The new system is referred to as the Intelligent Safety and Information System (ISIS). ISIS consists of a series of satellites connected by an optical bus network called *byte-flight*. The *byteflight* network was specifically designed a high speed network for use on safety related systems.

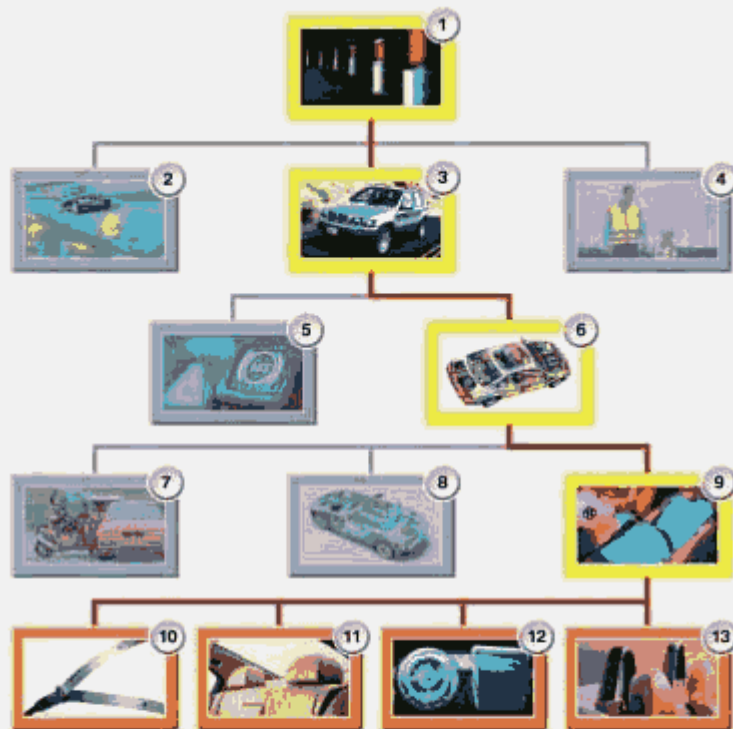

Fig. 4: Identifying E65 (ISIS) System Overview
Courtesy of BMW OF NORTH AMERICA, INC.

The ISIS concept was also adopted on the new Advanced Safety Electronic (ASE) systems which was introduced on the E85. The ASE system is also used on the new E60, E63 and E64 vehicles. ASE is similar in design to ISIS, and uses the bytelight fiber optic network. However the total number of satellites is reduced as compared to ISIS.

Fully Integrated Road Safety Technology (F.I.R.S.T.)

The BMW FIRST safety concept incorporates the environmental considerations (traffic, road conditions), the vehicle (active and passive safety), and the people involved. During the design process, all of these things are taken into to consideration to create a safe environment for the passengers as well as considering the durability of the vehicle during an impact to comply with federal law and insurance regulations.

6	Passive Safety	13	Rollover Protection
7	Partner Protection		

Fig. 5: Identifying Fully Integrated Road Safety Technology (F.I.R.S.T.) System
 Courtesy of BMW OF NORTH AMERICA, INC.

F.I.R.S.T. is the cornerstone behind BMW's safety philosophy. This technology consists of *active* and *passive* safety features designed to help the driver avoid accidents as well as protect the occupants in the event of an unavoidable accident.

Fig. 6: Identifying F.I.R.S.T. Cornerstone Behind BMW'S Safety Philosophy
Courtesy of BMW OF NORTH AMERICA, INC.

Active Safety features are designed to help the driver avoid accidents. In other words these features allow the driver to actively avoid potentially dangerous situations. These features consist of a responsive engine, stable suspension, precise steering and excellent all around vision. Systems such as Dynamic Stability Control (DSC) and ABS also help the driver retain precise control of the vehicle.

Traffic and adverse environmental conditions can be offset by systems such as RLS (rain sensing wiper control), X-Drive, climate control with mist sensor and driving lights etc.

Other features which are "transparent" to the driver include the multi-function steering wheel which allows the driver to control the cruise control and audio systems while still focusing on the road. The seating position and location of switches and controls are also taken into consideration during the design process. The new HUD also allows the driver to access important driving information while maintaining concentration.

Passive Safety features provide vehicle occupant protection when an accident cannot be avoided. Today's BMW Passive Safety systems consist of the following features:

- Energy absorbing body structures
- Seatbelts with Automatic tensioners and force limiters
- Dual front airbags with 2-stage deployment
- Head Protection Systems (front as well as rear on some models)
- Side Impact Airbags (standard) and Rear Side Airbags (optional)
- Active Knee Protection Airbags (On some models)
- Battery Safety Terminal
- Active Head Restraints (on some models)
- Rollover Protection on Convertibles (E36, E46 and E64) and fixed rollover bars on the Z3 and Z8 and Z4.

Energy Absorbing Body Structures

One of the first considerations in designing a safe vehicle is the body and chassis design. It is vital to protect the passenger in the event of an impact. This is accomplished by maintaining the integrity of the "passenger cell" during an accident.

The main consideration during an impact is to avoid transferring crash energy to the vehicle occupants. By adding energy absorbing crash elements to the vehicle, this energy transfer is reduced considerably.

Passenger Safety Cell E60

Fig. 7: Identifying Passenger Safety Cell E60 And Energy Absorbing Body Structures System
Courtesy of BMW OF NORTH AMERICA, INC.

In addition to having energy absorbing structures in the front and rear of the vehicle, there are also side impact protection structures in the doors. These structures not only help prevent impact intrusion into the safety cell, but also allow the door to be opened after most impacts.

Engine Support Arm showing "Crumple Zone"

Fig. 8: Identifying Engine Support Arm System (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 9: Identifying Engine Support Arm System (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

SMART Airbags

Front driver and passenger airbags have been in use with single stage activation since 1986. Once an impact is detected, the airbags are triggered with one specific level of deployment force.

From 1999, BMW developed the SMART airbag which is designed to deploy in 2 stages.

There are 4 triggering thresholds which are dependent upon the severity of impact detected, the status of the seatbelts and whether the passenger seat is occupied.

Driver's side SMART Airbag (Rear view)

Fig. 10: Identifying Driver Side SMART Airbag System
Courtesy of BMW OF NORTH AMERICA, INC.

Passenger side SMART Airbag (Rear view)

Fig. 11: Identifying Passenger Side SMART Airbag System
Courtesy of BMW OF NORTH AMERICA, INC.

The two stage airbags are used for both the front driver and front passenger which allows for a softer cushioning effect when the bags are triggered at lighter impacts.

The 2-stage airbags also employ the "cold-gas" inflation method which differs from the previous single stage airbags. The gas generators contain an inert gas mixture which is released when the airbags are triggered.

Also, the cold gas inflation method was incorporated into the side airbags and the ITS assemblies.

Side Airbags

Since the introduction of MRS, side airbags have been standard equipment. Rear airbags on some vehicles are part of an option package.

Side airbags are designed to prevent injury to the thorax (chest) region of the occupants.

Side Airbag with Inert Gas Inflation (Rear view)

Fig. 12: Identifying Side Airbag With Inert Gas Inflation System
Courtesy of BMW OF NORTH AMERICA, INC.

Seatbelts

Of all of the safety innovations brought forth by the automotive industry, the safety belt is universally recognized as the single most effective safety device. Specifically, the 3-point safety belt provides passengers

with safety as well as comfort.

The effectiveness of the 3-point seat belt depends upon the correct positioning of the safety belt on the body.

Fig. 13: Identifying Seat Belt Depends Correct Position Of Safety Belt On Body
Courtesy of BMW OF NORTH AMERICA, INC.

BMW safety belt systems use an upper anchor point which is height adjustable. In addition, the tensioning mechanisms allow the belt to remain relatively slack to increase comfort while driving.

The seat belt tensioning device is designed to remove slack in the seatbelt during an impact. This increases the effectiveness of the seatbelt and reduces the bio-mechanical load on the passenger.

There are 4 different belt tensioning systems which have been in use on BMW vehicles.

The 4 systems are as follows:

- Pyrotechnic automatic tensioners/end fitting tensioners
- Mechanical seat belt tensioners
- Pyrotechnic seat belt tensioners
- SGS (Seat Integrated Belt System)

More information on the seat belt tensioning systems will be covered in the forthcoming training modules.

Fig. 14: Identifying Mechanical Seat Belt Tensioners
Courtesy of BMW OF NORTH AMERICA, INC.

Battery Safety Terminal

The Battery Safety Terminal (BST) is designed to minimize the risk of short circuits in severe accidents. The BST protects the B+ cable from the battery to the starter and generator by disconnecting the main connections via a pyrotechnic device.

The rest of the power distribution circuits are protected by various fuses etc. This allows those circuits to remain available for SOS calls, power window and lock operation.

Fig. 15: Identifying Battery Safety Terminal
Courtesy of BMW OF NORTH AMERICA, INC.

The BST assembly is bolted to the positive battery terminal. It consists of a conventional battery terminal and a contact sleeve attached to the surface of the terminal. The sleeve houses an igniter pellet which contains a small amount of solid propellant.

Upon impact, the propellant is ignited which separates the battery cable from the positive terminal of the battery.

Fig. 16: Identifying BST - Not Deployed
Courtesy of BMW OF NORTH AMERICA, INC.

Once the BST is deployed, it must be replaced. Depending upon application, the entire B+ cable must be replaced or there are repair kits available on some models.

Head Protection System

Head injuries account for a large portion of overall accident statistics. To address this statistic BMW added the Head Protection System to complement the side airbags already in use. HPS was developed by BMW to offer increased occupant protection during a side impact and lower the instance of head injuries.

The original HPS, introduced on the E38, consisted of an Inflatable Tubular Structure (ITS) which was mounted in the headliner between the A and B pillars.

The ITS assembly consists of a woven fabric tube containing an inner tube of polyurethane. A gas generator is used to inflate the ITS assembly. When deployed, the ITS increases in diameter and overall length decreases by approximately 100mm. This causes the ITS assembly to emerge from the headliner trim.

Fig. 17: Identifying Head Protection System
Courtesy of BMW OF NORTH AMERICA, INC.

The ITS is designed as a sealed unit, unlike an airbag which deflates immediately. The ITS assembly deflates as the gas cools over a period of time, which allows the ITS to remain inflated in the event of secondary impacts.

Fig. 18: Identifying ITS Assembly Deflates Gas Cools
Courtesy of BMW OF NORTH AMERICA, INC.

Rear HPS was introduced later as part of a special rear side airbag option on the E38 and E39. The rear HPS does not use a conventional ITS assembly, but rather an "cushion" type airbag located in the C-pillar. A vehicle with rear HPS can be identified by observing "HPS" in the C-pillar cover.

Fig. 19: Identifying Vehicle With Rear HPS Identified By Observing In C-Pillar Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

The Head Protection System was further developed to increase the level of occupant protection. The Advanced Head Protection System was introduced on the E65. It consists of a modified ITS which is now extended by a curtain. There are 2 versions of AHPS available. The first, AHPS I, extends from the A-pillar to the B-pillar and protects the front passengers.

The second version, AHPS II, is part of an option for rear passenger head protection. The AHPS II extends for the A-pillar to the C-pillar to protect front and rear passengers simultaneously. The advantages of AHPS include protection from glass splinters and protruding objects as well as optimized coverage for occupants of all sizes.

Fig. 20: Identifying AHPS II And AHPS I Part
 Courtesy of BMW OF NORTH AMERICA, INC.

Active Knee Protection

The Active Knee Protection consists of a knee airbag located on the front driver and passenger sides of the vehicle. The knee airbag prevent the driver from sliding under the seat belt during an impact. This effect is

known as "submarining". This effect is counteracted by the knee airbag and initiates a controlled forward shift of the upper body.

This increases the effect of the seatbelt and the airbag.

The knee airbag is available on the E65, E85 and E63/64.

Active Head Restraint System (AKS)

In a rear end collision, the risk for cervical vertebrae injuries (whiplash) is high. To prevent this, the objective would be to position the head as close as possible to the headrest. This prevents excessive rearward motion.

On the E65/E66 and E60, the basic seat option only allows for a fixed position between the backrest and head and eliminates the need for the AKS. However, on vehicles equipped with the multi-function seat option, the adjustability of the headrest and backrest allows for the possibility of a large gap between the headrest and the occupants head.

For this reason AKS was developed. The AKS is located in the backrest of the multifunction seat. It is deployed by a pyrotechnic device, similar to an airbag.

Fig. 23: Identifying Active Head Restraint (AKS) System
Courtesy of BMW OF NORTH AMERICA, INC.

Rollover Protection Systems

In order to protect the passengers of a convertible in the event of a rollover, BMW has developed the Rollover Protections System (RPS). Convertible models with RPS include the E36, E46 and E64. BMW roadsters use fixed steel rollover bars, these vehicle include the E52 (Z8), E36/7 (Z3), and the E85 (Z4).

The RPS consists of a set of automatically deployable rollbars which are triggered when the vehicle exceeds certain criteria. This criteria is based on the amount of tilt which is monitored by a rollover sensor.

When an impending rollover is detected, the rollover bars lock into place to provide the necessary head clearance to protect the occupants.

Fig. 24: Identifying Rollover Protection (RPS) Systems
Courtesy of BMW OF NORTH AMERICA, INC.

Also, the rollover bars can be deployed by the diagnostic equipment for testing. There is also a reset procedure for each model which is done manually. This allows the bars to be reset in the event of an erroneous deployment.

2004-05 GENERAL INFORMATION

Safety Systems - Overview - X3

SAFETY SYSTEMS

HISTORY OF MULTIPLE RESTRAINT SYSTEMS

Multiple restraint systems have a long history at BMW. The first multiple restraint system, the MRS 1, was introduced as long ago as 1996.

MRS 1

With the introduction of the side airbags in March 1996, the MRS 1 replaced the ZAE/BAE control unit used until then on the E38/E39. When the side airbags were introduced, two MRSA external sensors were also added for improved side-impact detection. Because of the required number of inputs/outputs, the number of pins had to be increased from 30 to 50.

MRS 2

The addition of the ITS head airbag and rear side airbags on the E38 in May 1997 saw the introduction of the MRS2. On the E39, the MRS2 was first used when the ITS head airbag was fitted in September 1997. September 1998 saw the introduction of the 2-stage front-passenger airbag (SMART airbag).

MRS 3

The MRS3 system was launched with the arrival of the 2-stage driver's airbag in March 1999. Another innovation on the MRS3 was its connection with the K-bus. The previous MRS systems had been hooked up to the diagnostic bus. The exception in that regard was the E36/7 (Z3). Since the Z3 has no K-bus, the MRS3 on the Z3 remained connected to the diagnostic bus.

MRS 4

The changes on the MRS4 as compared with the MRS3 consisted of a modified processor and new software for calculating the restraint system triggering algorithm. The MRS4 was first used in April 2001 with the launch of the MINI as well as on the E46 and E53. The E38 and E39 models were fitted with the MRS4 for the first time in August 2001.

MRS4RD

The multiple restraint system 4 redesign MRS4RD is a development of the MRS4 on the E46. The MRS4RD has had its interfaces expanded to 75 pins.

The job of the MRS4RD is to detect accident scenarios that are critical for the vehicle occupants and to selectively activate the necessary restraint systems according to the severity of the crash.

The MRS4RD has been further optimized and equipped with the following sensors:

- Up-front sensors
- Door-compression sensors
- B-pillar satellites

The job of the up-front sensors is to detect frontal impacts. This allows the restraint systems such as seatbelt tensioners and airbags to be activated.

The job of the door-compression sensors is to detect side impacts. The MRS4 satellites (MRSA) under the front seats have been moved to the B-pillars. The B-pillar satellites contain acceleration sensors for linear and lateral acceleration.

The MRS4RD performs a self-diagnosis and monitors all input and output signals. Any faults detected are stored in a non-volatile memory and indicated to the driver by the airbag warning lamp (AWL).

Communication with other control units in the vehicle's network of systems takes place via the K-bus.

The MRS4RD can be programmed/encoded via the K-bus.

SYSTEM COMPONENTS

The MRS4RD multiple restraint system consists of the following components:

- MRS4RD control unit
- Sensors and switches
- Actuators

MRS4RD Control Unit

The number of pins on the MRS4RD control unit has been increased from 50 (MRS4) to 75 because of the greater number of interfaces.

The MRS4RD control unit is located centrally in the vehicle on the transmission tunnel. Integrated in the MRS4RD control unit are two acceleration sensors set right-angles to one another. The linear acceleration sensor (X-axis) is positioned at 0 degrees to the vehicle's longitudinal axis, and the lateral acceleration sensor (Y-axis) at 90 degrees to that axis.

All acceleration sensors sense acceleration in two directions, i.e. they register both positive and negative acceleration. The polarity of the acceleration signals depends on the direction of impact. That means it is possible to distinguish between a front or rear impact and between a left or right side impact.

G03399720

Fig. 3: Identifying MRS4RD Control Unit
Courtesy of BMW OF NORTH AMERICA, INC.

The MRS4RD multiple restraint system has more sensors than its predecessor system.

They include the following sensors:

- Up-front sensors
- Door-compression sensors
- B-pillar satellites with lateral and linear acceleration sensors

Up-Front Sensors

The job of the up-front sensors is to detect frontal impacts. The up-front sensors are located in the front end above the longitudinal subframe members. The up-front sensors provide the MRS control unit with the initial information on the progression and severity of the impact.

An up-front sensor consists of an acceleration sensor for detecting deceleration, a signal converter and a microprocessor for data transmission.

The up-front sensors are supplied with power via a current-signal interface. The up-front sensors are supplied with a current of 5 - 10 mA. When a data message is transmitted, the level jumps vertically by 20 mA.

The advantage of the current-signal interface is its constant supply of current which prevents corruption of the signal. A change of resistance in the lead does not affect the signal.

A power supply with a voltage signal would be corrupted by changes in resistance in the lead. The signal could equally be corrupted by EMC interference from other leads.

Door Pressure Sensors

The function of the door pressure sensors (1) is to provide supplementary detection of side impacts in addition to the information supplied by the lateral acceleration sensors in the B-pillar satellites and the MRS4RD control unit. The door pressure sensors are located on the inner door panel and measure the pressure inside the door.

G03399721

Fig. 4: Identifying Door Pressure Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

In the event of a side impact, the outer door panel may be pushed inwards, thus compressing the space inside the door and increasing the pressure. That pressure increase is detected by the door pressure sensors. At the same time, the side impact is detected by the acceleration sensors in the B-pillar satellite. The B-pillar satellite then also transmits a data message. The MRS4RD control unit in the center of the vehicle processes the two signals and is able to trigger the restraint systems on the basis of the information provided.

B-Pillar Satellites

The two MRSA modules (multiple restraint system external satellites) which were previously positioned under the seats, have been replaced by B-pillar satellites. Each B-pillar satellite consists of a lateral acceleration sensor and a linear acceleration sensor.

As with the up-front sensors, signal transmission is cyclic. The B-pillar satellites detect side, front and rear impacts.

The left and right B-pillar satellites are identical.

G03399722

Fig. 5: Identifying B-Pillar Satellites
Courtesy of BMW OF NORTH AMERICA, INC.

Seat Occupancy Detector (OC-3 Mat)

Because of the legal situation in the USA, the presence of a child seat for a child up to one year old must be automatically detected and the passenger airbags then deactivated. The OC3 mat detects a child seat that conforms to the relevant standard (NHTSA FMVSS 208) by virtue of the pattern of the impression it makes on the seat and deactivates the passenger airbags.

A straightforward seat occupancy detector recognizes a certain weight as proof that the seat is occupied. In order to meet legislative requirements, the seat occupancy detector (SBE) has been developed into an intelligent occupant classifier (OC). This was achieved by means of the following measures:

- By a larger number of sensor elements
- By sensing a larger area of the seat
- By an intelligent electronic analyzer

G03399723

Fig. 6: Identifying OC3 Mat
Courtesy of BMW OF NORTH AMERICA, INC.

OC3 Mat

G03399724

Fig. 7: Identifying Convention Seat Occupancy Detector
Courtesy of BMW OF NORTH AMERICA, INC.

Convention Seat Occupancy Detector

The OC-3 mat is capable of distinguishing between a one-year-old child in a child's seat and a light person.

The OC-3 mat is integrated into the seat area of the passenger seat. The OC-3 mat consists of conductors with pressure-dependent resistor elements (FSR, or Force Sensitive Resistance elements). The conductors are

connected to the electronic analyzer.

The FSR elements are wired in such a way that they can be sampled individually. When the mechanical load on a sensor element increases electrical resistance decreases and the measurement current changes accordingly.

By analyzing the signals from the individual sensors, the analyzer maps the occupancy of the seat surface and can identify the local concentrations of weight. The distances between the areas where pressure is applied and the concentrations of pressure reveal whether the seat is occupied by a person (A) or a child seat (B).

G03399725

Fig. 8: Identifying Local Concentrations Of Weight
Courtesy of BMW OF NORTH AMERICA, INC.

The analyzer of the OC3 mat sends a message to the MRS4RD control unit via the K-bus. If the system detects that the seat is unoccupied or that a child seat for a child up to one year old is fitted, the airbags on the passenger side are deactivated. The MRS4RD control unit switches on the airbag warning light. The airbag warning light indicates that the airbags on the passenger side are deactivated.

NOTE: The airbag warning light is switched on if the seat is unoccupied.

Belt Buckle Switch

The belt buckle switch is used to detect whether the seatbelt has been fastened or not. The detection signal is sent to the MRS4RD control unit. The signal is used as a criterion for selective triggering of the actuators in the event of a crash. The belt buckle switch is located in the seatbelt buckle on the driver and passenger seat.

The belt buckle switch is a two-wire Hall switch. The Hall switch is supplied by the MRS4RD control unit via a current-signal interface. The current draw of the switch is the signal for the switch position. The belt buckle switch is permanently diagnosed and monitored in all electrical system statuses from Terminal R "ON" onwards.

Actuators

The Multiple Restraint System 4 Redesign is responsible for activation of the following actuators:

- Front airbag, 2-stage, driver's side
- Front airbag, 2-stage, passenger side
- Head air bag (curtain airbag), left and right
- Side airbag, front door, left and right
- Side airbag, rear door, left and right
- Seatbelt tensioner, front, left and right
- Safety battery terminal
- Airbag warning lamp

Driver's Airbag

The purpose of the driver's front airbag in conjunction with the seatbelt is to reduce the risk of serious or fatal injury to the driver in the event of a head-on collision. The front airbag for the driver's side is located in the impact pad of the steering wheel. The front airbag for the driver is equipped with a 2-stage gas generator.

Depending on the crash severity, the two stages of the airbag are ignited with a delay. The two stages of the gas generator permit the airbag to perform its restraining function in a manner appropriate to the severity of the collision, thus avoiding additional trauma to the driver during the deployment stage. The gas flowing into the airbag inflates it, and in combination with the seat belt this reduces the risk of injury in an accident.

Passenger Airbag

The purpose of the passenger front airbag in conjunction with the seatbelt is to reduce the risk of serious or fatal injury to the front passenger in the event of a head-on collision. The 2-stage passenger front airbag is located underneath the dashboard.

In a crash and depending on crash severity, the two stages of the airbag are triggered with a delay. In this way the restraining effect is matched to the severity of the crash situation. Another effect is to reduce the strain on the occupant during the airbag-deployment phase.

When the passenger airbag inflates, a hinged flap that is attached to the dashboard opens. The passenger airbag inflates towards the windscreen. The front passenger's airbag emerges upwards and supports itself on the windscreen glass and the dashboard.

Head Airbag (Curtain Airbag)

On the E83, a new head protection system, the curtain airbag, is introduced as standard equipment for the first time. It differs from the head-protection system used on the E46/E53 as follows:

- Continuous head airbag extending all the way from the A-pillar to the C-pillar

The curtain airbag extends all the way from the A-pillar to the C-pillar, covering the entire side-window area. The curtain airbag inflates between the vehicle occupants and the side windows and pillar trims. In conjunction with the side airbags in the front and rear doors, it provides optimum protection for all passengers in the event of a side on impact.

The curtain airbag reduces the risk of occupants' heads or other extremities protruding through the windows in a sideways collision. This leads to less severe neck backlash forces and less severe head injuries.

Advantages of the system:

- Extended covered area for side windows front and rear.
- Protection against glass splinters and penetrating objects.
- Optimized protective area offering protection for occupants of differing sizes.

G03399726

Fig. 9: Identifying Head Airbag (Curtain Airbag)
Courtesy of BMW OF NORTH AMERICA, INC.

The curtain airbag is positioned along the line of roof side member, folded up. It consists of a gas generator, the two gas lances and the curtain.

In the event of a side-on collision, the generator is detonated and the gas flows through the two gas lances into the curtain. Simultaneous inflation of the curtain at the front and back achieves more even deployment.

The attachment of the curtain airbag to the A-pillar and the C-pillar pulls it into position. The curtain airbag inflates between the vehicle occupants and the side windows and pillar trims.

Being a sealed system, the curtain airbag retains its shape and strength for several seconds.

Curtain Airbag

Fig. 10: Identifying Curtain Airbag
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 11: Identifying Gas Generator
Courtesy of BMW OF NORTH AMERICA, INC.

Side Airbag

The side airbags in the front and rear doors reduce the risk of occupant injury in the torso region of the body in the event of a side-on impact.

The side airbags are folded up inside an aluminum casing with a plastic cover behind the door trim panels. In the area of the side airbag in the door trim is a tear seam. The side airbags are fixed to the door trims as well as by a single screw to the inner door panel.

The plastic cover has defined breaking points. In a side impact of sufficient severity, the side airbag is triggered. The side airbag exits through the split line and deploys between the door and the rear occupants.

Seatbelt Tensioner

The pyrotechnic seatbelt tensioner has the task in the event of a crash to minimize any belt slack in the pelvic and shoulder region.

The seatbelt tensioner is located on the driver's and/or passenger seat. In combination with the mechanical force limiter in the inertia reel, this reduces the chest load for the seat occupants.

BST

If the MRS detects an impact of sufficient severity, the safety battery terminal is deployed. When this happens, the starter/alternator cable is electrically and mechanically disconnected. The alternator is deenergized. The safety battery terminal is located directly at the positive terminal of the battery.

G03399729

Fig. 12: Identifying BST

Courtesy of BMW OF NORTH AMERICA, INC.

SYSTEM FUNCTIONS

The MRS4RD control unit has to perform the following functions:

- Crash detection and calculation of deployment timing
- Activation of deployment output stages
- Documentation of time sequence of actuator deployment
- Pre-drive check
- Cyclic monitoring
- Indication of system readiness
- Indication and storage of faults
- Output of fault data (diagnosis)
- Output of crash signal for other members of the communication network
- Activation of the warning lamp if the passenger airbag is deactivated

Deployment

For the deployment output stages to be activated, the appropriate signals must be received from two different sensors, i.e. the B-pillar satellite and the MRS control-unit sensor.

In electrical-system statuses from Terminal R "ON" onwards, the MRS4RD control unit is supplied with power and is ready for operation on completion of the pre-drive check. The deployment capacitor, which acts as a power reserve, is charged to approx. 26 V via a switching regulator. The deployment capacitor provides the back-up power supply in the event of a crash in which the battery power supply is cut off.

The deployment capacitor, which provides the deployment power for the deployment output stages is controlled by a safety switch (trigger switch). The safety switch is operated by the microprocessor.

The deployment output stages consist of a high-side and a low-side power switch. The high-side power switch switches the deployment current and the low-side power switch switches the earth current. The high-side and low-side power switches are also used to check the deployment circuits as part of the pre-drive check.

The incoming sensor signals are analyzed by the analyzer module and passed on to the microprocessor. The microprocessor performs the deployment-algorithm calculations. The calculation results are compared with the event/deployment matrix and a decision reached as to the deployment of the various detonator pellets.

Pre-Drive Check

As of system status Terminal R "ON," the MRS4RD performs a pre-drive check (system test). While the pre-drive check is in progress, the airbag warning lamp is switched on for 3 - 5 seconds. Once the pre-drive check has been completed, and assuming no faults have been detected, the airbag warning lamp is switched off and the system is ready for operation.

The following tests are performed as part of the pre-drive check:

- Comparison of programmed equipment with actual equipment fitted
- Testing of deployment circuits
- Testing of resistance of deployment circuits
- Testing of internal components
- Testing of external components
- Checksum calculation for algorithm parameters

Cyclic Check

Once the pre-drive check has been successfully completed and the system is ready for operation, a cyclic check for the purposes of fault monitoring is performed. The cyclic check continues to be carried out as long as the system status is Terminal R "ON."

The following tests are performed as part of the cyclic check:

- Monitoring of resistance of deployment circuits
- Communication capability and status of components
- Power supply

System Readiness

The MRS4RD indicates that the system is ready for operation by extinguishing the airbag warning lamp (AWL).

Fault Storage

If there is a fault in the system, it is indicated by the airbag warning lamp.

If a fault occurs on the MRS4RD, it must be stored in a non-volatile memory (EEPROM). When faults are recorded, a distinction is made between internal and external faults.

If an internal fault has been detected, the record of the fault cannot be deleted, i.e. the control unit has to be replaced. The only exception in that regard is incorrect programming data.

External faults on system components are also recorded in the fault memory. Once such faults have been rectified, the record can be removed from the fault memory.

Crash Signal

In the event of a crash involving deployment of the restraint systems, the MRS4RD control unit sends a crash signal to the members of the bus network.

On receipt of that signal, the control units concerned perform the following functions according to the severity of the crash:

- Switch off electric fuel pump
- Switch off alternator
- Unlock central locking system
- Switch on hazard warning flashers
- Make emergency call (only if Professional phone option fitted)

EMERGENCY CALL (IF EQUIPPED W/TELEMATICS)

The E83 offers the customer a number of emergency call functions and a breakdown call function if the vehicle is equipped w/Telematics. The emergency call functions include a manual emergency call as well as the automatic emergency call activated as a result of a crash of appropriate severity.

Even if the vehicle is not equipped with the Motorola Everest telephone, every vehicle has a Telematic Control Unit TCU (if equipped w/Telematics), a telephone aerial, a hands-free unit as well as a GPS aerial for localization.

Manual Emergency Call

The emergency call switch (4) is connected directly to the telephone. Pressing the emergency call switch sets up a voice connection with the provider "Cross Country." The voice connection is indicated by a flashing LED in the switch.

Breakdown Call

The Breakdown call button in the Central Information Display can be activated by means of the controller. If the breakdown call button is activated, a connection to the BMW Emergency Service of the relevant country is set up.

Automatic Emergency Call

In the event of a crash of the appropriate severity, the MRS4RD control unit transmits a crash telegram to the TCU. The TCU places an emergency call, which at the same time contains the location of the vehicle.

If a navigation system is installed, the location of the vehicle is notified to the TCU. If no navigation system is installed, the location of the vehicle is determined by the internal GPS receiver of the TCU.

A voice connection is set up with the provider "Cross Country" to obtain more information on the accident (severity of the accident, number of injured) so that rescue operations can be initiated.

GENERAL INFORMATION

Starting Systems - Overview

STARTING SYSTEMS

Model: All

Production Date: All

PURPOSE OF STARTING SYSTEM

The purpose of the starting system is to convert chemical energy stored in the battery into electrical energy, then into mechanical energy in the starter motor. This mechanical energy is then transferred through gears and drives from the starter motor to the engine flywheel.

After the transfer and conversion of all this energy the engine flywheel begins to rotate.

The rotation must be of sufficient speed to allow the engine to form the combustible air-fuel mixture required for starting. It must be maintained during initial combustion long enough until the engine can sustain operation.

To accomplish this a starter or cranking motor is used.

The starting system consists of the following components:

- Battery.
- Ignition Switch.
- Starter Motor Assembly.
- EWS (if equipped).
- Starter Safety Switch.
- Cables and Wiring Harness.

Fig. 1: Identifying Starting System

Courtesy of BMW OF NORTH AMERICA, INC.

SYSTEM COMPONENTS

Battery

The Battery is the primary EMF source in the automobile. The automotive battery is an electromechanical device that provides the potential difference (voltage). The battery does not store electrical energy. It stores chemical energy that is converted to electrical energy as it discharges.

All energy for starting the car is drawn from the battery. State-of-charge, and capacity of the battery are important factors in the ability of the engine to start, especially in cold and harsh conditions.

Ignition Switch

The Ignition Switch provides a request to the starting system to engage the starter motor. This request is handled differently depending on the year of the vehicle and particular systems the vehicle is fitted with.

In non EWS systems the ignition switch provided power directly to the starter solenoid or a starter relay. Beginning with EWS I the start request (KL50) is passed to an Immobilizer control module or an EWS module (EWS II/III).

On vehicles with one touch starting the KL50 signal is passed to the DME.

Starter Motor Assembly

The Starter Motor Assembly is a DC motor which uses the interaction of magnetic fields to convert electrical energy into mechanical energy.

G03390223

Fig. 2: Identifying Starter Motor Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

Electric Starter Motor

The Starter Motor provides the mechanical energy to rotate the engine through a direct or a gear reduction drive.

- Armature Shaft (1)
- Armature Winding (2)
- Armature Stack (3)
- Commutator (4)
- Poles Shoes (5)
- Field Coil (6)
- Carbon Brushes (7)
- Brush Holder (8)

G03390224

Fig. 3: Identifying Major Components Of Starter Motor
Courtesy of BMW OF NORTH AMERICA, INC.

Armature

The Armature assembly is comprised of the armature shaft, armature winding, armature stack and commutator. Thin iron stampings are laminated together to form the stack or core. The slots on the outside of the laminations hold the armature windings. The windings loop around the core and are connected to the commutator. Each commutator segment is insulated from the adjacent segments. The commutator may have up to 30 segments. A steel shaft is insert in the center hole of the laminations with the commutator insulated from the shaft.

G03390225

Fig. 4: Expanded View Of Armature Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

Field Coils

There are two types of field coils:

- Electromagnetic.
- Permanent magnet.

Electromagnetic

Wire ribbons or coils wrapped around a pole shoe, attached to the inside of the starter housing. The iron pole shoes and the iron starter housing work together to increase and concentrate the strength of the field coils. When current flows through the field coils strong electromagnetic fields with North and South poles are created.

Permanent

Multiple permanent magnets manufactured from an alloy of boron, neodymium and iron are positioned in the starter housing. Use of permanent magnets allow for the elimination of the field circuit and windings and realize a 50% weight savings.

Brushes

Brushes are electrically conductive sliding contacts, usually made of copper and carbon. The brushes make contact with the commutator and as the starter begins to rotate the brushes reverse the flow of current to the armature. Starter brushes carry the full flow of current through the motor.

Solenoid

The Solenoid assembly is an integral part of the starter and is actually a combined relay and engagement solenoid.

G03390226

Fig. 5: Identifying Solenoid Switch And Pinion Engaging Drive
Courtesy of BMW OF NORTH AMERICA, INC.

Solenoid switch and pinion engaging drive.

The solenoid has two functions:

- Pushing the pinion forward so that it engages in the ring gear of the engine.
- Closing the moving contact, providing the main current path for the starter.

The solenoid has two windings.

- Pull-in winding.
- Holding-in winding.

Both windings are used to draw in the plunger and engage the pinion, only the hold-in winding is used to hold the plunger in position.

Pinion Engaging Drive

The starter's end shield assembly contains the Pinion Engaging Drive with pinion, overrunning clutch, engagement lever and spring. The drive mechanism is responsible for coordinating the thrust motion of the solenoid switch and the rotary motion of the electric starter motor and transferring them to the pinion.

The starter engages the ring gear on the flywheel by means of the pinion. A high conversion ratio of pinion teeth to flywheel teeth (between 10:1 and 15:1) make it possible to overcome the high cranking resistance of the engine using a relatively small but high speed starter motor.

As soon as the engine starts and accelerates past cranking speed, the pinion must automatically demesh in order to protect the starter. For this reason, the starter incorporates an overrunning clutch.

STARTER DRIVES

Conventional Drive

In a Conventional Drive starter the pinion gear is located directly on the armature shaft.

The pinion and overrunning clutch form the driver assembly.

The driver assembly rides on a helical spline on the armature shaft so that when the driver is thrust by the solenoid, a combined axial and rotary motion occurs which greatly facilitates the meshing of the pinion.

Gear Reduction Drive

In their design and function, Gear Reduction Drives are much the same as conventional drive starters. The main difference in the gear reduction drive starter is a planetary gear set added between the field frame and the drive end shield. This design allows for the use of smaller and lighter starters.

OVERRUNNING CLUTCH

In all starter designs the rotary motion is transmitted via an Overrunning Clutch. The overrunning clutch allows the pinion to be driven by the armature shaft (or planetary gear set), however it breaks the connection between the pinion and the armature shaft as soon as the accelerating engine spins the pinion faster than the starter.

The overrunning clutch is located between the starter motor and the pinion and prevents the starter motor armature from being accelerated to an excessive speed when the engine starts.

EWS

The EWS system(s) is designed to provide electronic anti-theft protection for the vehicle through the use of coded keys and coded data communication between the EWS and the engine control module. The starter and engine control module are locked out until a properly coded key is recognized and the proper code is established between the EWS and the engine control modules.

Starter Safety Switch

The Starter Safety Switch is part of the transmission range switch on automatic transmission vehicles and a clutch switch on manual transmission vehicles (beginning MY 1997). The purpose of the switch is to prevent engine start-up with the vehicle in gear or the clutch not depressed. On vehicles with EWS, this signal is sent directly to the EWS module for processing.

Cable and Wiring Harness

Cables to the starter from the battery must carry large amounts of current. The wiring harness from the ignition switch and/or EWS carry little current as they are control signals to a relay or starter solenoid. Minimum voltage drop in starter cables is necessary to ensure sufficient starter speed and torque.

PRINCIPLE OF OPERATION

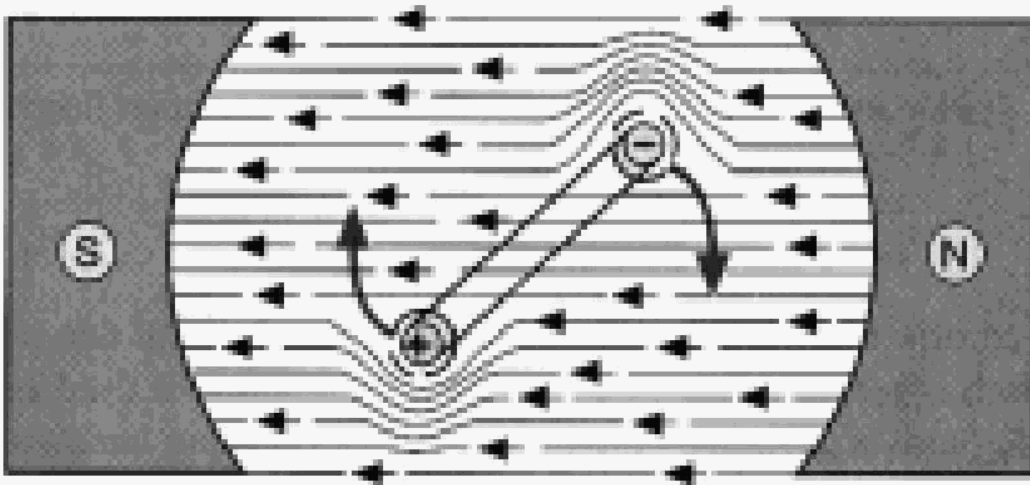

Electric Starter Motor

The Electric Starter Motor converts electrical current into rotary motion. In doing so it converts electrical energy into mechanical energy. The interaction of two magnetic fields produce this rotational force.

The field coils (either electromagnetic or permanent) located in the housing produce magnetic flux lines. Within the stationary field coils is the armature, a loop of wire (a conductor) with one end connected to B+, the other to B-. When current is applied to the armature flux lines circle the loop in one direction on one side and in the opposite direction on the other side. The interaction of the flux lines on the armature and the flux lines from the field coil cause the armature to rotate.

The armature will only rotate to the point where the magnetic force is equal on both sides. (Armature 90° to magnetic flux lines of field) For the armature to continue to rotate, the polarity or direction of current flow must be reversed.

Through the brushes and the commutator, the current flow is reversed as the magnetic forces become equal, causing the armature to continue to rotate.

G03390231

Fig. 10: Identifying Magnetic Flux Lines
Courtesy of BMW OF NORTH AMERICA, INC.

This constant reversal of current flow in the armature provides continual rotation.

Direction of rotation is determined using **Flemings Left Hand Rule**.

- Point your First finger in the direction of the magnetic Field (from N to S).
- Rotate your hand about that finger until your second finger points in the direction of the Current

(conventional current, from + to -).

G03390232

Fig. 11: Identifying Magnetic Field
Courtesy of BMW OF NORTH AMERICA, INC.

Loop symbolizes force out of magnetic field.

- Then your thumb points in the direction of the Movement of the wire.

To increase the force on the wire (armature) do one of the following:

- Use a larger current.
- Use a stronger magnetic field.
- Use a greater length of wire in the field.

To increase torque and speed in the starter motor, more windings in the armature are added, and the field has more pairs of magnets (either permanent or electromagnetic).

Flemings left hand rule:

The basic law of motors, the direction of force on a wire that is carrying current when it is in a magnetic field.

Fig. 12: Illustrating Fleming's Left Hand Rule
Courtesy of BMW OF NORTH AMERICA, INC.

MOTOR WINDINGS

Torque and speed of the starter motor is dependent on the wiring of the field coils (electromagnetic coils).

There are three types of Motor Windings:

- Shunt Wound.
- Series Wound.
- Compound.

Shunt Wound Motors

In Shunt Wound Motors, the field coil is connected in parallel with the armature. The shunt motor does not decrease its torque as speed increases. Shunt motors do not produce high torque.

G03390234

Fig. 13: Identifying Shunt Wound Motors
Courtesy of BMW OF NORTH AMERICA, INC.

Series Wound Motors

In Series Wound Motors, the field coil is in series with the armature.

The current flows to the field windings, then to the brushes, commutator, and armature back again to the ground side brush. A series wound motor will develop maximum torque output at the time of initial start, then as motor

speed increases, torque falls off rapidly due to the CEMF.

Fig. 14: Identifying Series Wound Motors
Courtesy of BMW OF NORTH AMERICA, INC.

Compound Wound Motors

Compound Wound Motors have some of the field coils wired in series to the armature and some in parallel. This configuration allows the compound motor to develop good starting torque and constant operating speed.

CEMF:

Counter Electromotive Force.

The voltage produced in the starter motor itself through electromagnetic induction.

This voltage acts against the supply voltage from the battery.

Motors must be designed to control the CEMF for optimum operation.

Permanent Magnet Motors

Permanent Magnet Motors eliminate all wiring to the field coils. The magnetic field is generated by the permanent magnet without the need for winding and pole shoes. The magnets use flux-concentrating pieces to direct the magnetic field.

G03390236

Fig. 15: Identifying Permanent Magnet Motors
Courtesy of BMW OF NORTH AMERICA, INC.

G03390237

Fig. 16: Identifying Permanent Magnets With Flux Concentrating Pieces
Courtesy of BMW OF NORTH AMERICA, INC.

Arrangement of permanent magnets (M) with flux concentrating pieces (F).

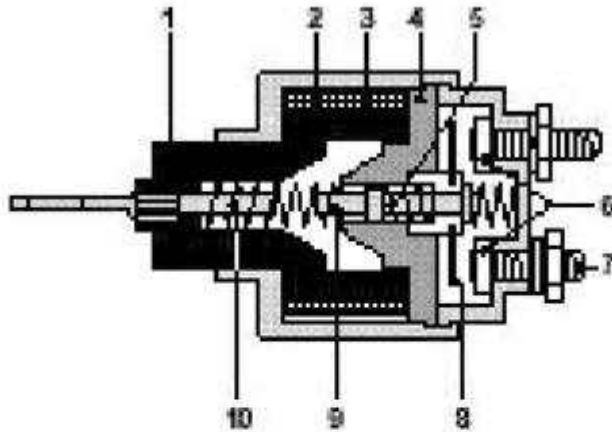

SOLENOID

The Solenoid performs the following functions:

- Pull the pinion to engage the flywheel.

- Hold the pinion engaged with the flywheel during starting rotation.
- Complete the electrical circuit from the battery to the brushes of the starter.
- Cause the pinion to retract from the flywheel.

Two windings are used to pull and hold the pinion engaged to the flywheel.

- | | |

| 9. Switching pin | 10. Return spring |

G03390238

Fig. 17: Identifying Solenoid Components

Courtesy of BMW OF NORTH AMERICA, INC.

Pull-In Winding- The stronger of the two windings, used to pull the pinion into engagement. This winding is released when the starter circuit is completed.

Hold-In Winding- Used to help the pull-in winding move the pinion initially, then holds the pinion engaged to the flywheel.

Signal 50 is received at the solenoid, energizing both windings. The windings cause the armature to be drawn into the coils, pressing on a spring, causing the moving contacts to close. The pull-in winding is released, the starter begins to turn. When signal 50 is released, the power is lost to the hold-in winding, spring pressure forces the armature out of the coil, the moving contacts are opened and the pinion returns to the rest position.

Workshop Hint:

The starter motor does not begin to spin until after the pinion is engaged in the flywheel.

This aids in the meshing of the pinion and flywheel

Workshop Hint:

Battery voltage is critical.

The combination of the pull-in winding and the hold-in winding may have sufficient power to engage the pinion. When the moving contacts are completed and the increased load of the starter motor is added to the system, low voltage will cause the hold-in winding to release the pinion. If signal 50 is still present the pull-in winding will again assist in pulling the pinion into engagement and the cycle starts over again. This gives the "clicking" noise from the starter.

Pinion Drive

The Pinion Drive gear is attached to the roller-type overrunning clutch which is splined via a helical shaft to the starter armature. At rest the spring pressure in the overrunning clutch wedge rollers between the pinion shaft and the clutch hub race. This locks the pinion to the clutch. During start-up the clutch and pinion rotate as one.

As the engine speed exceeds starter speed, the pinion pushes the rollers, against the spring pressure, into a wider area. This movement of the rollers allow the pinion to turn independently of the starter armature, not causing the armature to overspeed.

When the solenoid windings are released the clutch assembly is pulled away from the flywheel through spring pressure.

GENERAL INFORMATION

Telephone Diagnostics - Overview - All Models

TELEMATICS

FREQUENTLY ASKED QUESTIONS

1. What is telematics?

Telematics combines wireless voice and data to provide location-specific security, information, productivity, and in-vehicle entertainment services to drivers and their passengers.

2. How does a telematics system work?

The heart of a telematics system within the car is a telematics Communications Unit (TCU) that is connected (wirelessly) to a central service center. The TCU serves as the central platform of a telematics system, where all telematics-related technologies are deeply integrated. It communicates location-specific information to a central service center and in turn the center helps deliver telematics services to a driver via the cellular phone.

These services can include dispatching ambulance services to a driver in an emergency situation, or sending roadside assistance to a driver whose car has broken down. Other services include the ability of a central server to deliver navigation assistance and real-time traffic information, among others. What's more, the TCU is also connected to the engine control unit (or the onboard computer) which enables enhanced services such as remote engine diagnostics and automatic airbag notification.(01)

3. What is the difference between telematics and navigation systems?

A telematics system provides numerous services to drivers, and navigation is simply one of the services offered. Navigation systems that are starting to appear in highend cars today are referred to as autonomous navigation systems. Here, the navigation database resides in the car on a CD. These systems are relatively expensive. telematics systems provide navigation assistance "off-board". This means that the database resides outside the car, making the service far more affordable to a wider number of people.

4. Where does the word "telematics" come from?

The term originated in Europe and remains widely used in the European automotive industry to describe automotive communications technologies.

5. Can you explain a telematics system in technological detail? What are its components?

The main component in a telematics system is the telematics Communications Unit (TCU). In North America, a TCU contains a Motorola GPS receiver, cellular transceiver, and modem/transceiver control board. In Europe, a TCU contains a Motorola GPS receiver and GSM transceiver. Motorola's European telematics systems do not require a modem due to the already existing digital data transfer services, such as SMS (short message service) available with GSM.

Every telematics system developed by Motorola contains Motorola's automotive-grade telematics software, which is uniquely programmed to deeply integrate the components of a TCU, enabling simplified delivery of telematics services from one centralized area.

6. What services does a telematics system offer today?

Today, telematics systems offer drivers emergency and roadside assistance, air bag deployment notification, navigation, remote door unlock, vehicle security notification and stolen vehicle tracking services.(01) (02)

7. What services will telematics offer in the future?

Just as today's telematics safety and security features are a direct result of initial consumer demand, future telematics services will also be a direct result of what drivers want in their cars. These systems may provide customized services such as travel information (traffic updates, parking availability, airline status), messaging (voice mail and email retrieval), information (sports, weather, stock market updates and Internet access) and entertainment (audio games, books, magazines and newspapers). These are only a few of the applications which will evolve with telematics to keep drivers and their passengers in touch.

Eventually, telematics will even reach outside the car and communicate with the office and home, extending far beyond voice conversations. Drivers will be able to turn on home lights, start and stop the sprinkler system, set their office security system - all via their telematics systems.

8. How does a driver interact with a telematics system?

Drivers activate telematics systems via buttons located on the dashboard or the overhead console of the car. Motorola works with each automaker to help develop a purpose-built system for the projected ergonomic desires of drivers. The BMW Mayday telematics system has an emergency and roadside assistance button located on a cellular handset. The Mercedes TeleAid system has an S.O.S. button located behind the rear view mirror and "Information" and "Roadside Assistance" buttons located in the armrest.

9. Can a Global Positioning System (GPS) phone handle telematics services?

We have several concerns about integrating GPS functionality into a phone handset, instead of the vehicle itself.

Our first issue is the ability of a GPS phone to operate inside of the automobile without an external GPS or cellular antenna. GPS antennas must have an unrestricted view of the sky to track satellites. So the decision must be made whether it's more cost-effective to have the GPS in the phone or in the car.

Furthermore, integrating telematics into a portable phone may be very attractive from a cost and convenience perspective, but does not support the stolen vehicle alarm, door lock/unlock, and other features that require the device to remain in the car when the occupants have left.

Finally, GPS is only one part of the locating solution. In addition, cellular infrastructure positioning, such as cell tower triangulation, can help. Given current technology, GPS does not operate as effectively inside multiple story, concrete or metal buildings, where many emergency calls originate.

All of these issues, and many others, are taken into account when designing telematics systems and service.

10. How does the airbag deployment notification feature work?

The TCU is constantly "listening" or on the lookout for any sign of emergency. Because the TCU is connected to the engine control unit, when the airbag sensor sends a message to the engine controller to deploy the airbag, the controller alerts the TCU as well. Automotive-grade software that enables these functions and assures their reliability.

Once the TCU is alerted, it automatically makes a cellular call to the response center. The call gets priority call status and jumps ahead of other telematics calls, and the operator is alerted that a call has been received from an airbag deployment. That way, emergency crews can be sent immediately to the scene. (01)

11. What services do consumers really want in their cars?

Initially, autonomous navigation-only systems caught the fancy of drivers in Europe and Japan, while in North America, consumers were more interested in emergency response or emergency call systems. Increasingly, consumers are attracted to the broader spectrum of telematics services, such as the delivery of personalized information and entertainment.

12. Do Motorola's systems use digital cellular technology?

Yes. In Europe, Motorola's telematics systems use the European digital standard, GSM.

In North America, however, only AMPS offers the broad geographic coverage essential for reliable emergency response services. That's why it's the system being utilized in North American telematics right now.

13. What do telematics systems cost?

While each automotive company determines its own pricing, system prices currently range from \$500 to \$2000 in Europe and North America. Some GM vehicles include the OnStar system at no additional equipment charge, and require only a low monthly service fee. Monthly service costs vary, depending on the services offered. Like other new technologies, we anticipate that consumer demand will ultimately drive these costs down.

14. Do European and North American drivers expect different features?

It's clear that Europeans and Americans are all interested in navigation, safety and security services. But the degree to which they prioritize these services varies.

In Europe, there is a greater emphasis on navigation. At the same time, frequent cross-border travel creates language barriers, making familiar navigation and security services even more welcome. In the United States and Canada, safety and security are the most desired services. North Americans are also interested in navigation, but the need for it is not as great. All drivers are interested in getting real-time traffic information.

15. When will North American telematics make the shift to digital?

In North America, the growth of telematics depends on digital cellular standards providing service over a larger geographic area, especially in cities. Unlike the European-wide GSM standard, North America has multiple standards including AMPS, TDMA, CDMA, GSM and iDEN®.

Today, only AMPS offers wide enough geographic cellular coverage for emergency response services. That's why it is utilized in the Motorola telematics systems Motorola currently installed in North America. For data transmission on analog AMPS, modems can be added to the telematics hardware and central service center. In the future, systems will be based on digital wireless, to allow a richer array of features in metropolitan areas.

In addition, as the industry endeavors to deliver comprehensive data services such as Internet access and customized entertainment services, the migration to digital communications technology will be even more essential.

Companies such as Motorola, Nokia, Ericsson and Unwired Planet are addressing these issues for a wide variety of wireless devices. Through the Wireless Applications Protocol (WAP) consortium, we are working together to ensure a reliable and standard method of transferring data over wireless networks worldwide.

16. What new technologies will help deliver greater telematics services?

An important, ongoing initiative that will help drive telematics growth is the ITS Data Bus, or IDB. IDB is based on an open protocol for networking car audio, video, communication and computing devices. Led by the Society of Automotive Engineers (SAE) and supported by several corporations (including Motorola), IDB will allow seamless integration of multiple technologies inside the car.

IDB will allow simple plug-and-play use of any consumer electronics, regardless of the manufacturer. In addition, a firewall contained in the IDB will allow all electronics in the car to operate independently of each other, eliminating signal interference.

17. How will IDB specifically impact telematics?

Many companies are expected to integrate IDB into their telematics components and other electronics systems. Motorola, for example, plans to integrate IDBs into our telematics Communications Units, enabling the system to act as the central hub for all electronics interacting within the car. This will allow consumers to simply plug and play various electronics via their TCU, and take advantage of additional telematics services, without requiring multiple wires and cables overlapping in different areas of their vehicle. Not only will IDB allow easier installations, but it enable drivers to add new services without being concerned about propriety systems and wiring. With IDB, consumers will have greater choice, resulting in greater market growth.

Automatic airbag deployment notification, information services and other telematics services must be supported by your carrier's network, depend on service availability and coverage, and require a subscription. These services are not available in all areas. Check with your service provider for availability. All location based services are subject to the availability of GPS signal or alternative location tracking means. GPS coverage is not

available in all areas.

The use of wireless devices and their accessories may be prohibited or restricted in certain areas. Always obey the laws and regulations on the use of these products. All navigation systems select routes based on several criteria: geographic distance, type of route, and in some cases dynamic traffic information. While these systems usually opt for the shortest travel time to your destination, it is important that you take into account factors including road and driving conditions, terrain and local environments, some of which may contain hazards to you or your vehicle. Always use your best judgment when deciding on a route. As the driver of your vehicle, you are always the final decision-maker, and despite the many advantages of using any Telematics system, you are ultimately responsible for ensuring your safety.

GLOSSARY

AMPS Advanced Mobile Phone System

The first-generation analog cellular phone system that originated in the United States.

APCO

Association of Public Communications Officials

CDMA Code Division Multiple Access

An advanced digital cellular and PCS platform that converts audio signals into a stream of digital information (made up of 1s and 0s). This "digital speech packet" is transmitted via a wide-band channel consisting of several radio frequencies. CDMA differs from the other popular digital cellular platform, TDMA, in that it uses several frequencies instead of just one. These digital platforms ensure greater call clarity and security, prevent cloning fraud and allow a greater number of calls to be handled by a tower or response center at one time.

CDPD Cellular Digital Packet Data

Using the existing AMPS system to carry digital data, by transmitting dense packets of information across vacant analog channels.

CTIA

Cellular Telephone Industry Association

Data Bus

The central collection of wires that carry instructions to electronic components throughout the vehicle.

DCS-1800

The low-power variant of GSM (the European digital standard). Uses a 1.8 GHz carrier. Example: Mercury One-2-One.

DCS-1900

The proposed use of GSM (the European digital standard) with a 1.9 GHz carrier for PCS applications.

DCTU Digital Cordless Telephone U.S.

A standard based on a micro-cellular radio system that provides low-power cordless access between a subscriber and a base station up to a few hundred meters away. DCTU is a version of its European counterpart, DECT.

DECT Digital European Cordless Telephone

A standard based on a micro-cellular radio system that provides low-power cordless access between a subscriber and a base station up to a few hundred meters away.

ETACS Enhanced TACS (Total Access Communication System)

European analog cellular.

ETSI European Telecommunications Standards Institute

The standards body responsible for GSM.

FDMA Frequency Division Multiple Access

Used for AMPS and TACS, the two key analog systems and their variants, this system gives each conversation its own unique radio channel.

FLEX® Protocol

Created by Motorola, FLEX is the global de facto standard for high-speed, one-way alphanumeric paging. With its ability to handle more robust code transport messages effectively, Motorola's FLEX protocol is laying the foundation for graceful growth from 1600 to 6400 bits per second (bps) transmission rates.

Gateway

A device that allows consumer products to interface with the communication system in vehicles, while protecting the vehicle's system from defective devices or inappropriate messages.

GPS Global Positioning System

Also refers to Global Positioning Satellite. A system using satellites, receivers and software to allow users to determine their exact geographic position.

GSM Global System for Mobiles

A European digital standard.

Half-Rate

A variant of GSM, Half-Rate doubles system capacity by more efficient speech coding.

IDB ITS Data Bus

A medium-speed multiplexed bus intended for command and control of devices in vehicles. It has been proposed by Motorola and the Society of Automotive Engineers (SAE) as an industry standard. Should this happen, IDB will allow device manufacturers to create products that will be compatible with all vehicles - versus today's data bus systems which differ by automobile manufacturer. The IDB would interface with an existing vehicle bus through a gateway.

iDEN® Integrated Digital Enhanced Network

A new generation of digital wireless technology developed by Motorola to enable multiple services to be delivered from a single, integrated wireless communications system. iDEN is the backbone of the Nextel all-digital cellular service.

InFLEXion®

A Motorola protocol which enables transmission and storage of voice messages and offers enhanced privacy, channel efficiency and ease of use. What's more, InFLEXion allows greater detail and expression to come through.

IS-41

The protocol for "roaming" within the U.S., describing how services should "hand over" between operators.

IS-54

The TDMA standard for U.S. digital cellular.

IS-95

The CDMA standard for U.S. digital cellular.

ISO 9000

The International Organization for Standardization (ISO) published the ISO 9000 series of quality management and quality assurance standards in 1987 as a means to rationalize the many various national approaches to the subject of product quality. The ISO 9000 series has been widely recognized as an aid in developing manufacturing and service organizations' quality management as an additional assurance to product purchasers that the products and services they buy will consistently meet quality objectives.

ISO 9001

This standard is used when conformance with specific requirements is to be assured by the supplier during several product stages including design and development, production, testing, inspection and servicing.

ITS Intelligent Transportation Systems

A broad range of diverse technologies, including information processing, communications, control and electronics, which, when applied to our transportation system, can save time, money and lives.

ITS America Intelligent Transportation Systems of America

An organization mandated by the U.S. Congress in 1991 to foster public and private partnerships to increase the safety and efficiency of surface transportation through the application of advanced ITS technologies.

JDC Japanese Digital Cellular

Now renamed PDC.

JTAC Japanese Total Access Communication

Like the European TACS, JTAC is the Japanese analog cellular system.

LMR Land Mobile Radio

Wireless communication for specialized applications, such as taxis and emergency services.

MMI Man/Machine Interface

Also known as User Interface. The means by which the user interacts with a machine or device. In the past, knobs, dials and displays manipulated by a user's hand were common interfaces on technical devices. Today, MMI includes more advanced functions such as Voice Dialing, speech synthesis and touch screens.

NAMPS

Narrowband AMPS.

PCS Personal Communications Service

Service that bundles voice communications, numeric and text messaging, voice mail and other features into one device, service or bill.

PCS-1900

Like DCS-1900, this refers to the proposed use of a 1.9 GHz carrier for PCS applications.

PDC Personal Digital Cellular

The Japanese cellular standard.

PHS Personal Handy System

The Japanese cordless phone standard.

Protocol

A standard set of rules that governs how computers or other electronics communicate with one another. Protocols define a message's format as well as how they are exchanged. Agreeing to a standard protocol allows different types of computer systems to communicate with one another in spite of their differences.

PSAP Public Safety Answering Point

PSTN Public Switched Telephone Network

QS 9000

The quality system standard established by Chrysler, Ford, General Motors, truck manufacturers and other subscribing companies. This standard includes the ISO 9000 requirements, plus additional requirements for all aspects of the business. QS 9000 includes a detailed Advanced Product Quality Planning, Control Plan, Continuous Improvement, Production Part Approval Process, Manufacturing Capabilities methodologies and more.

ReFLEX®

The world's first two-way alphanumeric paging protocol, created by Motorola. ReFLEX enables pagers to confirm receipt, respond to and initiate messages.

SAE Society of Automotive Engineers

A one-stop resource for technical information and expertise used in designing, building, maintaining and operating self-propelled vehicles for use on land or sea, in air or space.

SIM Subscriber Identification Module

A card used in GSM to personalize a handset.

TACS Total Access Communication System

European analog cellular.

TCU Telematics Control Unit

The embedded vehicle control unit that communicates with the automobile controls, GPS satellite and customer service center to provide Telematics features to a driver.

TDMA Time Division Multiple Access

An advanced digital cellular platform that converts audio signals into a stream of digital information (made up of 1s and 0s) and divides it into "digital speech packets" according to time. The packets are then transmitted one a single radio frequency. TDMA differs from the other popular digital cellular platform, CDMA, in that it uses one channel instead of many. These digital platforms ensure greater call clarity and security, prevent cloning fraud and allow a greater number of calls to be handled by a tower or response center at one time.

TETRA TERrestrial Trunked RAdio

European digital cellular land mobile radio system.

TIA Telecommunications Industry Association

The United States' telecommunications standards making body.

User Interface

Also known as Man/Machine Interface (MMI). The means by which the user interacts with a machine or device. In the past, knobs, dials and displays manipulated by a user's hand were common interfaces on technical devices. Today, User Interfaces include more advanced functions such as Voice Dialing, speech synthesis and touch screens.

VR Virtual Reality

Used in a variety of Motorola products and services, it is a type of computer-generated environment in which the user interacts with the environment in three dimensions that provide sensory information to make an individual feel that they are in a different place.

WAP Wireless Application Protocol

A standard that aims to align industry efforts to bring advanced applications and Internet content to digital cellular phones.

GENERAL INFORMATION

The Battery - Overview - All Models

THE BATTERY

Model: All

Production Date: All

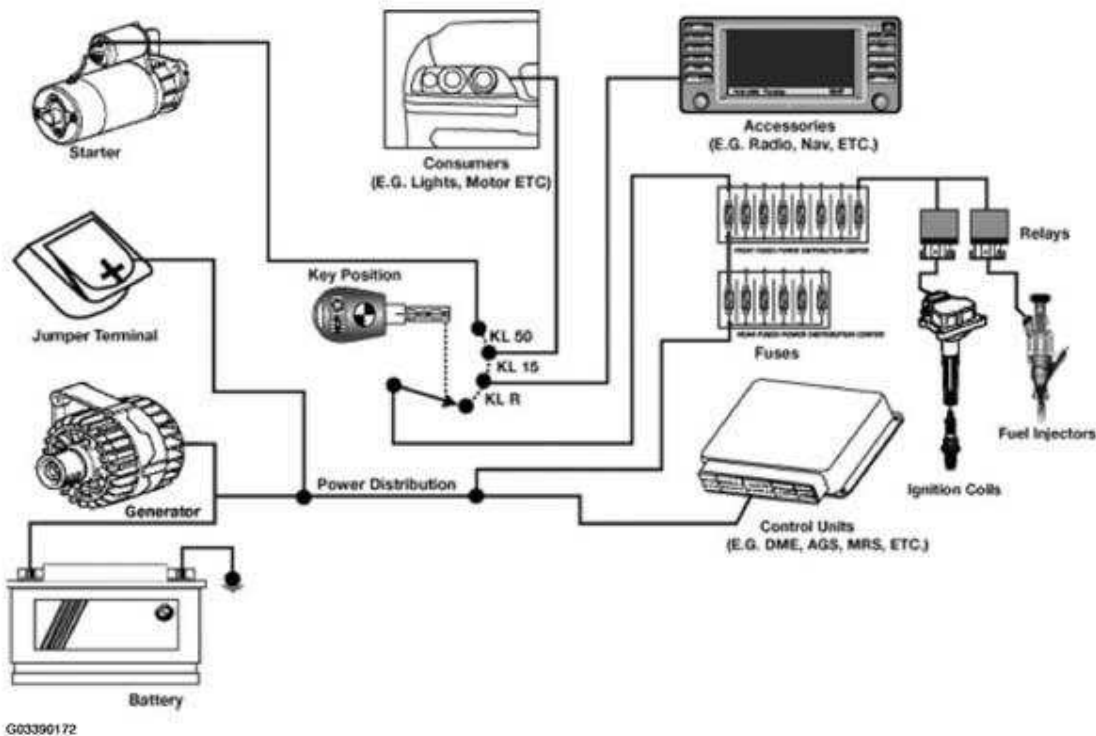

Fig. 1: View Of Electrical Components Connected To Battery
Courtesy of BMW OF NORTH AMERICA, INC.

Purpose of the Automotive Battery:

The battery is the primary EMF source in the automobile. In addition the battery performs the following functions:

- Provides voltage and current for the starter motor.
- Provides voltage and current for the ignition during cranking.
- Supplies all electrical power when the charging system is not operating.
- Supplies the extra power necessary when the vehicle's electrical load exceeds the supply from the charging system.
- Acts as a voltage stabilizer in the electrical system. The battery evens out voltage spikes and prevents

them from damaging other components in the electrical system.

- Provides power to KL30, KL15 and KLR.

The battery does not store electrical energy. It stores chemical energy that is converted to electrical energy as it discharges.

BATTERY CONSTRUCTION

Modern automotive batteries are made of cases (usually plastic) containing alternating plates of Lead and Lead Dioxide (or Lead Oxide) separated by insulators. These alternating plates are connected in series to produce a voltage of 12.6 volts, or about 2.1 volts for each set of Lead and Lead Dioxide plates. The negative terminal is connected to a Lead Dioxide plate and the positive terminal to a Lead plate.

6 x 2.1 volts = 12.6 volts

G03390173

Fig. 2: Identifying Battery Plates

Courtesy of BMW OF NORTH AMERICA, INC.

The plates are covered with electrolyte which is a solution of 35% Sulfuric acid and 65% Water.

G03390174

Fig. 3: Cross Sectional View Of Battery
Courtesy of BMW OF NORTH AMERICA, INC.

1. Plastic container.
2. Positive and negative internal plates made of lead.
3. Plate separators made of porous synthetic material.
4. Electrolyte which is a dilute solution of Sulfuric acid and water better known as Battery Acid.
5. Lead terminals which are the connection point between the battery and whatever it powers.

Battery Case

Most battery cases and their covers are made of polypropylene. The case is divided into six sections or cells, shaped similar to an ice-cube tray.

The case is designed to:

- Withstand hot and cold temperature extremes.
- Resist damage caused by mechanical shock in automotive applications.

- Resist acid absorption and chemical damage.

The Grids

The grids are the supporting framework for the active material of the plates. They also conduct current to and from the active material plates.

Fig. 4: Identifying Battery Grids
Courtesy of BMW OF NORTH AMERICA, INC.

The Plates

Plates are grids covered with a paste mixture of Lead Oxide and Sulfuric Acid and water. An expander material made of powdered sulfates is added to the paste to produce negative plates.

A forming charge is applied to the positive plates converting the Lead Oxide to Lead Dioxide, a highly porous material which allows the electrolyte to freely penetrate the plate.

A forming charge is also applied to the negative plates converting the Lead Oxide to Sponge Lead. The Sponge Lead allows the electrolyte to penetrate freely allowing the material beneath the plate surface to take part in the chemical reaction.

The Separators

Separators are thin sheets of electrically insulating porous material used as spacers between the plates to prevent short circuits within the cells.

Fine pores in the separators allow ionic current flow in the electrolyte between the positive and negative plates.

A cell:
positive and
negative plates
with separators

Cells are connected
with metal that
conducts electricity
from one cell to the
next.

G03390176

Fig. 5: Identifying Battery Separators

Courtesy of BMW OF NORTH AMERICA, INC.

Elements

In the most common method of construction, a stack of alternate positive and negative plates are formed with separators between each positive and negative plate. The lugs of the negative plates are welded together as are

those of the positive plates. The plate strap of each group of plates is used to connect them in series with the plate group of the next cell, or with a battery terminal.

The assembly resulting from placing one positive plate group and one negative plate group together, with separators is known as an element. There is one element per battery cell. More or larger plates per cell will increase plate surface area and increase capacity of the battery but will not affect the voltage output.

Electrolyte

The electrolyte is a mixture of Sulfuric Acid and Water. Electrolyte consists of 35% sulfuric acid and 65% water.

The electrolyte is the carrier for the electric current to move between the positive and negative plates through the separators.

The Lead Terminals

BMW's use a tapered top terminal. This design uses tapered terminal posts built to industry standards so that all cable clamps will fit any battery with these posts.

The positive terminal is slightly larger than the negative to minimize the danger of installing the battery in reverse. The positive terminal is 17.5mm in diameter at the top. The negative terminal is 15.9mm at the top.

Fig. 6: Identifying Battery Terminals
Courtesy of BMW OF NORTH AMERICA, INC.

BATTERY TYPES

There are at least three types of the Lead-acid batteries that are currently used in the Automotive Industry.

Lead-Acid Battery

The three major contributors to battery chemistry are lead, lead dioxide and sulfuric acid. Pure lead is too soft to

withstand the physical abuse of mobile applications, so a strengthener is needed. About 6% antimony, a semi metallic element produced as a by-product to copper and lead ore refining, is added to strengthen the lead.

The antimony added to the grids acts as a catalyst and makes the loss of hydrogen and oxygen through outgassing worse. These batteries require frequent water replenishing.

Lead/Calcium Battery

Introduced in the 1970's Lead/Calcium batteries have Calcium added to the positive and negative grids to reduce the outgassing. These batteries were first referred to as "maintenance free". The Lead/Calcium batteries are not resistant to deep-cycling which occurs when a battery is drained to a very low voltage before being recharged. Frequent deep-cycling renders these batteries unable to sustain a charge. Lead/Calcium batteries need to be charged at higher voltage settings or they will not be recharged to full capacity.

Hybrid Battery

Hybrid batteries use a positive grid strengthened with antimony and a negative grid with calcium. The hybrid battery is more resistant to deep cycling than the lead/calcium, but still not as good as the original Lead-acid battery. Water usage is greatly reduced in the hybrid battery, although regular checking is advisable. Most cars supplied with hybrid batteries have their voltage regulators set to 14.3 volts.

Hybrid batteries were first installed in the E30 convertible during the 1991 Model Year.

HOW THE BATTERY WORKS

Discharging

Batteries don't store electrical energy, they store chemical energy and convert it to electrical energy during the discharging process.

Each cell of a battery contains positive and negative plates (grids). The positive plate is made of lead dioxide, the negative plate of a spongy lead. The negative plate combines with the sulfuric acid to create lead sulfate and one extra electron. The positive plate produces hydrogen ions and sulfuric acid ions (positive ions, atoms missing one electron).

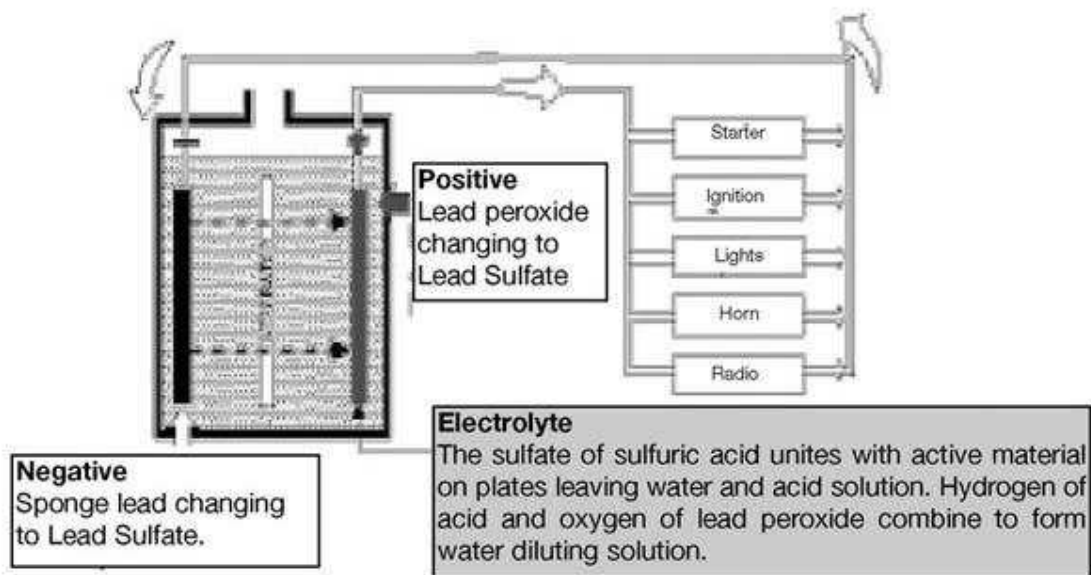

The extra electrons from the negative plate are passed from the negative battery terminal and through the electrical consumer, back to the positive battery terminal. Once back at the battery, the free electrons combine with the positive ions at the positive battery terminal producing lead sulfate and water.

It is important to remember that the system is closed. For every electron generated at the negative terminal, there is an electron consumed at the positive terminal.

As the process continues, the active materials (lead and lead dioxide plates and the electrolyte) become depleted and the reactions slow down until the battery is no longer capable of supplying electrons. At this point the battery is discharged.

The discharge process changes the ratio of sulfuric acid to water in the electrolyte, as more water is produced in the discharge process. By measuring the volume of acid in the water, the state of charge of the battery is

discovered.

G03390178

Fig. 7: Identifying Discharge Process

Courtesy of BMW OF NORTH AMERICA, INC.

Charging

Applying voltage to the battery from an external source such as the generator or battery charger reverses the chemical action in the battery.

Reversing the chemical action in the battery, forces the free electrons at the negative terminal of the battery back into the electrolyte raising the sulfuric acid percentage. This chemical action removes the Lead sulfate that had formed on the negative plates leaving pure active material.

The electrons that were forced into the electrolyte are able to react with the lead sulfate on the positive terminal again raising the Sulfuric acid content and leaving pure active material on the positive plates.

This process enables the battery to be used over and over again.

12V 90RC 425CCA	SAE Group No . 47

fur Ersatz (for replacement):

Teile - Nr. 61 21 6 902 796 Nass (wet)

G03390180

Fig. 9: View Of Battery Label
Courtesy of BMW OF NORTH AMERICA, INC.

- **Ah - Amp Hour Capacity**

This rating is derived from discharging a fully charged battery at a constant amp draw for 20 hours @ 80°F, without the voltage of the battery falling below 10.5 volts. The constant amp draw is multiplied by the 20 hours to come up with the Amp Hour Rating.

- **CCA - Cold Cranking Performance**

Represents the amperage capacity a fully charged battery can deliver @ 0°F for 30 seconds before the voltage of the battery falls below 7.2 volts.

- **RC - Reserve Capacity**

Reserve capacity is expressed in minutes and relates to the amount of time a fully charged battery can maintain a constant draw of 25 amps @ 80°F before the voltage falls below 10.2 volts.

- **W - Watts**

The measurement of electrical power that the battery can deliver for a cold start. It is calculated by multiplying the starter amperage draw @ 0°F times 10 volts.

- **V - Volt**

Unit of measure of potential difference (Electrical pressure).

- **A - Amp**

The current flow in a circuit. Value is proportional to the number of electrons flowing past a point in one second.

- **ohms - Ohm**

The measurement of the resistance of a component or circuit to current flow.

- **Electrolyte**

The mixture of sulfuric acid and water. 35% sulfuric acid, 65% water.

- **Specific Gravity**

The measurement (by weight) of the volume of sulfuric acid in the electrolyte. A specific gravity of 1.275 (the specific gravity of a fully charged battery) means that the electrolyte is 1.275 times heavier than water. The specific gravity of water is 1.000.

- **Sulfate**

Deposits formed on the plates of the battery as the electrolyte gives up its sulfuric acid. Excessive deep

cycling of a battery can cause a hardening of this deposit and make it impossible to return sulfate to the electrolyte. A sulfated battery is one which has these hardened deposits on the plates and cannot be recharged to full capacity.

- **OCV Open Circuit Voltage**

The measurement of the voltage of a battery across the terminals.

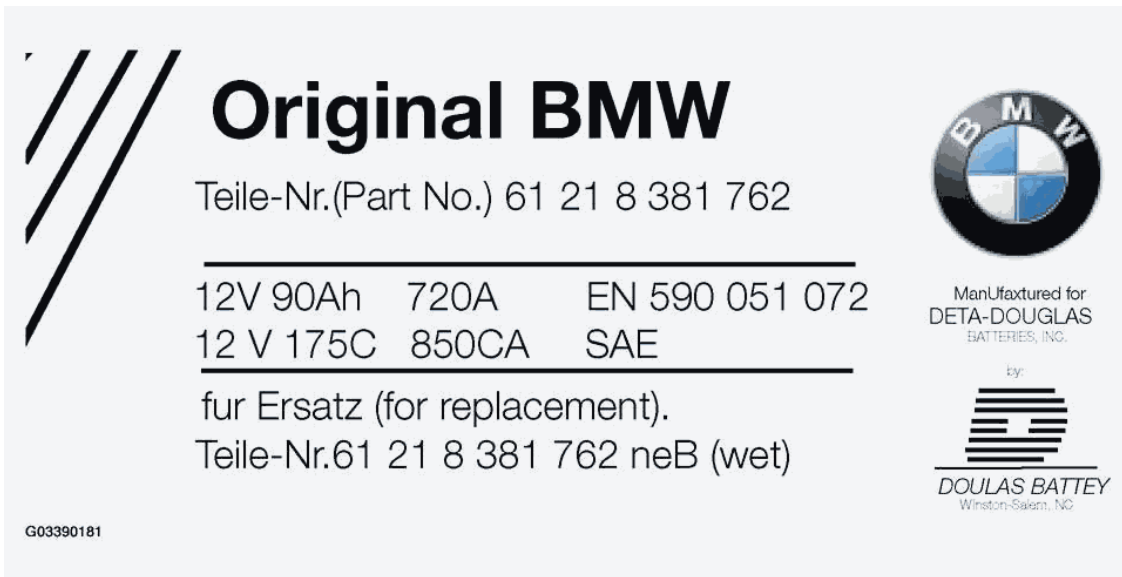

Fig. 10: View Of Battery Information Label
Courtesy of BMW OF NORTH AMERICA, INC.

BATTERY TESTING

There are four steps to follow in testing an automotive battery:

- Inspection.
- Removal of Surface Charge.
- State-of-Charge Test.
- Load Test.

Tools Needed

To test a battery following tools are needed:

- DVOM Digital Volt Ohm Meter.
- Battery Load Tester (i.e. Snap On VAT 60).
- DISplus or MoDic.
- Battery Draw Test Special Tool PN 61 2 300.
- Closed Circuit Measurement Adapter PN 90 88 6 612 310.

- Temperature Compensating Hydrometer.

G03390182

Fig. 13: Identifying Temperature Compensating Hydrometer
Courtesy of BMW OF NORTH AMERICA, INC.

G03390185

Fig. 14: View Of Closed Circuit Measurement Adapter
Courtesy of BMW OF NORTH AMERICA, INC.

Inspection

Visual inspection is important for the detection of obvious problems:

- Loose Generator Belt.
- Low Electrolyte Level.
- Corroded Cable or Terminal Clamps.
- Loose Hold-Down Camps or Cable Terminals.
- Damaged Battery Case.

NOTE: **The proper electrolyte level is just covering the plates, not all the way to the top of the battery inspection holes.**

Removal of Surface Charge

If the battery has just been recharged, or the car has been driven, eliminate any surface charge by one of the following methods:

- Allow the battery to sit for 2-3 hours.
- Turn the headlights on high beam for 5 minutes and wait 5 minutes after turning off.
- With battery load tester, apply a load of 1/2 the battery's CCA for 15 seconds, then wait 5 minutes.

State-of-Charge Test

OPEN CIRCUIT BATTERY VOLTAGE SPECIFICATIONS

Open Circuit Battery Voltage	Approximate State Of Charge	Average Cell SG
12.65 +	100%	1.265 +
12.45	75%	1.225
12.24	50%	1.190
12.06	25%	1.155
11.89	0%	1.120

Use the table to determine the battery's State-of-Charge.

Pay special attention if the DVOM measurement of OCV is equal to:

- 0 volts - Indicate an open cell.
- 10.45-10.65 volts - Indicates a shorted cell.

For non-sealed batteries, check both specific gravity (SG) in each cell with a temperature compensated hydrometer and battery OCV, without the engine running.

For sealed batteries, measuring the battery's OCV (without the engine running) with an accurate DVOM is the only way to determine the state-of-charge.

Batteries with a built-in hydrometer measure the state-of-charge in one cell only. If the indicator is clear or light yellow, the battery has a low electrolyte level and should be refilled before proceeding or replaced.

A state-of-charge reading **BELOW** 75% using SG, voltage measurement or dark indicator in batteries with built-in hydrometers, indicates the battery must be recharged before proceeding.

Replace the battery if one or more the following conditions are met:

- More than 0.050 difference in the specific gravity readings between the highest and lowest cell (There is a weak or dead cell).
- The battery will not recharge to 75% or greater state-of-charge or the built in hydrometer does not indicate good (green indicates 65% or better).
- DVOM reading indicates 0 volts (Open cell).
- DVOM reading indicates 10.45-10.65 volts (Shorted cell).

Load Test

A battery which has a state-of-charge of 75% or greater or has a "good" built-in hydrometer indication may be load tested.

With a battery load tester properly installed, load the battery for 15 seconds to one of the following:

- One-half (1/2) the CCA (Cold Cranking Amps).
- Three (3) times the AH Rating (Amp Hour Rating).

The voltage on a good battery will **NOT** drop below 9.7 volts during the battery load test. After the load is removed, wait 5 minutes, the battery should bounce back to 50% or greater state-of-charge. If a battery drops below 9.7 volts during the load test, does not bounce back or fails to start the engine, the battery should be replaced. Batteries which pass this test should be recharged to restore peak performance.

Load Test Conditions

Tests assume electrolyte temperature of 80° F, 26.7° C.

If the electrolyte temperature is above 80° F add .1 volt for every 10 degrees up to 100°.

If the temperature is below 80° F subtract .1 volt for every 10 degrees to 40°.

BATTERY MAINTENANCE

Electrolyte Level

If battery electrolyte level is allowed to drop substantially, the gas volume inside the battery grows proportionately resulting in an increased amount of flammable gas mixture. Any external or internal spark may result in an oxyhydrogen explosion. Additionally the plates are no longer covered by the electrolyte and may corrode.

The battery electrolyte level should be checked on every Inspection I and Inspection II.

Use only distilled water to top up the battery!

Tap water and electrolyte must never be used to refill or top off an automotive battery.

Workshop Hint:

Electrolyte levels may drop at a higher rate in the winter months, due to higher loads and increased utilization of electrical systems.

Battery Cable Connections

The top of the battery should be clean. Check for and correct corrosion on the top of the battery and the cable connections.

Workshop Hint

Many battery problems are caused by loose or corroded connections. Insure that cables are free from corrosion and tight before continuing diagnosis.

Battery Charging

The purpose of charging a battery is to put back the energy that has been removed. A battery that is not properly charged will deliver sub-standard performance and display a shorter life span.

A battery should be charged only after performing a visual inspection on the battery case and the electrolyte levels. Never attempt to charge a battery with a damaged case or low electrolyte levels.

A state-of-charge test should be performed before attempting to charge a battery.

Always connect the positive lead of the battery charger to the positive terminal of the battery and the negative lead of the battery charger to the negative terminal of the battery.

Unplug the charger or turn it off **BEFORE** disconnecting the leads at the battery.

Batteries that are fully discharged should be charged according to the following table.

BATTERIES SPECIFICATIONS

Reserve Capacity Rating (RC)	Slow Charge	Fast Charge
80 minutes or less	15 hours @ 3 amps	2.5 hours @ 20 amps
80 to 125 minutes	21 hours @ 4 amps	3.75 hours @ 20 amps
125 to 170 minutes	22 hours @ amps	5 hour @ 20 amps
170 to 250 minutes	23.hours @ 6 amps	7.5 hours @ 10 amps
Above 250 minutes	24 hours @ 10 amps	6 hours @ 40 amps

The best charging method is to **SLOWLY** recharge the battery using the BMW approved battery charger.

A slow charging rate allows more time for the electrolyte to penetrate the plates.

Sulfated Batteries

Continuous discharging of the battery or low electrolyte levels cause crystals to form on the plates. These crystals of lead sulphate occur when a battery is discharged. The deeper the discharge the more serious the sulphation. The sulphur molecules that form the sulphate are then absent from the electrolyte, causing the electrolyte to become inefficient.

A battery relies on clean plates and strong electrolyte to both receive charging current and offer strong current discharge. A sulphated battery can do neither. Proper recharging of the battery will remove some but not all of the sulphate. Eventually the battery plates are coated with enough sulphate that it is impossible to achieve an efficient recharge.

Testing A Battery for Sulphation

A battery which fails the load test should be tested for sulphation. To test a battery for sulphation, place it on a battery charger for three minutes with the charger set on 40 amps. After three minutes check the OCV, if the reading is greater than 15.0 volts the battery is sulphated. Batteries which indicate a sulphated condition should be recharged slowly and retested before being discarded.

Battery Freezing

A fully charged battery can be stored at sub-freezing temperatures with no damage. The battery is protected from freezing to a temperature of -75° F. A fully discharged battery however will freeze at +27° F.

Avoid freezing by keeping the battery fully charged.

Carefully inspect a battery which has frozen for a cracked case.

Battery Maintenance (Center Vehicles)

The battery charge is monitored while the vehicle is at the VPC and before it leaves on the transport. When the vehicle is having the QC I performed at the center the check list requires that the battery voltage be checked and maintained to 12.65V minimum.

In order to facilitate tracking vehicles in inventory, BMW has in place a Battery Maintenance Program. The program uses:

- Battery Log Forms.
- Battery Log Binder.
- Colored windshield stickers (red, green, yellow and white).

The Battery Maintenance Program has three possibilities:

- Vehicle in storage, battery disconnect switch removed.
- Vehicle in showroom or display.
- Vehicle in storage, Battery disconnect switch left in the vehicle.

Vehicle In Storage, Battery Disconnect Switch Removed

A four week charging cycle has been established for these cases. All vehicles arrive with a color coded sticker on the windshield. The color corresponds to the week that the battery must be charged. Also the vehicle will be provided with a Battery Log Form.

The "A" portion (Vehicle Receipt) of the Log Form must be completed during the QC I Display check and then has to be filed in the Battery Charge Log Book under the applicable color coded section. All the vehicles in that color section will have to be charged that week.

Vehicle In Showroom or Display

Because of the high consumer demand on vehicles that are being displayed and not driven, a four week charging cycle is not enough. For vehicles in the showroom the battery has to be charged as frequently as

necessary to ensure that the battery never drops below 12.5V. Use the "C" portion of the log form (Display Vehicle - Monitored Daily) to keep track of the charging and checking of the battery.

Vehicle In Storage, Battery Disconnect Switch Left In The Vehicle.

Since the battery disconnect switch is left installed and in the "OFF" position the 3 month charge cycle can be used. Use the "D" section of the Battery Log Form to document when the battery is charged.

Upon the sale of the vehicle, the Battery Log Form should be removed from the binder and placed in the vehicle file for future reference.

Battery Maintenance Flowchart

G03390188

Fig. 17: Battery Maintenance Flow Chart
 Courtesy of BMW OF NORTH AMERICA, INC.

BATTERY REPLACEMENT

Batteries determined to be defective through testing procedures should be replaced using the following guidelines.

- Reconfirm battery is actually defective and it does not need charging.
- Insure that ignition switch is in "Off" position and engine is not running.
- Disconnect negative battery terminal first.
- Place negative battery cable in a position so that it can not come in contact with battery during removal process.
- Reinstall battery hold down clamp.
- Install positive cable first.
- Recheck output of vehicle generator and balance of electrical system for other problems.
- Provide clear and concise description of the defect including cell readings, load test results and any other pertinent information which led to the battery replacement.
- Tag battery with VIN and repair order number.

Battery Failures

An analysis of batteries replaced under warranty shows that many claims could have been avoided had the batteries been maintained in a full state of charge.

Batteries must be maintained at all times when vehicles are at a retailer whether they are new cars, used cars, in storage (back lot), on display, or customer cars in for maintenance or repairs.

Batteries replaced due to lack of maintenance will not be covered by warranty.

Most Common Causes of Premature Battery Failures

- Failure to maintain proper state of charge.
- Loss of electrolyte due to overcharging or excessive heat.
- Deep discharging (Leaving lights on or other parasitic draws).
- Undercharging of battery.
- Vibration (Loose battery hold down clamp).
- Using tap water (instead of distilled water).
- Corrosion.
- Freezing.

Workshop Hints

Safety Tips

- Proper Clothing:
 - Always wear a face shield or safety goggles.
 - Plastic gloves can prevent acid burns to hands.
- Neutralizing Electrolyte:

Any leakage or spillage of battery electrolyte should be neutralized as soon as possible to prevent damage to

paint, body or trunk linings. Depending on the amount of spillage dilute some baking soda in water and apply to areas of the car that have been exposed to the battery electrolyte. The neutralizing action will create some foaming in the area where the chemical action takes place. Flush with ample amounts of water once the chemical reaction has subsided.

General Battery Hints

- Add only distilled water NEVER TOP OFF WITH ACID.
- Keep electrolyte level above plate separators.
- Keep battery top clean and dry.
- Keep open flame and metal objects away from battery top and terminals.
- Keep vent caps tightly in place (if applicable).
- Use proper charging equipment.

SPECIAL BATTERY SYSTEMS

Special battery systems are broken into two groups:

- Vibration Compensating Battery Systems.
- Dual Battery Systems.

Vibration Compensating Battery Systems

Vibration Compensating Battery Systems act as vibration absorbers, smoothing out road vibrations in the E36 and E46 convertibles.

E36:

The E36 convertible is not only an energy source. The battery is designed as a vibration dampener. Due to this additional function the battery also has a special tray with an integrated vibration absorber.

NOTE: E36 convertible batteries are labeled "Vibration Proof". Replacement batteries must be of the same type.

G03390189

Fig. 18: View Of Battery Identification Label
 Courtesy of BMW OF NORTH AMERICA, INC.

E46:

The E46 convertible uses the same battery as the E46 sedan, coupe and touring. The battery box is specially designed to float on the vertical axis through three articulated rods.

This allows the battery to act as an inertia mass and dampen various vibrations while the vehicle is driven.

G03390190

Fig. 19: Identifying Dampening Rods
Courtesy of BMW OF NORTH AMERICA, INC.

Dual Battery Systems

E31 (850i):

The dual battery system on the 850i was introduced to handle the higher level of electronic technology with increased functions and safety features that were added to the vehicle, as well as the added diagnostic information.

Design considerations were made to minimize electrical loads during Key Off and periods of driving with low engine speeds while certain timed operations (e.g. Glove compartment light, courtesy lights and seat heating) were active.

Special testing and charging procedures exist for the dual battery system on the 850i, refer to appropriate article for specific information.

E38 750iL:

The dual battery system on the 750iL is necessary due to the addition of the E-CATs. If a single battery system was used, the E-CATs would be provided power from the single battery just after cold engine start-up when the battery is at its lowest capacity. This would increase engine loads due to charging of the single battery and cause an increase in injector "On" time during the cold engine warm-up period, which result in unnecessary tail pipe

emissions.

Providing separate battery systems for the starting circuit and the vehicle circuits also minimizes the possibility of a discharged starter battery ensuring reliable engine starting.

Components of E38 Dual Battery System

- **Starter Battery:** Located in the right rear trunk wheel, the starter battery is connected to the starter motor and to the heating coils of the E-CATs (via the E-CAT module).
- **Vehicle Circuit Battery:** Located above the starter battery on a swing out mount, the vehicle circuit battery provides operating power for the balance of the vehicles electrical requirements and is directly connected to the vehicle generator.
- **Battery Isolation Switch:** Located on the swing out mount of the vehicle circuit battery the battery isolation switch opens and closes the circuit between both batteries based on monitored conditions.

NOTE: The battery isolation switch is NOT used to boost a discharged starter battery with the voltage of the vehicle circuit battery to start the engine. The battery isolation switch can only withstand a maximum current flow of 60 amps.

Battery Isolation Switch

The Battery Isolation Switch provides the vehicle with separate battery systems for the vehicle circuits and the starting circuit.

When the isolation switch is open, the vehicle circuit battery is the only power source connected to the power distribution center.

When the isolation switch is closed the starter battery is charged and the vehicle circuit battery is boosted by the starter battery.

Modes of the isolation switch:

Battery isolation switch

250 amp generator circuit fuse

Vehicle circuit battery

Starter/E CAT battery

G03390191

Fig. 20: Identifying Battery Isolation Switch
Courtesy of BMW OF NORTH AMERICA, INC.

- Starting Mode:
 - Normal Starting.
 - Safety Starting.
- Driving Mode.
- Charging Mode.
- Sleep Mode.

Starting Mode

When the isolation switch recognizes KL15 via the K Bus, it determines the voltage of the vehicle circuit battery.

- If the vehicle circuit battery **IS** sufficiently charged, it proceeds with **Normal Starting**.
- If the vehicle circuit battery **IS NOT** sufficiently charged, it proceeds with **Safety Starting**.

Normal Starting

- The isolation switch is open.
- Within 0.5 seconds of engine start-up the E-CAT module energizes the E-CAT heating coils (program dependent) and simultaneously signals the isolation switch that the ECATs are "On" via signal "KATON" (low signal).
- Upon completion of the heating period, the E-CAT module signals the isolation switch that the E-CATs are off (High Signal).
- Under normal conditions, the isolation switch is not closed before the heating procedure is finished.

Safety Starting:

- In response to a discharged condition of the vehicle circuit battery, the isolation switch closes to momentarily boost the vehicle circuit battery and supply all systems with starter battery voltage via the power distribution center.

This operation lasts for a maximum of 30 seconds or until confirmation of engine start up is received. (TD signal on the K Bus)

- Receiving the TD signals causes the isolation switch to immediately open for the duration of the E-CAT heating cycle.
- If the engine is not started within the 30 seconds, the isolation switch opens and remains open until KL 15 is recognized on the next start-up cycle.

Driving Mode

The vehicle circuit battery is permanently connected in parallel to the generator and is charged when the engine is running. When the isolation switch is closed, the generator simultaneously charges the starter battery.

As the vehicle is driven the isolation switch cycles between open and closed based on:

- Voltage values of both batteries.
- Current transfer between both batteries as monitored by the isolation switch.
- Internal temperature of isolation switch.

Conditions Causing Switch To Open While Driving:

- Sufficiently charged starter battery.
- Current flow through switch exceeding 0.5 amps.

The starter battery will supplement vehicle electrical needs during periods of high demand (e.g continuous wiper operation combined with lights and blower).

- The internal temperature of the isolation switch exceeds programmed maximum value.

Conditions Causing Switch To Close While Driving:

- Monitored voltage of vehicle circuit battery exceeds that of starter battery by 0.7 volts.
- The voltage of the vehicle circuit battery drops below 9 volts three times within one minute.

Fig. 21: Identifying Battery Charging System
Courtesy of BMW OF NORTH AMERICA, INC.

Charging Mode (in the workshop)

The isolation switch monitors starter battery voltage during key off conditions and continues monitoring after the vehicle and the isolation switch have entered sleep mode.

- If starter battery voltage exceeds 13.8 volts during charging in the workshop, the isolation switch comes out of sleep mode and closes.

This causes the starter battery voltage to bleed off to the vehicle circuit battery, charging the circuit battery and protecting the starter battery from overcharging.

The isolation switch remains closed until the next key on cycle.

G03390193

Fig. 22: Identifying Charging Mode (In Workshop)
Courtesy of BMW OF NORTH AMERICA, INC.

Sleep Mode

The isolation switch goes into sleep mode as soon as the engine is switched off. The current draw of the isolation switch drops below 1 mA. The isolation switch comes out of sleep mode if:

- KL15 is recognized.
- Starter battery voltage exceeds 13.8 volts (charging mode)

Failure of KATON signal:

If the **KATON** signal is not received due to:

- Open or short to B+ - isolation switch closes for 4 seconds after start-up, TD received.
- Short to B- - isolation switch opens 60 seconds after receiving TD.

CLOSED CIRCUIT CURRENT DRAW TESTING

Increased closed-circuit currents may occur permanently or intermittently and cause the battery to discharge prematurely. The increase in closed circuit current may be caused by a faulty control unit or by the installation of a non-approved accessory.

In a situation where a vehicle has broken down due to a discharged battery, for diagnostic purposes it is important not to disconnect the battery. The control unit may reset if the battery is disconnected. Following a reset, a faulty control unit may start functioning correctly again, making accurate diagnosis impossible.

Tools Needed:

- Closed Circuit Current Measurement Adapter.
- MoDic Adapter.
- DISplus, MoDic or DVOM.

To correctly measure closed-circuit current, measurement adapter **61 2 300** (P/N 90 88 6 612 300) should be used. This tool provides a bridge to ground, before the negative battery terminal is disconnected, and this prevents the control units from being reset.

The additional use of MoDiC adapter **61 2 310** (P/N 90 88 6 612 310) provides a method for current measurements over an extended period of time.

The measuring device needed depends on the situation.

The DISplus may be used in situations of suspected high current draw.

The 1000 amp probe measures AC and DC current from 0 to 1000 amps. It is a self calibrating inductive pick-up. (Use this pick-up with current draws over 10 amps) The DISplus, through MFK 1 is capable of measuring up to 2 amps.

The MoDic is particularly suitable for extended measurements and provides a graphical readout of recorded measurements over time. It is recommended for the situations where the use of a multimeter provided insufficient information for problem diagnosis.

The DVOM may be used for measurements up to 10 amps either with the measurement adapter or alone.

NOTE: **It is extremely important that the battery is NOT disconnected during the installation of test equipment. Disconnection of battery may cause faulty component to function normal.**

Performing Closed Current Draw Test

- Select proper measuring device (DISplus, MoDic or DVOM)
 - Remember amperage draw in excess of 10A will damage DVOM.
 - Use inductive amp probe of DISplus when amperage draw is high.
 - When using DISplus inductive probe, clamp on negative battery cable with:
 - Arrow pointing away from battery. Switch off all consumers.
 - (It is not necessary to disconnect B- from body when using inductive probe).
- Connect (-) test lead to negative battery terminal and (+) test lead to a known good ground.
- Ensure all systems are **OFF !**
- **Be sure DVOM is on and set in proper mode.**
- Disconnect battery ground lead from body.
- Observe meter reading, wait for vehicle to enter sleep mode.
- Identify faulty circuit by disconnecting fuses, relays, control modules or connectors, observing meter readings.
- Defective circuit is found when current is below maximum closed current for vehicle being tested.

current measurement using measurement adapter and MoDlc adapter.

GENERAL INFORMATION

Understanding Diagnostics - Overview - All Models

UNDERSTANDING DIAGNOSTICS

Model: All

Production Date: All

Trial and error creates inconvenience for the Customer and the Service Department when mis-diagnosis or longer waits occur as the technician tries different repair attempts. This is against BMW's promise to the customer to **"Fix it right the first time, on time, every time"**.

If the vehicle is not repaired efficiently the productivity of the technician suffers. Taking some time at the beginning to plan a diagnostic course of action can help give structure to what may appear in the beginning to be a chaotic situation.

As future systems increase in complexity so does their dependency on the Diagnosis Program as the principle tool for troubleshooting. However, the importance of understanding the calculated steps of a basic troubleshooting plan is just as important as before.

There will always be instances where the Test Modules provided by the DISplus need to be supplemented by a thoughtful diagnostic plan that is created by the skilled Technician. A parallel diagnostic plan that includes proper recording of test data along with the Diagnosis Program is a good habit to follow every time that troubleshooting is required.

A successful diagnostic plan will:

- Save repair time.
- Satisfy the customer by reducing vehicle down time.
- Increase Center profitability.
- Increase technician pride and earnings.

DIAGNOSTIC PLAN

The Diagnostic Plan consists of 5 steps:

- Verify the Customer Complaint - "Experience the Symptom!"
- Analyze the Problem.
- Isolate the Problem.
- Repair the Problem.
- Verify the Repair.

VERIFY THE COMPLAINT

Most troubleshooting starts the moment you receive a written description of the customer complaint. The complaint is the customer's description of a symptom that they are experiencing with the vehicle.

Symptom

A symptom is any circumstance, event or condition that accompanies something and indicates its existence or occurrence.

There may be multiple symptoms that are created with one problem.

An example is a defective thermostat: If the thermostat is stuck open the heater output will be insufficient, also, if the engine can never reach operating temperature then fuel mileage and performance will suffer. Which one of these complaints (symptoms) would lead you to the problem faster?

What is important to remember is that the customer may only complain about one symptom. It is the job of the technician to be a detective and carefully observe. There may be another symptom not complained of that directly points to the root cause of the problem.

Steps to Verify The Complaint

- Before getting in the vehicle, review the R.O., confirm this is the correct vehicle.
- Is any additional information needed about the complaint? Certain questions to the customer can help narrow this step.
- Is the problem intermittent? What are the conditions (roads, temp., speed, etc.)? What is the frequency of the occurrence?
- Test drive if driveability related or the conditions require, duplicate conditions as stated by customer.
- Was the complaint reproduced?
- Is knowledge of system or vehicle sufficient?
- Review Reference Training material and owner's handbook for a description of feature operation.
- Research complaint in SIB's.
- Research past repair history on vehicle.

ANALYZE THE PROBLEM

After verification of the complaint, analyze the problem. Use all resource available to aid in system diagnostics:

- Vehicle Fault Memory.
- ETM, RM, SIB.
- Vehicle Repair History.
- Training Handouts.
- Round Table Information.
- Hotline.
- Known Good Vehicle.

Analyzing the problem allows for the development of a repair plan.

Steps in Analyzing The Problem

- Perform a Short Test.
- Does an SIB pertain to this vehicle?
- Refer to the Function Description for additional system information.
- Is a test plan available for this system?
- Use fault symptom selection.
- Perform Diagnosis Request.

ISOLATE THE PROBLEM

To isolate the problem is "to place apart from others".

The object here is to zoom in on the problem area. It is easy to be overwhelmed by a problem, just reaching for an ETM can add to the confusion. The DISplus provides automatic tests in test modules to aid in the determination of the exact area or cause of the problem.

The elimination of components from the diagnostic trail, shortens the path. The first question asked should be:

- Is the problem Hydraulic, Mechanical or Electrical?

Save time by **NOT** testing components that could not create the problem.

Steps in Isolating The Problem

- Use Test Modules.
- Perform electrical tests with the DISplus Measurement System or a DVOM.
- Consult fault charts in Repair or Diagnostic Procedures Articles.
- Control Module Self Diagnosis.
- Use appropriate special tools (e.g. battery draw tester, tank leakage adapters, breakout boxes, etc.).
- Substitute a known good part.

Workshop Hints:

If a **TEST PLAN** is not available for a particular situation do the following:

- Think about the system in its entirety.
- Be sure the normal operation is understood.
- Develop a **PLAN**.
- Use all available resources.
- Don't try to diagnose the entire system at once, break it into manageable chunks.
- Check the easy things first. It would waste time to install the Breakout Boxes to find a bad bulb.

When following a TEST PLAN:

- **DON'T** Skip steps.
- **NEVER** assume results without doing a step.
- Recheck your work.

REPAIR THE PROBLEM

Repair the problem using approved repair techniques and parts. Having verified, isolated and analyzed the problem the last step is to repair or replace the component. Before installing that shiny new part, take one last step back from the vehicle to ask a final set of questions.

- Could another component have caused this part to fail?
- Were all the instructions in the Test Plan or Diagnostic Procedures followed?
- Is there *anything* that might have been overlooked?

Confident that the proper diagnosis has been made, complete the repairs.

Steps to Repairing The Problem:

- Follow the instructions in the repair article.
- Follow specific guidelines for wire harness repair or replacement.
- Make proper adjustments after installing the part.
- Perform Coding or Programming if required.
- Make sure another problem is not created in performing this repair.

VERIFY THE REPAIR

Always recheck for the complaint under the same conditions used to verify. The object is to prove the problem does not resurface.

- Clear the fault codes.
- Test drive the car.
- Check for re-occurring fault codes.
- Clear adaptations if necessary.
- Recheck the part installation for missing bolts or tie wraps.

Workshop Hints:

- Follow repair or replacement procedures as detailed in appropriate article.
- Use only genuine BMW parts.

THE I.P.O. PRINCIPLE

Control Modules receive information from sensors advising them of certain operating conditions. This information is identified as Input to the control modules. The Input continually informs the control modules of conditions that may be changing.

The control module then process the Input information comparing it to programmed responses or commands based on every possible operating condition. The control module decides based on the programming and the Input conditions which Output signal to operate.

The control module, based on the processing that has occurred, then sends a signal to a component changing the status of that component. The components respond to the Output signal of the control module.

This is known as the I.P.O. Principle.

I.P.O.

- Status of switch is changed.
- Changing switch status is sent to processor.
- Processor looks at conditions which must be met.
- If the processor deems the conditions for switch status change are met, a relay is signaled via a ground signal.
- The relay is energized, the points are closed and the light bulb glows.

NOTE: The processor looked at other inputs before making the decision to activate the relay.

G03389043

Fig. 1: Identifying I.P.O. Principle

Courtesy of BMW OF NORTH AMERICA, INC.

Any device controlled by a processor requires input to alert the operating program of a condition. The program processes the input information and logically activates an output of a component.

All BMW control systems are explained by the IPO principle. It is the key to understanding all BMW control

system technologies.

Fig. 2: I.P.O. Principle Display

GENERAL INFORMATION

xDrive/DSC - Overview - X3

XDRIVE/DSC

PURPOSE OF THE SYSTEM

xDrive

The innovative xDrive four-wheel drive is a system that controls and regulates the distribution of driving torque to the front and rear axles. The measured variables of DSC are used by xDrive but are also influenced by modified handling performance.

The multi-disc clutch is the heart of the xDrive. By using the controlled multi-disc clutch, it is possible to resolve the conflict between traction and handling performance.

This is achieved through the fact that torque distribution is not determined by a fixed gear ratio in the xDrive as was the case in the previous systems. Instead, the distribution of driving torque is dependent on the locking torque of the controlled multi-disc clutch in the transfer case and on the transferable torque to the front and rear axles.

G03399730

Fig. 1: Identifying xDrive

Courtesy of BMW OF NORTH AMERICA, INC.

XDRIVE - SYSTEM COMPONENTS

ATC 400 / ATC 500 Transfer Case

The ATC 400 is installed in the E83 and the ATC 500 in the E53 MU. They differ in that the ATC 500 is splined to the front propeller shaft and the ATC 400 uses a four bolt flange. In addition, there is one more disc in the multi-disc clutch of the ATC 500 and the distance between the input shaft and the output shaft to the front axle is 19 mm greater than in the ATC 400.

G03399731

Fig. 2: Identifying ATC 400 / ATC 500 Transfer Case Components
Courtesy of BMW OF NORTH AMERICA, INC.

The flange illustration of the ATC transfer case is the same for automatic and manual transmissions.

Power Flow

When the multi-disc clutch in the transfer case is disengaged, no driving torque is transmitted to the front axle. All of the driving torque is then distributed to the rear axle. This is because the input shaft (1) is splined providing a permanent connection to the rear axle propeller shaft output flange (2). The multi-disc clutch couples the rear axle propeller shaft output flange to the front propeller shaft output (3).

The driving torque on the front axle is increased or decreased by regulating the locking pressure of the multi-disc clutch, providing a stepless coupling of the front axle to the drivetrain. This depends on driving situations and road conditions. When the multi-disc clutch is fully engaged, the front and rear axles turn at the same speed.

Driving torque distribution (front/rear) is based on available traction at each axle. For example, when traction is identical on the front and rear axles and a driver accelerates from a stop in first gear at full throttle, the rear axle is capable of sustaining greater driving torque as the vehicle weight shifts from the front to the rear.

Another example is when the front axle is on a high traction surface and the rear axle is on ice. In this case,

virtually 100% of the available driving torque is transmitted to the front axle. Based on available traction, virtually no driving torque can be supported by the rear axle. Obviously, when more driving torque is transmitted to the front axle, driving torque on the rear axle is proportionally reduced due to lack of traction.

Fig. 3: Identifying Power Flow
Courtesy of BMW OF NORTH AMERICA, INC.

1. Input from transmission 2. Rear propeller shaft output 3. Front propeller shaft output

NOTE: On a vehicle equipped with an automatic transmission, when driving onto brake analyzers, move the selector lever to the "N" position. On a vehicle equipped with a manual transmission, do not press the accelerator pedal once on the brake analyzer. This keeps the transfer case clutch open and the vehicle cannot be pulled off the analyzer.

Adjusting Levers

When the disc cam is rotated, it forces the adjusting levers apart.

The ball ramps create a precision axial movement which compresses and increases pressure on the multi-disc clutch.

This is completely variable up to a full lock.

G03399733

Fig. 4: Identifying Adjusting Levers
Courtesy of BMW OF NORTH AMERICA, INC.

Servomotor With Motor Position Sensor

The servomotor with worm gear are powered to rotate the disc cam.

The servomotor is a permanent magnet (1) DC motor which contains a Hall sensor (2) to detect the position and the adjusting speed of the motor shaft.

This is proportional to the degree of multi-disc clutch engagement.

G03399734

Fig. 5: Identifying Servomotor With Motor Position Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

Coding Resistor

Because of mechanical tolerances in production, the characteristic curve of the multi-disc clutch locking torque varies slightly.

Once the actual locking torque has been measured on the clutch test bench, a resistor is attached to the servomotor; the resistor's value is a reference to the locking torque characteristic.

Each time the engine is started, the transfer case control unit measures the resistance value once and the optimum program map for the transfer case fitted is selected.

XDRIVE - PRINCIPLE OF OPERATION

xDrive

The transfer case control unit (VGSG) regulates the locking pressure of the multi-disc clutch in the transfer case. The transfer case control unit receives information on the required clutch locking pressure from the DSC control unit. The processing, control and electronics required for this are integrated in the transfer case control unit. This information is converted and output as a corresponding rotary motion of the servomotor.

In order to position the servomotor and compensate for wear, a reference run is carried out each time the ignition is switched off. The servomotor position is determined by a Hall sensor integrated in the servomotor. During the reference run, the clutch is engaged and disengaged completely (once). While the clutch is actuated, the current consumption is measured for the servomotor position. This allows the VGSG to determine the beginning and end of the clutch actuating procedure.

A clutch and oil wear calculation is also processed and stored in the VGSG. It increases the locking pressure as necessary in order to reduce friction.

In the event of DSC failure, the VGSG incorporates a fallback level (strategy) for activating the transfer case clutch in order to maintain the four-wheel drive function.

TCC

Regulation of the transfer case clutch (TCC) locking pressure allows stepless coupling of the front axle to the drivetrain. The driving torque on the front axle can be increased or decreased depending on the driving situation and road conditions. Obviously, when more driving torque is transmitted to the front axle, driving torque on the rear axle is proportionally reduced due to lack of traction.

The advantages of variable distribution of driving torque to the front and rear axles are:

- Optimum utilization of the cornering and longitudinal wheel forces on the front and rear axles.
- DSC brake interventions only become necessary at a significantly later stage, an increase in comfort refinement.
- Compared with an "open" differential transfer case and DSC, xDrive significantly improves driving torque distribution when traction on the front and rear axles is notably different.

The DSC control unit influences control of the transfer case clutch. Even when DSC is deactivated, TCC remains active for the purpose of maximum traction and driving dynamics.

Permanent four-wheel drive is only completely deactivated in three control situations:

- During very tight cornering with low engine torque to allow speed compensation between the front and rear axles (e.g. parking)
- At speeds > 180 km/h

- When the vehicle dramatically understeers

The transfer case clutch control logic is described in three main modules:

- Pre-control
- Traction control / driving dynamics control
- Tire tolerance logic

Pre-Control

The pre-control logic (shared from DSC) reflects the driver's command and is calculated based on:

- Accelerator pedal value
- Engine torque
- Engine RPM
- Vehicle speed
- Gear
- Steering angle

In normal driving, the clutch is operated with minimum slip so that permanent four-wheel drive with a driving torque distribution of 40% on the front axle and 60% on the rear axle is available.

Even when the traction for the front and rear axles is dramatically different, the pre-control ensures that the system responds very quickly, as can be seen in graphic on the following page.

Notes:

"Open" Transfer Case VS xDrive

M = Driving torque

M VA = Driving torque on front axle

t = Time

G03399739

Fig. 10: Open Transfer Case Vs xDrive
 Courtesy of BMW OF NORTH AMERICA, INC.

In the case of the open transfer case, the brake is applied after slip is detected on the rear axle. This takes

approximately one half of a second in reaction time. 62% of the driving torque is supported on the two rear brake discs and only 38% of the driving torque can be transferred to the front axle. In other words, wheel slip must be sensed first before driving torque is transferred through the transfer case by applying the rear wheel brakes.

In contrast to an "open" transfer case (differential), the xDrive does not require brake intervention on the rear axle because no slip can occur (permanent through connection). The transfer case clutch is engaging the front axle as the vehicle is accelerating. This takes significantly less time (approx. one/tenth of a second).

Traction Control / Driving Dynamics Control

Traction control monitors the slip conditions on the front and rear axles. The wheel speeds, yaw rate and transversal acceleration serve as the input signals.

The function of traction control/driving dynamics control is to achieve optimum traction and to keep the vehicle stable.

As seen in the following graphic, in the event of an oversteer tendency, the transfer case clutch is completely engaged and the maximum supportable driving torque on the front axle is transmitted. This helps to "pull" the front of the vehicle until stability is achieved.

G03399740

Fig. 11: Identifying Traction Control / Driving Dynamics Control (Oversteer Tendency)
Courtesy of BMW OF NORTH AMERICA, INC.

In the event of an understeer tendency, the clutch can be fully disengaged if necessary. In this example, the front axle is separated from the drivetrain and the driving torque can only be transmitted to the rear axle. This helps to "push" the rear of the vehicle until stability is achieved.

G03399741

Fig. 12: Identifying Traction Control / Driving Dynamics Control (Understeer Tendency)
 Courtesy of BMW OF NORTH AMERICA, INC.

Tire Tolerance Logic

The tire tolerance logic detects different tread circumferences on the front and rear axles. This occurs when:

- Mixed tires are used
- Space saving spare tire is installed
- Tires are used that have been worn down to different levels

Normally, tire circumference deviations result in drivetrain torque bias (unwanted variations).

The tire circumference can fluctuate up to 1% or more as a result of mixed tires or wear.

The tire tolerance logic decides depending on the driver's command and driving situation whether the slip is to occur in the transfer case clutch or at the contact area between tire and road.

If the slip is permitted in the transfer case clutch, the locking pressure set by the pre-control is reduced in order to keep the work loss low. In the driving dynamic control situation, the clutch is locked slightly more than normal, the four wheel drive is always guaranteed when required.

For maximum xDrive performance, tires (and wheels) of the same diameter should be installed on the vehicle.

Notes:

XDRIVE / DSC - SYSTEM COMPONENTS

The xDrive / DSC system consists essentially of those components from the familiar DSC8. The controllable

multi-disc clutch in the transfer case is a new feature.

- DSC8 module
- Transfer case electronic control unit (VGSG)
- Yaw and transversal acceleration sensors
- Wheel speed sensors
- Pressure sensor
- Steering angle sensor
- Brake fluid warning switch
- Brake light switch
- DSC button
- Transfer case motor position sensor
- Coding resistor
- Transfer case servomotor

Hydraulic Schematic

G03399742

Fig. 13: Hydraulic Schematic
 Courtesy of BMW OF NORTH AMERICA, INC.

DSC Module

The DSC module located in the engine compartment consists primarily of the following three components:

- Surface mounted control unit
- Valve block with integrated pressure sensor
- Pump motor

It is the same design as the DSC8 module which was introduced at BMW with the E60.

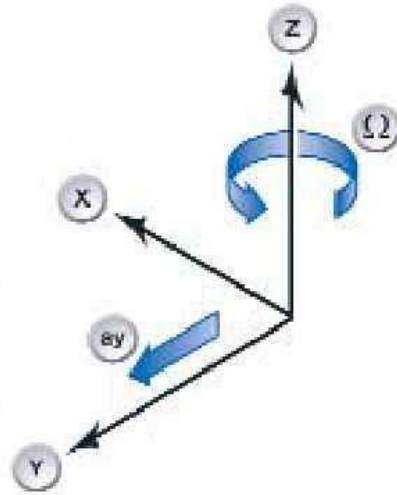

G03399743

Fig. 14: Identifying DSC Module
Courtesy of BMW OF NORTH AMERICA, INC.

Yaw And Transversal Acceleration Sensors

The sensor (assembly) in the E83 and the E53 MU is located on the transmission tunnel at the rear.

G03399744

Fig. 15: Identifying Yaw And Transversal Acceleration Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

Wheel Speed Sensors

The active wheel speed sensors require a supply voltage for operation and output a signal of non speed dependent constant amplitude.

G03399745

Fig. 16: Identifying Wheel Speed Sensors
Courtesy of BMW OF NORTH AMERICA, INC.

The xDrive uses wheel speed sensors with an integrated evaluation circuit. The output signal is transmitted with the pulse width modulation (PWM).

The rising signal edge is used to determine road speed; the pulse width contains additional information on the direction of rotation, standstill detection, installation position detection and air gap reserve to the sensor ring. Direction of rotation detection is by the internal Hall sensor signals (like E65).

XDRIVE / DSC SYSTEM - PRINCIPLE OF OPERATION

As featured in earlier DSC modules, the DSC8 mounted control unit also features two microprocessors. The surface mounted control unit also incorporates two semiconductor relays:

- One for the pump motor
- One for the solenoid valves

When a speed of 6 km/h (4 mph) is exceeded, an electronic self-test is started which the pump motor and all the solenoid valves are briefly activated. When the brake light switch is activated simultaneously at that speed (for example: two footed drivers), the self-test is carried out at 15 km/h. Checking of the wheel speed signals is started at 2.75 km/h.

In the xDrive, the DSC also assumes the function of calculating the locking pressure for the multi-disc clutch in the transfer case. The locking pressure is set based on the driver's command and regulated as required depending on the driving situation.

The locking pressure produces the distribution of driving torque to the front and rear axles. The DSC sends the required locking pressure request to the VGSG via the PTCAN Bus.

In turn, the VGSG signals the locking pressure actually set depending on:

- Transfer case fluid temperature (calculation based on locking pressures)
- Electric motor loads
- Multi-disc clutch loads

System Functions

The xDrive / DSC system comprises the following functions (same as E60 or E53 except for *):

DSC:

- ABS Antilock Braking System
- ASC-X Automatic Stability Control X *
- DSC Dynamic Stability Control
- EBV Electronic brake-force distribution
- DBC Dynamic Brake Control
- CBC Cornering Brake Control

- MSR Engine drag-torque control
- HDC Hill Descent Control
- ADB-X Automatic Differential Brake *

xDrive:

- TCC Transfer Case Control (previously covered)

ASC-X / ADB-X

Unlike regular road vehicles, SAVs are also meant to demonstrate satisfactory handling characteristics and appropriate traction on unconventional roads. In order to provide optimum propulsion with sufficient cornering stability on both normal roads and other road surfaces, Automatic Stability Control X (ASC-X) contains a detection function to distinguish between them.

When off-road terrain is detected, wheel slip threshold is increased to provide sufficient traction force with the increased levels of traction loss.

ASC-X is supplemented by the Automatic Differential Brake (ADB-X) function, which applies the brakes to the wheels per axle, for side to side torque transfer. For example, when a wheel is spinning on one side (up to the slip setpoint), the brakes are applied to that wheel and the driving torque is transferred through the axle differential to the wheel with the higher traction. This provides superb capabilities when there are diagonal traction losses (ie. left front/right rear).

ADB-X remains active when DSC is deactivated. Furthermore, ADB-X can develop full capability because the engine power is not reduced, even during extreme four wheel drive operation. Only that wheel which has a low traction receives the brake application.

The brake disc can overheat with excessive ADB-X intervention with DSC deactivated. In this situation, the operation is discontinued at a disc temperature of approx. 700 °C and is resumed when this temperature drops below approx. 400 °C. This is a calculation performed by the DSC control unit based on brake application time, pressure, wheel speed, etc.

Limp Home Operation

In order to maintain the four wheel drive function for as long as possible even in the event of important sensor signal failures or failure of the DSC control unit, a limp home control is integrated in the transfer case control unit. This control operates in redundancy to the transfer case clutch control in the DSC control unit. The limp home control contains only two control functions, precontrol and traction-slip control.

The wheel speed signals are very important to traction/slip control. Engine signals, steering angle and yaw are used predominantly for precontrol. If individual sensor signals fail, substitute values are calculated and the relevant functions operated with extended control thresholds.

This strategy is continued until useful four wheel drive control is no longer possible. In this event, the driver is alerted by the DSC/xDrive lamp coming on in the instrument cluster and also by an acoustic warning signal (gong).

Faulted wheel speed signals on the rear axle are calculated by driving or engine speed (remember, the rear wheels are always driven). If the front wheel speed signals fail, the values of the rear axle are adopted. Wheel speeds also substitute for a faulty steering angle signal.

Warning Indicator Lamps

The warning indicator lamps for the xDrive / DSC are found in the instrument cluster as shown on the right.

The warning indicator lamps and acoustic signals (gong) are assigned to the xDrive / DSC system states of malfunction described below.

G03399746

Fig. 17: Identifying Warning Indicator Lamps For xDrive / DSC
Courtesy of BMW OF NORTH AMERICA, INC.

DSC deactivated	no gong	
DSC faulty (ABS only) or VGSG faulty	with gong	
Complete DSC failure or Complete DSC failure and VGSG failure	with gong

WORKSHOP HINTS

CAUTION: On a vehicle equipped with an automatic transmission, when driving onto brake analyzers, move the selector lever to the "N" position. On a vehicle equipped with a manual transmission, do not press the accelerator pedal once on the brake analyzer. This keeps the transfer case clutch open and the vehicle cannot be pulled off the analyzer.

Towing: Use only a flatbed carrier!

Transfer Case Oil And Monitoring

Please refer to Operating Fluids for the required transfer case oil and specifications for the correct amount.

Oil Monitoring is performed by the VTG control module to determine when a service (change) is due. The VTG calculates transfer case and clutch wear based on the amount of slip, engagement pressure (torque), speed and mileage.

This calculation accounts for normal "dry" road driving, "adverse" road driving and "other" road extreme driving. Depending on individual vehicle use - driving styles and driving conditions, the transfer case oil service interval will vary.

When a service is due, this will be indicated by a Fault Code and additional details are available using the DISplus/ GT1. Service functions provide directions on changing the transfer case oil and updating the VTG control module with the necessary reset and adaption procedure. This is extremely important for CBS.

Diagnosis

Diagnosis is available for fault repairs and service procedures using the DSIplus/GT1. When the tire tolerance logic is active, it can be read out in the fault memory.

Programming (Flashing)

Both the transfer case control unit (VTG) and the DSC control unit are programmable and the new control unit (s) must be programmed when replaced. The wear values stored in the VTG control module (to be replaced) must be transferred to the replacement VTG.

<u>P0131/P0151, P0132/P0152</u>	Upstream Oxygen Sensor - Short Circuit Monitoring
<u>P112C/P112D, P2243/P2247, P2626/P2629</u>	Upstream Oxygen Sensor - Open Circuit Monitoring
<u>P3022/P3023, P3024/P3025</u>	Upstream Oxygen Sensor - Signal Controller Monitoring
<u>P2414/P2415</u>	Upstream Oxygen Sensor - Signal Activity Check
<u>P0040</u>	Upstream Oxygen Sensor - Swapped Sensors Check
<u>P2195, P2196, P2197, P2198</u>	Upstream Oxygen Sensor - Active Signal Check (Shift to lean / rich)
<u>P0133/P0153</u>	Upstream Oxygen Sensor - Signal Dynamic Monitoring (Slow Response)
<u>P2297/P2298</u>	Upstream Oxygen Sensor - Signal Monitoring During Fuel Cut-off
<u>P3026/P3027</u>	Upstream Oxygen Sensor - Heater Monitoring

<u>P0030, P0031, P0032, P0050, P0051, P0052</u>	Upstream Oxygen Sensor - Heater Circuit Monitoring
<u>P0137, P0138, P0140, P0157, P0158, P0160</u>	Downstream Oxygen Sensor - Circuit Monitoring
<u>P0139/P0159</u>	Downstream Oxygen Sensor - Signal Dynamic / Plausibility Check During Fuel Cutoff
<u>P1130/P1131</u>	Downstream Oxygen Sensor - Dynamic / Transition Time in Sensor Midpoint Range Monitoring
<u>P114A, P114B, P114C, P114D, P2279, P2271, P2271, P2273</u>	Downstream Oxygen Sensor - Active Signal Check (Stuck lean / rich)
<u>P0141, P0161, P0036, P0037, P0038, P0056, P0057, P0058</u>	Downstream Oxygen Sensor - Heater Circuit Monitoring
<u>P0017, P0018</u>	Electrical Coolant Temperature Diagnosis
<u>P3198</u>	Coolant Temperature Gradient Diagnosis
<u>P3199</u>	Coolant Temperature Stuck Diagnosis
<u>P316A</u>	Coolant Temperature Sensor stuck in a range Diagnosis with Engine off timer
<u>P1515, P1551</u>	Engine off timer Monitoring
<u>P0128, P0597, P0598, P0599</u>	Thermostat
<u>P0112, P0113</u>	Electrical Intake Air Temperature Diagnosis
<u>P0111, P111E, P111F</u>	Intake Air Plausibility Check
<u>P0012/P0015</u>	Variable Camshaft Timing (Vanos) (detection of mechanical IVVT error)
<u>P0340/P0365/P1300/P130A/P0344/P0369/P1554/P1553/P0016/P0017</u>	Camshaft position sensor (CMP)
<u>P0341</u>	Camshaft Crankshaft synchronization
<u>P0335/P0370/P0373</u>	Crankshaft position sensor (CRK)
<u>P1047, P1048, P1049, P1076, P1075, P103A, P1078, P107A, P107B, P107C, P105B, P105A, P1055, P1056, P1019, P1020, P1057, P1017, P1030, P1064, P101A, P1023, P1024, P1041</u>	Variable Valve Lift - Electrical Diagnosis
<u>P169A, P1694</u>	ETC spring check (start routine)
<u>P1632, P1633, P1634, P1635</u>	ETC adaptation diagnosis
<u>P1637, P1639</u>	Electronic Throttle Control

	(ETC) Motor Control Performance
<u>P0506, P0507</u>	ISC (Idle Speed Control) Actuator
<u>P1415, P1424</u>	Air Mass Flow Meter - Rationality check
<u>P1124, P1104, P1105</u>	Manifold Differential Pressure Sensor - Rationality check

SELF-DIAGNOSTICS DTCS

SELF-DIAGNOSTICS DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description
<u>DTC P0010</u>	'A' Camshaft Position - Actuator Circuit/Open (Bank 1) (SIG)
<u>DTC P0012</u>	'A' Camshaft Position - Timing Over-Retarded (Bank 1) (PLAUS)
<u>DTC P0013</u>	'B' Camshaft Position - Actuator Circuit/Open (Bank 1) (SIG)
<u>DTC P0015</u>	'B' Camshaft Position - Timing Over-Retarded (Bank 1) (PLAUS)
<u>DTC P0016</u>	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A) (MAX)
<u>DTC P0017</u>	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B) (MAX)
<u>DTC P0030</u>	HO2S Heater Control Circuit (Bank 1 Sensor 1) (SIG)
<u>DTC P0031</u>	HO2S Heater Control Circuit Low (Bank 1 Sensor 1) (MIN)
<u>DTC P0032</u>	HO2S Heater Control Circuit High (Bank 1 Sensor 1) (MAX)
<u>DTC P0036</u>	HO2S Heater Control Circuit (Bank 1 Sensor 2) (SIG)
<u>DTC P0037</u>	HO2S Heater Control Circuit Low (Bank 1 Sensor 2) (MIN)
<u>DTC P0038</u>	HO2S Heater Control Circuit High (Bank 1 Sensor 2) (MAX)
<u>DTC P0040</u>	O2 Sensor Signals Swapped Bank 1 Sensor 1/Bank 2 Sensor 1 (PLAUS)
<u>DTC P0041</u>	O2 Sensor Signals Swapped Bank 1 Sensor 2 / Bank 2 Sensor 2 (PLAUS)
<u>DTC P0050</u>	HO2S Heater Control Circuit (Bank 2 Sensor 1) (SIG)
<u>DTC P0051</u>	HO2S Heater Control Circuit Low (Bank 2 Sensor 1) (MIN)
<u>DTC P0052</u>	HO2S Heater Control Circuit High (Bank 2 Sensor 1) (MAX)
<u>DTC P0056</u>	HO2S Heater Control Circuit (Bank 2 Sensor 2) (SIG)
<u>DTC P0057</u>	HO2S Heater Control Circuit Low (Bank 2 Sensor 2) (MIN)
<u>DTC P0058</u>	HO2S Heater Control Circuit High (Bank 2 Sensor 2) (MAX)
<u>DTC P0070</u>	Ambient Air Temperature Sensor Circuit (SIG)
<u>DTC P0071</u>	Ambient Air Temperature Sensor Range/Performance (PLAUS)
<u>DTC P0072</u>	Ambient Air Temperature Sensor Circuit Low (MIN)
<u>DTC P0073</u>	Ambient Air Temperature Sensor Circuit High (MAX)
<u>DTC P00B2</u>	Radiator Coolant Temperature Sensor Circuit Range/Performance (PLAUS)
<u>DTC P00B3</u>	Radiator Coolant Temperature Sensor Circuit Low (MIN)
<u>DTC P00B4</u>	Radiator Coolant Temperature Sensor Circuit High (MAX)
<u>DTC P0100</u>	Mass or Volume Air Flow 'A' Circuit (MAX)
<u>DTC P0111</u>	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1) (PLAUS)
<u>DTC P0112</u>	Intake Air Temperature Sensor 1 Circuit Low (Bank 1) (MIN)
<u>DTC P0113</u>	Intake Air Temperature Sensor 1 Circuit High (Bank 1) (MAX)
<u>DTC P0117</u>	Engine Coolant Temperature Sensor 1 Circuit Low (MIN)
<u>DTC P0118</u>	Engine Coolant Temperature Sensor 1 Circuit High (MAX)
<u>DTC P0121</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit Range/Performance (PLAUS)

<u>DTC P0122</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit Low (MIN)
<u>DTC P0123</u>	Throttle/Pedal Position Sensor/Switch 'A' Circuit High (MAX)
<u>DTC P0128</u>	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature) (PLAUS)
<u>DTC P0131</u>	O2 Sensor Circuit Low Voltage (Bank 1 Sensor 1) (MIN)
<u>DTC P0132</u>	O2 Sensor Circuit High Voltage (Bank 1 Sensor 1) (MAX)
<u>DTC P0133</u>	O2 Sensor Circuit Slow Response (Bank 1 Sensor 1) (MAX)
<u>DTC P0135</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 1) (MAX)
<u>DTC P0135</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 1) (MIN)
<u>DTC P0137</u>	O2 Sensor Circuit Low Voltage (Bank 1 Sensor 2) (MIN)
<u>DTC P0138</u>	O2 Sensor Circuit High Voltage (Bank 1 Sensor 2) (MAX)
<u>DTC P0139</u>	O2 Sensor Circuit Slow Response (Bank 1 Sensor 2) (PLAUS)
<u>DTC P0140</u>	O2 Sensor Circuit No Activity Detected (Bank 1 Sensor 2) (SIG)
<u>DTC P0141</u>	O2 Sensor Heater Circuit (Bank 1 Sensor 2) (MAX)
<u>DTC P0151</u>	O2 Sensor Circuit Low Voltage (Bank 2 Sensor 1) (MIN)
<u>DTC P0152</u>	O2 Sensor Circuit High Voltage (Bank 2 Sensor 1) (MAX)
<u>DTC P0153</u>	O2 Sensor Circuit Slow Response (Bank 2 Sensor 1) (MAX)
<u>DTC P0155</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 1) (MAX)
<u>DTC P0155</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 1) (MIN)
<u>DTC P0157</u>	O2 Sensor Circuit Low Voltage (Bank 2 Sensor 2) (MIN)
<u>DTC P0158</u>	O2 Sensor Circuit High Voltage (Bank 2 Sensor 2) (MAX)
<u>DTC P0159</u>	O2 Sensor Circuit Slow Response (Bank 2 Sensor 2) (PLAUS)
<u>DTC P0160</u>	O2 Sensor Circuit No Activity Detected (Bank 2 Sensor 2) (SIG)
<u>DTC P0161</u>	O2 Sensor Heater Circuit (Bank 2 Sensor 2) (MAX)
<u>DTC P0171</u>	System Too Lean (Bank 1) (MAX)
<u>DTC P0172</u>	System Too Rich (Bank 1) (MIN)
<u>DTC P0174</u>	System Too Lean (Bank 2) (MAX)
<u>DTC P0175</u>	System Too Rich (Bank 2) (MIN)
<u>DTC P0201</u>	Injector Circuit/Open - Cylinder 1 (SIG)
<u>DTC P0202</u>	Injector Circuit/Open - Cylinder 2 (SIG)
<u>DTC P0203</u>	Injector Circuit/Open - Cylinder 3 (SIG)
<u>DTC P0204</u>	Injector Circuit/Open - Cylinder 4 (SIG)
<u>DTC P0205</u>	Injector Circuit/Open - Cylinder 5 (SIG)
<u>DTC P0206</u>	Injector Circuit/Open - Cylinder 6 (SIG)
<u>DTC P0221</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit Range/Performance (PLAUS)
<u>DTC P0222</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit Low (MIN)
<u>DTC P0223</u>	Throttle/Pedal Position Sensor/Switch 'B' Circuit High (MAX)
<u>DTC P0261</u>	Cylinder 1 Injector Circuit Low (MIN)
<u>DTC P0262</u>	Cylinder 1 Injector Circuit High (MAX)
<u>DTC P0264</u>	Cylinder 2 Injector Circuit Low (MIN)
<u>DTC P0265</u>	Cylinder 2 Injector Circuit High (MAX)

<u>DTC P0267</u>	Cylinder 3 Injector Circuit Low (MIN)
<u>DTC P0268</u>	Cylinder 3 Injector Circuit High (MAX)
<u>DTC P0270</u>	Cylinder 4 Injector Circuit Low (MIN)
<u>DTC P0271</u>	Cylinder 4 Injector Circuit High (MAX)
<u>DTC P0273</u>	Cylinder 5 Injector Circuit Low (MIN)
<u>DTC P0274</u>	Cylinder 5 Injector Circuit High (MAX)
<u>DTC P0276</u>	Cylinder 6 Injector Circuit Low (MIN)
<u>DTC P0277</u>	Cylinder 6 Injector Circuit High (MAX)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (MAX)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (MIN)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (PLAUS)
<u>DTC P0300</u>	Random/Multiple Cylinder Misfire Detected (SIG)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (MAX)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (MIN)
<u>DTC P0301</u>	Cylinder 1 Misfire Detected (SIG)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (MAX)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (MIN)
<u>DTC P0302</u>	Cylinder 2 Misfire Detected (SIG)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (MAX)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (MIN)
<u>DTC P0303</u>	Cylinder 3 Misfire Detected (SIG)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (MAX)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (MIN)
<u>DTC P0304</u>	Cylinder 4 Misfire Detected (SIG)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (MAX)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (MIN)
<u>DTC P0305</u>	Cylinder 5 Misfire Detected (SIG)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (MAX)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (MIN)
<u>DTC P0306</u>	Cylinder 6 Misfire Detected (SIG)
<u>DTC P0313</u>	Misfire Detected With Low Fuel (MIN)
<u>DTC P0326</u>	Knock Sensor 1 Circuit Range/Performance (Bank 1 or Single Sensor) (PLAUS)
<u>DTC P0327</u>	Knock Sensor 1 Circuit Low (Bank 1 or Single Sensor) (MIN)
<u>DTC P0328</u>	Knock Sensor 1 Circuit High (Bank 1 or Single Sensor) (MAX)
<u>DTC P0335</u>	Crankshaft Position Sensor 'A' Circuit (MAX)
<u>DTC P0335</u>	Crankshaft Position Sensor 'A' Circuit (MIN)
<u>DTC P0340</u>	Camshaft Position Sensor 'A' Circuit (Bank 1 or Single Sensor) (MAX)
<u>DTC P0341</u>	Camshaft Position Sensor 'A' Circuit Range/Performance (Bank 1 or Single Sensor) (MAX)
<u>DTC P0344</u>	Camshaft Position Sensor 'A' Circuit Intermittent (Bank 1 or Single Sensor) (MAX)

<u>DTC P0351</u>	Ignition Coil 'A' Primary/Secondary Circuit (MAX)
<u>DTC P0352</u>	Ignition Coil 'B' Primary/Secondary Circuit (MAX)
<u>DTC P0353</u>	Ignition Coil 'C' Primary/Secondary Circuit (MAX)
<u>DTC P0354</u>	Ignition Coil 'D' Primary/Secondary Circuit (MAX)
<u>DTC P0355</u>	Ignition Coil 'E' Primary/Secondary Circuit (MAX)
<u>DTC P0356</u>	Ignition Coil 'F' Primary/Secondary Circuit (MAX)
<u>DTC P0365</u>	Camshaft Position Sensor 'B' Circuit (Bank 1) (MAX)
<u>DTC P0366</u>	Camshaft Position Sensor 'B' Circuit Range/Performance (Bank 1) (MAX)
<u>DTC P0369</u>	Camshaft Position Sensor 'B' Circuit Intermittent (Bank 1) (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MAX)
<u>DTC P0370</u>	Timing Reference High Resolution Signal 'A' (MIN)
<u>DTC P0373</u>	Timing Reference High Resolution Signal 'A' Intermittent/Erratic Pulses (MAX)
<u>DTC P0420</u>	Catalyst System Efficiency Below Threshold (Bank 1) (MAX)
<u>DTC P0420</u>	Catalyst System Efficiency Below Threshold (Bank 1) (MIN)
<u>DTC P0430</u>	Catalyst System Efficiency Below Threshold (Bank 2) (MAX)
<u>DTC P0430</u>	Catalyst System Efficiency Below Threshold (Bank 2) (MIN)
<u>DTC P0440</u>	Evaporative Emission System (PLAUS)
<u>DTC P0441</u>	Evaporative Emission System Incorrect Purge Flow (SIG)
<u>DTC P0442</u>	Evaporative Emission System Leak Detected (Small Leak) (MAX)
<u>DTC P0444</u>	Evaporative Emission System Purge Control Valve Circuit Open (SIG)
<u>DTC P0456</u>	Evaporative Emission System Leak Detected (Very Small Leak) (MIN)
<u>DTC P0458</u>	Evaporative Emission System Purge Control Valve Circuit Low (MIN)
<u>DTC P0459</u>	Evaporative Emission System Purge Control Valve Circuit High (MAX)
<u>DTC P0461</u>	Fuel Level Sensor 'A' Circuit Range/Performance (PLAUS)
<u>DTC P0462</u>	Fuel Level Sensor 'A' Circuit Low (MIN)
<u>DTC P0463</u>	Fuel Level Sensor 'A' Circuit High (MAX)
<u>DTC P0475</u>	Exhaust Pressure Control Valve (SIG)
<u>DTC P0477</u>	Exhaust Pressure Control Valve Low (MIN)
<u>DTC P0478</u>	Exhaust Pressure Control Valve High (MAX)
<u>DTC P0480</u>	Fan 1 Control Circuit (SIG)
<u>DTC P0491</u>	Secondary Air Injection System Insufficient Flow (Bank 1) (MAX)
<u>DTC P0492</u>	Secondary Air Injection System Insufficient Flow (Bank 2) (MIN)
<u>DTC P0500</u>	Vehicle Speed Sensor 'A' (SIG)
<u>DTC P0503</u>	Vehicle Speed Sensor 'A' Intermittent/Erratic/High (PLAUS)
<u>DTC P0506</u>	Idle Air Control System RPM Lower Than Expected (MIN)
<u>DTC P0507</u>	Idle Air Control System RPM Higher Than Expected (MAX)
<u>DTC P0512</u>	Starter Request Circuit (MAX)
<u>DTC P0512</u>	Starter Request Circuit (MIN)
<u>DTC P0512</u>	Starter Request Circuit (SIG)
<u>DTC P0520</u>	Engine Oil Pressure Sensor/Switch Circuit (SIG)
<u>DTC P0521</u>	

	Engine Oil Pressure Sensor/Switch Range/ Performance (PLAUS)
<u>DTC P0522</u>	Engine Oil Pressure Sensor/Switch Low (MIN)
<u>DTC P0523</u>	Engine Oil Pressure Sensor/Switch High (MAX)
<u>DTC P0524</u>	Engine Oil Pressure Too Low (MIN)
<u>DTC P0571</u>	Brake Switch 'A' Circuit (PLAUS)
<u>DTC P0597</u>	Thermostat Heater Control Circuit/Open (SIG)
<u>DTC P0598</u>	Thermostat Heater Control Circuit Low (MIN)
<u>DTC P0599</u>	Thermostat Heater Control Circuit High (MAX)
<u>DTC P0604</u>	Internal Control Module Random Access Memory (RAM) Error (MAX)
<u>DTC P0604</u>	Internal Control Module Random Access Memory (RAM) Error (MIN)
<u>DTC P0604</u>	Internal Control Module Random Access Memory (RAM) Error (MIN)
<u>DTC P0605</u>	Internal Control Module Read Only Memory (ROM) Error (MAX)
<u>DTC P0606</u>	ECM/PCM Processor (SIG)
<u>DTC P060C</u>	Internal Control Module Main Processor Performance (PLAUS)
<u>DTC P0620</u>	Generator Control Circuit (MAX)
<u>DTC P0620</u>	Generator Control Circuit (SIG)
<u>DTC P062F</u>	Internal Control Module EEPROM Error (PLAUS)
<u>DTC P062F</u>	Internal Control Module EEPROM Error (SIG)
<u>DTC P062F</u>	Internal Control Module EEPROM Error (SIG)
<u>DTC P0645</u>	A/C Clutch Relay Control Circuit (SIG)
<u>DTC P0646</u>	A/C Clutch Relay Control Circuit Low (MIN)
<u>DTC P0647</u>	A/C Clutch Relay Control Circuit High (MAX)
<u>DTC P0668</u>	PCM/ECM/TCM Internal Temperature Sensor Circuit Low (MIN)
<u>DTC P0669</u>	PCM/ECM/TCM Internal Temperature Sensor Circuit High (MAX)
<u>DTC P0686</u>	ECM/PCM Power Relay Control Circuit Low (MIN)
<u>DTC P0687</u>	ECM/PCM Power Relay Control Circuit High (MAX)
<u>DTC P0691</u>	Fan 1 Control Circuit Low (MIN)
<u>DTC P0692</u>	Fan 1 Control Circuit High (MAX)
<u>DTC P0703</u>	Brake Switch 'B' Circuit (PLAUS)
<u>DTC P0831</u>	Clutch Pedal Switch 'A' Circuit Low (MIN)
<u>DTC P0832</u>	Clutch Pedal Switch 'A' Circuit High (MAX)
<u>DTC P0A14</u>	Engine Mount 'A' Control Circuit/Open (MAX)
<u>DTC P0A14</u>	Engine Mount 'A' Control Circuit/Open (MIN)
<u>DTC P0A14</u>	Engine Mount 'A' Control Circuit/Open (SIG)
<u>DTC P0A14</u>	Engine Mount 'A' Control Circuit/Open (SIG)
<u>DTC P0A15</u>	Engine Mount 'A' Control Circuit Low (MIN)
<u>DTC P0A16</u>	Engine Mount 'A' Control Circuit High (MAX)
<u>DTC P0A3B</u>	Generator Over Temperature (MAX)
<u>DTC P0A3B</u>	Generator Over Temperature (MAX)
<u>DTC P1004</u>	VVT-Guiding Sensor Solenoid Loss (Bank 1) (MAX)
<u>DTC P1006</u>	VVT-Guiding Sensor Parity Error (Bank 1) (SIG)
<u>DTC P1012</u>	

	VVT-Reference Sensor Solenoid Loss (Bank 1) (MAX)
<u>DTC P1014</u>	VVT-Reference Sensor Parity Error (Bank 1) (SIG)
<u>DTC P1017</u>	VVT-Sensors Plausibility (Bank 1) (PLAUS)
<u>DTC P1017</u>	VVT-Sensors Plausibility (Bank 1) (PLAUS)
<u>DTC P1019</u>	VVT-Supply Voltage Sensors High Input (Bank 1) (MAX)
<u>DTC P101A</u>	VVT-Self-Learning Function, Stops Not Learned (MAX)
<u>DTC P101A</u>	VVT-Self-Learning Function, Stops Not Learned (MIN)
<u>DTC P101A</u>	VVT-Self-Learning Function, Stops Not Learned (SIG)
<u>DTC P1020</u>	VVT-Supply Voltage Sensors Low Input (Bank 1) (MIN)
<u>DTC P1023</u>	VVT-Self-Learning Function Faulty Adjustment Range (Bank 1) (MAX)
<u>DTC P1024</u>	VVT-Self-Learning Function Faulty Lower Learning Range (Bank 1) (MIN)
<u>DTC P102B</u>	VVT-Guiding Sensor Diagnostic Error (Bank 1) (MIN)
<u>DTC P102C</u>	VVT-Reference Sensor Diagnostic Error (Bank 1) (MIN)
<u>DTC P1030</u>	VVT-Actuator Monitoring Position Control, Control Deviation (Bank 1) (PLAUS)
<u>DTC P1030</u>	VVT-Actuator Monitoring Position Control, Control Deviation (Bank 1) (SIG)
<u>DTC P103A</u>	VVT-System Current Too High (MAX)
<u>DTC P1041</u>	Internal VVT-Control Module EEPROM Error (Bank 1) (PLAUS)
<u>DTC P1047</u>	VVT-Control Circuit High Input (Bank 1) (MAX)
<u>DTC P1048</u>	VVT-Control Circuit Low Input (Bank 1) (MIN)
<u>DTC P1049</u>	VVT-Control Circuit Engine Cables Short Circuit (Bank 1) (SIG)
<u>DTC P1055</u>	VVT-Supply Voltage Control Motor High Input (Bank 1) (MAX)
<u>DTC P1056</u>	VVT-Supply Voltage Control Motor Low Input (Bank 1) (MIN)
<u>DTC P1057</u>	VVT-Supply Voltage Control Motor Electrical (Bank 1) (PLAUS)
<u>DTC P105A</u>	Internal Control Module VVT Error, Current Too High (MAX)
<u>DTC P105B</u>	Internal Control Module VVT Error, Voltage Too Low (MIN)
<u>DTC P1062</u>	VVT-Limp Home Request Full Stroke Position Not Reached (Bank 1) (SIG)
<u>DTC P1064</u>	VVT-Value Comparison Starting Position/Parking Position Plausibility (Bank 1) (MAX)
<u>DTC P1075</u>	VVT-Overload Protection (Bank 1) (MAX)
<u>DTC P1076</u>	VVT-Overload Protection ECU-Temperature High Input (Bank 1) (SIG)
<u>DTC P1078</u>	VVT-Overload Protection Control Motor Current High Input (Bank 1) (MIN)
<u>DTC P107A</u>	VVT-Overload Protection Control Motor Current Too High (MAX)
<u>DTC P107B</u>	VVT-Overload Protection Control Motor Temperature Too High (MIN)
<u>DTC P107C</u>	VVT-Overload Protection Temperature Too High (MIN)
<u>DTC P107C</u>	VVT-Overload Protection Temperature Too High (SIG)
<u>DTC P1104</u>	Differential Pressure Sensor Intake Manifold Pressure Too Low (Bank 1) (MIN)
<u>DTC P1105</u>	Differential Pressure Sensor Intake Manifold Pressure Too High (Bank 1) (MAX)
<u>DTC P110D</u>	Throttle Position Sensor A and B Range/Performance (PLAUS)
<u>DTC P111E</u>	Intake Air Temperature Sensor 1 Maximum Temperature Implausible (Bank 1) (MAX)
<u>DTC P111F</u>	Intake Air Temperature Sensor 1 Minimum Temperature Implausible (Bank 1)

	(MIN)
<u>DTC P1124</u>	Differential Pressure Sensor Intake Manifold Offset (Bank 1) (PLAUS)
<u>DTC P112C</u>	O2 Sensor Negative Current or Positive Current Control Circuit/Open (Bank 1 Sensor 1) (MIN)
<u>DTC P112C</u>	O2 Sensor Negative Current or Positive Current Control Circuit/Open (Bank 1 Sensor 1) (SIG)
<u>DTC P112D</u>	O2 Sensor Negative Current or Positive Current Control Circuit/Open (Bank 2 Sensor 1) (MIN)
<u>DTC P112D</u>	O2 Sensor Negative Current or Positive Current Control Circuit/Open (Bank 2 Sensor 1) (SIG)
<u>DTC P1130</u>	O2 Sensor Circuit Dynamic Test (Bank 1 Sensor 2) (PLAUS)
<u>DTC P1131</u>	O2 Sensor Circuit Dynamic Test (Bank 2 Sensor 2) (PLAUS)
<u>DTC P114A</u>	Post Catalyst Fuel Trim Via Oxygen Sensor System Too Rich (Bank 1) (MAX)
<u>DTC P114B</u>	Post Catalyst Fuel Trim Via Oxygen Sensor System Too Lean (Bank 1) (MIN)
<u>DTC P114C</u>	Post Catalyst Fuel Trim Via Oxygen Sensor System Too Rich (Bank 2) (MAX)
<u>DTC P114D</u>	Post Catalyst Fuel Trim Via Oxygen Sensor System Too Lean (Bank 2) (MIN)
<u>DTC P114F</u>	Air Mass Flow Sensor Defective (MIN)
<u>DTC P115A</u>	Mass or Volume Air Flow 'A' Maximum Exceeded (MAX)
<u>DTC P116C</u>	Air Mass Flow Sensor Signal Range (MAX)
<u>DTC P116D</u>	Air Mass Flow Sensor Signal Gradient Error (MIN)
<u>DTC P116E</u>	Air Mass Flow Sensor Signal Electrical (SIG)
<u>DTC P1197</u>	Differential Pressure Sensor Intake Manifold High Input (Bank 1) (MAX)
<u>DTC P1198</u>	Differential Pressure Sensor Intake Manifold Low Input (Bank 1) (MIN)
<u>DTC P1214</u>	Fuel Pump Speed Too High (MAX)
<u>DTC P1215</u>	Fuel Pump Speed Too Low (MIN)
<u>DTC P1216</u>	Fuel Pump Emergency Operation (SIG)
<u>DTC P1217</u>	Fuel Pump Overtemperature Condition (PLAUS)
<u>DTC P1230</u>	Fuel Pump Relay Primary Circuit (SIG)
<u>DTC P1234</u>	Fuel Pump Relay Primary Circuit Low (MIN)
<u>DTC P1236</u>	Fuel Pump Relay Primary Circuit High (MAX)
<u>DTC P1244</u>	Fuel Pump Emergency Cut-Off (SIG)
<u>DTC P1300</u>	Camshaft Position Sensor 'A' Segment Timing Error (Bank 1) (MAX)
<u>DTC P1301</u>	Ignition Monitoring Cylinder 1 Spark Duration Too Short (MIN)
<u>DTC P1302</u>	Ignition Monitoring Cylinder 2 Spark Duration Too Short (MIN)
<u>DTC P1303</u>	Ignition Monitoring Cylinder 3 Spark Duration Too Short (MIN)
<u>DTC P1304</u>	Ignition Monitoring Cylinder 4 Spark Duration Too Short (MIN)
<u>DTC P1305</u>	Ignition Monitoring Cylinder 5 Spark Duration Too Short (MIN)

GENERAL INFORMATION

Diagnostic Connector (DLC) Locations

DOMESTIC CARS

CHRYSLER GROUP LLC

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

CHRYSLER GROUP LLC - DOMESTIC CARS

Application	Connector Location
Acclaim	
1989-90	Under Left Side Of Dash
1991-92	On Left Front Fender Panel, Near Shock Tower
1993-94	Near Battery
1995	Behind Left Side Of Dash, Near Fuse Block
Aries, Caravelle, Dynasty, E Class, Executive Sedan, LeBaron Sedan, New Yorker, Reliant, Town & Country, 400 & 600	
1984-85	On Left Fender Apron, Behind Battery (2.2L Only)
1986-87	On Front Of Right Shock Tower (2.2L & 2.5L Only)

1994	On Center Of Firewall
1995 & 1996	
1.6L	Under Center Of Dash, Mounted On Floorboard
2.0L	Under Right Side Of Dash, Near Kick Panel

LAND ROVER

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

LAND ROVER - IMPORTED CARS & TRUCKS

Application	Connector Location
Defender 90	Behind Fuse Cover, In Center Of Console
Range Rover	Under Right Side Of Dash, In Footwell

LEXUS

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

LEXUS - IMPORTED CARS & TRUCKS

Application	Connector Location
ES Series	
1990-91	
DLC	Near Left Shock Tower
Total Diagnostic Communication Link Connector	Under Left Side Of Dash
1992-94	

DLC No. 1	On Bracket, Behind Right Front Strut Tower
DLC No. 2 & 3	Under Left Side Of Dash
1995-97	In Fuse Box At Lower Left Of Dash
GS Series	
1990-95	
DLC No. 1	On Bracket, On Top Of Engine
DLC No. 2	Under Left Side Of Dash
1996-00	In Fuse Box At Lower Left Of Dash
LS Series	
1990-94	
DLC No. 1	On Bracket, On Top Of Engine
DLC No. 2	Under Left Side Of Dash
1995-00	In Fuse Box At Lower Left Of Dash
SC Series	
1992-95	
DLC No. 1	On Bracket, Behind Right Front Strut Tower
DLC No. 2 & 3	Under Left Side Of Dash
1996-00	In Fuse Box At Lower Left Of Dash

MAZDA

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

MAZDA - IMPORTED CARS & TRUCKS

Application	Connector Location
B-Series	
1987-88	On Right Front Fender Apron
1989-93	
Engine Control Check Connector (Black 6-Pin)	Near Windshield Washer Motor
Trouble Codes Connector (Green 1-Pin)	Near Black 6-Pin Connector (Engine Control)
1994-95	On Right Front Fender Panel
Miata (1990-95)	On Left Rear Of Engine Compartment, Near Master Cylinder
MPV (1989-95)	
Engine Control Unit (Green 6-Pin & 1-Pin Connectors)	On Left Side Of Engine Compartment, Near Inner Fender Panel
MX-3	Mounted On Bracket, On Left Front Strut Tower

MX-6 & 626	
1988	Behind Left Front Shock Tower
1989	On Left Front Corner Of Engine Compartment
1990-91	At ECU Connector Terminal
1992	On Left Rear Corner Of Engine Compartment
1993	On Side Of Fuse/Relay Block, Near Battery
1994-95	On Left Front Fender Apron
Navajo	
1991-93	On Right Rear Corner Of Engine Compartment
1994-95	On Right Front Fender Panel
Protege	
1987-89	On Passenger's Footwell (Left Foot Area)
1990-95	On Left Side Of Firewall, Near Wiper Motor
RX7	
1986-88 (3 Check Connectors)	At Left & Right Corners Of Engine Compartment
1989-91 (Green 6-Pin Connector)	Behind Ignition Coil
1993-95	On Bracket, On Left Front Strut Tower
323	
1986-88	Front Left Of Engine Compartment, Near Ignition Coil
1989 (Green 6-Pin & Green 1-Pin Connectors)	On Left Side Of Firewall
1990-95	On Left Side Of Firewall, Near Wiper Motor
929	
1989	Near Air Cleaner
1990-91 (Green 6-Pin Connector)	In Left Front Corner Of Engine Compartment
1992-93	Mounted On Air Cleaner Housing
1994-95	On Left Front Strut Tower

MERCEDES-BENZ

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

MERCEDES-BENZ - IMPORTED CARS & TRUCKS

Application	Connector Location
C-Class (1994)	On Right Rear Of Engine Compartment
E-Class	
1994-97	On Right Rear Of Engine Compartment
G-Class	Under Left Side Of Dash, Behind Cover
ML-Class	Under Left Side Of Dash, Behind Cover
S-Class	
140 Platform (1994-99)	On Right Rear Of Engine Compartment
190 Series	
1986-87	On Left Rear Of Engine Compartment
1988-93	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1994	On Right Rear Of Engine Compartment
260E	
1987	On Left Front Fender Apron, Next To Ignition Control Module
1988-89	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
300 Series	
1986-87	On Left Front Fender Apron, Next To Ignition Control Module
1988-92	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1993	
Except 300E	Left Fender Apron
300E	Right Rear Corner Of Engine Compartment
1994-95 (All Models)	On Right Rear Of Engine Compartment
400 & 500 Series	

1993	
12-Pin Connector	On Rear Of Left Front Inner Fender Panel
38-Pin (Impulse Readout)	In Module Box, On Right Rear Of Engine Compartment
1994-95	On Right Rear Of Engine Compartment
420SEL & 560 Series (Except 2.2L)	
1986-89	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1990-91	In Engine Compartment, On Left Front Fender
560 Series (2.2L)	On Lower Left Side Of Engine Connector

MITSUBISHI

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

MITSUBISHI - IMPORTED CARS & TRUCKS

Application	Connector Location
Diamante (1992-98)	Under Left Side Of Dash, Near Fuse/Relay Block
Expo	Under Left Side Of Dash, Near Fuse/Relay Block
Montero	
1986-88	Left Rear Corner Of Engine Compartment
1989-91	Behind Glove Compartment
Pickup	Under Left Side Of Dash, Near Fuse/Relay Block
Raider	
1987-88	Left Rear Corner Of Engine Compartment
1989	Behind Glove Compartment
3000GT	
1991-98	Under Left Side Of Dash, On Fuse/Relay Block
1999	Under Left Side Of Dash, Left Of Center Console

NISSAN

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

NISSAN - IMPORTED CARS & TRUCKS

Application	Connector Location
Altima	
1993-94	On Driver-Side Of Center Console, Above Accelerator Pedal
1995-96	Below Fuse Box
Maxima	
1989-94	Under Left Side Of Dash
1995-96	Below Fuse Box
NX & Sentra	Under Left Side Of Dash, Near Fuse Block
Pulsar NX	
1986	Above Right Side Of Dash, Below Wiper Motor
1987	Above Steering Column
Quest (1993-95)	
CONSULT Tester Connector	On Driver-Side Of Center Console, Above Accelerator Pedal
Self-Test Connector	Located Near Starter
Stanza	Below Center Of Dash, Near Center Console
Van	On Right Side Of Engine Compartment, Behind Fuel Filter
200SX (1995-96)	Below Fuse Box
240SX	
1991-94	Under Left Side Of Dash, Below Fuse Block
1995-96	In Glove Box
300ZX (1990)	Near Parking Brake

PEUGEOT

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

PEUGEOT - IMPORTED CARS & TRUCKS

--	--

Application	Connector Location
505 Series	On Lower Left Side Of Engine Connector

PORSCHE

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that **ARE NOT** located at the lower left side of the dash, as mandated in 1996 by the Federal government.

PORSCHE - IMPORTED CARS & TRUCKS

Application	Connector Location
911 Series	
1992-95	In Passenger's Footwell
1996	Left Side Of Center Console
928S	Top Front Of Engine
944 Series	On Left Side Of Engine Compartment

RENAULT

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that **ARE NOT** located at the lower left side of the dash, as mandated in 1996 by the Federal government.

RENAULT - IMPORTED CARS & TRUCKS

Application	Connector Location
Sportwagon	
Engine Diagnostic	On Center Of Firewall
Fuel Injection Diagnostic	Right Rear Of Engine Compartment, Behind Airflow Meter

ROLLS-ROYCE

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that **ARE NOT** located at the lower left side of the dash, as mandated in 1996 by the Federal government.

ROLLS-ROYCE - IMPORTED CARS & TRUCKS

Application	Connector Location
All Models	
1996-00	In Glove Compartment
2001-	Under Left Side Of Dash

SAAB

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

SAAB - IMPORTED CARS & TRUCKS

Application	Connector Location
900 Series	
1986-90	In Front Of Fuse/Relay Panel
1991-93	Under Back Seat, On Right Side
1994	
Convertible	Under Rear Seat
Hatchback	Under Steering Column
All Others	Under Right Front Seat
9000 Series	
1990	On Left Side Of Engine Compartment
1991-92	Under Passenger's Seat
1993	On Left Of Firewall
1994-95	Under Right Front Seat

SUBARU

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

SUBARU - IMPORTED CARS & TRUCKS

Application	Connector Location
Brat, Coupe, Hatchback, Sedan & Wagon	
1987	
Read Memory Connector	Under Left Side Of Dash, Next To MFI/SMFI Control Unit
Test Mode Connector	
MFI	On Left Side Of Dash, Next To MFI Control Unit
Sequential MFI	On Left Side Of Firewall
1988-89	On Left Side Of Dash, Next To ECU
Forester	Under Left Side of Dash, Behind Cover
Justy	
1987-88	
Read Memory Connector (Factory)	On Right Front Fender, Near Strut Tower
Test Mode Connector	On Driver-Side Kick Panel Or ECU

1989-95	
Read Memory Connector (Factory)	Under Left Side Of Dash
Test Mode Connector	On Driver-Side Kick Panel Or ECU
Legacy	
1990-94	
Check Connector (Black Connector)	Behind Right Side Of Steering Column, Near Heater Case
Diagnostic Connector (Black 4-Pin Connector)	Behind Right Side Of Steering Column, Near Heater Case
Read Memory Connector (Black Connector)	Behind Knee Panel, Right Of Steering Column
Select Monitor Connector (Yellow Connector)	Behind Right Side Of Steering Column, Near Heater Case
Test Mode Connector (Green Connector)	Behind Knee Panel, Right Of Steering Column
1995-	Under Left Side Of Dash, Behind Cover
Loyale	
1990-91	
MFI (5-Pin Connector)	In Front Of ECU
SMFI (Yellow 9-Pin & Black 13-Pin Connectors)	Near Brake Booster
1992-95	
Diagnostic Check Connector (Yellow 9-Pin & Black 13-Pin Connectors)	Behind Brake Booster
Diagnostic Read-Memory Connector (2-Single Wire Connectors)	Behind Left Front Strut Tower
Outback & Outback Sport	Under Center Of Dash
SVX	
1992-96	Under Left Side Of Dash
1997	Right Of Steering Column, On Center Console

SUZUKI

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

SUZUKI - IMPORTED CARS & TRUCKS

Application	Connector Location
Esteem (1995)	Near Battery
Samurai	
1986-90	Under Right Side Of Dash, Behind Glove Compartment

1991-92	On Right Side Of Firewall
1993-95	Under Left Side Of Dash, In Fuse Block
Sidekick & X90	
1989-91	Under Left Side Of Dash, In Fuse Block
1992-93	
ALDL Connector	Under Left Side Of Dash
Engine Connector	Under Left Side Of Dash, Near Fuse Block
1994-96	In Engine Compartment, Near Battery
Swift	
1989-91	Under Left Side Of Dash, In Fuse Block
1992	
ALDL Connector	Under Left Side Of Dash
Diagnostic Test Terminal	In Fuse Block
1993-95	Under Left Side Of Dash, In Fuse Block

TOYOTA

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

TOYOTA - IMPORTED CARS & TRUCKS

Application	Connector Location
Camry	
1983-90	Next To Brake Master Cylinder
1991	Near Left Front Shock Tower
1992-95	
4-Cylinder	Near Wiper Motor
V6	Under Left Side Of Dash
Celica	
1983-84	Next To Battery
1985-95	Behind Left Front Shock Tower
Celica Supra	Rear Of Battery, Near Relay Panel (2-Pin Connector)
Corolla	
Front Wheel Drive	
1987	Side Of Left Front Shock Tower (2-

	Pin Connector)
1988-94	Behind Left Front Shock Tower
Rear Wheel Drive	
1985-86	Side Of Right Front Shock Tower (2-Pin Connector)
1987	Right Rear Corner Of Engine Compartment
Cressida	
1988-93	
Check Connector	On Left Front Shock Tower
Total Diagnostic Communication Link Connector	Under Left Side Of Dash
Land Cruiser (1988-94)	Near Wiper Motor
MR2	
1986-90	Near Airflow Meter
1992-95	On Right Rear Of Engine Compartment, Near MAP Sensor
Paseo (1992-95)	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
Pickup	
1984-86	Near Ignition Coil, Near Master Cylinder (2-Pin Connector)
1987-90	Right Front Inner Fender Panel, Near Relay Block
1992-94	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
Previa	
1992-93	Under Front Of Driver's Seat
1994	
Except Supercharged	Under Center Console, Near Parking Brake Lever
Supercharged	Under Cover, On Top Center Of Instrument Panel
1995-97	On Top Center Of Instrument Panel
RAV4	Under Dash, Near Center Console
Starlet	
1981-82	On Instrument Panel Fuse Block, On Top Of Dash
1983-84	Right Rear Of Engine Compartment
Supra	
1986-90	Rear Of Battery, Near Relay Panel
1991-92	On Left Front Shock Tower
1993-94	
DLC No. 1	On Right Side Of Firewall

DLC No. 2	Under Left Side Of Dash, Near Kick Panel
Tacoma & T100	
1993	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
1994-95	
Except OBD-II DLC	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
OBD-II DLC	Under Left Side Of Dash
Tercel	
1987-90	In Engine Compartment, Next To Master Cylinder
1991-94	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
1995-98	Near Steering Column
Van	Near Airflow Meter
4Runner	
1985-86	Near Ignition Coil, Next To Master Cylinder (2-Pin Connector)
1987-95	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery

VOLKSWAGEN

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

VOLKSWAGEN - IMPORTED CARS & TRUCKS

Application	Connector Location
Cabrio	
1996	In Center Console, Below Tachometer
1997-02	On Center Dash, Behind Panel Near Ashtray
Corrado	Under Center Console Trim Plate
Fox	Under Center Console, Near Shift Lever
Golf	
1993	On Center Of Dash, Below A/C-Heater Control Knobs
1994	Under Center Console
1998-03	In Center Console

Golf III 2.0L	
1995-96	Below A/C-Heater Control Panel
1997-98	On Center Dash, Behind Panel Adjacent To Ashtray
GTI	
1993	On Center Of Dash, Below A/C- Heater Control Knobs
1994	Under Center Console
GTI 2.8L	On Center Dash, Behind Panel Adjacent To Ashtray
Jetta	
1993	On Center Of Dash, Below A/C- Heater Control Knobs
1994	Under Center Console
Jetta III 2.0L	
1995-96	Below A/C-Heater Control Panel
1997-98	On Center Dash, Behind Panel Adjacent To Ashtray
Jetta/Jetta III 2.8L	On Center Dash, Behind Panel Adjacent To Ashtray
New Beetle	Lower Part of Dash, In Front Of Shift Lever
Passat	
1992-94	Under Center Console, Forward Of Shift Lever
1995-97	On Center Dash, Behind Panel Near Ashtray
Toureg	
2004-2007	In the cover of the drivers side footwell, to right of engine hood release lever

VOLVO

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

VOLVO - IMPORTED CARS & TRUCKS

Application	Connector Location
C30	Under Left Center Of Dash
C70	Behind Cover, Below Parking Brake Lever

S40	Under Left Center Of Dash
S70	Behind Cover, Below Parking Brake Lever
S90	Behind Cover, Below Parking Brake Lever
V40	Under Left Center Of Dash
V70 (1997-00)	Behind Cover Below Parking Brake Lever
V90	Behind Cover, Below Parking Brake Lever
240	
1986-92	Left Rear Corner Of Engine Compartment
1993	Behind Left Front Strut Tower
740 & 760	
1986-92	
Ignition System	On Left Front Fender Apron
Fuel Injection (1990-92 Only)	Left Rear Corner Of Engine Compartment
780	On Left Front Fender, Behind Air Cleaner Housing
850	
1993	On Center Console, Forward Of Shift Lever & Near ECM
1994-95	
Non-Turbo	On Right Front Strut Tower
Turbo	Behind Cover, Forward Of Shift Lever
1996-97	Behind Cover, Forward Of Shift Lever
940	
1991-93	
Ignition System	On Left Front Fender Apron
Fuel Injection	Left Rear Corner Of Engine Compartment
1994-95	Behind Left Front Strut Tower
960	
1992-95	On Left Front Strut Tower
1996	In Center Console, To Right Of Parking Brake Lever
1997	Behind Cover, Forward Of Shift Lever

2007 BMW

X3

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
A/C Compressor Relay (K19)	Right side of dash. See Fig. 31 .
DME Relay (K6300)	Left rear engine compartment. See Fig. 33 .
Fog Light Relay (K47)	Right side of dash. See Fig. 31 .
Fuel Injectors Relay (K6327)	Left rear engine compartment. See Fig. 33 .
Fuel Pump Relay (K6301)	Under right side of dash. See Fig. 40 .
Headlight Washer Relay (K6)	Under right side of dash. See Fig. 41 .
Horn Relay (K2)	Right side of dash. See Fig. 31 .
Rear Window Defroster Relay (K13)	Right rear quarterpanel. See Fig. 32 .
Reversing Light Relay (K6325)	Left rear of engine compartment. See Fig. 46 .
Secondary Air Pump Relay (K6304)	Under right side of dash. See Fig. 41 .
Variable Valve Timing Gear Relay (K6316)	Left rear of engine compartment. See Fig. 45 .
Windshield Wiper Relay (K11)	Left rear engine compartment. See Fig. 42 .

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
E Box	Left rear of engine compartment.
Fuse Box (A400)	In right side of rear compartment floor board. See Fig. 50 .
Power Distribution (A41)	Right side of dash. See Fig. 22 .
Rear Fuse Holder (A49)	Center of rear compartment floor board. See Fig. 47 .

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location
Adaptive Directional Headlight (A214)	Under right side of dash. See Fig. 20 .
Digital Motor Electronics (DME) Control Module (A6000)	Left rear engine compartment. See Fig. 24 .
Dynamic Stability Control (A65a)	Left rear engine compartment. See Fig. 23 .
General Module Control Unit (A1)	Right side of dash. See Fig. 18 .
Heating/Air Conditioning System (A11a)	Center of dash. See Fig. 48 .
Intermittent Wipe/Wash Control Module (Rear) (A36)	In liftgate. See Fig. 21 .
Multiple Restraint System Control Module (A12)	In center console. See Fig. 19 .

Navigation System (A112a)	Left side of rear compartment. See Fig. 49 .
Panorama Glass Sunroof Module (A336)	In overhead console. See Fig. 52 .
Park Distance Control (PDC) (A81a)	Center of rear compartment floor board. See Fig. 54 .
Servotronic (A17)	Right side of dash. See Fig. 20 .
Trailer Module (A6)	Center of rear compartment floor board. See Fig. 47 .
Transfer Box Control Module (A70006)	Center of rear compartment floor board. See Fig. 54 .
Transmission Control (A7000a)	Left rear of engine compartment. See Fig. 44 .
Video Module (A197)	Left side of rear compartment. See Fig. 64 .
Voice Control System (U6a)	Left side of rear compartment. See Fig. 114 .

MOTORS

MOTORS LOCATION

Component	Location
Auxiliary Water Pump (M37)	Left side of engine compartment. See Fig. 105 .
Driver's Door System Lock (S47)	In driver's door. See Fig. 60 .
Driver's Seat Angle Adjustment Drive (M50a)	Under driver's seat. See Fig. 106 .
Driver's Seat Backrest Angle Adjustment Drive (M53a)	Under driver's seat. See Fig. 107 .
Driver's Seat Forward/Backward Adjustment Drive (M51a)	Under driver's seat. See Fig. 107 .
Driver's Seat Height Adjustment Drive (M52a)	Under driver's seat. See Fig. 107 .
Driver's Seat Lumbar Support Drive (M55a)	Under driver's seat. See Fig. 108 .
Driver's Window Motor (M21)	In driver's door. See Fig. 61 .
Electric Fan (M9)	Front of engine compartment. See Fig. 83 .
Electric Fuel Pump (M2)	Below right rear seat. See Fig. 34 .
Fuel Filler Flap Central Locking Drive (M16)	Above right rear wheel. See Fig. 32 .
Glass Roof Motor (M14105)	In overhead console. See Fig. 113 .
Headlight Washer Pump (M7)	Right front of engine compartment. See Fig. 36 .
Hydraulic Selector Unit (Y8505)	Under center of vehicle. See Fig. 121 .
Left Headlight Beam Height Control Stepper Motor (M80)	Left front of engine compartment. See Fig. 17 .
Left Rear Door Power Window (M20a)	In left rear door. See Fig. 104 .
Left Rear Door System Lock (M15)	In left rear door. See Fig. 104 .
Passenger's Backrest Angle Adjustment Drive (M58a)	Under front passenger's seat. See Fig. 110 .
Passenger's Door System Lock (S49)	In front passenger's door. See Fig. 63 .
Passenger's Seat Angle Adjustment Drive (M61a)	Under front passenger's seat. See Fig. 111 .
Passenger's Seat Forward/Backward Adjustment Drive (M60a)	Under front passenger's seat. See Fig. 111 .

Passenger's Seat Height Adjustment Drive (M59a)	Under front passenger's seat. See Fig. 111.
Passenger's Seat Lumbar Support Drive (M56a)	Under front passenger's seat. See Fig. 109.
Passenger's Window Motor (M23)	In front passenger's door. See Fig. 62.
Rear Window Washer Pump (M95)	Right front engine compartment. See Fig. 36.
Right Headlight Beam Height Control Stepper Motor (M81)	Right front of engine compartment. See Fig. 95.
Right Rear Door Power Window (M22a)	In right rear door. See Fig. 103.
Right Rear Door System Lock (M14)	In right rear door. See Fig. 103.
Secondary Air Injection Pump (M63)	Right side of engine compartment. See Fig. 35.
VTG Actuator (M8533)	Under left side of vehicle. See Fig. 112.
Windshield Washer Pump (M4)	Right side of engine compartment. See Fig. 35.
Wiper Motor (M3a)	Left rear of engine compartment. See Fig. 102.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
Automatic Air Recirculation Sensor (B414)	Left front of engine compartment. See Fig. 82.
Brake Pad Wear Sensor (Left Front) (B16a)	Left front wheel. See Fig. 27.
Brake Pad Wear Sensor (Right Rear) (B17a)	Right rear wheel. See Fig. 28.
Coolant Pressure Sensor (B8)	Right front wheelwell. See Fig. 25.
Driver's Side Front Airbag Sensor (B10508a)	Left front of engine compartment. See Fig. 84.
DSC Sensor (B75)	Center console. See Fig. 19.
DSC Steering Angle Sensor (A68)	Under left side of dash. See Fig. 53.
Headlight Beam Height Control Load Sensor (B42a)	Behind right front wheel. See Fig. 76.
Interior Movement Detector (A121b)	In overhead console. See Fig. 57.
Left Front Airbag Sensor (S71)	Left front of engine compartment. See Fig. 17.
Left Front Center Ultrasonic Sensor (B31a)	Front bumper. See Fig. 74.
Left Front Ultrasonic Sensor (B30a)	Front bumper. See Fig. 74.
Left Front Wheel Speed Sensor (B2)	Front of left front wheel. See Fig. 69.
Left Rear Center Ultrasonic Sensor (B35a)	Rear bumper. See Fig. 75.
Left Rear Ultrasonic Sensor (B34a)	Rear bumper. See Fig. 75.
Left Rear Wheel Speed Sensor (B4)	Right side of left rear wheel. See Fig. 72.
Outside Temperature Sensor (B21a)	Left front wheelwell. See Fig. 29.
Passenger's Side Front Airbag Sensor (B10509a)	Right front of engine compartment. See Fig. 85.
Pedal Position Sensor (R10)	Under left side of dash. See Fig. 37.
Rain/Headlight Sensor (B57b)	Top center of windshield. See Fig. 79.
Right Front Airbag Sensor (S72)	Right front of engine compartment. See Fig. 95.

Right Front Center Ultrasonic Sensor (B32a)	Front bumper. See Fig. 74 .
Right Front Ultrasonic Sensor (B33a)	Front bumper. See Fig. 74 .
Right Front Wheel Speed Sensor (B1)	Top of right front wheel. See Fig. 68 .
Right Rear Center Ultrasonic Sensor (B36a)	Rear bumper. See Fig. 75 .
Right Rear Ultrasonic Sensor (B37a)	Rear bumper. See Fig. 75 .
Right Rear Wheel Speed Sensor (B3)	Left side of right rear wheel. See Fig. 71 .
Seat Occupancy Recognition (A113)	Under front passenger's seat. See Fig. 56 .
Tilt Sensor (B28)	Center of rear compartment floor board. See Fig. 47 .

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
Driver Lumbar Support Valve Block (Y193)	Under driver's seat. See Fig. 108 .
Exhaust Flap (Y198)	Left side of rear compartment. See Fig. 120 .
Passenger's Lumbar Support Valve Block (Y194)	Under front passenger's seat. See Fig. 109 .
Refrigerant Compressor Control Valve (Y2a)	Right front of engine compartment. See Fig. 119 .
Servotronic Valve (B15a)	Under left front of vehicle. See Fig. 26 .
Water Valve (Y4a)	Left side of engine compartment. See Fig. 105 .

SWITCHES

SWITCHES LOCATION

Component	Location
Backup Light Switch (S8511)	Right rear side of transmission. See Fig. 39 .
Brake Fluid Level Switch (B18a)	Left rear engine compartment. See Fig. 23 .
Brake Light Switch (S29)	Under left side of dash. See Fig. 37 .
Clutch Switch (S805)	Under left side of dash. See Fig. 37 .
Coolant Level Switch (S63b)	Left front engine compartment. See Fig. 38 .
Heated Spray Nozzles Thermal Switch (S198)	Under right front side of vehicle. See Fig. 73 .
Hood Contact Switch (S19a)	Right rear of engine compartment. See Fig. 101 .
Park Brake Switch (S31)	Rear center console. See Fig. 19 .
Park/Neutral Position Switch (Y19)	Bottom of center dash. See Fig. 117 .
Wash Water Level Switch (S136)	Right front of engine compartment. See Fig. 36 .

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location
Amplifier (A18)	Left side of rear compartment. See Fig. 49 .
Antenna Diversity (A421)	Top center of rear compartment door. See Fig. 65 .

Antitheft Horn (H1a)	Rear of engine compartment. See Fig. 93 .
Basic Interference Telephone (U407a)	Left side of rear compartment. See Fig. 116 .
Bluetooth Antenna (W18)	Top of left "C" pillar. See Fig. 118 .
Chime Module (H10)	Left side of dash. See Fig. 30 .
Classification Resistor (R8554)	Under vehicle. See Fig. 112 .
Compensator (N27a)	Left side of rear compartment. See Fig. 114 .
Driver's Airbag Inflator Assemblies (G5)	Part of steering wheel. See Fig. 48 .
Driver's Seat Belt Tensioner Generator (G12)	Part of seat belt buckle assembly. See Fig. 87 .
Driver's Side Airbag Inflator Assembly (G14b)	In driver's door. See Fig. 60 .
Electric Auxiliary Heater (I01062)	Left side of engine compartment. See Fig. 96 .
Electronic Immobilizer (EWS) (A836)	Under left side of dash. See Fig. 53 .
Horn (Left) (H2a)	Left front wheelwell. See Fig. 29 .
Interference Suppression Capacitor (L400)	Top left of rear compartment. See Fig. 100 .
Left "B" Pillar Satellite (A157)	Bottom of left "B" pillar. See Fig. 58 .
Left Condenser (I01140)	Left side of rear compartment. See Fig. 99 .
Left Front Door Satellite (A162)	In driver's door. See Fig. 60 .
Left Front RDS Transmitter (B43a)	Behind left front wheel. See Fig. 77 .
Left Head Airbag Inflator Assembly (G37)	Top left of rear compartment. See Fig. 91 .
Left Heated Washer Nozzle (E51a)	Bottom left of windshield. See Fig. 86 .
Left Rear Side Airbag Inflator Assembly (G20a)	In left rear door. See Fig. 89 .
Left TV Amplifier (A453)	Left side of rear compartment. See Fig. 66 .
Microphone (H65)	In overhead console. See Fig. 80 .
OBDII (X19527)	Left side of left footwell. See Fig. 30 .
Passenger's Airbag Inflator Assemblies (G6)	Top right side of dash. See Fig. 48 .
Passenger's Seat Belt Tensioner Generator (G13)	Part of seat belt buckle assembly. See Fig. 88 .
Passenger's Side Airbag Inflator Assembly (G15b)	In front passenger's door. See Fig. 63 .
Ride Height Sensor (B64)	Under vehicle. See Fig. 81 .
Right "B" Pillar Satellite (A158)	Bottom of right "B" pillar. See Fig. 59 .
Right Condenser (I01141)	Left side of rear compartment. See Fig. 99 .
Right Front Door Satellite (A163)	In front passenger's door. See Fig. 63 .
Right Front RDC Transmitter (B47a)	Behind right front wheel. See Fig. 78 .
Right Head Airbag Inflator Assembly (G38)	Top right of rear compartment. See Fig. 92 .
Right Heated Washer Nozzle (E52a)	Bottom right of windshield. See Fig. 86 .
Right Horn (H3a)	Under right front of vehicle. See Fig. 94 .
Right Rear Side Airbag Inflator Assembly (G21a)	In right rear door. See Fig. 90 .
Right Side TV Amplifier (A453a)	Right side of rear compartment. See Fig. 67 .
Satellite Receiver (A20)	Left side of rear compartment. See Fig. 51 .
Telephone Transceiver (U400a)	Left side of rear compartment. See Fig. 115 .
Wave Trap 1 (I01101)	Bottom right side of rear compartment door. See Fig. 97 .

CONNECTORS

CONNECTORS LOCATION

Component	Location
X256 (37 Pin)	Right front door. See Fig. 12 .
X257 (37 Pin)	Left front door. See Fig. 13 .
X273 (27 Pin)	Bottom of left "B" pillar. See Fig. 58 .
X274 (27 Pin)	In right rear door. See Fig. 70 .
X275 (25 Pin)	Under seat. See Fig. 123 .
X279 (25 Pin)	Under front passenger's seat. See Fig. 56 .
X322 (8 Pin)	Center console. See Fig. 55 .
X13318 (10 Pin)	Left side of rear compartment. See Fig. 120 .
X14087 (26 Pin)	Right "A" pillar. See Fig. 10 .

GROUNDS

GROUNDS LOCATION

Component	Location
X46	Center console. See Fig. 19 .
X165	Left front of engine compartment. See Fig. 122 .
X166	Right front engine compartment. See Fig. 2 .
X167	Right front wheelwell. See Fig. 1 .
X170	Left rear engine compartment. See Fig. 3 .
X173	Below driver's seat. See Fig. 4 .
X490	Right door sill. See Fig. 14 .
X494	Right side of rear seat. See Fig. 15 .
X498	Right side of luggage compartment. See Fig. 16 .
X0861	Right front wheelwell. See Fig. 1 .
X861	Left front of engine compartment. See Fig. 17 .
X1105	Left side of dash. See Fig. 5 .
X1108	Left kick panel. See Fig. 6 .
X2184	Center of rear compartment floor board. See Fig. 54 .
X10012	Center of dash. See Fig. 7 .
X13016	Right side of luggage compartment. See Fig. 9 .

SPLICES

SPLICES LOCATION

Component	Location

X181	Right side of dash. See Fig. 22 .
X183	Right side of dash. See Fig. 22 .
X217	Left side of dash. See Fig. 11 .
X218	Right side of right footwell. See Fig. 7 .
X219	Right side of dash. See Fig. 22 .
X428	Right side of dash. See Fig. 22 .
X461	Bottom right of rear compartment door. See Fig. 97 .
X595	Center of rear compartment floor board. See Fig. 46 .
X834	In left rear door. See Fig. 89 .
X835	In right rear door. See Fig. 103 .
X891	In front passenger's door. See Fig. 62 .
X10116	Right side of dash. See Fig. 22 .
X10148	Right side of dash. See Fig. 43 .
X10189	Right side of dash. See Fig. 22 .
X10237	Center of dash. See Fig. 8 .
X18826	Right side of right footwell. See Fig. 7 .
X18827	Right side of right footwell. See Fig. 7 .

SATELLITE DIGITAL AUDIO RADIO SERVICE E60, E61, E63, E64, E90, E91

G03350949

Fig. 1: Identifying Satellite Digital Audio Radio Service
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

In the USA, BMW supports the digital radio reception system SDARS (Satellite Digital Audio Radio Service). The following providers offer SDARS:

- "Sirius Satellite Radio Inc."
- "XM Satellite Radio Inc."

BMW uses the SDARS system of "Sirius Satellite Radio Inc.". For system overview, refer to **SDARS SYSTEM OVERVIEW: E60, E61, E63, E64, E90, E91**.

The installation of special equipment creates the prerequisites in the car for using SDARS. These items of special equipment include the hardware and software for digital radio reception.

- Option 655 "BMW satellite tuner" together with
- Option 645 "Radio Control US"

SDARS System Overview: E60, E61, E63, E64, E90, E91

This system overview contains the following overviews:

- Input/output
- System circuit diagram
- Overview of control units and busses
 - > E60, E61, E63, E64 up to 09/2005
 - > E60, E61, E63, E64 from 09/2005
 - > E90, E91

Inputs/Outputs

Item	Description	Item	Description
1	Sirius satellite 1	2	Satellite tuner (SDARS: Satellite Digital Audio Radio Service)
3	Controller (CON)	4	Central Information Display (CID)
5	Loudspeaker	6	Multi-audio system controller (M-ASK)
7	Loudspeakers (TOP-HiFi system)	8	TOP-HiFi amplifier (optional) "Logic 7"
9	Telephone and GPS antenna on vehicle (includes SDARS antennas)	10	Stationary antennae for terrestrial reception
MOST	Media Oriented System Transport		

G00431735

NEW FEATURES:

- Digital radio reception from satellites and stationary antennae for terrestrial reception. For more information, refer to **SDARS TECHNOLOGY: E60, E61, E63, E64, E90, E91** .
- Radio text: Information concerning radio programs are displayed.

SDARS Technology: E60, E61, E63, E64, E90, E91

Satellite Technology

The following firms in the USA supply the Satellite Digital Audio Radio Service (SDARS):

- "Sirius Satellite Radio Inc."
- "XM Satellite Radio Inc."

BMW uses "Sirius Satellite Radio Inc.". With "Sirius Satellite Radio Inc." 3 Sirius satellites circle the earth on an elliptical orbit. The orbit around the earth and the positions of the Sirius satellites were deliberately selected so that 2 Sirius satellites always transmit to the reception area. The illustration below shows the orbit and satellites.

Item	Description	Item	Description
1	Sirius satellite 1	2	Sirius satellite 2
3	Elliptical orbit	4	Sirius satellite 3

G00431744

Fig. 11: Identifying Satellite Orbit Of SDARS System
Courtesy of BMW OF NORTH AMERICA, INC.

The advantages of "Sirius Satellite Radio Inc." (as compared to "XM Satellite Radio Inc.") are:

- Higher orbit, eliminating screening from mountains and buildings.
- Fewer stationary antennae for terrestrial reception are required.

Sirius needs approx. 105 stationary antennae for terrestrial reception. "XM Satellite Radio Inc." requires 1500 stationary antennae for terrestrial reception.

"Sirius Satellite Radio Inc." System

Generates and distributes the radio program through:

- National "Sirius Satellite Radio Inc." station
- Transmitting antennae (parabolic antennae)
- Satellites
- Satellite control centre
- Stationary antennae for terrestrial reception

The vehicle needs:

- SDARS antenna for satellite reception
- SDARS antenna for terrestrial reception
- Satellite tuner (SDARS)
- Audio system (HiFi system or TOP-HIFI system)

T6503016

G00431747

Fig. 13: Legend For SDARS Signal Diagram
Courtesy of BMW OF NORTH AMERICA, INC.

National Radio Station "Sirius Satellite Radio Inc." is located in the Rockefeller Center, New York City. The radio programs are transmitted by cable from the studios to the transmitting antennae.

Transmitting Antennae The transmitting antennae are parabolic antennae to focus the antenna beam onto the satellites. The transmitting antennae are connected by cable to the national radio station in New York. Digital signals are transmitted to the 3 Sirius satellites from the transmitting antennae.

Fig. 14: Identifying SDARS Ground Transmitting Antenna
Courtesy of BMW OF NORTH AMERICA, INC.

The digital signals are transmitted to the 3 Sirius satellites from the transmitting antennae as follows:

- 2 antennae in New Jersey transmit to 2 satellites.
- 1 antenna at the radio station in New York transmits to 1 satellite.

Satellite Control Station The satellite control station continually monitors the 3 Sirius satellites of the "Sirius Satellite Radio Inc.".

Stationary Antennae For Terrestrial Reception The stationary antennae disperse the signals from the satellites into reception areas where there is no satellite reception.

Fig. 15: Identifying SDARS System Stationary Antenna Signal
Courtesy of BMW OF NORTH AMERICA, INC.

Frequency Range The SDARS systems work in the frequency range 2320 MHz to 2345 MHz. The SDARS system used by BMW uses the frequency range 2320 MHz to 2332.5 MHz.

NOTE: ***SDARS can only be received by digital tuners. Radios for AM (Amplitude Modulation: medium waves, long waves, short waves) or FM (Frequency Modulation: VHF) are not able to pick up digital signals.***

BENEFITS:

- Low degree of interference from outside sources (no noise) because signals are transmitted digitally.
- Reception of the national radio station is possible over the whole of mainland USA.
- Sound quality is nearly as good as from Compact Disk or MiniDisk.
- Radio program not interrupted for commercials.
- At present, some 100 radio programs can be received digitally.
- Approximately 20 current affairs and "talk" radio programs can be received digitally.
- Dividing the stations into groups allows a particular musical style or information station to be found quickly.
 - The selection "Preset" creates and stores a list of favourite stations.

- Additional information is available with radio text: Station name, artist, song title.

BRIEF DESCRIPTION OF COMPONENTS

The components involved can be split into the following functional areas:

- Master control unit and aerials
- Central display and control
- Audio

Master Control Unit And Aerials

Satellite Tuner: Tuner For Satellite Digital Audio Radio Service

The satellite tuner converts the digital signals from the SDARS aerials into optical signals (light signals). The satellite tuner transmits these optical signals onto the MOST bus (Media-Oriented System Transport).

Installation Location

On E60, E61, E63, E64 the satellite tuner is located on the side panel on the left-hand side of the luggage compartment.

Item	Description	Item	Description
1	Top-HiFi amplifier (AMP) (optional)	2	Satellite tuner (SDARS)

B00431748

Fig. 16: Locating Satellite Tuner (E60, E61, E63, E64)

3	Satellite tuner (SDARS)	4	Telematics control unit (TCU)
5	CD changer (CDC)	6	Audio amplifier (HiFi amplifier or TOP-HiFi amplifier)

000431750

Fig. 17: Locating Satellite Tuner (E90, E91)
 Courtesy of BMW OF NORTH AMERICA, INC.

Design

The satellite tuner has connections for 2 SDARS antennas:

- 1 antenna connector for SDARS antenna for satellite reception
- 1 antenna connector for SDARS antenna for terrestrial reception

The satellite tuner is connected to the MOST bus via an internal interface. The same plug is also used for the power supply.

Pin Assignment

PIN ASSIGNMENTS FOR SATELLITE TUNER CONNECTOR X14062, 4-PIN

Pin	Type	Description
1	V	Terminal 30g (= terminal 30 active), activation of the Car Access System (CAS)
2	-	-
3	M	Terminal 31, earth
4	-	-

M = Ground

V = Supply

For current specifications regarding pin assignments, please refer to BMW diagnosis system.

How It Works

The digital signals (high-frequency signals) are fed to the satellite tuner from the following 2 SDARS antennas:

- SDARS antenna for terrestrial reception
- SDARS antenna for satellite reception The digital signals have a varying modulation (frequency or time modulation) but carry the same information. They are first processed separately and then evaluated to ensure the best possible quality of data transmission.

After they have been amplified, the digital signals are routed to an intermediate-frequency amplifier and converted into intermediate-frequency signals (ZF signals).

The ZF signals are then sent separately to two analogue/digital converters and converted into digital signals.

The separate processing and evaluation of the signals ensures that the best possible combination of signals from the 3 separate sources (Sirius satellite 1, Sirius satellite 2 and stationary antennae for terrestrial reception) is always used.

The processed signals are converted into optical signals (light signals) in an integrated MOST transmitter/receiver. The optical signal generated in the MOST transmitter/receiver is emitted on the MOST bus.

SDARS Antennas

High-frequency signals (digital signals) from satellites and stationary aerials for terrestrial reception are picked up by 2 SDARS aerials on the vehicle. Separate aerial cables route the signals to the satellite tuner.

SDARS aerials:

- 1 SDARS aerial for terrestrial reception from stationary aerials
- 1 SDARS aerial for satellite reception

Installation Location

On E60, E61, E90, E91, the antennas are located in the fin on the rear edge of the roof.

G00431752

Fig. 19: Locating SDARS Antennas (E60, E61, E90, E90)
Courtesy of BMW OF NORTH AMERICA, INC.

On E63, E64, the antennas are located under the interior trim of the tailgate. As the tailgate is made of plastic, there is no interference with reception.

5	Antenna connector for telephone antenna 1		

G00491755

Fig. 22: Identifying Connectors For "Fin" Type Antenna
 Courtesy of BMW OF NORTH AMERICA, INC.

How It Works

The SDARS antennas are receiving antennas.

- **SDARS Antenna For Terrestrial Reception** The SDARS antenna for terrestrial reception picks up the signals from the terrestrial antennae. Terrestrial antennae are stationary antennae located, for example on masts or in tunnels. The stationary antennae for terrestrial reception are needed as satellite signals cannot be received everywhere.
- **SDARS Antenna For Satellite Reception** The SDARS antenna for the satellite reception picks up the signals direct from the 3 Sirius satellites.

Central Display And Operation

RAD2: BMW "Professional" Radio

> E90, E91

The BMW "Professional" radio is an item of special equipment.

The radio serves as the gateway (data interface) between the MOST bus and the K-CAN.

SDARS is controlled on the radio.

SDARS is only available in conjunction with the following equipment:

- BMW "Professional" radio (RAD2)
- Car Communication Computer (CCC)

M-ASK: Multi-audio system controller

> E60, E61, E64, E65

M-ASK is an item of special equipment.

M-ASK is the interface for operating the satellite tuner. The radio stations and other SDARS information are displayed on the Central Information Display (CID).

CCC: Car Communication Computer

The CCC is installed in connection with one of the following options:

- Navigation system "Professional"
- "Voice recognition system"
- "TV function" (not US version)

On the CCC, several control units and the CD-ROM/MD/DVD drives are integrated into a single housing. The CCC is used to control all information and communication systems, including SDARS.

CID: Central Information Display

The menus for the M-ASK and CCC are displayed on the CID.

CON: Controller

The menus on the CID are selected with the controller.

Audio

AMP: TOP-HiFi Amplifier (Optional)

Option 677 "HiFi system Professional LOGIC7" guarantees the best possible interior sound. The TOP-HiFi amplifier is connected to the MOST-bus.

Loudspeaker

Tweeters, mid-range loudspeakers and woofers are arranged to give the best possible interior sound.

SYSTEM FUNCTIONS

The following SDARS system functions are described:

- Digital radio reception
- Optimised radio reception
- Wide selection of radio programs, grouped according to musical style

Digital Radio Reception

The "Sirius Satellite Radio Inc." radio station records the radio programs in digital form. Parabolic antennae transmit the signals to the 3 Sirius satellites.

The digital signals are transmitted back to Earth as follows:

- 2 satellites transmit to all parts of the Earth. The signals are received by the car's SDARS aerial for satellite reception.
- 1 satellite transmits the digital signals to stationary antennae for terrestrial reception. The aerials transmit digital signals in all directions. The vehicle's SDARS aerial for terrestrial reception receives these digital signals.

Different reception paths for digital signals ensure that reception is good even if there is no direct visual contact between the vehicle and the Sirius satellites.

If there is not direct visual contact, the signal will be received via the stationary antennae for terrestrial reception.

Satellite reception can be prevented by topographical and constructional features (e.g. valleys, skyscrapers, tunnels).

Very good reception across the entire region covered is achieved through the following measures:

- Satellites positioned in a high elliptical orbit
- Use of additional stationary antennae for terrestrial reception

Optimised Radio Reception

The quality of the signal is further improved by a special process for evaluating the signal.

Wide Selection Of Radio Programs, Grouped According To Musical Style

- A wide selection of musical styles can be grouped together in the following categories:
 - "Rock"

- "Hip-Hop"
- "Country"
- "Dance"
- "Jazz/Standards"
- "Popular"
- "Rhythm and Blues"
- "Variety"
- "Classical"
- "News"
- "Sports"
- "Entertainment"

OPERATION

NOTE: ***"Sirius Satellite Radio Inc." may only be used with a valid contractual agreement.***

- **A contract must be signed with the company before the "Sirius Satellite Radio Inc." service can be used.**
- **"Sirius Satellite Radio Inc." may block the service through the satellite contact: e.g. if payment obligations are not met.**

NOTE: ***SDARS must be enabled.***
After enablement, perform initial operation of SDARS as described in the operating instructions. How to use the satellite tuner is described in detail in the operating instructions.

Depending on the vehicle's equipment, the SDARS will be operated as follows:

- On the BMW "Professional" radio (RAD2)
- On the M-ASK or CCC: with the Central Information Display (CID) and Controller (CON)
- With the multi-function steering wheel (buttons for station-search: upwards/downwards)
- With voice input (only if Car Communication Computer (CCC) is fitted)
- With buttons in the centre console (selection of radio station: upwards/downwards)

NOTES FOR SERVICE STAFF

Service staff should note the following points:

- General information: refer to **SDARS, GENERAL INFORMATION FOR SERVICE STAFF (E60, E61, E63, E64, E90, E91)** .
- Diagnosis: refer to **SDARS DIAGNOSIS (E60, E61, E63, E64, E90, E91)** .

- Encoding/programming: refer to **ENCODING/PROGRAMMING SDARS (E60, E61, E63, E64, E90, E91)** .
- Car and Key Memory: refer to **CAR & KEY MEMORY FOR SDARS (E60, E61, E63, E64, E90, E91)** .

E90, E91: Almost all Car & Key Memory functions are programmed inside the vehicle itself. (See "Personal Profile" in the Owner's Handbook: Individual settings for a maximum of 3 remote control units via the display in the instrument cluster or via the Central Information Display)

Subject to change.

SDARS, General Information For Service Staff (E60, E61, E63, E64, E90, E91)

IMPORTANT: Do not subject fibre-optic cables to mechanical loads during assembly work.

When performing assembly work on the satellite tuner and on the M-ASK or CCC, make sure the fibre-optic cables (for the MOST bus) are handled correctly:

- **Do not pull on the fibre-optic cable.**
- **Do not crush the fibre-optic cable.**
- **Do not kink the fibre-optic cable.**

Incorrect handling could affect the function of the fibre-optic cables. A total failure of the SDARS system is the result of a broken fibre-optic cable.

Using A Satellite Tuner For The First Time

The first time a satellite tuner decodes a signal from a satellite, the so-called "Preview Channel" can be heard for a period of 6 months without a contract. ("Preview Channel: selected station for trials purposes) Once this period has been exceeded, the radio station will block sound output. (The list of stations will still be displayed.) Continued use of the radio station requires enablement. To this end, a contract must be concluded with "Sirius Satellite Radio Inc."

For reasons of quality assurance, some satellite tuners are tested by the manufacturer. These satellite tuners are marked with a blue label. The date of manufacture is shown on the white label. That means: The trials period with the "Preview Channel" has been running since the date of manufacture. For this reason, it may occasionally happen that the trials period has expired before the satellite tuner is first used in the vehicle.

T6505028

- 1) Satellite tuner
- 2) Date of manufacture on white label
- 3) Blue label
(indicates a satellite tuner that has been tested by the manufacturer)

G00431756

Fig. 23: Identifying Satellite Tuner & Label
Courtesy of BMW OF NORTH AMERICA, INC.

SDARS Diagnosis (E60, E61, E63, E64, E90, E91)

Option 645 "Radio Control US" together with option 655 "BMW satellite tuner" can be diagnosed with the BMW diagnosis system over the vehicle's diagnosis interface. The BMW diagnosis system displays the necessary operations as it guides the user through the menus.

Software update, maintenance and troubleshooting: Like all other subscribing control units the satellite tuner has read and write access to the diagnosis operations. In the CAS control unit, the saved profile can be actively

changed via the diagnosis log.

Encoding/Programming SDARS (E60, E61, E63, E64, E90, E91)

Programming/Replacing Control Unit

Most of the selected settings for SDARS are retained even if the relevant control units are reprogrammed. The following procedure is executed:

- Before programming or encoding starts, the data is automatically read off by CIP (Encoding, Individualisation, Programming) into the intermediate memory.
- After programming, the data is stored again in the respective control units.

Car & Key Memory For SDARS (E60, E61, E63, E64, E90, E91)

With the Car & Key Memory, 12 channels can be stored as individual default settings ("Presets"). The presets are stored in the satellite tuner (SDARS). The presets are specified for a specific ignition key by means of a code. When the car is started the satellite tuner finds the last radio station that was being listened to prior to switching off.

NOTE: ***Personal Profile on the E90, E91.*** Please refer to the **Personal Profile** section in the **Owner's Handbook: Individual default settings are stored for p to 3 remote controls.**

DIGITAL AND ANALOGUE TELEVISION E60, E61, E63, E64, E65, E66

NOTE: **Television in front is inactive while the vehicle is being driven. For safety reasons television is forbidden in the front when the vehicle is in motion. For this reason the television is switched off in the front when the vehicle is in motion. The sound is not switched off.**

Fig. 24: Identifying Digital And Analogue Television System
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

The television can be ordered as special equipment (option 601). The Control Display or Central Information Display in the instrument panel act as a monitor for the television (control display in the E65, E66; Central Information Display in the E60, E61, E63, E64).

With option 603, "Rear monitor", it is possible to use the television in the rear seat area too. Option 603 is not available for the E65 or E66.

New feature: The newly developed video modules receive both analogue and digital television in accordance with the international standard DVB-T. The abbreviation "DVB-T" stands for "Digital Video Broadcasting - Terrestrial".

Depending on the series there are the following equipment versions for analogue and digital television:

1. Front television:

Viewing television in the front is only possible when the vehicle is stationary.

- E60, E61, E63, E64 - Television in front without amplifier (AMP)

For System Overview, refer to **E60, E61, E63, E64 - SYSTEM OVERVIEW OF TV IN FRONT WITHOUT AMPLIFIER** .

- E60, E61, E63, E64 - Television in front with amplifier (AMP)

For System Overview, refer to **E60, E61, E63, E64 - SYSTEM OVERVIEW OF TV IN FRONT WITH AMPLIFIER** .

- E65, E66: Television in front without navigation system

For System Overview, refer to **E65, E66: SYSTEM OVERVIEW OF TV IN FRONT WITHOUT NAVIGATION SYSTEM** .

- E65, E66: Television in front with navigation system

For System Overview, refer to **E65, E66 - SYSTEM OVERVIEW OF TV IN FRONT WITH NAVIGATION SYSTEM** .

2. Television in front and rear is only available with E65, E66.

When the vehicle is in motion it is only possible to watch television in the rear seat area. It is only possible to watch television in the front when the vehicle is stationary.

- E65, E66: television in front and rear, with or without navigation system

For System Overview, refer to **E65, E66: SYSTEM OVERVIEW OF TELEVISION IN FRONT AND REAR** .

NOTE: **The Japan national version has its own system overview.
There is a separate television system overview for the Japan national version.
Please refer to the NATIONAL VERSION section.**

E60, E61, E63, E64 - System Overview Of TV In Front Without Amplifier

NOTE: ***The overviews also include the Japan version of the television with navigation system. On the Japan version, the navigation system has its own control unit: JNAV (Japan navigation system) The RGB wire for this navigation system (JNAV) is controlled by the video module.***

BRIEF DESCRIPTION OF COMPONENTS

The following components supply signals or data for the television:

TV Aerial

The TV aerial receive the signals for the television.

2 or 3 TV aerials are used as follows for the best possible TV reception under varying reception conditions:

- E60, E61, E63, E64 - Television in front, digital and analogue 2 TV aerials
- E65, E66 without navigation system: Television in front, digital and analogue 3 TV antennae
- E65, E66: Television in front and rear, analogue: 2 TV aerials
- E65, E66: Television in front and rear, analogue and digital: 3 TV aerials

2 TV aerials are used at all times to guarantee optimum reception.

The TV aerials are in the rear window. The heating areas for the rear-window heater are also used as TV aerials.

MOST port

Control units for the television are programmed and encoded via the MOST port.

Aerial Amplifier

There are always 2 aerial amplifiers (TV tuners) installed.

On equipment versions with 3 TV aerials, 2 TV aerials are amplified by one aerial amplifier. One more TV aerial is amplified by the 2nd aerial amplifier.

The aerial amplifiers are to the right and left of the rear window.

The aerial signals are transmitted to the video module via coaxial cables.

Diagnosis Lead

Control units for the television are diagnosed via the diagnosis lead.

AMP: Amplifier

NOTE: *The following control units are involved in the television system (in alphabetical order):*

The amplifier issues the audio signals to the loudspeakers.

The following amplifier is fitted, depending on equipment variant:

- HiFi amplifier without AMP control unit
- TOP-HiFi amplifier with AMP control unit:

This amplifier belongs to the "TOP-HiFi amplifier" option (Logic 7).

The TOP-HiFi amplifier is a control unit in the MOST network.

The audio signals are transmitted to the TOP-HiFi amplifier via the MOST bus.

ASK: Audio System Controller

> E65, E66

The audio system controller controls the sound.

The audio system controller is a control unit in the MOST network.

BZMF: Control centre, rear compartment centre armrest

> E65, E66

The rear compartment centre armrest control centre controls the headphones.

The BZMF is a control unit in the K-CAN system.

CCC: Car Communication Computer

> E60, E61, E63, E64

The Car Communication Computer controls the information and communication systems.

Depending on the equipment and national version, the CCC processes RGB signals or FBAS signals (RGB: red-green-blue; FBAS: Composite Video Burst Synchronisation).

The CCC converts the analogue picture signals into digital LVDS signals (LVDS: Low Voltage Differential Signalling). The LVDS signals are transmitted to the screen via a special LVDS data wire (monitor is the CD or the CID).

The CCC is a control unit in the MOST network.

For more information, please refer to SI Technology bulletin (SBT) 84 06 03 053. Refer to **CAR COMMUNICATION COMPUTER (CCC) E60, E61, E64, E65** .

CD: Control Display

> E65, E66

The Control Display is the screen for the television and other information and communication systems (e.g. navigation system).

The CD is a control unit in the MOST network.

CID: Central Information Display

> E60, E61, E63, E64

The Central Information Display is the screen for the television and other information and communication systems (e.g. for the navigation system).

The CID is a control unit on the K-CAN.

For more information, please refer to SI Technology bulletin (SBT) 62 01 03 027. Refer to **iDRIVE, CENTRAL INFORMATION DISPLAY AND CONTROLLER E60, E61, E63, E64, E87, E90, E91** .

CON: Controller

The controller is integrated in the centre console switch centre (BZM). The CON is the operating unit and the control unit for operating the screen (Control Display or Central Information Display, see below).

The controller is a control unit on the K-CAN system or K-CAN

(K-CAN-S for E65, E66; K-CAN for E60, E61, E63, E64).

For more information, please refer to SI Technology bulletin (SBT) 62 01 03 027. Refer to **iDRIVE, CENTRAL INFORMATION DISPLAY AND CONTROLLER E60, E61, E63, E64, E87, E90, E91** .

DVD Changer

> E65, E66

The E65 and E66 also have a DVD changer (DVDC). The films on DVD use the components and software of the television.

FCON: Rear Compartment Controller

> E65, E66

The rear compartment controller is part of the "Rear seat area entertainment" option.

The rear compartment controller is integrated into the rear compartment centre armrest control centre (BZMF).

The rear compartment controller is the operating unit and control unit for operating the rear display.

The rear compartment controller is a control unit on the K-CAN system

Signal path when operating the FCON:

FCON -> K-CAN SYSTEM -> BZMF -> K-CAN SYSTEM -> SG-FD -> VM.

KHI: Headphone Interface

> E65, E66

The headphones interface is part of the "Rear seat area entertainment" option.

The headphones interface transmits audio data to the headphones connection module.

The headphones interface is a control unit in the MOST network.

NAV: Navigation System

The navigation system is important for the equipment variant "Television in front" (E60, E61, E63, E64, E65, E66).

With the equipment variant "Television in front", the NAV control unit works as an RGB decoder:

The navigation system converts FBAS signals into RGB signals.

The navigation system is a control unit in the MOST network.

SG-FD: Rear Display Control Unit

> E65, E66

The rear compartment controller control unit is only provided with the option "Rear seat area entertainment".

The SG-FD is installed beneath the rear display.

The SG-FD is a control unit on the K-CAN system

The SG-FD converts the image signal into the screen display on the rear display: e.g. RGB signals into LVDS signals.

The SG-FD is actuated by the video module.

Signal path: VM -> RGB wire -> SG-FD -> LVDS data wire -> FD

SGM: Safety And Gateway Module

The safety and gateway module is the data interface between the K-CAN or K-CAN system and the diagnosis cable.

The control units are diagnosed via the SGM.

VM: Video module

The video module is the central receiver unit for the picture signals from the TV aerials. In addition, the video module is a selector switch for the video sources.

- The video module is the master control unit for the television.
- The video module edits the picture signals from the TV aerials and from the DVD drive or DVD changer.

The video module is a control unit in the MOST network.

The video module (VM) is the master control unit for the television.

Installation Location

Video module is fitted at the rear left in the luggage compartment.

Construction

The video module comprises the following components:

- 2 Or 3 Aerial Connectors
- TV Tuner
- 2 Large Connectors
- Electronic Circuitry For Signal Processing

T6504098

Key	Explanation	Key	Explanation
1	Connector X18803 for MOST, power supply and outputs	2	Connector X18804 for image signal inputs, e.g. on JNAV or DVDC (JNAV: Japan navigation system; DVDC: DVD changer)
3	Aerial connector	4	Aerial connector
5	Aerial connector		

G00431775

Fig. 45: Identifying Video Monitor

Courtesy of BMW OF NORTH AMERICA, INC.

The illustration shows the video module on the E65, E66 for digital and analogue television in the front and rear. The video module with Japan navigation system has a different housing and different aerial inputs (VM5 RGB). For details of the classification of the equipment variants for video modules, see below.

Aerial Connector

Depending on the equipment variant, the following aerial connectors may be fitted:

On vehicles with television in the front and rear, the video module has 2 aerial inputs.

The video module has 3 aerial input with the following equipment variants:

- E65, E66: with analogue and digital television in the front and rear
- E65, E66: Television in front without navigation system

These 3 aerial inputs use the following aerial connectors:

- Aerial connector FAKRA E, green: TV 1 with signal and screening (item "3" in illustration)
- Aerial connector FAKRA F, brown: TV 2 with signal and screening (item "4" in illustration)
- Aerial connector FAKRA F, pink: TV 3 with signal and screening (equipment variant television in front and rear; this connector is shown as item "5" in the illustration)

FAKRA is the name of a standard. FAKRA stands for "Fachausschuss Kraftfahrzeuge" (technical committee for motor vehicles).

The video module also receives TV signals if only one aerial is working. However, signal processing will then be restricted.

Aerial Amplifier

Each aerial amplifier (TV tuner) is connected to its own aerial input.

- Vehicles with television in the front: The video module has 2 aerial amplifiers.
- Vehicles with television in the front and rear: The video module has 3 aerial amplifiers in 2 housings.

The aerial amplifiers work as follows:

Each aerial amplifier is independent of the other aerial amplifiers.

The aerial amplifiers are flexibly used as follows:

- Flexible reception: Depending on reception conditions, each aerial amplifier is able to receive a TV program in the foreground. The best reception quality is then used.
- Flexible background search: An aerial amplifier conducts a background search to find a new frequency for the current TV station. The other aerial amplifier receives the current TV program.

Each aerial amplifier is able to search for new frequencies. This means that the frequency range is scanned as quickly as possible. The list of stations is thus kept as current as possible. Alternative frequencies for the TV program selected are kept on standby.

2 Large Connectors

Depending on equipment variant, the two large connectors have different pin assignments:

- Pin assignment of video module for television in front: X18803 and X18804
- Pin assignment of video module for television in front and rear: X18803 and X18804

Television In Front:

PIN ASSIGNMENT X18803, 18+2-PIN WITH MOST, ENCODING C (BLUE)

Pin	Type	Description
1	M	Terminal 31
2	-	-
3	-	-
4	A	Composite Video Burst Synchronisation (FBAS), output
5	-	-
6	-	-
7	-	-
8	-	-
9	-	-
10	-	-
11	V	Terminal 30
12	A	Screening 1: The wire for the image signal to the Car Communication Computer (CCC) has additional screening (for improved electromagnetic compatibility).
13	A	Composite Video Burst Synchronisation (FBAS), terminal 31, earth
14	-	-
15	-	-
16	-	-
17	A	Screening 2: The wire for the image signal to the Car Communication Computer (CCC) has additional screening (for improved electromagnetic compatibility).
18	-	-
19	-	-
20	-	-
MOST	E/A	2 pins
<p>A = Output E/A = Input/output M = Earth V = Supply voltage For current specifications regarding pin assignment, please refer to BMW diagnosis system.</p>		

PIN ASSIGNMENT X18804, 18-PIN, ENCODING B (NATURAL, I.E. COLOURLESS)

Pin	Type	Description
1	-	-
2	-	-
3	E	DVD changer (DVDC), Composite Video Burst Synchronisation (FBAS)
4	-	-
5	-	-

12	-	-
13	-	-
14	-	-
15	-	-
16	-	-
17	-	-
18	-	-
E = Input M = Earth For current specifications regarding pin assignment, please refer to BMW diagnosis system.		

Television In Front And Rear:

PIN ASSIGNMENT X18803, 18-PIN WITH MOST, ENCODING C (BLUE)

Pin	Type	Description
1	M	Terminal 31
2	-	-
3	A	Red 1, 75 ohm
4	A	Green 1, 75 ohm
5	A	Blue 1, 75 ohm
6	M	Red-green-blue 2
7	-	-
8	-	-
9	-	-
10	-	-
11	V	Terminal 30
12	A	Screening 1: The wire for the image signal to the Car Communication Computer (CCC) has additional screening (for improved electromagnetic compatibility).
13	M	Composite Video Burst Synchronisation (FBAS), terminal 31, earth
14	A	Red 2, 75 ohm
15	A	Green 2, 75 ohm
16	A	Blue 2, 75 ohm
17	A	Screening 2: The wire for the image signal to the Car Communication Computer (CCC) has additional screening (for improved electromagnetic compatibility).
18	-	-
19	-	-
20	-	-
MOST	E/A	2 pins

A = Output

E/A = Input/output

M = Earth

V = Supply voltage

For current specifications regarding pin assignment, please refer to BMW diagnosis system.

PIN ASSIGNMENT X18804, 18-PIN, ENCODING B (NATURAL, I.E. COLOURLESS)

Pin	Type	Description
1	-	-
2	-	-
3	E	DVD changer (DVDC), Composite Video Burst Synchronisation (FBAS)
4	-	-
5	E	Red-green-blue, terminal 31
6	-	-
7	-	-
8	E	AUX-In connection (if fitted)
9	-	-
10	-	-
11	M	DVD changer (DVDC), Composite Video Burst Synchronisation (FBAS), terminal 31, earth
12	E	Red, 75 ohm
13	E	Green, 75 ohm
14	E	Blue, 75 ohm
15	-	-
16	-	-
17	E	AUX-In connection, Composite Video Burst Synchronisation (FBAS), terminal 31, earth (if fitted)
18	E	Synchronisation pulse from Japan navigation system (if fitted): The JNAV has an external synchronisation pulse. This synchronisation pulse is transmitted by the JNAV to the video module. The current video modules (VM hybrid) no longer need this synchronisation pulse.
E = Input M = Earth For current specifications regarding pin assignment, please refer to BMW diagnosis system.		

How It Works

The following functions are described:

- Power Supply
- Various Equipment Variants (List)
- Video Modules And Aerial Inputs

Power Supply A cycled current supply (switching power unit) provides power. The power unit creates very little power loss. Voltage peaks are avoided by switching on and off (hence the name "switching power unit").

In addition, a power supply is also created in standby mode.

Various Equipment Specifications Depending on the model series and equipment variant, the video module can work in different ways. In general, the following as described:

- "Analogue": The video module is only suitable for analogue television.
- "Hybrid": The video module is suitable for analogue and digital television.
- "Drive": The video module is suitable for watching television while the vehicle is moving. It is only possible to watch television in the rear while the vehicle is moving.
- "FBAS": The video module is connected to an FBAS wire. Inputs and outputs have FBAS wires. This video module is always hybrid, i.e. suitable for analogue and digital television.
- "RGB": The video module is connected to RGB wires. This video module supports analogue television.

To date, only analogue video modules have been fitted. The analogue video modules work either on the basis of FBAS or on the basis of RGB (FBAS: Composite Video Burst Synchronisation; RGB: red-green-blue).

ANALOGUE VIDEO MODULES: HOW IT WORKS AND MODEL SERIES

How it works	E name	E60, E61, E63, E64	E65, E66	Japan E60, E61, E63, E64	Japan E65, E66
RGB	VM5 RGB	0	0	1 with JNAV	1
FBAS	VM5 ECE	1	1	0	0
DRIVE (with RGB outputs)	VM5 DRIVE	0	1	0	1 With TV in rear and as video switch with rear seat area entertainment with external navigation

1: fitted
0: not fitted
E name: development code

Since 09/2004, hybrid video modules have been fitted in countries with DVB-T (in model series E60, E61, E63, E64, E65, E66). Hybrid video modules process analogue and digital television. The hybrid video modules also work on the basis of either FBAS or RGB.

HYBRID VIDEO MODULES: HOW IT WORKS AND MODEL SERIES

How it works	E name	E60, E61, E63, E64	E65, E66	Japan E60, E61, E63, E64	Japan E65, E66
FBAS	VM hybrid FBAS	1	1 Without TV in rear	0	0
DRIVE (RGB)	VM hybrid DRIVE	0	1 with TV in rear	0	0

		or with TV in front without NAV	
--	--	---------------------------------------	--

1: fitted

0: not fitted

E name: development code

NOTE: *In Japan there is only analogue television. Japan does not have DVB-T. For this reason, an analogue video module is fitted for television in the front in Japan (on RGB basis). With equipment variant television in front and rear, the video module VM5 DRIVE is fitted in Japan (analogue video module on RGB basis).*

Video Modules And Aerial Inputs All video module have 2 aerial inputs, except: video module 5 hybrid DRIVE.

Monitors: Control Display or Central Information Display

NOTE: **The following components are controlled:**

> E65, E66: Control Display

> E60, E61, E63, E64: Central Information Display

FD: Rear Display

> E65, E66

The rear display is part of the "Rear seat area entertainment" option.

The rear display is the monitor for the television in the rear.

The rear display is mounted on the centre console between the driver's and front passenger's seats.

The rear display is actuated by the SG-FD (rear display control unit, via the LVDS data wire).

The rear display is a control unit on the K-CAN system

Loudspeakers

The following loudspeakers are actuated for television sound output:

- Tweeters and medium-range loudspeakers: The loudspeakers are actuated by the CCC or ASK.

(CCC: Car Communication Computer: E60, E61, E63, E64)

(ASK: audio system controller: E65, E66)

- **Woofers:** If an amplifier (AMP) is fitted (HiFi amplifier or TOP-HiFi amplifier), the woofers are actuated by the amplifier.

KHA: Headphones Connector Module

> E65, E66:

The headphones connector module is integrated into the rear compartment centre armrest control centre.

The headphones are connected to the KHA.

FBAS Wire

NOTE: The following wires are important:

FBAS: Farbbild-Austast-Synchronsignal,

English CVBS: Composite Video Burst Synchronisation

> E60, E61, E63, E64:

The FBAS wire connects the video module to the Car Communication Computer.

The FBAS wire consists of 2 wires:

- One wire is used to transmit all three 3 RGB signals (red-green-blue) together.
The synchronisation pulse (for a sharp TV picture) are also transmitted on the wire for RGB signals.
- The other wire is used for screening and earthing.

Coaxial cable

The coaxial cables transmit high-frequency signals, e.g. between the aerial amplifier and the video module (VM):

- E60, E61, E63, E64, E65, E66: between the video module and the aerial amplifier
- E65, E66: between the DVD changer and video module

Construction of coaxial cable:

- Inner conductor ("core"), insulated
- The outer conductor forms a mantle around the inner conductor

LVDS Data Wire

LVDS stands for "Low Voltage Differential Signalling".

There is always a LVDS data wire between the display control unit and the monitor:

- E60, E61, E63, E64:

Between the Car Communication Computer and Central Information Display

- E65, E66:

Between the rear display control unit and the rear display

LVDS is a special technology for fast and secure data transmission:

There are 2 wires for each signal. The signal is transmitted positively on one wire, negatively on the other (inverted). This means that each pair of wires is electrically neutral.

Interference from outside has **no** effect on the signal transmission: such interference affects both wires equally. The signal information is thus unaffected. This is because:

The control unit processes the difference between the positive and negative signals. This difference remains unchanged even in the event of interference from outside.

The LVDS data wire for the television consists of the following wires:

- 2 wires for red
- 2 wires for green
- 2 wires for blue
- 2 earth wires
- Screening

The synchronised pulses are transmitted on the wire for image signals.

RGB Wire

> E60, E61, E63, E64: between the video module and the CCC

> E60, E61, E63, E64: between the NAV and CD

> E65, E66: between the video module and the CD

> E65, E66: between the video module and SG-FD

The RGB wire has 3 wires for image signals: red-green-blue. The synchronised pulse is transmitted on the wire for the green signal.

The RGB wire is screened. The screening carries no current.

In addition, the RGB wire has its own earth wire for improved electromagnetic compatibility. The earth wire conducts current.

MOST Bus

The MOST bus connects the control units for the vehicle's information and communication systems. These control units are programmed via the MOST port.

K-CAN or K-CAN SYSTEM: Body CAN or Body CAN SYSTEM:

> E60, E61, E63, E64: K-CAN

> E65, E66: K-CAN SYSTEM

For more information, please refer to SI Technology bulletin (SBT) 61 02 03 015] **BUS DIAGNOSIS ALL MODELS FROM E60** .

SYSTEM FUNCTIONS

The video module comprises the following functions:

- Digital and analogue television
- Television when the vehicle is stationary (front)
- Television when the vehicle is in motion (rear compartment only)
- Television reception
- Image buildup
- Sound reception
- Transmission of image signals in the vehicle
- Sound output
- Mute
- Station selection
- Aerial diversity for TV aerials TV 1, TV 2 and TV 3 (only E65, E66 with television in front and rear):

Aerial diversity for TV aerials is not a separate component, but rather a software component within the video module.

- Video switch

NOTE: **Digital television: Basic principles and introduction in various countries**
This SI Technology bulletin (SBT) describes digital television as used by BMW.
The enclosures also include the following information:

- **Fundamental information about digital television**

- **An overview of the conversion from analogue to digital television in various countries**

Overview Of E60, E61, E63, E64, E65, E66: Digital Television

This SI Technology bulletin (SBT) principally describes digital television as used by BMW. In addition, the following information is provided:

- Fundamental information: Advantages of and standards for digital television
- An overview of the conversion from analogue to digital television in various countries

Basic Principles Of Digital Television

Advantages of digital television:

- **Number of TV Programs**

Digital television makes better use of the band-width when broadcasting TV programs than analogue television:

The digital signals can be transmitted and compressed without loss. Example: A TV picture with 625 lines (PAL) has an uncompressed data transmission rate of 216 Mbit/s.

With MPEG-2, this TV picture is compressed at least to 8 MBit/s.

Data compression is variable and dynamic, depending on the content of the TV picture.

This provides the following possibilities:

- Multiplex: Several TV stations on one channel:

Because of the data compression, up to 5 TV stations can be digitally broadcast on a single conventional UHF or VHF channel.

This transmission is known as "Bouquet".

- Specification of UHF and VHF channels:

- VHF channel for television: 48-67 MHz

VHF: Very High Frequency, frequency range: 30-300 MHz

- UHF channel for television: 471-860 MHz

UHF: Ultra High Frequency, frequency range: 300 MHz to 3 GHz

- Higher transmission quality due to data compression:

The band-width is used for TV stations with higher resolution (HDTV: High Definition Television, previously only used in Australia).

○ **Improved Transmission Performance**

DVB-T has a better transmission performance than analogue television:

Digital television is some 10 dB "better" than analogue television. This means that a lower transmission output is needed for the same range.

○ **Interference-Free Data Transmission Due To Multipath Reception**

Analogue television produces "shadows" when a TV program is received more than once (caused by the reflection of the signal): A TV picture appears superimposed on top of the same TV picture, shifted slightly to one side and significantly weaker.

Multipath reception is useful for digital reception: Even reflected signals are used for building up the picture.

○ **Mobility**

Because digital television is resistant to interference, it also supports mobile reception: Stable reception is possible at speeds of up to 200 km/h under favourable conditions.

○ **Universal Coverage Of Large Areas With Single-Frequency Network**

Several geographically separate TV stations are linked in a single-frequency network (SFN). The single-frequency network functions as follows:

All TV stations work on the same transmission frequency. The TV stations are synchronised by GPS so that exactly the same information is transmitted to within 100 nanoseconds. Because the information is precisely synchronised, only one frequency is needed for a TV program, even in a large reception area.

○ **Loss-Free Recording**

TV Programs can be stored without loss on CD, PC and laptop.

Digital television (DVB: Digital Video Broadcasting) has the following standards:

- DVB-S: Digital television for data transmission via satellite
- DVB-C: Digital television for data transmission via cable networks
- DVB-T: Digital television for data transmission via stationary antennae for terrestrial reception (frequency ranges: VHF or UHF).
 - Terrestrial, digital television in USA: Standard for digital television in USA: ATSC (Advanced Television Systems Committee).
 - Terrestrial, digital television in Japan: Standard for digital television in Japan: ISDB (Integrated Services Digital Broadcasting).

- DVB-H: Digital television for asynchronised transmission onto mobile final devices (handheld units), also terrestrial.

Digital And Analogue Television

Depending on the equipment variant, analogue and/or digital television can be received.

For digital television the DVB-T standard is supported. Only terrestrial reception is possible.

The abbreviation "DVB-T" stands for "Digital Video Broadcasting" - Terrestrial. In other words "DVB-T" means: digital television transmitted via antenna ("terrestrial").

There are two equipment specifications for analogue and digital television:

1. Television when the vehicle is stationary
2. Television when the vehicle is in motion

Television When The Vehicle Is Stationary (Front)

Viewing television in the front is only possible when the vehicle is stationary.

The television is deactivated when the vehicle reaches walking pace. The sound remains unaffected.

Television in the front is available for the following model series:

> E60, E61, E63, E64, E65 and E66

Television When The Vehicle Is In Motion (Rear Compartment Only)

Television in the rear is only available with the model series E65 and E66.

It is also possible to watch television in the rear when the vehicle is in motion.

Television Reception

The analogue television supports the following television standards:

- NTSC: NTSC is most common in North and South America and in Japan. NTSC is an analogue television standard for colour transmission.

NTSC stands for "National Television Standards Committee".

- PAL: PAL is most common in Europe.

PAL is also used in Australia and in most African and Asian countries (except for Japan). PAL is common in all countries that **do not have** NTSC and SECAM.

PAL is an analogue television standard for colour transmission.

PAL is a further development of NTSC. As with NTSC, the TV pictures are transmitted in lines. PAL, however, evens out colour faults.

PAL stands for "Phase Alternating Line".

- SECAM: SECAM is most common in France and Eastern Europe.

SECAM stands for "Sequentielle Couleur a Memoire", i.e. "sequential colour memory".

Digital television supports data transmission via MPEG.

MPEG stands for "Motion Picture Experts Group". MPEG is the designation of a data compression standard for image signals.

Transmission Of Image Signals In Vehicle

Image signals are transmitted as follows, depending on equipment fitted:

- E65, E66: Television in front:

Depending on the vehicle's equipment, the video module or the navigation system will transmit the RGB signals to the control unit for the monitor (CD or SG-FD:

Control Display or rear display control unit):

If a navigation system is fitted, the navigation system will transmit the RGB signals to the monitor (exception: Japan navigation system)

The red-green-blue image signals are transmitted via the RGB wire.

Signal path: Aerial -> Aerial cable -> Aerial amplifier -> Video module (VM) -> FBAS wire -> Navigation system (NAV) -> RGB wire -> CD (Control Display).

If there is **no** navigation system fitted, the video module will transmit the image signal to the monitor as follows:

- E60, E61, E63, E64: from the video module through the FBAS wire to the Car Communication Computer (CCC).

A LVDS data wire transmits the image signal between the CCC and the CID (Central Information Display).

- E65, E66: From the video module through the RGB wire to the Control Display
- Television in front and rear (E65, E66 only)

The navigation system transmits its image data to the video module.

The image signals are transmitted between the SG-FD and rear display through a LVDS data wire.

Image Buildup

E60, E61, E63, E64, E65, E66:

The TV picture is built up as follows:

- Colours are made up of individual red, green and blue pixels.
- The TV picture is built up line by line.
- Synchronisation of image signals: For a sharp TV picture, the pixels must be precisely synchronised. The synchronisation works as follows:
 - Horizontal synchronisation defines when a line ends and a new line starts.
 - Vertical synchronisation defines when a new image buildup is to start (in the top left corner).

A separate electrical pulse is provided for synchronisation: The synchronisation pulse. The synchronisation pulse is transmitted with the green signal (all model series).

Sound Reception

The sound signal is received together with the image signal in the TV signal.

Signal path for sound: Aerial -> Aerial cable -> Aerial amplifier -> Coaxial cable -> Video module -> MOST bus -> Radio or amplifier (AMP) -> Loudspeakers.

The video module processes the sound for the television.

Sound Output

Sound is output in mono or stereo as follows:

- Analogue TV sound in mono:

The video module receives the analogue TV sound in mono.

The analogue TV sound is digitalised.

The video module lays the digitalised signal on both the left and right synchronous channel of the MOST bus.

The ASK or CCC emit the audio signals to the loudspeakers (via the amplifier, depending on equipment variant).

- Digital TV sound in stereo:

The digital TV sound is received and emitted in stereo.

Precondition: The TV program is transmitted in stereo.

- 2-channel sound:

2-channel sound is only available with digital television reception.

2-channel sound allows, for example, a foreign-language broadcast to be overdubbed in English. With 2-channel sound, the language of the country concerned will be output through the loudspeakers. The other language will be muted.

Depending on the equipment variant, the loudspeakers are actuated by amplifiers are follows:

- HiFi amplifier

> E60, E61, E63, E64, E65, E66

The HiFi amplifier actuates the woofers. CCC or ASK actuate the mid-range loudspeakers and the tweeters.

- TOP-HiFi amplifier "Logic 7"

> E60, E61, E63, E64, E65, E66

The TOP-HiFi amplifier actuates all loudspeakers.

Mute

If necessary, sound output can be switched between navigation system and television.

The sound signals from the radio and television are muted under the following conditions:

- Telephone call
- Navigation system announcements
- Traffic reports

The CCC or the ASK controls the muting.

Station Selection

The video module manages a list of all the television stations that can currently be received.

This list of stations is shown on the Control Display (CD) or Central Information Display (CID) as follows:

- Where station names for individual TV programmes can be determined, the list starts with the station names arranged in alphanumeric order (e.g. ARD, BR3, SAT1 ...).

- After this, a list will appear showing the reception channels with unknown station names. This list is also alphanumerically ordered: e.g. CH3, CH7, CH12, ... for Channel 3, Channel 7, Channel 12.

> E65, E66: Front and rear seat television: The list of stations is updated automatically.

> E60, E61, E63, E64 and E65, E66 with television in front: The list of stations is updated manually by selecting "Autostore".

The list of stations is also updated if another entertainment module is selected (e.g. if you change to the radio or CD changer). When the television is called up again the current list of stations is offered automatically.

Aerial Diversity

> E65, E66 Only: television in front and rear, analogue and digital

The "aerial diversity" function is only available with 3 TV aerials.

To ensure optimum reception, these 3 TV antennae work as follows:

- 2 TV aerials receive the required television station.
- 1 TV aerial searches in the background for other transmission frequencies for this television station.

The required television station is received on the transmission frequencies with the highest signal strength.

Aerial diversity works as follows:

If more than one station have the same name when analogue TV is in use, then there are alternative frequencies. e.g. "Television station 1" is being received on 3 different analogue frequencies. In this case the television station is displayed just once.

Aerial diversity automatically selects the best frequency. "Television station 1" is shown in the display.

If, however, a television station is transmitting "Television station 1" analogue on several frequencies and "1st digital" digitally on another frequency, then the display shows the following:

- Aerial diversity combines all frequencies for analogue television.

The best frequency is selected and displayed. e.g.: "Television station 1".

- However, aerial diversity is **not** able to combine the following TV stations: Analogue reception for "Television station 1" and digital reception for the "1st digital".

This is because: The video module cannot assign the two different notations and meanings to one another.

This means "Television station 1" appears twice in the list of stations: Once analogue as "Television station 1" and once digitally as the "1st digital".

Video Switch

The video module switches between the various video sources, e.g. between television and video.

This function is called "video switch".

OPERATION

The following operations are described:

- Adjusting screen settings
- Selecting television stations
- Updating list of stations

NOTE: ***Please comply with instructions in Owner's Handbook.***
Detailed instructions for the television can be found in the vehicle's Owner's Handbook.

Adjusting Screen Settings

Users can adjust the screen settings for colour, contrast and brightness: Call up the corresponding menu (using the CD and controller on the E65, E66; using the CID and controller on the E60, E61, E63, E64).

The controller controls the monitor settings.

Depending on the equipment specification, the screen setting is processed in the following control units:

- Vehicles with television in the front:
 - > E60, E61, E63, E64: Car Communication Computer (CCC)
 - > E65, E66:

For vehicles with a navigation system the screen setting is processed in the control unit for the navigation system (NAV).

On vehicles **without** navigation system, the video module processes the monitor settings.

- Vehicles with rear display (E65, E66 only): The video module processes the monitor settings.

Selecting Television Stations

- Select country

(On the Control Display or Central Information Display; CD on E65, E66; CID on E60, E61, E63, E64):

When a country is selected, the video module will set the correct television standard.

- Select the required television station from the list of stations.

The video module administers a list of stations with all receivable television stations. This list is displayed on the CD or CID.

Updating List Of Stations

On vehicles with television in the front, the list of stations is manually updated as follows: Call up "Autostore".

SWITCH-ON CONDITIONS

The television is available from terminal R ON.

NOTES FOR SERVICE STAFF

The following information is available for service staff:

- General information: N/A
- Diagnosis: refer to **E60, E61, E63, E64, E65, E66: TELEVISION DIAGNOSIS** .
- Encoding/programming: N/A
- Car & Key Memory: The last settings made remain stored when the vehicle is shut down. The video module remembers the last TV station selected. The colour settings are also stored (in either the video module or navigation system, depending on equipment variant).

E60, E61, E63, E64, E65, E66: Television Diagnosis

The following information is available for diagnosis on the television:

- Measuring With And Without Adapter
- Check Signal Paths Of FBAS Signal And RGB Signal
- Self-Diagnosis For Aerials And Aerial Amplifiers

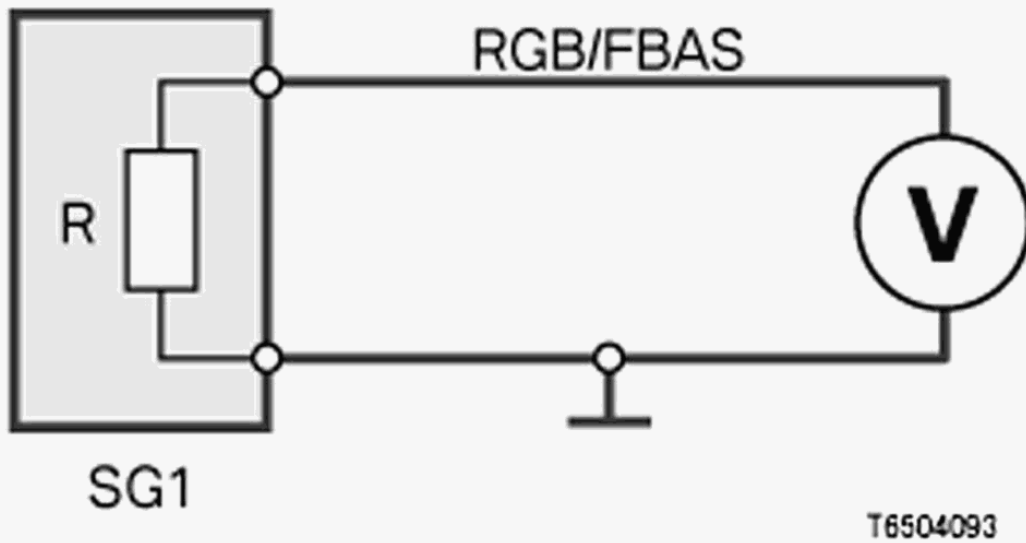

Measuring With And Without Adapter

IMPORTANT: Only connect control units to oscilloscope using adapter. If measurements are made without an adapter, the voltage values will be twice as high as they would be with an adapter. The adapter works as a power diplexer.

Measuring Without Adapter

When measuring without an adapter, the second control unit (SG2, e.g. NAV) is disconnected. The signal is only measured using the resistance R. This means that the signal a voltage that is twice as high as it would be if measured with an adapter.

The illustration shows a measurement without adapter.

Courtesy of BMW OF NORTH AMERICA, INC.

Measuring With Adapter

When measuring with an adapter, the second control unit (SG2, e.g. NAV) remains connected. The signal is only measured across the parallel circuit of the two resistances R1 and R2. This means that the signal a voltage that is half that it would be if measured without an adapter.

T6504094

Check Signal Paths of FBAS Signal and RGB Signal

The following signal paths may differ from the voltage values. However, the path must agree at the points

marked.

Checking FBAS Signal

FBAS signal path:

A 200 mV 10 p.s. Trig: A J T6504090

1. 0 volt
2. 0.3 V measurement **with** adapter
0.6 V measurement **without** adapter
3. 1 V measurement **with** adapter
2 V measurement **without** adapter
4. Voltage between 1 and 2

Fig. 50: Checking FBAS Signal Path

Courtesy of BMW OF NORTH AMERICA, INC.

Composite Video Burst Synchronisation With FBAS, the image signals (red-green-blue) are transmitted via a single wire. The signal path has 3 important points. These points are independent of the oscillograph displayed. These points are meaningful for the measurement.

Checking RGB Signal

RGB signal path: red-green-blue

+ 597 mV

A 200 mV 10 p.s. Trig: A

T6504092

1. With green signal, red signal and blue signal:
0.5 V measurement **with** adapter,
1 V measurement **without** adapter
2. With green signal:
0.1 V measurement **with** adapter,
0.2 V **without** adapter
3. Signal path of green signals **with** synchronisation.
The pulse synchronisation pulse is
marked number 2.
4. Signal path of blue and red signals **without**
synchronisation pulse

Fig. 51: Checking RGB Signal Path

Courtesy of BMW OF NORTH AMERICA, INC.

With the RGB signal, the image signals are separated according to colour and transmitted through 3 wires: green, yellow and blue.

The synchronisation pulse for the RGB signals is carried on the green signal. The signal path has 2 important points. These points are independent of the oscillograph displayed. These points are meaningful for the measurement.

Self-Diagnosis For Aerials And Aerial Amplifiers

The video module recognises how many aerial amplifiers are fitted in the vehicle.

The video module diagnoses the aerial inputs by measuring the supply voltage and supply current.

With hybrid video modules (VM5 hybrid), each aerial input is diagnosed individually. The range 20 mA to 100 mA is recognised as valid. This means that diagnosis is independent of the different aerial amplifiers and their supply currents.

The video module recognises the following states:

- Short circuit: In the event of a short circuit, the power supply from the video module to the aerial amplifier remains switched off until the video module is restarted.
- 1 aerial amplifier connected (all other aerial amplifiers failed or electrically disconnected)
- 2 aerial amplifiers connected (depending on equipment variant, 3rd aerial amplifier failed or electrically disconnected)
- 3 aerial amplifiers connected (only with analogue and digital television in rear)

The video module recognises the following states as faults:

- The aerial amplifiers draw too little current (less than 20 mA).
- The aerial amplifiers draw too much current (more than 100 mA).

Self-diagnosis cannot be deactivated.

NATIONAL VERSIONS

Digital television is already available in many countries.

There are numerous analogue television standards worldwide. The video module supports these television standards and frequencies.

**NOTE: Subscription TV is not supported.
Because special cards and decoders are needed for subscription TV (pay TV),
pay TV is not supported.**

**Pay TV is available, for example in the Netherlands and in the UK.
Free TV stations in the UK are supported.**

The following details are available with regard to national versions:

- US national version
- Japan national version
- Different switch-off conditions when driving in different national versions

**NOTE: The Japan national version is also valid for China and Korea.
The equipment specifications for the Japanese national version also support
television reception in China and Korea.**

US National Version

In the US version, the television is deactivated by encoding.

Reason: watching television in cars is forbidden in the USA.

However, a video module is fitted, depending on the equipment. This video module serves as a video switch between the different entertainment sources (e.g. radio, CD changer).

ANTI-THEFT ALARM SYSTEM E63/E64

NOTE: Refer to AUDIO, NAVIGATION & ANTI-THEFT - SI TECHNIQUES .

ACCESSORIES AND EQUIPMENT

65 11 045 REMOVING AND INSTALLING/REPLACING RADIO/NAVIGATION CONTROL PANEL

This operation is described under:

"Removing and installing/replacing radio receiver", see **65 11 080 Removing and installing/replacing radio receiver**.

65 11 070 REMOVING AND INSTALLING/REPLACING CD CHANGER

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove CD magazine
- Remove storage compartment, see **51 16 200 REMOVING AND INSTALLING/REPLACING STORAGE COMPARTMENT (WITH CD CHANGER) .**

Release screws (1) on both sides.

Tightening torque: 65 11 1AZ. , see **65 11 CD CHANGER**

Pull CD changer (2) up and out.

Fig. 3: Screws And CD Changer

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connections (1) and remove CD changer (2).

Fig. 4: Plug Connections And CD Changer

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Before installation, remove all transport securing screws on equipment floor and seal openings with adhesive spots.

Follow instructions on setting the installation location on the CD changer, see **65 11 ... Instructions on setting the installation location on the CD changer**.

65 11 080 REMOVING AND INSTALLING/REPLACING RADIO RECEIVER

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove operator unit for heater/air conditioner, see **64 11 377 REMOVING AND INSTALLING CONTROL PANEL FOR HEATER - A/C SYSTEM (REPLACING, AUTOMATIC AIR CONDITIONING)** .

Release screws (1).

Pull back radio receiver (2) slightly.

Unlock and disconnect associated plug connections, remove radio receiver (2).

Installation:

Make sure guide pin (3) is correctly seated in associated fixture.

Fig. 5: Radio Receiver And Guide Pin
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

12 STEREO RADIO, AMPLIFIER

65 12 050 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT CENTRAL BASS SPEAKER (UNDER FRONT SEAT)

Necessary preliminary tasks:

- Remove front seat, see **13 FRONT SEAT NORMAL, MA** .
- Remove panel for door pillar, see **51 43 150 REMOVING AND INSTALLING OR REPLACING TRIM FOR LEFT OR RIGHT DOOR PILLAR (BOTTOM)** .

Fold back carpet (1) in direction of arrow.

Fig. 6: Carpet
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Remove central bass speaker trim (2) from floor trim (3).

Fig. 7: Screws And Central Bass Speaker Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Pull out floor trim (1) under rear compartment heating duct (2) and fold back in direction of arrow.

Feed electrical lead (3) out of floor trim (1).

Installation:

Ensure correct cable routing.

Fig. 8: Floor Trim And Electrical Lead
Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten plug connection (1) and disconnect.

Unscrew nuts (2).

Feed out central bass speaker (3) in direction of arrow and remove.

Fig. 9: Plug Connection And Bass Speaker
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure seal (1) is correctly seated on central bass speaker (2).

Fig. 10: Central Bass Speaker And Seal
 Courtesy of BMW OF NORTH AMERICA, INC.

65 12 070 REMOVING AND INSTALLING/REPLACING AMPLIFIER

Necessary preliminary tasks:

- Remove luggage compartment wheel arch trim on left, see **51 47 151 REMOVING AND INSTALLING / REPLACING LEFT LUGGAGE COMPARTMENT WHEEL ARCH TRIM** .

Unfasten plug connection (1) and disconnect.

Release screws (2).

Remove amplifier (3) with holder in direction of arrow.

Fig. 11: Screws And Amplifier
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Unscrew nuts (2).

Remove amplifier (3) from holder (4).

Fig. 12: Screw, Nuts And Amplifier
Courtesy of BMW OF NORTH AMERICA, INC.

65 12 072 REMOVING AND INSTALLING (REPLACING) AMPLIFIER (TOP HI-FI SYSTEM)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove luggage compartment wheel arch trim on left, see **51 47 151 REMOVING AND INSTALLING / REPLACING LEFT LUGGAGE COMPARTMENT WHEEL ARCH TRIM** .

Unfasten plug connection (1) and disconnect.

Release screws (2).

Remove amplifier (3) with holder in direction of arrow.

Fig. 13: Screws And Amplifier
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Fold back retaining bracket (2) in direction of arrow and remove.

Remove amplifier (3) from holder (4).

Fig. 14: Retaining Bracket And Amplifier
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

13 SPEAKER AND COVER

65 13 050 REMOVING AND INSTALLING/REPLACING SPEAKER (TWEETER IN FRONT DOOR)

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT DOOR TRIM PANEL** .

Unlock catches (1) in direction of arrow and remove tweeter (2) from front door trim panel (3).

Fig. 15: Catches And Front Door Trim Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

65 13 070 REMOVING AND INSTALLING/REPLACING SPEAKER (MID-RANGE SPEAKER IN FRONT DOOR)

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT DOOR TRIM PANEL** .

NOTE: **Secure mid-range speaker against falling out.**

Release nuts (1) and remove mid-range speaker (2) in direction of arrow from door trim panel (3).

Fig. 16: Nuts And Mid-Range Speaker
 Courtesy of BMW OF NORTH AMERICA, INC.

65 13 080 REMOVING AND INSTALLING/REPLACING SPEAKER (TWEETER IN REAR DOOR)

Necessary preliminary tasks:

- Remove rear door trim, see **51 42 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR TRIM PANEL** .

Unlock catches (1) in direction of arrow and remove tweeter (2) from rear door trim panel (3).

Fig. 17: Catches And Rear Door Trim Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

65 13 090 REMOVING AND INSTALLING/REPLACING SPEAKER (MID-RANGE SPEAKER IN REAR DOOR)

Necessary preliminary tasks:

- Remove rear door trim, see **51 42 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR TRIM PANEL** .

NOTE: **Secure mid-range speaker against falling out.**

Release nuts (1) and remove mid-range speaker (2) in direction of arrow from rear door trim panel (3).

Fig. 18: Nuts And Mid-Range Speaker
 Courtesy of BMW OF NORTH AMERICA, INC.

20 AERIAL/ANTENNA

65 20 035 REMOVING AND INSTALLING/RENEWING ROOF AERIAL

Necessary preliminary tasks:

- Detach **empty housing** for roof-mounted aerial.

Release screw (1) and feed out roof aerial (2) towards top.

Fig. 19: Release Screw (1) And Feed Out Roof Aerial (2) Towards Top
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connections (1) and remove aerial (2).

Fig. 20: Disconnect Plug Connections (1) And Remove Aerial (2)
Courtesy of BMW OF NORTH AMERICA, INC.

After installation: Stick on **empty housing** for roof-mounted aerial.

65 20 030 REMOVING AND INSTALLING/REPLACING EMPTY HOUSING FOR ROOF-MOUNTED

Special tools required:

- 65 2 010 (Knife)

WARNING:

- Risk of injury!
- Special tool has sharp edges!
- Adapt working height to vehicle height with non-tilting and non-slip platform.
- Handle special tool correctly and make sure it is positioned without tilting or slipping on the vehicle.
- Special tool 65 2 010 is only permitted in conjunction with a suitable stepladder.
- Risk of damage!
- In order to prevent dents in the roof, do not exert any pressure on the roof.

IMPORTANT: In order to guarantee a permanent connection and adhesive curing: After bonding the empty housing for the roof-mounted aerial, wait 24 hours before driving the vehicle through a car wash.

NOTE: Clean roof. Mask roof (2) around empty housing for roof-mounted aerial (3) with yellow plastic adhesive tape (1). To do so, slide plastic adhesive tape under empty housing (3) slightly.

Fig. 21: Mask Roof (2) Around Empty Housing
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage! Make sure your arms do not cross over (1) when holding

special tool 65 2 010. Pull handle must always be ahead of the guiding hand (2).

Fig. 22: Pull Handle Must Always Be Ahead Of The Guiding Hand (2)
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage! To avoid damaging the paintwork on the roof and empty housing (3), do not fit special tool 65 2 010 skew.

Cut through adhesive bead all round with special tool 65 2 010. Pull on handle (1) and align blade on handle (2).

Fig. 23: Pull On Handle (1) And Align Blade On Handle (2)
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Use sharp blades only. Replace blade if necessary.

Remove empty housing (3).

Installation: Empty housing for roof-mounted aerial is secured with window glass adhesive. All preparatory operations correspond to the Window cementing instructions.

NOTE: Replace empty housing for roof-mounted aerial if centering pins (1) on empty housing are damaged.

Bonding surface (2) must be clean and free from grease.

Fig. 24: Bonding Surface (2) Must Be Clean And Free From Grease
Courtesy of BMW OF NORTH AMERICA, INC.

Position two spacers (1) on cleaned empty housing.

Dimensions:

- A. 10 mm
- B. 14 mm

Fig. 25: Position Two Spacers (1) On Cleaned Empty Housing
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Use spacers without fail!

Apply trace of adhesive bead all around outer contour as follows. Distance between adhesive bead and edge of aerial cover: $A = 6.5 \text{ mm} \pm 1 \text{ mm}$

Fig. 26: Apply Trace Of Adhesive Bead All Around Outer Contour
Courtesy of BMW OF NORTH AMERICA, INC.

Start and end of bead trace must have an overlap length of max. 10 mm.

IMPORTANT: To prevent the adhesive from escaping, the adhesive bead diameter must not exceed max. 1.5 mm to 2.5 mm.

NOTE: Attach the empty housing coated with adhesive by hand. To spread the adhesive better, move the housing back and forth horizontally slightly when pressing down. Secure empty housing if necessary with adhesive tape and press down uniformly. After bonding, leave vehicle to stand for at least 3 hours at room temperature.

65 20 090 REMOVING AND INSTALLING OR REPLACING ANTENNA AMPLIFIER

Necessary preliminary tasks:

- Remove trim for rear window frame at top, see **51 49 015 REMOVING AND INSTALLING/REPLACING TRIM FOR REAR WINDOW FRAME AT TOP** .

Unlock plug connections (1) and disconnect.

Unscrew bolt (2).

Remove antenna amplifier (3) in direction of arrow from rear lid (4).

LEFT OR RIGHT INTERIOR LIGHT (SIDE ROOFLINER) .

- Detach mocket in area of roofliner

IMPORTANT: Do not under any circumstance kink roofliner (1).

Unclip roofliner (1) at retaining point (2) towards bottom and lower.

Unlock plug connections (3) and disconnect.

Release screw (4) and remove suppression filter (5).

Fig. 29: Roofliner And Suppression Filter

Courtesy of BMW OF NORTH AMERICA, INC.

65 20 380 REMOVING AND INSTALLING/REPLACING RADIO REMOTE CONTROL RECEIVER

NOTE: This operation is described in:
"Removing antenna amplifier." See **65 20 090 Removing and installing or replacing antenna amplifier.**

24 REAR WINDOW AERIAL/ANTENNA

65 24 020 REMOVING AND INSTALLING OR REPLACING BLOCKING CIRCUIT

Necessary preliminary tasks:

- Remove panel for rear lid, see **51 49 008 REMOVING AND INSTALLING/REPLACING PANEL FOR REAR LID .**

Unlock plug connections (1) and disconnect.

Unscrew bolt (2).

Remove blocking circuit (3) in direction of arrow.

Fig. 30: Bolt And Blocking Circuit
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit blocking circuit (1) so that screw (2) engages thread (3) and locating pin (4) engages bore (5).

Fig. 31: Blocking Circuit And Locating Pin
 Courtesy of BMW OF NORTH AMERICA, INC.

65 24 030 REMOVING AND INSTALLING/REPLACING TV AMPLIFIER (LEFT OR RIGHT)

Necessary preliminary tasks:

- Remove inner window cavity cover strip for rear side window, see **51 37 261 REMOVING AND INSTALLING/REPLACING WINDOW CAVITY COVER STRIP FOR DOOR WINDOW, REAR LEFT OR RIGHT** .

Unlock plug connections (1) and disconnect.

Release screw (2) and remove TV amplifier (3) in direction of arrow.

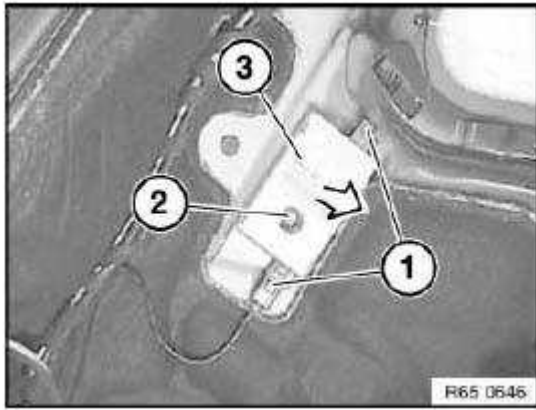

Fig. 32: Screw And TV Amplifier
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit TV amplifier (1) so that screw (2) engages thread (3) and locating pin (4) engages bore (5).

Fig. 33: TV Amplifier
 Courtesy of BMW OF NORTH AMERICA, INC.

50 VIDEO AND TV EQUIPMENT

65 50 011 REMOVING AND INSTALLING (REPLACING) VIDEO MODULE FOR ON-BOARD MONITOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Disconnect battery negative lead, see **THE BATTERY** .
- Remove flap in luggage compartment panel on left, see **51 47 172 REMOVING AND**

INSTALLING/REPLACING FLAP IN LUGGAGE COMPARTMENT TRIM, LEFT OR RIGHT .

Unlock plug connections (1) and disconnect.

Installation:

Do not mix up antenna connectors (2).

Mark antenna plugs (2) and disconnect.

Release screws (3).

Release nut on stud (4).

Guide video module for on-board monitor (5) with holder over stud (4) and feed out in direction of arrow.

Fig. 34: Antenna Connectors

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Unclip wiring harness (2) at point (3) and pull video module for on-board monitor (4) with holder (5) out of side recess slightly.

Feed video module for on-board monitor (4) in direction of arrow out of holder (5) and remove.

Fig. 35: Wiring Harness And On-Board Monitor With Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

65 50 055 REMOVING AND INSTALLING/REPLACING CENTRAL INFORMATION DISPLAY

Necessary preliminary tasks:

- Remove operator unit for heater/air conditioner, see **64 11 377 REMOVING AND INSTALLING CONTROL PANEL FOR HEATER - A/C SYSTEM (REPLACING, AUTOMATIC AIR CONDITIONING)** .

Fold monitor (1) open.

Loosen screws (2).

Unlock plug connection for central information display (3) and disconnect.

Raise central information display (4) on passenger side.

Feed out associated wiring harness and remove central information display (4).

Fig. 36: Central Information Display
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure wiring harness of central information display (4) is correctly routed.

75 ANTI-THEFT ALARM SYSTEM

65 75 055 REMOVING AND INSTALLING/REPLACING EMERGENCY POWER SIREN WITH TILT SENSOR

Necessary preliminary tasks:

- Remove heater bulkhead, see **51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD**.

Unfasten plug connection (1) and disconnect.

Release screw (2) and remove emergency power siren (3) with emergency power siren holder in direction of arrow.

Installation:

Make sure emergency power siren holder is in correct installation position.

Fig. 37: Emergency Power Siren
 Courtesy of BMW OF NORTH AMERICA, INC.

Release nut (1) and remove emergency power siren (2) from holder (3).

Fig. 38: Nut And Emergency Power Siren
 Courtesy of BMW OF NORTH AMERICA, INC.

65 75 071 REMOVING AND INSTALLING (REPLACING) MODULE FOR PASSENGER COMPARTMENT SENSOR

Necessary preliminary tasks:

- Remove front roofliner trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM**.

Open detent lugs (1) in direction of arrow and remove module for passenger compartment sensor (2) from front roofliner trim (3).

Installation:

Arrow (4) on module for passenger compartment sensor (2) points in direction of travel.

Fig. 39: Detent Lugs And Passenger Compartment Sensor
 Courtesy of BMW OF NORTH AMERICA, INC.

65 75 551 REMOVING AND INSTALLING/REPLACING TILT SENSOR

Necessary preliminary tasks:

- Remove luggage compartment floor trim panel, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL** .

Remove clips (1) and fold up front luggage compartment floor trim panel (2) slightly.

Installation:

Make sure front luggage compartment floor trim panel (2) is correctly seated.

Fig. 40: Front Luggage Compartment Floor Trim Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Front luggage compartment floor trim panel shown removed for purposes of clarity.

Unfasten plug connection (1) and disconnect.

Unscrew nuts (2).

Remove tilt sensor (3) in direction of arrow.

Fig. 41: Nuts And Tilt Sensor

Courtesy of BMW OF NORTH AMERICA, INC.

77 AIRBAG TRIGGER DEVICE

65 77 ... NOTES ON SCRAPPING BMW VEHICLES WITH GAS GENERATORS (CENTRAL AIRBAG CONTROL UNIT, AIRBAG SYSTEM)

The gas generator is a pyrotechnic component of:

- Airbag module
 - Driver's/passenger airbag
 - Side airbags
 - Head airbag
 - Knee airbag
- Belt pretensioner
- Belt buckle tensioner
- Safety battery terminal

X3: E83

Gas generators that have not fired constitute a hazard (also to the environment)!

In accordance with accident prevention regulations and specific national regulations, gas generators must be rendered unusable before they are scrapped. This is necessary because pyrotechnical objects can cause injury if improperly activated (e.g. scrapping with flame cutters).

With above-mentioned vehicles which are scheduled for scrapping, it is always essential prior to draining and further stripping work to ensure that all the gas generators **in the vehicle** are fired. The fired gas generators can then be scrapped together with the vehicle.

Triggering failure

If correct triggering is not possible, the relevant components must (while observing the safety regulations for handling airbag system components) be removed and disposed of by special disposal companies!

If a triggering operation has failed:

- Disconnect the triggering device from the battery and
- only approach the vehicle after a few minutes have elapsed

The components of an airbag system must always be disposed of. Such components must not be sold on as used parts.

Triggering

Triggering of the gas generators may only be carried out by expert personnel and under the supervision of a responsible person. Other standard accident prevention regulations (safety goggles, ear defenders etc.) must also be observed.

The gas generators must be fired from the outside in the vehicle scheduled for scrapping with the doors closed but with the tailgate, door windows and sunroof open. To fire the gas generators, use the BMW-developed triggering device with the corresponding cables.

**WARNING: Once gas generators have been fired, observe a ventilation period of 10 minutes with the doors opened.
Only then is it permitted to continue work inside the vehicle.
Wear protective goggles and protective gloves when handling a fired gas generator!
The burning of solid fuel will heat up airbag unit - danger of burning hands!
Wash skin with water after contact with fired gas generators!**

1. **Vehicles with central airbag control unit (all airbags, seat belt pretensioners, safety battery terminal)**
 - 1.1 Expose airbag control unit, see 65 77 016 Removing and installing/replacing airbag control unit.
 - 1.2 Connect "Airbagmaster".

65 77 016 REMOVING AND INSTALLING/REPLACING AIRBAG CONTROL UNIT

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE).

WARNING: Note airbag safety instructions! See AIR BAG DEACTIVATION PROCEDURES .

Incorrect handling can activate airbag and cause injury.

Necessary preliminary tasks:

- Remove luggage compartment floor trim, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL** .
- Disconnect battery negative lead, see **THE BATTERY** .
- Remove center console, see **51 16 200 REMOVING AND INSTALLING STORAGE COMPARTMENT** .

Unfasten plug connection (1) and disconnect.

Unscrew nuts (2).

Installation:

Before screwing down airbag control unit, make sure negative lead (3) is resting on associated stud bolt.

Tightening torque: 65 77 1AZ, see **65 77 AIRBAG TRIGGERING CONTROL** .

Remove airbag control unit (4) in direction of arrow.

Fig. 42: Airbag Control Unit

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

65 77 532 REMOVING AND INSTALLING/REPLACING FRONT LEFT SENSOR

Necessary preliminary tasks:

- **M54 only:**

Remove intake filter housing.

Unfasten plug connection (1) and disconnect.

Tightening torque: 65 77 3AZ, see **65 77 AIRBAG TRIGGERING CONTROL** .

Remove front sensor (3).

Installation:

Position negative lead (4) before screwing sensor on.

Fig. 43: Front Sensor And Negative Lead
Courtesy of BMW OF NORTH AMERICA, INC.

65 77 534 REMOVING AND INSTALLING/REPLACING FRONT RIGHT SENSOR

Necessary preliminary tasks:

- **M57 only:**

Remove fluid reservoir for windscreen washer system and place to one side, see **61 71 061 REPLACING FLUID RESERVOIR FOR WINDSHIELD WASHER SYSTEM** .

NOTE: Subsequent work is described in:
"Removing front left sensor". See **65 77 532 Removing and installing/replacing front left sensor**.

65 77 560 REMOVING AND INSTALLING/REPLACING CONTROL ELECTRONICS FOR PASSENGER SEAT OCCUPANCY DETECTOR

Necessary preliminary tasks:

- Move seat into most upward position
- Unlock and remove first aid kit under passenger seat

NOTE: Seat removed for purposes of clarity.

Turn control electronics for passenger seat occupancy detector (2) approx. 45° in direction of arrow and unclip from seat frame.

Disconnect plug connections (1) and remove control electronics for passenger seat occupancy detector (3).

Fig. 44: Disconnecting Plug Connections
 Courtesy of BMW OF NORTH AMERICA, INC.

65 77 600 REPLACING SENSOR MAT FOR PASSENGER SEAT OCCUPANCY DETECTOR

WARNING: US/CND front passenger seat (with OC3 mat) only:
Seat cover must not be separated from padding.
All parts must be replaced completely and released with the diagnosis system in event of defective fan, seat cover, seat heating, OC3 mat or padding.

This operation is described in:

"Replacing seat cover for left or right front seat". See **52 13 400 REPLACING SEAT COVER ON LEFT OR RIGHT FRONT SEAT (NORMAL/MANUAL)** .

65 77 604 REPLACING SENSOR MAT (OC3 MAT) FOR PASSENGER SEAT OCCUPANCY DETECTOR

WARNING: US/CDN front passenger seat (with OC3 mat) only: The OC3 mat can only be removed in conjunction with the padding from the seat cover. If OC3 mat or padding is defective, both parts may only be replaced together. After fitting seat cover, enable OC3 mat with BMW diagnosis system.

The operation for removing the OC3 mat is described in:

52 13 400 REPLACING SEAT COVER ON LEFT OR RIGHT FRONT SEAT (NORMAL/MANUAL)

52 14 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

52 15 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

52 16 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (SPORTS/ELECTRIC)

65 77 720 REMOVING AND INSTALLING (REPLACING) LEFT B-PILLAR SENSOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

**WARNING: Note airbag safety instructions! See AIR BAG DEACTIVATION PROCEDURES .
Incorrect handling can activate airbag and cause injury.**

Necessary preliminary tasks:

- Remove luggage compartment floor trim, see **51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL** .
- Disconnect battery negative lead, see **THE BATTERY** .
- Remove trim panel for door pillar (bottom), see **51 43 150 REMOVING AND INSTALLING OR REPLACING TRIM FOR LEFT OR RIGHT DOOR PILLAR (BOTTOM)** .

Release screw (1).

Loosen screw (2).

Installation:

Tightening torque: 65 77 5AZ, see **65 77 AIRBAG TRIGGERING CONTROL** .

Raise B-pillar sensor (3) slightly through opening in B-pillar and feed out towards rear.

Unfasten plug connection (4) and disconnect.

Remove B-pillar sensor (3) from B-pillar.

Fig. 45: B-Pillar Sensor And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Establish correct positioning of B-pillar sensor (1) by means of guide pin (2) and screw (3).

Fig. 46: B-Pillar Sensor And Guide Pin
 Courtesy of BMW OF NORTH AMERICA, INC.

65 77 725 REMOVING AND INSTALLING/REPLACING RIGHT B-PILLAR SENSOR

Operation is identical to: **Removing and installing left B-pillar sensor**

65 77 740 REMOVING AND INSTALLING (REPLACING) LEFT FRONT DOOR SENSOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

WARNING: Note airbag safety instructions!

Incorrect handling can activate airbag and cause injury.

Necessary preliminary tasks:

- Disconnect battery negative lead, see **THE BATTERY** .
- Detach sound insulation in work area, see **51 48 060 REMOVING AND INSTALLING/REPLACING SOUND INSULATION IN LEFT OR RIGHT FRONT DOOR** .

Unfasten plug connection (1) and disconnect.

Tightening torque: 65 77 7AZ, see **65 77 AIRBAG TRIGGERING CONTROL** .

Remove front door sensor (3) in direction of arrow.

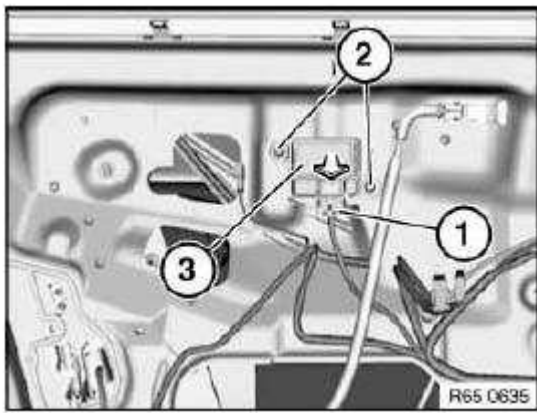

Fig. 47: Front Door Sensor

Courtesy of BMW OF NORTH AMERICA, INC.

81 ON-BOARD COMPUTER

65 81 050 REMOVING AND INSTALLING/REPLACING GONG

Necessary preliminary tasks:

- Remove panel for pedal assembly, see **51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY** .

Disconnect plug connection (1) and unclip catches (2) on both sides.

Fig. 48: Plug Connection And Catches
Courtesy of BMW OF NORTH AMERICA, INC.

65 81 060 REMOVING AND INSTALLING/REPLACING EXTERNAL TEMPERATURE SENSOR

Special tools required:

- **64 1 020 RELEASE HOOK**

Expand mount for outside temperature sensor with special tool 64 1 020 and feed out outside temperature sensor (1) in direction of arrow.

Pull out ambient temperature sensor (1).

Disconnect plug connection and remove ambient temperature sensor (1).

Installation:

Make sure ambient temperature sensor (1) engages correctly in its mount.

Fig. 49: Special Tool (64 1 020)
Courtesy of BMW OF NORTH AMERICA, INC.

90 NAVIGATION SYSTEMS

65 90 ... NOTES ON HANDLING NAVIGATION COMPUTERS

All model series:

CAUTION: Risk of damage!

The navigation computer must not be disconnected from the power supply while the LED on the computer remains lit (the LED goes out after approx. 1 minute).

NOTE: To ensure full operation of all the communications components, it is necessary in new cars to insert a Road Map CD in the navigation computer. This is absolutely essential as certain functions are disabled for distribution channels. These functions will only be available again after a Road Map CD has been inserted. The mode preset at the factory is automatically reset when this CD is inserted.

Software installation:

The navigation software must be loaded with terminal 15 activated and the navigation system ready for operation.

Make sure there is a stable power supply. If necessary, connect a battery charger to the vehicle.

The charging operation must not be interrupted (terminal 15 remains activated).

When replacing navigation computer:

From E65/66:

- Carry out coding of navigation computer with aid of Diagnosis and Information System via "CIP".

To E65/66:

- Carry out coding of navigation computer with aid of Diagnosis and Information System in path "1 Recoding".

E46 (with radio navigation) only:

When replacing navigation computer:

- Connect Diagnosis and Information System to vehicle.
- Switch on ignition.
- Select Coding/Programming.

- Select path "3 Coding ZCS".
- Select vehicle.
- Select path "4 Retrofitting".
- Select menu item "3 Instrument cluster".
- Select menu item "2 Language".
- Select the desired languages following the user prompting.
- Start coding of the instrument cluster.
- After the prompt from the Diagnosis and Information System "Now follow the instructions on the on-board monitor", insert the operating software CD.
- The following note appears from DIS CD 25 software (and higher):

"With radio navigation insert the operating software CD in the computer and wait until it is ejected. Then follow the instructions on the display. This procedure takes several minutes".

NOTE: The ignition must not be turned off and then on again during this procedure. The software is loaded when the operating software CD is ejected.

- Carry out coding of navigation computer with aid of Diagnosis and Information System in path "1 Recoding".

If the software is updated at a later stage, the last step is omitted if the navigation computer is already configured for a navigation system (radio navigation or navigation system).

65 90 511 REMOVING AND INSTALLING (REPLACING) NAVIGATION COMPUTER WITH CD DRIVE

Special tools required:

- **65 5 400 RELEASE BRACKET**

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove flap in luggage compartment panel on left, see **51 47 172 REMOVING AND INSTALLING/REPLACING FLAP IN LUGGAGE COMPARTMENT TRIM, LEFT OR RIGHT** .

Unlock navigation computer (1) with special tool 65 5 400 and pull out in direction of arrow.

Fig. 50: Navigation Computer With Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect antenna connector (1).

Unlock plug connections (2) and disconnect.

Remove navigation computer (3).

Installation:

Make sure navigation computer (3) is correctly seated.

Wires (4) must not be trapped between navigation computer (3) and insert frame (5).

Fig. 51: Antenna Connector And Navigation Computer
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

65 90 550 REPLACING CD/DVD DRIVE FOR NAVIGATION COMPUTER

Special tools required:

- 00 9 318

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Comply with notes and instructions on handling navigation computers, see **65 90 ... Notes on handling navigation computers**.

Replace the destroyed seal on all devices with the new seal supplied.

Necessary preliminary tasks:

- Remove navigation computer, see **65 90 511 Removing and installing (replacing) navigation computer with CD drive**.

MK II version:

Cut through seal (1).

Release screws (2) on both sides and carefully fold down front panel (3).

Installation:

Replace the destroyed seal with the new seal supplied.

G00426793

Fig. 52: Screws On Both Front Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Lever cover (1) with special tool 00 9 318 upwards out of side catches.

R65 0888

G00426804

Fig. 53: Special Tool (00 9 318)

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and carefully lift out CD drive (2).

G00426805

Fig. 54: Screws And CD Drive
Courtesy of BMW OF NORTH AMERICA, INC.

MK III and MK IV versions:

Cut through seal (1).

Carefully lever off cover (2) with special tool 00 9 318.

Installation:

Replace the destroyed seal with the new seal supplied.

G00426806

Fig. 55: Special Tool (00 9 318)
Courtesy of BMW OF NORTH AMERICA, INC.

MK III version:

Release screws (1) and carefully lift out drive (2).

G00426807

Fig. 56: Screws And Drive

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Ribbon cables and connectors must not be damaged!

Disconnect plug connections (1) and remove drive (2).

G00426808

Fig. 57: Plug Connections And Drive
Courtesy of BMW OF NORTH AMERICA, INC.

MK IV version:

Release screws (1).

Carefully lift out DVD drive (2).

G00426809

Fig. 58: Screws And DVD Drive
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Ribbon cables and connectors must not be damaged!

Disconnect plug connections (1) and remove DVD drive (2).

G00426810

Audio, Navigation and Anti-Theft - SI Techniques - X3

MULTIPLE RESTRAINT SYSTEM 4

E83

Fig. 1: Multiple Restraint System 4
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

Multiple restraint system 4 is a further development of the multiple restraint system (MRS) in the E46.

The MRS performs the following functions:

- Detects an accident situation which could be critical for the occupants
- Activates the necessary restraint systems (selectively, depending on the severity and type of accident)

New features, compared to the previous MRS (E46):

- 2 airbag front sensors
- Front left door satellite and front right door satellite

- Left-hand B-pillar satellite and right-hand B-pillar satellite with lateral and longitudinal acceleration sensors
- The MRS control unit interfaces have been expanded to 75 pins (50 pins in the E46).
- Discontinuation of the MRS acceleration sensors under the front seats

The lateral acceleration sensors are now in the left and right-hand B-pillar satellites.

An advantage compared to the previous multiple restraint system is more precise airbag trigger control

BRIEF DESCRIPTION OF COMPONENTS

The following sensors detect the direction and severity of an impact:

- **Airbag front sensors**

The airbag front sensors are longitudinal acceleration sensors. The front airbag sensors detect a head-on collision.

- **Front left door satellite and front right door satellite**

There is a pressure sensor in each satellite door. The pressure sensors detect a side impact.

- **Left-hand B-pillar satellite and right-hand B-pillar satellite**

The B-pillar satellites each contain a lateral acceleration sensor and a longitudinal acceleration sensor. The sensors are arranged at 90 degrees to each other.

- **Acceleration sensors in the MRS control unit**

There is a lateral acceleration sensor and a longitudinal acceleration sensor in the MRS control unit. The sensors are arranged at 90 degrees to each other.

The following components provide input signals for the multiple restraint system (MRS):

- **Seat-belt-lock switch (driver and passenger seat)**

The seat-belt-lock switch indicates whether the seat belt is engaged or not.

The seat-belt-lock switch is powered by the MRS control unit. The power consumption of the switch forms the signal for the switch position (seat belt engaged or not engaged).

The seat-belt-lock switches on the driver and passenger seats are permanently monitored when terminal R is ON. For example, if a seat belt is released while the vehicle is in motion, there is a seat-belt warning.

A seat-belt warning is started when terminal 15 is ON.

The seat-belt warning indicates to the occupants that they should fasten their seat belts.

The seat-belt warning is an extension of the previous time-dependent display (seat-belt warning lamp in the instrument cluster for approximately 6 seconds after terminal 15 is switched ON).

- **Seat-belt-lock switch (US version)**

When terminal 15 is ON, a seat-belt warning lamp lights up and a warning sounds if the driver and passenger seat belts are not engaged. Once the driver and passenger seat belts are engaged in the corresponding buckles, the seat-belt warning lamp and the audible warning are switched off.

If a seat belt is released while the vehicle is in motion, the seat-belt warning lamp lights up and a warning signal sounds for approximately 90 seconds.

The MRS control unit uses the signal from the seat-belt-lock switch to determine whether an airbag should be triggered at stage 1 (seat belt not engaged) or at stage 2 (seat belt engaged).

- **Passenger seat occupancy detector**

The passenger seat-occupancy detector recognizes whether the seat is occupied or not. When a weight is placed on the seat, resistance in the seat-occupancy mat changes.

If the multiple restraint system (MRS) triggers the driver's airbag, the passenger airbag and belt tensioner will not be triggered if the passenger seat is unoccupied.

- **Passenger seat-occupancy detector (US version)**

Due to legal requirements in the USA, a child seat securing a one-year-old child which is placed on the passenger seat must be automatically detected. Upon detection, the airbags on the passenger side are automatically deactivated (passenger airbag and front right-hand side airbag).

The passenger seat-occupancy detector is based on an evaluation of the surface pressure generated by the person sitting down. The electronic evaluation decides whether a person or a child seat is occupying the seat. If a one-year-old child in a child seat is detected, the airbags on the passenger side are deactivated (warning lamp for passenger-airbag deactivation lights up).

Several control units make up the multiple restraint system (MRS):

- **Multiple restraint system control unit**

All gas generators and sensors in the multiple restraint system (MRS) are connected to the MRS control unit.

The MRS control unit evaluates the data it receives from the sensors. In the event of a head-on or side impact, the control unit determines whether it is necessary to deploy any airbags and which airbags should be deployed.

○ **Digital motor electronics or digital diesel electronics**

When an airbag is triggered, the electric fuel pump is switched off by the DME or DDE (DME = Digital Motor Electronics, DDE = Digital Diesel Electronics).

Signal path: MRS control unit -> K bus -> instrument cluster -> PT-CAN -> DME or DDE -> direct line -> fuel-pump relay> electric fuel pump

○ **Instrument cluster**

The instrument cluster triggers the optical and audible seat-belt warning.

The MRS control unit only sends a message on the status of the seat belts and the seat-occupancy detector.

The instrument cluster receives the status message from the MRS control unit via the body bus when terminal R is ON. Depending on the status, the optical and audible warning is triggered when terminal 15 is ON.

The following components are controlled:

○ **Ignition circuit for the airbags**

With the maximum amount of equipment, the multiple restraint system consists of the following ignition circuits:

- Driver's airbag (stage 1)
- Passenger airbag (stage 1)
- Driver's airbag (stage 2)
- Passenger airbag (stage 2)
- Side airbag in the front left door
- Side airbag in the front right door
- Side airbag in the left rear door (option 261)
- Side airbag in the right rear door (option 261)
- Left-hand head airbag
- Right-hand head airbag
- Belt tensioner, front left
- Belt tensioner, front right
- Safety battery terminal

Driver and passenger airbag

The driver and passenger airbag reduce the risk of injury to the occupants in the event of a head-on collision.

The driver airbag is located in the center pad on the steering wheel. The passenger airbag is integrated into the instrument panel above the glove compartment. The driver and passenger airbags each have a dual-stage gas generator. The airbags are triggered at different levels depending on the severity of the accident.

Side airbags

The side airbags reduce the risk of injury to the occupants in the event of a side collision. The side airbags are located behind the door trim panel. The side airbags are always triggered at stage 1.

Head airbags

The head airbags protect the occupants' head in the event of an impact to the side body panels. They also protect the head from objects that may enter the vehicle.

Belt tensioners

The pyrotechnic belt tensioners pull the front seat belts tight against the occupants' body in the event of a head-on or rear-end collision.

In a normal situation, the seat belt does not sit completely tight against the body. The seat belt always has a small degree of play to guarantee the occupants an adequate degree of comfort. The play of a fastened seat belt is known as slack. To prevent the negative effects of this slack, the seat belt buckle is pulled down several centimeters by gas generators in the event of an accident. This pulls the seat belt tight.

Safety battery terminal

Depending on the severity of the accident, the safety battery terminal disconnects the starter motor and the alternator from the power circuit. This minimizes the risk of short circuits in a serious accident. The trigger signal comes from the MRS control unit.

○ Airbag warning lamp

The airbag warning lamp shows the operational capability of the multiple restraint system (MRS). The airbag warning lamp is located in the instrument cluster and is controlled by the MRS control unit (via the K bus).

After the ignition is switched on, the MRS performs a self test. While this is being run, the airbag warning lamp lights up (approximately 3 to 5 seconds). When the system is ready, the airbag warning lamp goes out.

If, during the self test or while the vehicle is in motion, the MRS control unit detects an existing fault or one that has been stored, the airbag warning lamp remains on.

If the MRS detects a fault, the operational capability is partially maintained, if possible, subject to the following:

- If a fault is detected in an MRS circuit, only the affected circuit is deactivated. The other airbags and belt tensioners remain operational.

- If there is a fault in the airbag warning lamp circuit, the lamp does not light up. If there is no other fault, the MRS remains fully operational.

If there is an internal fault in the MRS control unit or in the power supply, the entire system is deactivated.

- **Deactivation of the passenger airbag and the front right-hand side airbag**

The passenger airbag and the front right-hand side airbag are deactivated by a coding procedure.

- **Warning lamp for passenger-airbag deactivation (US version)**

If the warning lamp for passenger-airbag deactivation (passenger airbag off lamp) is lit, both airbags on the passenger side have been deactivated: the passenger airbag and the front right-hand side airbag. The passenger airbag off lamp is constantly monitored by the MRS control unit. A fault in the power supply or a defective lamp is stored in the MRS control unit's fault memory. If this occurs, the airbag warning lamp is switched on.

The passenger airbag OFF lamp is located in the control panel in the overhead console.

- **Shutting off the fuel pump**

When an airbag is triggered, the fuel feed is also shut off.

Mechanical components in the multiple restraint system (MRS):

- **Seat belts**

The seat belts are the primary restraint system for all occupants. A lap and diagonal automatic belt is fitted on each seat.

If there is a very severe impact, the seat belt strap may cause injuries to the chest of the person it is securing. To minimize this risk, the front seat belts are fitted with belt force limiters as standard. The belt force limiters allow the seat belt to be unrolled in a controlled fashion if the belt force exceeds a critical value. The risk of injury due to the belt force acting on the body is therefore reduced.

- **Passive knee protection (US version)**

Not every state in the USA has a requirement for seat belts to be worn. Therefore, the E83 also has additional plastic impact protection on the driver and passenger sides. In the event of an impact, the passive knee protection provides a flat support for the lower leg, especially if the front passengers are not wearing their seat belts. This causes the forwards movement of the upper body to be controlled towards the relevant airbag (driver or passenger airbag).

SYSTEM FUNCTIONS

The following system functions of the multiple restraint system (MRS) are described:

- Triggering the multiple restraint system
- Emergency call (EURO version)
- Emergency call (US version)

Triggering the multiple restraint system

Extensive testing has allowed the triggering thresholds to be determined for all possible types of accidents.

Various triggering thresholds were set for activating the different restraint systems:

The multiple restraint system comprises:

- Belt tensioners
- Front airbags
- Side airbags
- Head airbags
- Safety battery terminal
- Electric fuel pump

The following examples illustrate how the various restraint systems are triggered:

- **Head-on collision**

The belt tensioners, the front airbags and the safety battery terminal are triggered if the head-on collision is so severe that the triggering threshold of the MRS control unit is exceeded.

The belt tensioners have a lower triggering threshold than the front airbags. The belt tensioners are therefore triggered earlier.

If the seat-belt-lock switch is faulty, the triggering threshold for the front airbag on this side is lowered. Even though there is a fault message, the MRS control unit will try to trigger the belt tensioners.

If the seat-occupancy detector is faulty, the control unit assumes that the passenger seat is occupied. The restraint systems are activated.

The electric fuel pump is switched off. An automatic emergency call is initiated (only in vehicles with the relevant equipment fitted).

- **Side impact**

The side impact must be severe enough for the triggering threshold in the MRS control unit to be exceeded.

The side airbag and the head airbag are deployed on the side affected. The safety battery terminal is also triggered.

The electric fuel pump is switched off. An automatic emergency call is initiated (only in vehicles with the relevant equipment fitted).

○ **Front diagonal impact**

The airbags and belt tensioners are triggered depending on the impact speed and the angle of the impact. If several triggering thresholds are exceeded (e.g. the triggering thresholds for a head-on collision and a side collision), the corresponding restraint systems for head-on and side collisions are triggered.

○ **Rear-end collision**

The belt tensioners and the safety battery terminal are triggered if the rear-end collision is so severe that the triggering threshold of the MRS control unit is exceeded. An automatic emergency call is initiated (only in vehicles with the relevant equipment fitted).

○ **Rollover**

The MRS control unit does not detect the vehicle rolling over. If there is a collision after the vehicle has rolled and the triggering thresholds are exceeded for a head-on and side collision, the relevant restraint systems are triggered.

The electric fuel pump is switched off.

An automatic emergency call is initiated (only in vehicles with the relevant equipment fitted).

Emergency call (EURO version)

In vehicles equipped with BMW Assist, the multiple restraint system (MRS) has an additional function: the automatic emergency call

If at least one airbag is triggered in the event of an accident, BMW Assist automatically initiates an emergency call. The vehicle data and its exact location, which is determined by the GPS navigation system, are transmitted to the emergency call center.

Emergency call (US version)

All vehicles have the emergency control function as follows:

- Telematic control unit (TCU)
- Telephone aerial
- Hands-free device
- GPS aerial for location determination

The E83 has the following types of emergency call as standard:

- **Manual emergency call**

The emergency call button is directly connected to the telephone. Pressing the emergency call button establishes a voice connection with the provider. The voice connection is indicated by a flashing LED in the emergency call button.

The emergency call button is integrated into the control panel in the overhead console.

- **Automatic emergency call:**

If the accident is of corresponding severity, the MRS control unit sends a signal to the Telematics Control Unit (TCU). The TCU initiates an emergency call which also contains the location of the vehicle. The TCU receives the location determination for the navigation system. If a navigation system has not been installed, the location is determined by an internal GPS receiver in the TCU.

ACCESSORIES AND EQUIPMENT

ACCESSORIES AND EQUIPMENT

Cellular Phone Systems - Repair Instructions - X3

11 TRANSCEIVER, HANDSET AND SUPPORT, CARD READER

84 11 519 REMOVING AND INSTALLING/REPLACING EJECT BOX

Special tools required:

See 00 9 340 DISASSEMBLY AID (2)

- 00 9 341

Insert special tool 00 9 341 as shown between eject box (1) and trim (2).

Pull out eject box (1).

Fig. 1: Special Tool (00 9 341)

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connections (1 and 2).

Remove eject box.

Installation:

Catches (3) must not be damaged or missing.

Fig. 2: Plug Connections

Courtesy of BMW OF NORTH AMERICA, INC.

84 11 550 REMOVING AND INSTALLING/REPLACING HANDS - FREE MICROPHONE

Necessary preliminary tasks:

- Remove Front Roofliner Trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM** .

Expand catch (1) and feed hands-free microphone (2) in direction of arrow out of front roofliner trim (3).

Installation:

Arrow (4) on hands-free microphone (2) points in direction of travel.

Fig. 3: Catch And Feed Hands-Free Microphone

Courtesy of BMW OF NORTH AMERICA, INC.

84 11 650 REMOVING AND INSTALLING/REPLACING TELEMATIC CONTROL UNIT (TCU) (OPTION SA633/SA638/SA639)

IMPORTANT: Replacement with option SA638:

- Carry out programming/coding using appropriate BMW scan tool.

Replacement with option SA633/SA639:

- Carry out programming/coding using appropriate BMW scan tool.
- Via Diagnosis and Information System (DIS):
 - Service functions
 - Start subsequent assessment

Replacement with option SA633/SA638/SA639:

- If necessary, carry out coupling procedure
- Remove sticker (Bluetooth passkey) from front of TCU and stick to Service Booklet insert

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Disconnect the battery negative lead, see **THE BATTERY** .
- Remove luggage compartment wheel arch trim on left, see **51 47 151 REMOVING AND INSTALLING / REPLACING LEFT LUGGAGE COMPARTMENT WHEEL ARCH TRIM** .

Disconnect antenna plug (1).

Disconnect plug connection (3).

Release nuts (4) and remove TCU (2).

Installation:

Observe color coding of aerial/antenna plugs (1).

Fig. 4: Antenna Plug And TCU

Courtesy of BMW OF NORTH AMERICA, INC.

21 HANDHELD COMPUTER

84 21 522 REMOVING AND INSTALLING/REPLACING LINE COMPENSATOR

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove hands - free electronics, see **84 21 535 Removing and installing charging hands - free electronics (optional extra 644).**

Turn retaining clip (2) in clockwise direction and remove from holder (5).

Release wiring harness fastener (3).

Release bolt (1) and nut (4).

Slacken nut (6) and remove holder (5).

Fig. 5: Wiring Harness Fastener And Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Release screws (2).

Remove line compensator (3).

Fig. 6: Screws And Line Compensator
 Courtesy of BMW OF NORTH AMERICA, INC.

**84 21 535 REMOVING AND INSTALLING CHARGING HANDS - FREE ELECTRONICS
 (OPTIONAL EXTRA 644)**

**IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO
 STATIC DISCHARGE) .**

Necessary preliminary tasks:

- Remove control unit for voice input system, see **84 41 510 Removing and installing/replacing control unit for voice input system.**

Disconnect antenna lead plug connection (1).

Disconnect plug connection (3).

Release screws (4).

Remove hands-free charging electronics (2).

Fig. 7: Hands-Free Charging Electronics

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- Carry out vehicle programming/coding using appropriate BMW scan tool.
- If necessary, carry out coupling procedure

41 CONTROL UNIT FOR VOICE

84 41 510 REMOVING AND INSTALLING/REPLACING CONTROL UNIT FOR VOICE INPUT SYSTEM

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTRO STATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove flap in luggage compartment panel on left, see **51 47 172 REMOVING AND INSTALLING/REPLACING FLAP IN LUGGAGE COMPARTMENT TRIM, LEFT OR RIGHT .**

Disconnect plug connection (1).

Release screw (2).

Loosen screw (3).

Remove control unit for voice input system (4).

Fig. 8: Plug Connection And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- Carry out vehicle programming/coding using appropriate BMW scan tool.

50 ANTENNA

84 50 060 REMOVING AND INSTALLING/REPLACING BLUETOOTH ANTENNA

Necessary preliminary tasks:

- Remove trim for rear left roof pillar (C-pillar), see **51 43 252 REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (D-PILLAR)** .

Unfasten plug connection (1) and disconnect.

Release screws (2) and remove bluetooth antenna (3).

Fig. 9: Screws And Bluetooth Antenna

Courtesy of BMW OF NORTH AMERICA, INC.

ACCESSORIES AND EQUIPMENT

Cruise Control - Special Tools - X3

66 DISTANCE SYSTEMS, CRUISE CONTROL

66 3 140 OPS PACKAGE

Note: (complete set)

20 PARK DISTANCE CONTROL

66 20 508 REMOVING AND INSTALLING (REPLACING) CONTROL UNIT (PARK DISTANCE CONTROL)

IMPORTANT: Read and comply with 61 35 ... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

Necessary preliminary tasks:

- Remove Luggage Compartment Floor Trim Panel, see 51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL .

Remove clips (1) and fold up front luggage compartment floor trim panel (2) slightly.

Installation:

Make sure front luggage compartment floor trim panel (2) is correctly seated.

Fig. 1: Clips And Front Luggage Compartment Floor Trim Panel
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Front luggage compartment floor trim panel shown removed for purposes of clarity.

Unlock plug connections (1) and disconnect.

Lift control unit (2) out of mounting for control units (3).

Fig. 2: Plug Connections And Control Unit
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW service tool.

66 20 520 REMOVING AND INSTALLING/REPLACING AN ULTRASONIC TRANSDUCER AT FRONT (PARK DISTANCE CONTROL)

Necessary preliminary tasks:

- Remove Front Bumper Trim, see **51 11 156 REMOVING AND INSTALLING FRONT BUMPER TRIM (FROM 09/2006)**.

Unlock catches (1) in direction of arrow and pull ultrasonic transducer (2) out of bracket (3).

Fig. 3: Catches And Ultrasonic Transducer
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of ultrasonic transducer (2) must engage exactly in mountings (3).

Fig. 4: Retaining Hooks Of Ultrasonic Transducer
Courtesy of BMW OF NORTH AMERICA, INC.

66 20 540 REMOVING AND INSTALLING/REPLACING A REAR ULTRASONIC TRANSDUCER (PARK DISTANCE CONTROL)

Necessary preliminary tasks:

- Remove Rear Bumper Trim, see **51 12 156 REMOVING AND INSTALLING REAR BUMPER TRIM (FROM 09/2006)** .

Unlock catches (1) in direction of arrow and pull ultrasonic transducer (2) out of bracket (3).

Fig. 5: Catches And Ultrasonic Transducer
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining hooks (1) of ultrasonic transducer (2) must engage exactly in mountings (3).

Fig. 6: Retaining Hooks Of Ultrasonic Transducer
Courtesy of BMW OF NORTH AMERICA, INC.

66 20 560 REMOVING AND INSTALLING/REPLACING REAR SIGNAL SENSOR (PARK DISTANCE CONTROL)

Necessary preliminary tasks:

- Remove Right Luggage Compartment Wheel Arch Trim, see **51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM** .

Unfasten plug connection (1) and disconnect.

Release nut (2) and remove rear signal sensor (3).

Fig. 7: Rear Signal Sensor
Courtesy of BMW OF NORTH AMERICA, INC.

53 REVERSING CAMERA

66 53 ... INSTRUCTIONS FOR ADAPTING ADJUSTMENT UNIT FOR REVERSING CAMERA (CORGHI KDS QUICK - ACTION CLAMP)

The following operations should only be carried out when using the tool kit for calibrating the reversing camera for the first time.

NOTE: The operation is described for the left-hand side; proceed in the same way for the right-hand side.

Remove support plate (1) from spindle (2).

Replace spindle (2) by spindle (3).

Press support plate (1) on to spindle (3).

Fig. 8: Support Plate And Spindle
Courtesy of BMW OF NORTH AMERICA, INC.

Release retaining clip (1).

Remove ball pin (2) from rod (3).

Fig. 9: Retaining Clip And Ball Pin

Courtesy of BMW OF NORTH AMERICA, INC.

Fit new ball pin (1) on rod (2) and secure with retaining clip (3).

Fit ball pin (1) on CORGHI KDS quick-release clamp and secure.

Fig. 10: Ball Pin, Rod And Retaining Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Remove all spacers (1) on cross bar (2).

NOTE: Follow the same procedure for calibrating the reversing camera.

Fig. 11: Spacers On Cross Bar
Courtesy of BMW OF NORTH AMERICA, INC.

ACCESSORIES AND EQUIPMENT

Electrical Drives - Repair Instructions - X3

11 CENTRAL LOCKING UNIT/UNLOCKING UNITS

67 11 510 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR FRONT LEFT OR RIGHT DOOR LOCKING MECHANISM

NOTE: Servodrive for door locking mechanism is integrated in door lock in front door.

Procedure is described in the document [51 21 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT FRONT DOOR](#) .

67 11 530 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR REAR LEFT OR RIGHT DOOR LOCKING MECHANISM

This operation is described in:

[51 22 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT REAR DOOR](#) .

67 11 555 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR TANK FILLER FLAP

Necessary preliminary tasks:

- Remove Right Luggage Compartment Wheel Arch Trim, see **[51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM](#) .**

Unclip emergency actuator (1) on emergency actuator pull strap (2).

Feed out emergency actuator pull strap (2) through opening (3).

Slacken screws (4) and feed servodrive for tank filler flap (5) towards rear out of retaining plate.

If necessary, carry out adjustment of servodrive for tank filler flap (5) via elongated holes of retaining plate. It must be possible to lock or unlock the fuel filler flap completely.

Disconnect associated plug connection and remove servodrive for tank filler flap (5).

Fig. 1: Emergency Actuator And Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert servodrive for tank filler flap (1) in direction of arrow into gaiter (2).

Fig. 2: Tank Filler Flap
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Unhook emergency actuator pull strap (1) from clip (2) and remove from locking pin (3) of servodrive for fuel filler flap (4).

Fig. 3: Servodrive For Fuel Filler Flap
 Courtesy of BMW OF NORTH AMERICA, INC.

67 11 560 REPLACING SERVODRIVE FOR REAR LID LOCK

This operation is described under:

51 24 105 REMOVING AND INSTALLING/REPLACING REAR LID LOCK (LOWER SECTION OF LOCK) .

13 MIRROR ADJUSTMENT

67 13 001 REPLACING DRIVE UNIT FOR ELECTRICALLY OPERATED LEFT OR RIGHT DOOR MIRROR

Necessary preliminary tasks:

- Remove Mirror Glass, see **51 16 026 REPLACING MIRROR GLASS** .

Release screws (1).

Fold out drive unit for electrically operated door mirror (2) in direction of arrow.

Fig. 4: Screws And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) and remove drive unit for electrically operated door mirror (2).

IMPORTANT: In order to avoid ingress of water in non-sealed plug housing, coat plug housing (1) at cable and connection ends with battery terminal grease.

Fig. 5: Plug Connection And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

67 13 005 REPLACING DRIVE UNIT FOR ELECTRICALLY ADJUSTABLE LEFT OR RIGHT DOOR MIRROR (WITH MEMORY)

Special tools required:

- **61 1 150 RELEASING TOOL KIT**

Necessary preliminary tasks:

- Remove Mirror Glass, see **51 16 026 REPLACING MIRROR GLASS** .
- Remove Mirror On Left Or Right Front Door, see **51 16 000 REMOVING AND INSTALLING/REPLACING MIRROR ON LEFT OR RIGHT FRONT DOOR** .

Release screws (1).

Remove drive unit for electrically adjustable door mirror (2) in direction of arrow.

Fig. 6: Screws And Electrically Operated Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip cap (1) with a suitable tool.

Remove sound insulation (2) from mirror. Correctly disconnect cable plug (3) with special tool 61 1 150 .

Feed out cable (4).

Installation:

Make sure ribbon cable (4) is correctly routed. Cable must not be kinked!

Fig. 7: Sound Insulation And Cable Plug
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Sound insulation (1) on mirror (2) must not be damaged.

Fig. 8: Sound Insulation On Mirror
 Courtesy of BMW OF NORTH AMERICA, INC.

31 DRIVE, SEAT ADJUSTMENT

67 31 501 REMOVING AND INSTALLING/REPLACING DRIVE FOR LONGITUDINAL SEAT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (1).

Unclip plug housing (2) in direction of arrow from retaining fixture underneath.

NOTE: Secure drive for longitudinal seat adjustment (4) against falling out.

Release screws (3) and remove drive for longitudinal seat adjustment (4) in direction of arrow from flange (5).

If necessary, remove inner drive shaft from drive for longitudinal seat adjustment (4).

Fig. 9: Plug Housing
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is correctly seated.

Make sure drive for longitudinal seat adjustment (2) is correctly seated on flange (3).

Fig. 10: Drive Shaft

Courtesy of BMW OF NORTH AMERICA, INC.

67 31 511 REMOVING AND INSTALLING/REPLACING DRIVE FOR SEAT TILT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (4).

NOTE: Secure drive for seat tilt adjustment (5) against falling out.

Loosen screws (1).

Remove drive for seat tilt adjustment (5) with fixture for plug connection (3) in direction of arrow from flange (2).

If necessary, remove inner drive shaft from drive for seat tilt adjustment (5).

Fig. 11: Seat Tilt Adjustment

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is correctly seated.

Ensure fixture for plug connection (3) and drive for seat tilt adjustment (4) on flange (2) are correctly seated.

Fig. 12: Drive Shaft And Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

67 31 521 REMOVING AND INSTALLING/REPLACING DRIVE FOR SEAT HEIGHT ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (2).

NOTE: Secure drive for seat height adjustment (3) against falling out.

Release screws (1).

Remove drive for seat height adjustment (3) with fixture for plug connection (4) in direction of arrow from flange (5).

If necessary, remove inner drive shaft from drive for seat height adjustment (3).

Fig. 13: Seat Height Adjustment And Inner Drive Shaft
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is exactly seated.

Ensure fixture for plug connection (2) and drive for seat height adjustment (3) on flange (4) are correctly seated.

Fig. 14: Drive Shaft And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

67 31 531 REMOVING AND INSTALLING/REPLACING DRIVE FOR BACKREST ANGLE ADJUSTMENT (FRONT SEAT REMOVED)

Disconnect plug connection (1).

NOTE: **Secure drive for backrest angle adjustment (5) against falling out.**

Release screws (3).

Remove drive for backrest angle adjustment (5) with fixture for plug connection (2) in direction of arrow from

flange (4).

If necessary, remove inner drive shaft from drive for backrest angle adjustment (5).

Fig. 15: Backrest Angle Adjustment
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure drive shaft (1) is exactly seated.

Ensure fixture for plug connection (3) and drive for backrest angle adjustment (4) on flange (2) are correctly seated.

Fig. 16: Drive Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

61 DRIVE, SLIDE-TILT SUNROOF/CONVERTIBLE TOP

67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF)

Necessary preliminary tasks:

- **E53:** Remove mounting bracket from roofliner at front.
- **E83:** Remove Front Roofliner Trim, see **51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM** .

NOTE: **Secure drive with gear for actuating slide/tilt sunroof (2) against falling out.**

Release screws (1), tightening torque: 1AZ, see **54 13 ELECTRIC SUN ROOF COMPONENTS** .

Lower drive with gear for actuating slide/tilt sunroof (2).

NOTE: **Screws (1) are microencapsulated.**

Unlock plug connection (3), disconnect and remove drive with gear for actuating slide/tilt sunroof (2).

Fig. 17: Screws And Actuating Slide/Tilt Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert gear wheel (1) of drive with gear for actuating slide/tilt sunroof (2) exactly in gear teeth (3).

Fig. 18: Gear Wheel And Gear Teeth

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialize Panorama Glass Roof, see **54 0 ... NOTES ON PANORAMA GLASS ROOF (INITIALIZATION/NORMALIZATION/LEARNING OF CHARACTERISTIC CURVE)** .

67 61 517 REPLACING DRIVE WITH GEAR (REAR) FOR ACTUATING SLIDE/TILT SUNROOF

Necessary preliminary tasks:

- Remove rear grab handles, see **51 16 450 REMOVING AND INSTALLING/REPLACING REAR LEFT/RIGHT GRAB HANDLE** .
- Remove trim for rear left and right roof pillar (C-pillar), see **51 43 251 REMOVING AND INSTALLING/REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (C - PILLAR)** .
- Remove trim for rear left and right roof pillar (D-pillar), see **51 43 252 REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (D-PILLAR)** .
- Remove left and right interior lights, see **63 31 015 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT INTERIOR LIGHT (SIDE ROOFLINER)** .
- Detach mucket in area of roofliner

IMPORTANT: Do not under any circumstance kink roofliner (1).

Unclip roofliner (1) at retaining point (2) towards bottom and lower.

NOTE: Secure drive with gear for actuating slide/tilt sunroof (4) against falling out.

Release screws (3), tightening torque: 1AZ, see **54 13 ELECTRIC SUN ROOF COMPONENTS** .

Lower drive with gear for actuating slide/tilt sunroof (4).

Fig. 19: Roofliner And Actuating Slide/Tilt Sunroof
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Screws (3) are microencapsulated.

Unlock plug connection (5), disconnect and remove drive with gear for actuating slide/tilt sunroof (4).

Installation:

Insert gear wheel (1) of drive with gear for actuating slide/tilt sunroof (2) exactly in gear teeth (3).

Fig. 20: Gear Wheel And Gear Teeth
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Initialize Panorama Glass Roof, see **54 0 ... NOTES ON PANORAMA GLASS ROOF (INITIALIZATION/NORMALIZATION/LEARNING OF CHARACTERISTIC CURVE)**.

62 DRIVE, WINDOW REGULATOR

67 62 000 REMOVING AND INSTALLING / REPLACING FLAT MOTOR FOR FRONT LEFT OR RIGHT POWER WINDOW UNIT

Special tools required:

- **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Detach sound insulation on front door in working area, see **51 48 060 REMOVING AND INSTALLING/REPLACING SOUND INSULATION IN LEFT OR RIGHT FRONT DOOR**.

NOTE: For clearer illustration, shown with sound insulation removed.

Disconnect plug connection (1).

Unfasten screws (2).

Detach flat motor (3) in direction of arrow from power window unit (4) and remove.

IMPORTANT: If necessary, use special tool 00 9 310 to release flat motor (3) from power window unit (4).

Guide wheel must not be pulled out of power window unit (4).

Fig. 21: Screws And Flat Motor

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit flat motor (3) exactly on teeth of power window unit.

Replacement:

A normalization must be carried out in order to activate anti - trapping protection.

Operating sequence for normalization:

- Open corresponding window completely.
- Operate corresponding power window switch in "Close" position (second switch stage).
- Once the upper end position has been reached, hold power window switch down for approx. 1 second more.

Normalization is thus completed.

NOTE: Carry out function check (one-touch function, anti-trapping protection and, if necessary, comfort function).

67 62 020 REMOVING AND INSTALLING/REPLACING FLAT MOTOR FOR REAR LEFT OR RIGHT POWER WINDOW UNIT

Necessary preliminary tasks:

- Detach sound insulation on rear door in working area, see **51 48 070 REMOVING AND INSTALLING/REPLACING SOUND INSULATION ON LEFT OR RIGHT REAR DOOR** .

NOTE: For clearer illustration, shown with sound insulation removed.

Unfasten plug connection (1) and disconnect.

Release screws (2).

Detach flat motor for power window unit (3) in direction of arrow from power window unit (4) and remove.

Installation:

Fit flat motor for power window unit (3) exactly on teeth of power window unit.

Fig. 22: Screws And Flat Motor

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

A normalization must be carried out in order to activate anti - trapping protection.

Operating sequence for normalization:

- Open corresponding window completely.
- Operate corresponding power window switch in "Close" position (second switch stage).
- Once the upper end position has been reached, hold power window switch down for approx. 1 second more.

Normalization is thus completed.

NOTE: Carry out function check (one-touch function, anti-trapping protection and, if necessary, comfort function).

66 DRIVE, SEAT ADJUSTMENT

67 66 010 REMOVING AND INSTALLING/REPLACING LUMBAR SUPPORT DRIVE MECHANISM ON FRONT SEAT, LEFT OR RIGHT

Necessary preliminary tasks:

- Remove rear panel on front seat backrest, see **52 13 198 REMOVING AND INSTALLING / REPLACING REAR PANEL ON LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/MANUAL)** .

E53 comfort seat:

- Remove rear panel at bottom.

Detach backrest cover (1) in direction of arrow from backrest frame (2).

Fig. 23: Backrest Cover And Backrest Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Detach transparent hose (2) from valve housing (3).

NOTE: If necessary, gently heat transparent hose (2) if firmly seated.

If necessary, detach fabric adhesive tape (4).

Detach drive unit for lumbar support (5) with jacket in direction of arrow.

Fig. 24: Transparent Hose And Valve Housing
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean adhesive area (1) on backrest frame (2).

Fig. 25: Adhesive Area On Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Transparent hose (1) of drive unit for lumbar support must not be kinked.

Pull off protective film (3) from jacket (2). Stick drive unit for lumbar support to backrest frame.

If necessary, secure jacket (2) with cable strap.

Fig. 26: Transparent Hose And Protective Film
Courtesy of BMW OF NORTH AMERICA, INC.

11 INSTRUMENT CLUSTER

62 11 280 REMOVING AND INSTALLING (REPLACING) INSTRUMENT CLUSTER

IMPORTANT: Read and comply with 61 35... NOTES ON ESD PROTECTION (ELECTROSTATIC DISCHARGE) .

NOTE: Extend steering wheel completely and lower.

Tape off instrument panel trim (1) and upper steering column casing (2) with crepe tape.

Fig. 1: Identifying Instrument Panel Trim And Upper Steering Column Casing
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Carefully pull back instrument cluster (2).

Disconnect associated plug connection.

Remove instrument cluster (2).

Fig. 2: Identifying Instrument Cluster
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Carry out programming/coding using appropriate BMW scan tool.

ACCESSORIES & BODY, CAB

Remote Keyless Entry - SI Techniques - All Models (Model Year 09/1999 And Up)

NEW RADIO REMOTE CONTROL (RKE)

All Models Beginning 09/99

G03179551

Fig. 1: Identifying New Radio Remote Control
Courtesy of BMW OF NORTH AMERICA, INC.

1. RADIO TECHNOLOGY

Radio technology is a comprehensive term covering all areas of cordless telecommunication such as telephone, radio, television. Transmission is by means of electromagnetic waves.

Due to the fact that the radio waves are not limited to one single direction and have a wider range than the infrared waves, this technology is also being increasingly employed in remote controls.

The same remote-control technology is used in motor vehicle construction as, for example, in construction site cranes, in model construction, alarm systems, garage-door opening systems etc.

These remote controls are operated on the same approved frequency (315 MHz or 433.92 MHz).

2. RADIO REMOTE CONTROL, GENERAL INFORMATION

The radio remote control for the central locking system (FZV) is a further development of the radio-compact

remote control, or the radio remote control which first appeared in the E38.

The radio transmitter is still located in the grip of the car key, the receiver module is installed in the vehicle. All radio telegrams are encoded by means of a constantly changing code. This ensures that the vehicle cannot be opened by someone who has eavesdropped telegrams.

Depending on vehicle type, equipment and country-specific version, in addition to the functions "opening/closing central locking system" and "central arrest" the following functions are also available: "activating/deactivating alarm system", "deactivating tilt sensor/passenger-compartment sensor", "convenient opening/closing window and sliding roof", "switching on interior lighting" and "opening/closing luggage compartment lid".

The remote control keys can be initialized at the vehicle without visiting a BMW Service point when, for example, the owner requires additional keys or, for security reasons, following the loss of a radio remote control key. The initialization procedure is described in the respective Owner's Handbooks.

The radio remote control is available as standard equipment in the models E38, E39, E46 and as an option in the E36 models (option 302).

Up to 4 radio transmitters can be operated per vehicle.

In many countries, radio remote controls are subject to radio-technical registration specifications. The required designation is on the key grip.

3. SYSTEM OVERVIEW

The radio remote control consists of:

1. Radio transmitter (integrated in the key grip)
2. General module of the central body electrics (ZKE)
3. Receiver module (integrated in aerial amplifier or aerial diversity)
4. Aerial in rear window or rear side window on touring

G03179552

Fig. 2: Identifying RKE Components & Locations
Courtesy of BMW OF NORTH AMERICA, INC.

The reception of the radio signals from the transmitter varies according to location in relation to vehicle. The rear area (aerial) of the vehicle is the reference point.

External influences can cause the range or operation of the remote control to deviate from the mean distances specified below either **positively** (through reflection) or **negatively** due to sources of interference (radio-technical systems).

G03179553

Fig. 3: Identifying RKE Range Of Operation
Courtesy of BMW OF NORTH AMERICA, INC.

External radio-technical systems/equipment that are operated on the same frequency (433.92 MHz; 315 MHz; 70 cm band) with a higher output can interfere with the remote control function. Possible sources of interference are:

- Radio Headphones (Known As Cordless Headphones)
- Radio Sets (Amateur Radio; Radio Telephone; Toy Models)
- Radio Modems
- Garage-Door Remote Controls
- Telemetry Transmitters, E.G. Weather Station With Temperature Sensor
- House Burglar Alarm Systems With Sensors
- Remote-Controlled Sockets
- Radio Bells (For Paging)
- TV Radio Systems (Reverse Channel For Television Remote Control)
- Industrial Plants
- Non-Suppressed Electric Motors

4. REMOTE CONTROL FUNCTIONS

- Opening/closing central locking system (ZV)
- Switching on interior lighting
- Activating/deactivating anti-theft alarm system (DWA)
- Activating/deactivating tilt sensor and interior protection of the anti-theft alarm system
- Opening/closing side windows

- Opening/closing sliding roof
- Opening/closing luggage compartment lid
- Activating/deactivating Panic Mode - only US models

If required, this function can be used to trip an alarm via the DWA.

5. OPERATING RELIABILITY

As of ignition lock position 1 (terminal "R", no more remote control functions are carried out.

If the ignition lock switches to position 1 following "Central arrest" of the central locking system (ZV), the ZV changes "Central arrest" to "Central locking".

If there is a key in the ignition lock which is recognised as valid by the electronic immobiliser III, the central locking system cannot be actuated in "Central arrest".

Due to the high range, "Convenient closing" of the rear vent windows is not possible on the E46 coupe as these windows do not have an anti-trap function.

All of the comfort functions and closing of the automatic luggage compartment lid operate only as long as the appropriate button is actuated on the remote control key.

6. NEW RADIO TRANSMITTER (KEY)

Beginning in September 1999, a new generation of radio transmitters will be introduced into series production.

The most important basic functions are the same as those of the present transmitters.

The operating functions will still be actuated via three buttons.

G03179554

Fig. 4: Identifying New Radio Transmitter (Front Of Key)
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 5: Identifying New Radio Transmitter (Back Of Key)
Courtesy of BMW OF NORTH AMERICA, INC.

Overview Of Modifications:

1. New appearance with coloured BMW logo.
2. New keyboard arrangement and larger keys.
3. A storage battery instead of a regular battery, charged via the ring aerial at the ignition lock.
4. The key casing is waterproof, dustproof, sealed and cannot be opened.
5. The function display (red LED) has been omitted.

6.1 Operating Principles Of Input Keys

(Basic Functions)

G03179556

Fig. 6: Identifying RKE Input Buttons
Courtesy of BMW OF NORTH AMERICA, INC.

Press **button 1** briefly:

- Central locking system closes, moves into central arrest, the DWA may be activated.
- The interior lighting is switched on when the vehicle is locked.
- Panic Mode (on US models) is deactivated again.

Press **button 1** a second time after a short interval:

- The interior protection and tilt sensor of the DWA are deactivated

Press **button 1** and hold in:

- Central locking system, side windows and sliding roof close ("Convenient closing").
- This function is encoded differently from country to country and is not available in all national versions.

Press **button 2** briefly:

- Central locking system opens, interior lighting switches on, the DWA may be deactivated.

Press **button 2** and hold in:

- Central locking system, side windows and sliding roof open ("Convenient opening").

Press **button 3** briefly:

- Luggage compartment lid opens.

Press **button 3** and hold in:

- Panic Mode (on US models) is active again.
- Automatic luggage compartment lid closing.

Individual functions may deviate from those described above; this depends on the respective country-specific encoding and the settings made via Car & Key Memory.

6.2 Signal Processing

Signal processing is by means of a microprocessor on the printed circuit board in the key casing. This microprocessor:

- Evaluates The Key Actuations,
- Generates The New Key Code,
- Relays The Key Code,
- Controls Transmitter Output Stage,
- Monitors Power Supply (Storage Battery) For Radio Transmitter.

G03179557

Fig. 7: Identifying RKE Components On Printed Circuit Board Of Key
 Courtesy of BMW OF NORTH AMERICA, INC.

The signals transmitted via the transmitter output stage are radiated via an aerial integrated on the printed circuit board. The carrier frequency is 433.92 MHz (ECE) or 315 MHz (US), depending on country-specific registration.

When the system is being initialized, a key code is created and stored in the microprocessor of the radio transmitter. Following every key actuation at the radio transmitter, a new key code is transmitted (changing code). The codes are recalculated according to a specified process so that the receiver module can differentiate reliably between its own and external radio transmitters.

NOTE: Each transmitter can "lose" its key code if, e.g., someone inadvertently actuates buttons in the initialization sequence outside the car. In this case, all radio transmitters belonging to the car must be re-initialized.

6.3 Power Supply

The new radio transmitter does not use regular batteries but rather a rechargeable vanadium-lithium storage battery. New radio transmitters will be supplied with charged storage batteries.

- 1 - Storage battery
- 2 - High-frequency aerial (433.92 MHz or 315 MHz)

G03179558

Fig. 8: Identifying Storage Battery And High-Frequency Aerial
Courtesy of BMW OF NORTH AMERICA, INC.

As of ignition lock position 1 (terminal "R"), the storage battery is charged inductively. The charging process is realized via the ring aerial of the ignition lock and via the coiled aerial integrated in the radio transmitter. An electronic charging unit on the printed circuit board controls the charging process.

The battery is designed for a very long service life. A prerequisite is that the radio transmitter is used.

If radio transmitters are not used, the storage battery is discharged after approx. 18 months.

With severely discharged storage batteries, the charging period is approx. 30 hours up to maximum capacity. After charging for approx. 30 minutes, the remote control can be actuated approx. 15 times.

6.4 Voltage Monitoring

If cell-end voltage has been reached, the central locking system, for example, can no longer be locked using the remote control. The "Convenient closing" can no longer be used, nor can the radio transmitter be initialized.

Every time a button is actuated, the storage battery voltage in the radio transmitter is monitored. Once the storage battery signal is contained in three consecutive telegrams, it is stored together with the corresponding radio transmitter key number for diagnostic purposes in the general module of the central body electrics. The entry is deleted when five consecutive radio transmitter telegrams no longer contain the storage battery signal.

In the case of E38 and E39 models, this status is already indicated by a signal in the check control.

7. SYSTEM INITIALIZATION

In order that the radio transmitters can communicate with the vehicle, each individual radio transmitter must be initialized with the receiver module.

Up to four radio transmitters can be initialized and used per vehicle.

Since each radio transmitter has its own key code, all existing radio transmitters must be reinitialized when, for example, a new radio transmitter is to be added.

Initialization Procedure:

1. Open central locking system (ZV) using the car key.
2. Get into the car and close all doors.
3. Using the car key, switch the ignition lock briefly to ignition lock position 1 and then switch off again. The switching time must remain under 5 seconds, otherwise the system is not ready for initialization.
4. At the radio transmitter: Press button 2 and hold in.
5. Press button 1 three times (in a space of 10 seconds). Button 2 must remain held in.
6. Release button 2.
7. The ZV signals by means of "Locking" and immediate "Unlocking" that a radio transmitter has been successfully initialized.

G03179559

Fig. 9: Identifying RKE Input Buttons
Courtesy of BMW OF NORTH AMERICA, INC.

If the ZV does not send a return signal, initialization must be restarted.

Once the first initialization process has been completed, another three radio transmitters can be initialized.

For every other radio transmitter, the procedure described under step 4) above must be repeated within 30 seconds, otherwise initialization stand-by is switched off.

During initialization, all other existing radio transmitters must be initialized. The ignition lock must never be reactivated during the initialization process. If this were to happen, then all radio transmitters would have to be re-initialized.

8. DIAGNOSIS

The radio remote control can be diagnosed via DIS and MoDiC under "Central body electrics - ZKE".

9. SYSTEM INTERCONNECTIONS

Various functions in the central body electrics, the anti-theft alarm system (DWA) and the electronic immobiliser (EWS) can be activated or deactivated by means of the radio transmitters.

During vehicle diagnosis, it is important to know how the radio transmitter influences the total system.

G03179560

Fig. 10: Identifying System Interconnections And Function (E46 Shown)
Courtesy of BMW OF NORTH AMERICA, INC.

SYSTEM INTERCONNECTION LEGEND

Component	Designation
Z	Ignition lock, electromechanical part
EWSIII	Electronic immobiliser, control unit
EWSIII/1	Output - starter signal (X1659)
EWSIII/3	Input - ignition/starter switch signal (X1659)
EWSIII/4	Output - engine control unit signal, uni-directional (X1659)
EWSIII/5	Output - ring coil signal (X1659)
EWSIII/6	Input - transmission control unit switch signal (X1659)
EWSIII/9	Ground/earth (X1659)
EWSIII/10	Input - terminal 30 of fuse F67 (X1659)
EWSIII/11	Input - terminal R from ignition lock via fuse F14 (X1659)
EWSIII/12	Output - ring coil signal (X1659)
EWSIII/13	Input/output - K bus signal (X1659)
F9	Terminal 30/5A fuse
F46	Terminal 30/30A fuse
F49	Terminal 30/5A fuse
F67	Terminal 30/5A fuse
LSZ	Central light switch
LSZ/21	Input/output K bus (X12)
LSZ/31	Ground/earth (X12)
LSZ/47	Output - search light signal (58g) (X12)
ILV	Interior lighting, front
ACS	Automatic transmission control unit
DME/DDE	Digital Engine Electronics/Digital Diesel Electronics
DME/33	Input - EWS release signal (X6004)
CAN	Controller Area Network (CAN bus)
K-Bus	Bodyshell bus
FH	Window lift (stands for all window lifts in vehicle)
SHDM	Sunroof module
SMT	Lock module (stands for all doors)
HK	Luggage compartment lid motor
TK	Fuel filler cap drive
USIS	Ultrasonic interior protection
NG	Tilt sensor
FZV	Radio central locking receiver
FZV/1	Input - terminal 30 signal of fuse F49 (X1143)
FZV/2	Ground/earth - (X1143)

FVZ/3	Input/output - radio transmitter signal (X1153)
GM	General module V
GM/3	Output - electric consumer cut-out signal (X332)
GM/5	Output - tilt sensor monitoring signal (X254)
GM/6	Input - tilt sensor monitoring, immobiliser signal (X254)
GM/8	Input - interior lighting switch signal, front, continuous operation (X253)
GM/8	Output - control signal, DWA emergency power siren alarm (X254)
GM/9	Input/output - K bus signal (X253)
GM/10	Ground/earth (X253)
GM/17	Output - luggage compartment lid unlocking motor signal to luggage compartment lid drive (X253)
GM/18	Input - interior lighting signal (X253)
GM/23	Output - DWA light emitting diode signal (X254)
GM/24	Input - passenger-compartment sensor signal (USIS) (X254)
GM/27	Input - terminal R of fuse F9 (X253)
GM/35	Output - fuel filler cap unlocking signal (X253)
GM/42	Input - luggage compartment lid contact signal from luggage compartment lid drive (X253)
GM/47	Input - terminal 30 signal of fuse F49 (X253)
GM/49	Input/output - radio remote control data line signal (X253)
GM/50	Output - fuel filler cap locking signal (X253)
TXD	Diagnostic bus to diagnostic connector

ACCESSORIES & EQUIPMENT

Seats - Operating Fluids

1.0 SEAT LEATHER CARE

"Karneol" leather care cleans the leather upholstery of mild stains or dirt. It also provides conditioners to prevent drying out. Not suitable for suede.

BMW Part No. 81 22 9 400 901.

2.0 PREMIUM LEATHER CARE KIT

BMW Part No. 81 11 024 455.

ACCESSORIES AND EQUIPMENT

Seats - Repair Instructions - X3

13 FRONT SEAT NORMAL, MANUAL

52 13 ... REMOVING AND INSTALLING/REPLACING GUIDE FOR FRONT LEFT OR RIGHT HEAD RESTRAINT

Remove rear panel on front seat backrest:

Basic seat, refer to 52 13 198.

Sports seat, refer to 52 15 198.

Guide for head restraint with pushbutton:

Release catches (1) and (2) and slide guide (3) upwards.

Fig. 1: Releasing Catches And Slide Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Pull guide (1) out of backrest (2).

Fig. 2: Pulling Guide Out Of Backrest
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) and (2) on guide (3) must not be damaged.

Check that pushbutton (4) works properly.

After installing guide (3), make sure it is properly seated.

Fig. 3: Catches And Pushbutton
Courtesy of BMW OF NORTH AMERICA, INC.

Guide for head restraint without pushbutton:

Release catches (1) and slide guide (2) upwards.

Fig. 4: Releasing Catches And Slide Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Pull guide (1) out of backrest (2).

Fig. 5: Pulling Guide Out Of Backrest
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (1) on guide (2) must not be damaged.

After installing guide (2), make sure it is properly seated.

Fig. 6: Catches And Installing Guide
Courtesy of BMW OF NORTH AMERICA, INC.

52 13... REMOVING AND INSTALLING/REPLACING SEAT PAN AND FLEXMAT (NORMAL/MANUAL), LEFT OR RIGHT

Remove seat cover with support,

refer to 52 13 400.

Release left screw (1) and slacken right screw only.

Release left/right screws (3).

Slacken left/right screws (4) only.

Remove left retaining plate (2) downwards.

Installation:

Tightening torque: 52 10 9AZ, see **52 10 FRONT SEATS** .

Fig. 7: Left Retaining Plate And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Press seat pan (1) upwards, thereby relieving tension on flexmat.

Fig. 8: Pressing Seat Pan Upwards

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove retaining plates (2).

Installation:

Tightening torque: 52 10 9AZ, see **52 10 FRONT SEATS** .

Fig. 9: Retaining Plates And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Unhook cable (1) from holder (2).

Fig. 10: Releasing Cable From Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Turn seat pan (1) upwards.

Detach flexmat (2) at rear from mounts (3).

Fig. 11: Turning Seat Pan Upwards
Courtesy of BMW OF NORTH AMERICA, INC.

Detach seat pan (1) on left/right backwards/top from mount (2) and remove.

Fig. 12: Separating Seat Pan

Courtesy of BMW OF NORTH AMERICA, INC.

Detach flexmat (1) from mounts (2) on seat pan (3).

Fig. 13: Separating Flexmat From Mounts

52 13 015 REMOVING AND INSTALLING / REPLACING CONTROLS ON LEFT / RIGHT FRONT SEAT (NORMAL / MANUAL)

WARNING: The actuating unit for front seats which was fitted during car production is different from the spare part.

Actuating unit version (A):

The two adjusting screws (1) and (2) for eccentric disks, have a commercially available Torx screw head which is sealed with hot-melt adhesive.

- The adjusting screws (1) and (2) must not be adjusted in the workshop.
- The actuating unit may only be removed from and refitted to the same front seat.

Fig. 14: Adjusting Screws And Eccentric Disks (Actuating Unit Version A)
Courtesy of BMW OF NORTH AMERICA, INC.

Actuating unit version (B):

The two adjusting screws (1) and (2) for eccentric disks, are secured with tamper protection in the screw head.

- The adjusting screws (1) and (2) must not be adjusted in the workshop.
- The actuating unit may only be removed from and refitted to the same front seat.

Fig. 15: Adjusting Screws And Eccentric Disks (Actuating Unit Version B)
Courtesy of BMW OF NORTH AMERICA, INC.

Actuating unit version (C) (spare part):

The two adjusting screws for the eccentric disk have conventional Phillips heads.

- The adjusting screws (1) and (2) can be adjusted in the workshop.
- The actuating unit may be fitted to either front seat.
- Prior to installation, apply an acid-free grease to thread; the grease forces the eccentric disk upwards during adjustment

Fig. 16: Adjusting Screws And Eccentric Disks (Actuating Unit Version C
Courtesy of BMW OF NORTH AMERICA, INC.

Removing and installing actuating unit:

Remove front seat,

refer to .

Remove outer cover on front seat,

refer to **52 13 040**.

Move front seat to basic position:

CAUTION: One seat runner is spring-loaded, risk of injury when unlocking.

Operate actuating lever (1) and snap seat runners (2) into position by sliding.

Operate actuating lever (3) and snap seat cushion (4) into position by loading.

Operate actuating lever (5) and snap seat backrest (6) into position by moving.

Fig. 17: Removing Actuating Lever And Snap Seat Backrest
 Courtesy of BMW OF NORTH AMERICA, INC.

Lever out rear trim (1), unclip clips (2) and remove trim (1).

Fig. 18: Removing Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (1) and clips (2) on trim (3) must not be damaged; replace if necessary.

Fig. 19: Catch, Clips And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heater and/or lumbar support:

Slide cable (1) out of fixture (2) of actuating unit (3).

Fig. 20: Slide Cable And Actuating Unit

Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heater and/or lumbar support:

Slide cable (1) out of fixture (2) of actuating unit (3).

Fig. 21: Slide Cable And Fixture
Courtesy of BMW OF NORTH AMERICA, INC.

Model with lumbar supports:

If necessary, slide cable (1) out of fixture (2) of actuating unit (3).

If necessary, disconnect switch (4).

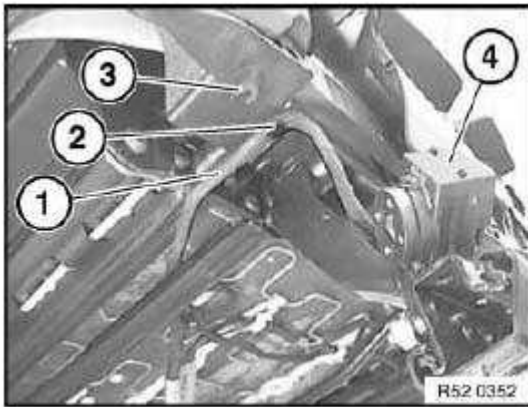

Fig. 22: Slide Cable And Actuating Unit
Courtesy of BMW OF NORTH AMERICA, INC.

Release expansion rivet (1) and detach rocker (2) (adjustment lever) from lever (3).

CAUTION: Do not turn adjustment lever (2) on threaded rod (2).

Fig. 23: Releasing Expansion Rivet
 Courtesy of BMW OF NORTH AMERICA, INC.

Lift actuating lever (1) and release screw (2).

Release screws (3) and (4) and detach actuating unit (5).

Installation:

Screw (3) is shorter than the others.

Insert screw (3) for assembly into actuating unit (5).

Tightening torque: 52 10 7AZ, see **52 10 FRONT SEATS** .

Fig. 24: Lifting Actuating Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Front guide (1) and eccentric disks (2) on actuating unit (3) must not be damaged.

Fig. 25: Eccentric Disks And Actuating Unit
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement of actuating unit version (C) (spare part) only:

Installation:

For adjustment, coat threads (1) with acid-free grease.

The eccentric disks (2) and (4) are carried upwards for adjustment by the grease.

Fig. 26: Coat Threads And Eccentric Disks
 Courtesy of BMW OF NORTH AMERICA, INC.

1. Threads for eccentric disks
2. Eccentric disk for backrest adjustment
3. Actuating lever for backrest adjustment
4. Eccentric disk for seat height adjustment
5. Actuating lever for seat height adjustment

Adjusting actuating unit, actuating unit version (C) (spare part) only:

Adjusting seat height and backrest inclination:

- The screw heads of threads (2) must remain clipped in place
- Unscrew eccentric disk (1)
- Apply acid-free grease to threads (2)
- Screw on eccentric disk (1)
- Turn eccentric disk (1) to zero position: straight surface (3) of eccentric disk (1) must be at top.

Fig. 27: Actuating Unit And Eccentric Disk

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The picture does not match the replacement unit, the replacement unit has **Phillips screws**.

- Install actuating unit.
- Press screws (1) and (2) out of hexagon head to seat center and screw down.

Tightening torque: 51 12 8AZ, see **51 12 REAR BUMPER** .

Fig. 28: Adjusting Screws And Eccentric Disks (Actuating Unit Version B)

Courtesy of BMW OF NORTH AMERICA, INC.

Adjust longitudinal seat setting:

- Compress unlocking plates (1) and (2) on seat runner on left/right with gripping pliers (3) (free of play)

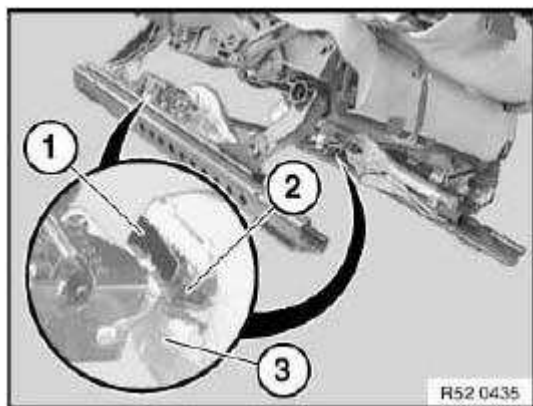

Fig. 29: Unlocking Plates And Pliers
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust longitudinal seat setting:

- Push new coupling link (1) (adjustment lever) onto threaded rod (3) and secure with expansion rivet (2)

Fig. 30: Coupling Link And Expansion Rivet
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust longitudinal seat setting:

- Press actuating lever (1) for longitudinal seat adjustment downwards and press together locking clip (3) on coupling link (4)

(coupling link (4) is now firmly connected to threaded rod (2))

- Install front seat in the car.

- If necessary, release expansion rivet (5) and readjust by turning coupling link (4)

Fig. 31: Pressing Actuating Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

Move front seat to basic position:

- Operate actuating lever (1) and snap seat runners (2) into position by sliding.
- Operate actuating lever (3) and snap seat cushion (4) into position by loading.
- Operate actuating lever (5) and snap seat backrest (6) into position by moving.
- Each actuating lever must have clearance until the mechanism is unlocked
- If there is no clearance, the mechanism may be in a semi - unlocked state (risk of injury in event of an accident)
- If there is excessive clearance, the mechanism may not unlock completely (no adjustment possible)

Fig. 32: Removing Actuating Lever And Snap Seat Backrest
 Courtesy of BMW OF NORTH AMERICA, INC.

Carrying out checks of seat height and backrest inclination adjustment (danger to life of vehicle occupants):

Check backrest inclination:

- Front seat must be in basic position
- Actuating lever (1) must be in zero position
- Pin (2) must rest against pull rod (3)
- There must be a clearance (A)

(A) 0 to 0.5 mm

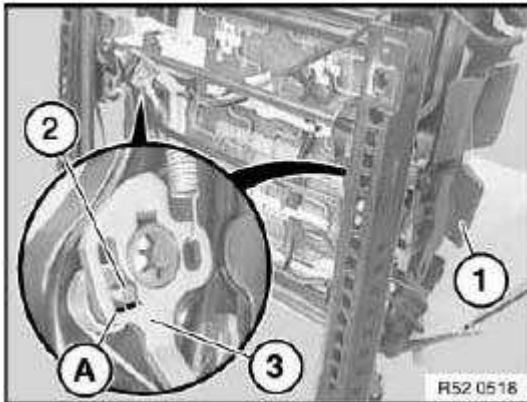

Fig. 33: Actuating Lever And Pin

Courtesy of BMW OF NORTH AMERICA, INC.

Check seat height:

- Front seat must be in basic position
- Actuating lever (1) must be in zero position
- Metal lever (2) must rest against metal lever (3)
- There must be a clearance (A)

(A) 0 to 0.5 mm

Fig. 34: Actuating Lever And Metal Lever
Courtesy of BMW OF NORTH AMERICA, INC.

52 13 025 REMOVING AND INSTALLING/REPLACING SEAT MECHANISM (ON FRONT SEAT NORMAL/MANUAL), LEFT OR RIGHT

Remove seat pan and flexmat on front seat,

refer to **52 13...**

Remove backrest frame on front seat,

refer to **52 13 030.**

Remove seatbelt tensioner,

refer to **72 11 030** .

Release screw (1) and cable tie (3).

Remove retaining bracket (2) with seat wiring harness from seat mechanism (4).

Fig. 35: Releasing Screw And Cable Tie
Courtesy of BMW OF NORTH AMERICA, INC.

52 13 030 REMOVING AND INSTALLING / REPLACING BACKREST FRAME ON LEFT OR RIGHT FRONT SEAT (NORMAL / MANUAL).

Remove backrest frame and backrest cover with support,

refer to **52 13 405.**

Model with lumbar supports:

If necessary, remove lumbar cushion on front seat,

refer to **52 13 050**.

If necessary, remove valve housing for lumbar support, front,

refer to .

If necessary, remove lumbar support drive mechanism on front seat,

refer to **67 66 010** .

If necessary, release screw (1) and remove metal nut (2).

Fig. 36: Metal Nut

Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, remove mat (1) from spring wire (2) of backrest frame (3).

Fig. 37: Mat And Spring Wire

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, suspend mat (1) on uppermost spring wire (2) on backrest frame (3).

Fig. 38: Spring Wire And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

52 13 040 REMOVING AND INSTALLING / REPLACING OUTER COVER ON LEFT OR RIGHT FRONT SEAT BACK-REST (NORMAL / MANUAL)

Unscrew bolt (1).

Fig. 39: Outer Cover Bolt
Courtesy of BMW OF NORTH AMERICA, INC.

Snap out catches (1) at front/rear
and tongue (2) at rear
from cover (3) towards top and
pull outwards a little.

Installation:

Slide tongue (2) into mounts and snap into place.

Fig. 40: Removing Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Lever lugs (1) on cover (3) out of brackets (2).

Fig. 41: Removing Lever Lugs
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out cover (1) at rear, detach at front from guide and remove.

Fig. 42: Removing Front From Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Model with lumbar supports:

If necessary, press down catches (1) on left/right and remove switch (2) from cover (3).

Fig. 43: Removing Switch From Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts must not be damaged,

replace cover (4) if necessary:

1. Catches, top
2. Guide, front
3. Lugs, bottom

Fig. 44: Catches, Guide And Lugs
Courtesy of BMW OF NORTH AMERICA, INC.

52 13 041 REMOVING AND INSTALLING / REPLACING INNER COVER ON LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/ MANUAL)

NOTE: Shown removed for purposes of clarity.
Release screw (1) and remove trim (2).

Fig. 45: Removing Trim

Courtesy of BMW OF NORTH AMERICA, INC.

52 13 050 REPLACING LUMBAR CUSHION ON FRONT LEFT OR RIGHT SEAT

Carry out following tasks beforehand:

Removing rear panel on front seat backrest:

- Basic seat, see 52 13 198 Removing and installing / replacing rear panel on left or right front seat backrest (normal/manual)
- Sports seat, see 52 15 198 Removing and installing/replacing rear panel on front left or right seat backrest (sports/manual).

Detach backrest cover (1) from backrest frame (2).

Fig. 46: Removing Backrest Cover From Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: If necessary, gently heat air hose when firmly seated. Housing (valve block) must not be unclipped (leaks). If it is unclipped, release screw and clip housing together.

Disconnect hoses (2) and (3) from valve housing (1).

2 Hose (blue) top cushion

3 Hose (red) bottom cushion

Installation:

Air hoses (2) and (3) must be laid without kinks.

Fig. 47: Hoses And Valve Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook lumbar cushion (1) from spring wire (2).

Version with seat heating:

Slide cable (3) for backrest heating to one side a little.

Fig. 48: Spring Wire And Slide Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Press back support (1) a little.

Turn lumbar cushion (2) and pull out downwards.

Fig. 49: Pulling Out Lumbar Cushion
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check lumbar cushion (1) at top and (2) bottom for damage.

Air hoses (3) must not be kinked.

Fig. 50: Air Hoses And Lumbar Cushion
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Attach lumbar cushion (1) to third wire (2) above spring (3).

Fig. 51: Lumbar Cushion And Wire
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, shown here without valve housing.

Installation:

Observe cable guide (1) for backrest heating.

Lay air hoses (2) without kinks through hole (3).

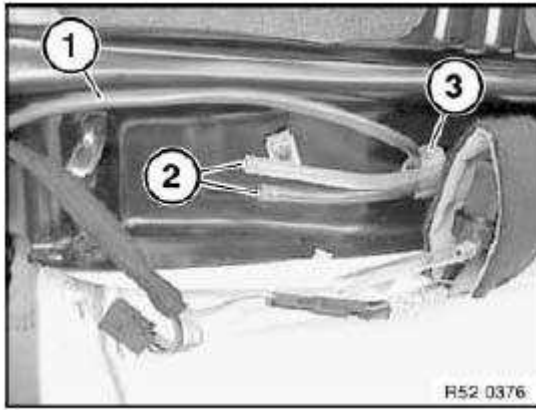

Fig. 52: Cable Guide And Hoses

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check function.

**52 13 070 REMOVING AND INSTALLING/REPLACING SEAT ANGLE ADJUSTER
(NORMAL/MANUAL) ON LEFT OR RIGHT FRONT SEAT**

Special tools required:

- **51 2 100 CLAMPING LEVER**

Necessary preliminary tasks:

- Remove front seat
- Remove actuating unit, see **52 13 015 Removing and installing / replacing controls on left / right front seat (normal / manual)**

WARNING: Torsion bar spring (1) is subject to tension. Risk of injury.

Lever torsion bar spring (1) with special tool 51 2 100 in direction of arrow from seat angle adjuster.

Feed torsion bar spring (1) out of seat mechanism.

Installation:

Make sure plastic protector is correctly positioned on contact surface between torsion bar spring and seat mechanism (grating noises).

Fig. 53: Removing Bar Spring

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Installation:

Replace Taptite screws (1).

Tightening torque: 52 10 16AZ, see **52 10 FRONT SEATS** .

Release screw (2).

Tightening torque: 52 10 17AZ, see **52 10 FRONT SEATS** .

Remove seat angle adjuster (3).

Installation:

Slide left and right O-rings onto shaft. Make sure O-rings are correctly located between seat angle adjuster and seat pan.

Fig. 54: Removing Seat Angle Adjuster

Courtesy of BMW OF NORTH AMERICA, INC.

52 13 198 REMOVING AND INSTALLING / REPLACING REAR PANEL ON LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/MANUAL)

Remove front seat.

Release clips (1) with side cutting pliers.

NOTE: Remove clip remainders.

Fig. 55: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully pull cover (1) with piping (2) out of groove in rear panel (3).

Fig. 56: Pulling Cover With Piping Out Of Groove

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The cover piping (1) has a marking (2) which must line up with hole (3) in rear panel groove (4).

From marking (2), press in piping (1) completely to left and right at bottom.

Five new repair clips must be fitted after each disassembly.

Fig. 57: Piping And Rear Panel Groove
Courtesy of BMW OF NORTH AMERICA, INC.

Release clips (1) (cut through with side cutting pliers).

NOTE: Remove clip remainders.

Fig. 58: Clips
Courtesy of BMW OF NORTH AMERICA, INC.

Pull rear panel (1) off backrest cover (2).

Fig. 59: Pulling Rear Panel Off Backrest Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Holes (1) and (2) on rear panel (3) must not be damaged.

Fig. 60: Holes And Rear Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Slide backrest cover (1) on left/right over clip mount (2).

Fig. 61: Clip And Backrest Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

To prevent noise:

Stick felt strip (1) to raised frame area (2).

Fig. 62: Frame Area
Courtesy of BMW OF NORTH AMERICA, INC.

**52 13 390 REMOVING AND INSTALLING / REPLACING FRONT HEADREST (NORMAL/
MANUAL)**

Move backrest back.

Move headrest (1) as far upwards as possible.

Unlock lock (2) and remove headrest (1).

Fig. 63: Removing Headrest

Courtesy of BMW OF NORTH AMERICA, INC.

52 13 400 REPLACING SEAT COVER ON LEFT OR RIGHT FRONT SEAT (NORMAL/MANUAL)

Special tools required:

- 52 0 050

Necessary preliminary tasks:

- Remove inner cover, see **52 13 041 Removing and installing / replacing inner cover on left or right front seat backrest (normal/ manual)**
- Remove cover (normal/electric) **52 16 040 Removing and installing/replacing outer cover on front left or right seat (sports/electric)** or outer actuating unit **52 13 015 Removing and installing / replacing controls on left / right front seat (normal / manual)**

WARNING: US/CDN front passenger seat (with OC3 mat) only:

To avoid damaging the OC3 mat, it is essential to carry out the following operations with extra care.

When replacing seat cover:

If seat cover is defective, seat cover and padding with OC3 mat must be replaced together.

New seat cover is supplied with padding, OC3 mat and if necessary seat heating.

When replacing padding with OC3 mat:

If OC3 mat or padding is defective, both parts may only be replaced together.

These must be fitted with the seat cover from the car.

Enabling seat occupancy detector (OC3 mat):

- Connect BMW diagnosis system
- Release seat occupancy detector
- Clear fault memory if necessary

Seat with electric actuating unit only:

Release screws (1).

Pull trim (2) out a little and release screw (3).

Release clip (5) from carrier (4).

Remove trim (2) and carrier (4).

Fig. 64: Releasing Clip From Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Cable holders (1) on carrier (2) must not be damaged.

Fig. 65: Cable Holder And Carrier

Courtesy of BMW OF NORTH AMERICA, INC.

E46 only:

Pull out tongue (1) on seat cover (2) on left/right.

Fig. 66: Pulling Out Tongue On Seat Cover On Left/Right
Courtesy of BMW OF NORTH AMERICA, INC.

Detach seat cover (1) from seat frame (2).

Fig. 67: Removing Seat Cover From Seat Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat occupancy detector:

If necessary, disconnect plug connection (1) from control unit (2).

Fig. 68: Plug Connection And Control Unit
Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heating:

If necessary, lever catch (1) towards top and detach cover (2).

Fig. 69: Lever Catch And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) from seat heating.

Fig. 70: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) from seat heating.

Expose cable (2).

Fig. 71: Plug Connection And Cable

Courtesy of BMW OF NORTH AMERICA, INC.

Release retainers (1) on left/right.

Pull out cover tabs (2) on left/right.

Fig. 72: Pulling Out Cover Tabs On Left/Right
Courtesy of BMW OF NORTH AMERICA, INC.

Pull out cover welt (1) completely from seat frame (2).

Fig. 73: Pulling Out Cover Welt Completely From Seat Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Begin assembly in middle.

Cover piping (1) and seat frame (2) have markings for middle position.

Fig. 74: Cover Piping And Seat Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Fold in tongues (1) on seat cover and push through under backrest (2) towards front.

Fig. 75: Pushing Under Backrest Towards Front
Courtesy of BMW OF NORTH AMERICA, INC.

Model without seat heating and without seat occupancy detector:

Remove seat cover (1) towards front/top.

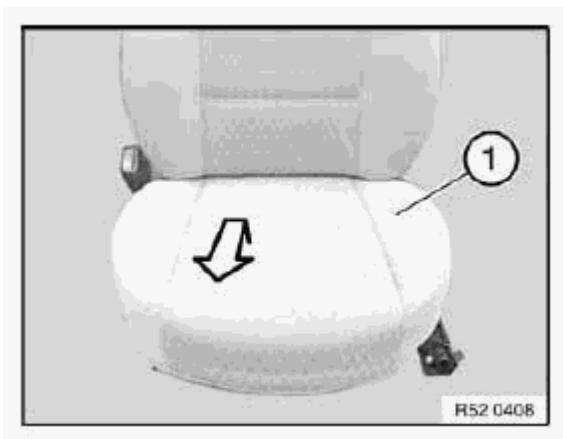

Fig. 76: Cover Piping And Seat Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heater and/or with seat occupancy detector:

Pull seat cover (1) forward a little and feed cable (2) out.

Remove seat cover (1) towards front/top.

Fig. 77: Seat Cover And Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The support is coated with wax to prevent grinding noises.

Do not remove wax (1) on seat pan (2).

NOTE: **The operation "Removing complete seat cushion" ends here.**

Fig. 78: Wax And Seat Pan
Courtesy of BMW OF NORTH AMERICA, INC.

Replacing support:

Detach retainers (1) at rear left/right from support (2).

Fig. 79: Retainers
Courtesy of BMW OF NORTH AMERICA, INC.

Version with OC3 mat:

- OC3 mat must not be kinked under any circumstances.

Detach all retainers in side area from longitudinal wires (1).

Pull trim wires (1) forward out of seat cover.

Carefully fold back seat cover and release retainers from cross - wires (2).

Remove seat cover from padding.

IMPORTANT: Remove all remnants of clips from seat cover and padding.

Fig. 80: Removing Seat Cover From Padding
Courtesy of BMW OF NORTH AMERICA, INC.

Padding (1) with OC3 mat (2).

IMPORTANT: No retainer remainders may be fitted as well.
Handle OC3 mat with extreme care.
Do not kink OC3 mat.
Do not clamp OC3 mat.
OC3 mat must lie without folds under seat cover.

Fig. 81: Padding And OC3 Mat
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Bend new clips (2) with special tool 52 0 050.

1. Padding
2. Retainer

3. Trim thread in padding
4. Trim thread in cover
5. Seat cover

Fig. 82: Padding And Seat Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The support is coated with wax to prevent grinding noises.

Do not remove wax (1) on support (2).

Fig. 83: Removing Wax
Courtesy of BMW OF NORTH AMERICA, INC.

Passenger seat only (replacing padding):

Installation:

In order to guarantee the function and fastening (adhesive strength) at the sticking surfaces of sensor mat (1), the foam most not show any traces of damage at all!

Replace the foam if it is hardened or damaged particularly in the area of the sticking surfaces.

Fit new sensor mat (1) for passenger seat occupancy detector.

Align new sensor mat (1) on foam (2).

Feed plug (3) through bore hole (4).

Fig. 84: Plug, Sensor Mat And Bore Hole
Courtesy of BMW OF NORTH AMERICA, INC.

Passenger seat only (replacing sensor mat):

Passenger seat only (replacing padding):

Installation:

Detach liner (1) at individual points and stick sensor mat (2) onto foam (3).

Fig. 85: Liner And Foam
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The work for "Replacing support" ends here.

Passenger seat only (replacing sensor mat):

Pull plug (1) out of bore hole (2).

In order to guarantee the function and fastening (adhesive strength) at the sticking surfaces of sensor mat (3), the foam most not show any traces of damage at all!

Replace the foam if it is hardened or damaged particularly in the area of the sticking surfaces.

Cut sticking surfaces on sensor mat (3) with cutter knife or razor blade from foam without damaging the foam.

Carefully remove sensor mat (3) from support (4).

Fig. 86: Sensor Mat And Support
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Replacing sensor mat" ends here.

Replacing seat cover:

Remove trim threads (1) from seat cover (2).

Cut new seat cover (2) to size and insert trim threads (1).

Cable (3) for seat heating.

Fig. 87: Removing Trim Threads
 Courtesy of BMW OF NORTH AMERICA, INC.

52 13 405 REPLACING BACK-REST COVER FOR LEFT OR RIGHT FRONT SEAT (NORMAL / MANUAL)

Remove rear panel on front seat backrest,

refer to **52 13 198**.

Detach backrest cover (1) from backrest frame (2).

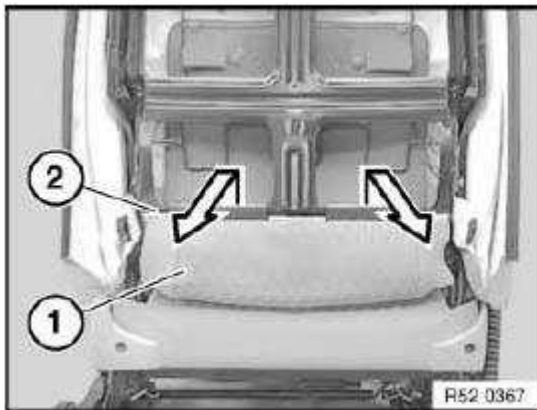

Fig. 88: Removing Backrest Cover From Backrest Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heating only: expose seat heating cable:

Remove outer cover on front seat:

Manual operation, refer to **52 13 040**.

Electrical operation, refer to **52 16 040**.

Unfasten plug connection (1).

Pull cable (2) out of holder (3).

Fig. 89: Plug Connection And Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Model with seat heating only:

Pull out tongue (1).

Pull cable (2) out of holder (3).

Fig. 90: Pulling Cable Out Of Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Model with seat heating only:

Lift out Omega clip (1).

Pull out cable (2) from Omega clip (1).

Model with lumbar supports:

If necessary, disconnect plug connections (3) and (4).

Lift out Omega clip (1).

Fig. 91: Omega Clip, Cable And Plug Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Removal/replacement of backrest frame only:

Detach cover (1) on left/right.

CAUTION: Do not under any circumstances turn screw underneath screw (2), this would destroy the seat frame.

Loosen left/right screw (2).

Detach backrest frame (3) with backrest cover upwards.

Installation:

Replace screws (microencapsulated).

Tightening torque: 52 10 2AZ, see **52 10 FRONT SEATS** .

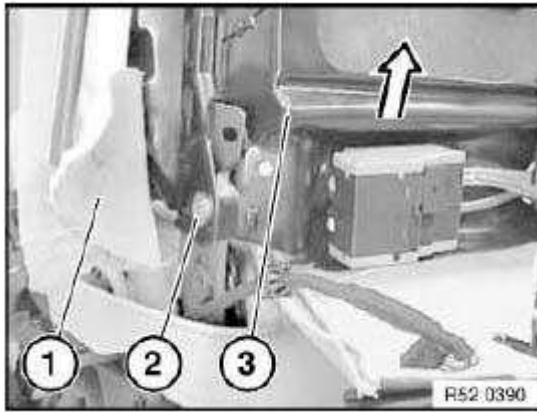

Fig. 92: Removing Backrest Frame

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Removing complete backrest" ends here.

Removal of backrest cover with padding/replacement of backrest frame only:

Remove both guides for front head restraint,

refer to **52 13 ... Removing and installing/replacing guide for front left or right head restraint**

Version with lumbar support only:

NOTE: If necessary, gently heat air hose when firmly seated.

Valve housing must not be unclipped, leakage.

If the valve housing is unclipped, release screw and clip valve housing together.

Disconnect hoses (2) and (3) from valve housing (1).

2 Hose (blue), top cushion

3 Hose (red), bottom cushion

Fig. 93: Hoses And Valve Housing

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, shown here without valve housing.

Installation:

Observe cable guide (1) for backrest heating.

Lay air hoses (2) without kinks through hole (3).

Fig. 94: Cable Guide And Hoses

Courtesy of BMW OF NORTH AMERICA, INC.

Detach backrest cover (1) at sides towards front and remove with support upwards from backrest frame (2).

Fig. 95: Removing Backrest Cover At Sides Towards Front
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Removing backrest cover with support" ends here.

Removal of backrest cover from padding, replacing padding:

Release retainers (1) on left/right of backrest cover (2).

NOTE: Support (3) is reinforced in this area.

Fig. 96: Retainers And Backrest Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Release all retainers.

Remove backrest cover (1) from padding.

Remove all remnants of retainers from backrest cover (1) and padding.

Fig. 97: Removing Backrest Cover From Padding
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fold in new clip (2) with special tool 52 0 050.

1. Support
2. Retainer
3. Trim thread in support
4. Trim wire in backrest cover
5. Back-rest cover

Fig. 98: Folding New Clip With Special Tool 52 0 050
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Replacing support" ends here.

Replacement of backrest cover:

Pull trim threads (1) out of backrest cover.

Cut new backrest cover to size and insert trim threads (1).

2 Seat heater cable

Fig. 99: Seat Heater Cable

Courtesy of BMW OF NORTH AMERICA, INC.

52 13 410 REPLACING SEAT AND BACKREST COVERS FOR FRONT SEAT (NORMAL/MANUAL), LEFT OR RIGHT

Operation is described in:

- Replace seat cover for left or right front seat, see **52 13 400 Replacing seat cover on left or right front seat (normal/manual)**
- Replace backrest cover for left or right front seat, see **52 13 405 Replacing back-rest cover for left or right front seat (normal / manual)**

52 13 415 REPLACING LEFT OR RIGHT SUPPORT FOR FRONT SEAT (NORMAL / MANUAL)

This operation is described in section on:

Replacing seat cover on left or right front seat, see **52 13 400 Replacing seat cover on left or right front seat (normal/manual)**

52 13 420 REPLACING LEFT OR RIGHT SUPPORT FOR FRONT SEAT BACK-REST (NORMAL / MANUAL)

This operation is described in section on:

Replacing backrest cover for left or right front seat, see **52 13 400 Replacing seat cover on left or right front seat (normal/manual)**

14 FRONT SEAT NORMAL, ELECTRIC

52 14... REMOVING AND INSTALLING/REPLACING GUIDE FOR FRONT LEFT OR RIGHT HEAD RESTRAINT (NORMAL/ELECTRIC)

Operation is identical to:

- **52 13 390 Removing and installing / replacing front headrest (normal/ manual)**

52 14 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

Necessary preliminary tasks:

- Remove head restraint, see **52 13 390 Removing and installing / replacing front headrest (normal/ manual)**

WARNING: Read and comply with safety regulations for handling airbag modules and pyrotechnical belt tensioners, see **41 00 ... HANDLING AIRBAGS AND RESTRAINT SYSTEMS**

Incorrect or improper handling may trigger the pyrotechnical belt pretensioner or side airbag and thereby cause injury.

Adjust front seat as far forward and upward as possible.

Switch off ignition!

Release seatbelt screw (1) and feed out seatbelt strap (2).

Tightening torque: 72 11 1AZ, see **72 11 SEAT BELTS** .

Fig. 100: Seatbelt Screw And Feed Out Seatbelt Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Move front seat forwards/upwards as far as possible.

Release bolts (1).

Installation:

Replace microencapsulated screws.

Tightening torque: 52 10 1AZ, see **52 10 FRONT SEATS** .

Move front seat backwards/downwards as far as possible.

Fig. 101: Seat Bolts

Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, unclip protective caps upwards.

Release screws (3).

Installation:

Replace microencapsulated screws.

Tightening torque: 52 10 1AZ, see **52 10 FRONT SEATS** .

Move seat runners forward so that they are flush.

Unlock lock (1) and disconnect plug connection (2).

IMPORTANT: Cover door sill with protective covers (risk of damage).

Lift out front seat.

Fig. 102: Lifting Out Front Seat

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Carpet must not get between seat rails and floor pan in area of fastening points (grating noises).

Tightening torque: 52 10 1AZ, see **52 10 FRONT SEATS** .

52 14 025 REMOVING AND INSTALLING/REPLACING SEAT MECHANISM ON LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

Special tools required:

- 61 2 071
- 61 2 074

Carry out following tasks beforehand:

- Remove seat pan and flexmat on front seat, see **52 13... Removing and installing/replacing seat pan and flexmat (normal/manual), left or right**
- Remove backrest frame on front seat, see **52 13 030 Removing and installing / replacing backrest frame on left or right front seat (normal / manual).**
- Remove seat belt tensioner.

Release screw (1) and cable holder (3).

Remove retaining bracket (2) with seat wiring harness from seat mechanism (4).

Fig. 103: Releasing Screw And Cable Tie
 Courtesy of BMW OF NORTH AMERICA, INC.

Attach cable 61 2 074 to cable 61 2 071 and connect plug connection (1) to front seat.

Connect cable 61 2 071 to battery.

Check function.

Fig. 104: Plug Connection And Special Tool
 Courtesy of BMW OF NORTH AMERICA, INC.

52 14 030 REMOVING AND INSTALLING/REPLACING BACKREST FRAME ON FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)

Necessary preliminary tasks:

- Remove rear panel on front seat, see **52 14 198 Removing and installing/replacing rear panel on left or right front seat backrest (normal/electric)**

Replacement only:

- Remove backrest cover, see 52 16 405 Replacing backrest cover on front left or right seat (sports/electric)
- Remove lumbar cushion, see 52 14 050 Replacing lumbar cushion on front left or right seat (normal/electric)
- Remove valve housing for lumbar support
- Remove drive unit for lumbar support, see 67 66 010 REMOVING AND INSTALLING/REPLACING LUMBAR SUPPORT DRIVE MECHANISM ON FRONT SEAT, LEFT OR RIGHT
- Remove release mechanism on front seat

Removing backrest frame only:

Unhook backrest cover (1) on left and right.

IMPORTANT: Do not under any circumstances turn screw underneath screw (2), this would destroy the seat frame.

Release screws (2) on left and right.

Fig. 105: Removing Backrest Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace screws (microencapsulated).

Tightening torque: 52 10 2AZ, see 52 10 FRONT SEATS .

Remove backrest frame (3) with backrest cover towards top.

Replacing backrest frame only:

Detach mount (1) for rear panel towards top/rear from backrest frame (2).

Fig. 106: Out Mount, And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (1) and guide (2) on mount (3) for rear panel must not be damaged.

Guide taper (4) must point downwards.

Fig. 107: Taper And Mount
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, remove mat (1) from spring wire (2) of backrest frame (3).

Fig. 108: Mat And Spring Wire

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, suspend mat (1) on uppermost spring wire (2) on backrest frame (3).

Fig. 109: Spring Wire And Backrest Frame

Courtesy of BMW OF NORTH AMERICA, INC.

52 14 040 REMOVING AND INSTALLING/REPLACING OUTER COVER ON FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)

Operation is identical to:

Remove and install/replace outer cover on front left or right seat (sports/electric),

refer to **52 16 040**.

52 14 041 REMOVING AND INSTALLING/REPLACING INNER COVER ON FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)

Operation is identical to:

Replacing inner cover on left or right front seat (normal/electric), see **52 13 041 Removing and installing / replacing inner cover on left or right front seat backrest (normal/ manual)**

52 14 050 REPLACING LUMBAR CUSHION ON FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)

Operation is identical to:

Replacing lumbar cushion on left or right front seat (normal/manual), see **52 13 050 Replacing lumbar cushion on front left or right seat**

52 14 060 REMOVING AND INSTALLING / REPLACING VALVE HOUSING FOR FRONT LEFT OR RIGHT LUMBAR SUPPORT (NORMAL / MANUAL)

Special tools required:

- **52 0 050 PLIERS**

Necessary preliminary tasks:

- Remove rear panel on front seat

E83:

If necessary, detach tensioning cables from backrest frame (2).

Detach backrest cover (1) in direction of arrow from backrest frame (2).

Fig. 110: Removing Backrest Cover From Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

E63:

Detach tensioning cables (1) from backrest frame (2).

Disconnect all retainers.

Detach partial cover (2) from backrest frame.

Installation:

Lock new retainers by bending with special tool 52 0 050.

Fig. 111: Removing Partial Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (5).

NOTE: If necessary, gently heat air hose when firmly seated.

Disconnect air hoses (2...4) from valve housing (1).

2 Hose (blue) top cushion

3 Hose (clear) lumbar drive

4 Hose (red) bottom cushion

Fig. 112: Disconnecting Air Hoses
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) from inside.

Remove valve housing (3) with metal nut (2).

Fig. 113: Removing Valve Housing With Metal Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Pay attention to seat heating cable guide (1).

Lay air hoses (2) without kinks through hole (3).

Check function.

Fig. 114: Cable Guide And Hoses

Courtesy of BMW OF NORTH AMERICA, INC.

52 14 070 REMOVING AND INSTALLING/REPLACING SEAT ANGLE ADJUSTER ON LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

Necessary preliminary tasks:

- Remove front seat, see **52 14 000 Removing and installing left or right front seat (normal/electric)**
- Remove outer cover, see **52 16 040 Removing and installing/replacing outer cover on front left or right seat (sports/electric)**

Release screws (1).

Release screw (2).

Unclip carrier (3) from seat mechanism at rear.

Fig. 115: Release Screw And Carrier

Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug connection (1) on drive unit (2) and disconnect.

Fig. 116: Plug Connection And Drive Unit
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Installation:

Replace Taptite screws (1).

Tightening torque: 52 10 16AZ, see **52 10 FRONT SEATS** .

Release screw (2).

Tightening torque: 52 10 17AZ, see **52 10 FRONT SEATS** .

Remove seat angle adjuster (3).

Installation:

Slide left and right O-rings onto shaft. Make sure O-rings are correctly located between seat angle adjuster and seat pan.

Fig. 117: Removing Seat Angle Adjuster
Courtesy of BMW OF NORTH AMERICA, INC.

52 14 198 REMOVING AND INSTALLING/REPLACING REAR PANEL ON LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/ELECTRIC)

Operation is identical to:

Replacing rear panel on left or right front seat backrest (normal/manual), see **52 13 198 Removing and installing / replacing rear panel on left or right front seat backrest (normal/manual)**

52 14 390 REMOVING AND INSTALLING OR REPLACING FRONT LEFT OR RIGHT HEAD RESTRAINTS (NORMAL/ELECTRIC)

Operation is identical to:

Replacing front left or right head restraint (normal/manual), see **52 13 390 Removing and installing / replacing front headrest (normal/ manual)**.

52 14 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

Operation differs as follows and is described in:

Replacing seat cover without thigh support for left or right front seat, see **52 13 400 Replacing seat cover on left or right front seat (normal/manual)**.

Replacing seat cover with thigh support for left or right front seat, see **52 16 400 Replacing seat cover for left or right front seat (sports/electric)**.

52 14 405 REPLACING BACKREST COVER FOR FRONT LEFT OR RIGHT SEAT (NORMAL/ELECTRIC)

Operation is identical to:

Replacing backrest cover for left or right front seat (normal/manual), see **52 13 405 Replacing back-rest cover for left or right front seat (normal / manual)**.

52 14 415 REPLACING SUPPORT FOR LEFT OR RIGHT FRONT SEAT (NORMAL/ELECTRIC)

WARNING: US/CND front passenger seat (with OC3 mat) only:
The support can only be removed in conjunction with the OC3 mat.
If support is defective, both parts may only be replaced together.
After fitting new support, enable OC3 mat with BMW diagnosis system.

The operation for removing the support with/without OC3 mat is described in:

- Replacing seat cover on front seat, see **52 14 400 Replacing seat cover for left or right front seat (normal/electric)**

Enabling seat occupancy detector (OC3 mat):

- Connect BMW diagnosis system
- Release seat occupancy detector
- Clear fault memory if necessary

52 14 420 REPLACING PADDING FOR LEFT OR RIGHT FRONT SEAT BACKREST (NORMAL/ELECTRIC)

This operation is described in section on:

Replace backrest cover for left or right front seat, see **52 14 405 Replacing backrest cover for front left or right seat (normal/electric)**.

52 14 899 ADDITIONAL WORK (NORMAL/ ELECTRIC) WITH DEFECTIVE DRIVE FOR LONGITUDINAL ADJUSTMENT

Set seat tilt adjustment to max. up setting.

Release screw (1) on actuator drive (2) of longitudinal seat adjustment.

Fig. 118: Actuator Drive And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on servodrive (2) of longitudinal seat adjustment and remove servodrive (2).

Activate the operating switch for the seat position adjustment:

- A. No function:
- Disconnect plug for longitudinal seat adjustment
 - Connect new servodrive and check function

- If servodrive is running, gear is O.K.
- Reassemble front seat

B. Actuator drive running:

- Transmission for longitudinal seat adjustment defective!
- Continue with

Fig. 119: Removing Servodrive

Courtesy of BMW OF NORTH AMERICA, INC.

Disassembly of faulty gear for longitudinal seat adjustment

Disassembly of faulty gear (1) for longitudinal seat adjustment:

NOTE: For purposes of clarity, the backrest frame and seat cover are shown removed.

(2) Input shaft

(3) Internal gear

Fig. 120: Input Shaft And Internal Gear

Courtesy of BMW OF NORTH AMERICA, INC.

Using a pneumatic saw (1),
cut through drive shaft (2) from rear.

Fig. 121: Pneumatic Saw And Drive Shaft
Courtesy of BMW OF NORTH AMERICA, INC.

Remove drive shaft (1) from gear (2).

Fig. 122: Removing Drive Shaft From Gear
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) and remove gear (2).

Fig. 123: Removing Gear And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Over rest of drive shaft (1),
 adjust front seat,
 release screws on floor panel
 and remove front seat.

NOTE: If gear (4) is faulty,
 detach cover (2),
 release screws (3),
 and remove gear (4).

Fig. 124: Removing Gear And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Replace seat mechanism on front seat.

52 15... REMOVING AND INSTALLING/REPLACING GUIDE FOR FRONT LEFT OR RIGHT HEAD RESTRAINT (SPORTS/NORMAL)

Operation is identical to:

- Removing and installing guide for front head restraint (normal/manual), see **52 13 ... Removing and installing/replacing guide for front left or right head restraint**

52 15 000 REMOVING AND INSTALLING FRONT SEAT (SPORTS/MANUAL), LEFT OR RIGHT

Operation is identical to:

Removing and installing front seat (normal/manual), left or right.

52 15 015 REMOVING AND INSTALLING/REPLACING ACTUATING UNIT ON FRONT LEFT OR RIGHT SEAT (SPORTS/MANUAL)

Operation is identical to:

Remove and install/replace actuating unit on front left or right seat (normal/manual),

refer to **52 13 015**.

52 15 025 REMOVING AND INSTALLING/REPLACING SEAT MECHANISM ON LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

Operation is identical to:

Replacing seat mechanism on left or right front seat (normal/electric), see **52 14 025 Removing and installing/replacing seat mechanism on left or right front seat (normal/electric)**

52 15 030 REMOVING AND INSTALLING/REPLACING BACKREST FRAME ON LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

Remove backrest frame and backrest cover with padding,

refer to **52 13 405**.

Replacement only:

Model with lumbar supports:

If necessary, remove lumbar cushion on front seat,

refer to **52 13 050**.

If necessary, remove valve housing for front lumbar support,

If necessary, remove drive unit for lumbar support on front seat,

refer to **67 66 010** .

Lift out mount (1) for rear panel

at top and pull off

towards rear/top from backrest frame (2).

Fig. 125: Out Mount, And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (1) and guide (2) on mount (3) for rear panel must not be damaged.

Guide taper (4) must point downwards.

Fig. 126: Taper And Mount
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, release screw (1) and remove metal nut (2).

Fig. 127: Metal Nut

Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, remove mat (1) from spring wire (2) of backrest frame (3).

Fig. 128: Mat And Spring Wire

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, suspend mat (1) on uppermost spring wire (2) on backrest frame (3).

Fig. 129: Spring Wire And Backrest Frame

Courtesy of BMW OF NORTH AMERICA, INC.

52 15 040 REMOVING AND INSTALLING/REPLACING OUTER COVER ON FRONT LEFT OR RIGHT SEAT (SPORTS/MANUAL)

Operation is identical to:

Remove and install/replace outer cover on front left or right seat (normal/manual),

refer to **52 13 040**.

52 15 041 REMOVING AND INSTALLING/REPLACING INNER COVER ON FRONT LEFT OR RIGHT SEAT (SPORTS/MANUAL)

Operation is identical to:

Replacing inner cover on left or right front seat (normal/electric), see **52 13 041 Removing and installing / replacing inner cover on left or right front seat backrest (normal/ manual)**.

52 15 050 REPLACING LUMBAR CUSHION ON FRONT LEFT OR RIGHT SEAT (SPORTS/MANUAL)

Operation is identical to:

Replace lumbar cushion on front left or right seat (normal/manual),

refer to **52 13 050**.

52 15 070 REMOVING AND INSTALLING/REPLACING SEAT ANGLE ADJUSTER (SPORT/MANUAL) ON LEFT OR RIGHT FRONT SEAT

Special tools required:

- **51 2 100 CLAMPING LEVER**

Necessary preliminary tasks:

- Remove front seat, see **52 15 000 Removing and installing front seat (sports/manual), left or right**
- Remove actuating unit, see **52 13 015 Removing and installing / replacing controls on left / right front seat (normal / manual)**

WARNING: Torsion bar spring (1) is subject to tension. Risk of injury.

Lever torsion bar spring (1) with special tool 51 2 100 in direction of arrow from seat angle adjuster.

Feed torsion bar spring (1) out of seat mechanism.

Installation:

Fig. 130: Removing Bar Spring

Courtesy of BMW OF NORTH AMERICA, INC.

Make sure plastic protector is correctly positioned on contact surface between torsion bar spring and seat mechanism (grating noises).

Release screws (1).

Installation:

Replace Taptite screws (1).

Tightening torque: 52 10 16AZ, see **52 10 FRONT SEATS** .

Release screw (2).

Remove seat angle adjuster (3).

Installation:

Slide left and right O-rings onto shaft. Make sure O-rings are correctly located between seat angle adjuster and seat pan.

Fig. 131: Removing Seat Angle Adjuster
Courtesy of BMW OF NORTH AMERICA, INC.

52 15 095 REMOVING AND INSTALLING/REPLACING THIGH SUPPORT HOLDER ON FRONT LEFT OR RIGHT SEAT (SPORTS/MANUAL)

Operation is identical to:

Remove and install/replace thigh support holder on front left or right seat (sports/electric),

refer to **52 16 095**.

52 15 198 REMOVING AND INSTALLING/REPLACING REAR PANEL ON FRONT LEFT OR RIGHT SEAT BACKREST (SPORTS/MANUAL)

Release clips (1) with side cutting pliers.

NOTE: Remove clip remainders.

Fig. 132: Clip Reminders

Courtesy of BMW OF NORTH AMERICA, INC.

Lever out rear panel (1) at bottom towards rear and pull out towards bottom from backrest frame (2).

Fig. 133: Pulling Out Rear Panel At Bottom Towards Rear

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Bores (1) and fastening set (2) of rear panel (3) must not be damaged.

Fig. 134: Fastening Set And Rear Panel

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Slide backrest cover (1) on left/right over clip mount (2).

Fig. 135: Backrest Cover And Clip Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Mounts (1) on backrest frame (2) must not be damaged.

To install rear panel, first slide into mounts (1) and then slide in at sides at bottom, refer to next work step.

Fig. 136: Mounts And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

After installing rear panel in upper mounts,

refer to previous work step:

Feed rear panel at sides into opening in backrest cover and

insert into mounts (1) on left/right on backrest frame (2) and snap into place.

Fig. 137: Installing Rear Panel In Upper Mounts
Courtesy of BMW OF NORTH AMERICA, INC.

52 15 390 REMOVING AND INSTALLING OR REPLACING FRONT LEFT OR RIGHT HEAD RESTRAINTS (SPORTS/MANUAL)

Operation is identical to:

Replacing front left or right head restraint (normal/manual), see **52 13 390 Removing and installing / replacing front headrest (normal/ manual)**

52 15 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

Operation is identical to:

Replacing seat cover for left or right front seat (normal/manual), see **52 16 400 Replacing seat cover for left or right front seat (sports/electric)**

52 15 405 REPLACING BACKREST COVER FOR LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

Operation is identical to:

Replacing backrest cover for left or right front seat (normal/manual), see **52 13 405 Replacing back-rest cover for left or right front seat (normal / manual)**

52 15 415 REPLACING PADDING FOR LEFT OR RIGHT FRONT SEAT (SPORT/MANUAL)

This operation is described in section on:

Replacing seat cover on left or right front seat, see **52 13 400 Replacing seat cover on left or right front seat (normal/manual)**

52 15 420 REPLACING PADDING FOR LEFT OR RIGHT FRONT SEAT BACKREST (SPORT/MANUAL)

This operation is described in section on:

Replace backrest cover for left or right front seat, see **52 13 405 Replacing back-rest cover for left or right front seat (normal / manual)**

16 FRONT SEAT SPORTS, ELECTRIC

52 16... REMOVING AND INSTALLING/REPLACING CARRIER FOR OUTER COVER ON LEFT OR RIGHT FRONT SEAT (SPORTS/ELECTRIC)

Remove outer front cover.

Release screws, remove lower section.

Fig. 138: Locating Lower Section

Courtesy of BMW OF NORTH AMERICA, INC.

52 16... REMOVING AND INSTALLING/REPLACING GUIDE FOR FRONT LEFT OR RIGHT HEAD RESTRAINT (SPORTS/ELECTRIC)

Operation is identical to:

- Removing and installing guide for front head restraint (normal/manual), see **52 13 ... Removing and installing/replacing guide for front left or right head restraint**

52 16... REMOVING AND INSTALLING/REPLACING SEAT PAN AND FLEX MAT ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Remove seat cover with padding,

refer to **52 16 400**.

Release left screw (1) and slacken right screw only.

Release left/right screws (3).

Slacken left/right screws (4) only.

Lever out retaining plate (2) on left.

Installation:

Tightening torque: 52 10 9AZ, see **52 10 FRONT SEATS** .

Fig. 139: Retaining Plate And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Press seat pan (4) upwards, thereby relieving tension on flex mat.

Release screw (1) and remove support (2) from gear (3).

Installation:

Tightening torque: 52 10 9AZ, see **52 10 FRONT SEATS** .

Fig. 140: Removing Support From Gear

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Using split-pin drift (1), lift support (2) onto guide (3).

Fig. 141: Lifting Support Onto Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat occupancy detector:

If necessary, unhook control unit (1) and cable (3) from holders (2).

Fig. 142: Releasing Control Unit And Cable From Holders
Courtesy of BMW OF NORTH AMERICA, INC.

Turn seat pan (1) upwards.

Detach flexmat (2) at rear from mounts (3).

Fig. 143: Detaching Flexmat At Rear From Mounts
Courtesy of BMW OF NORTH AMERICA, INC.

Detach seat pan (1) on left/right backwards/top from mount (2) and remove.

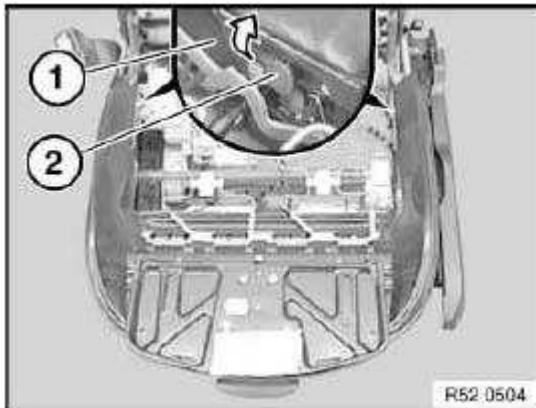

Fig. 144: Detaching Seat Pan On Left/Right Backwards/Top
Courtesy of BMW OF NORTH AMERICA, INC.

Detach flexmat (1) from mounts (2) on seat pan (3).

Fig. 145: Removing Flexmat From Mounts On Seat Pan
Courtesy of BMW OF NORTH AMERICA, INC.

Removing thigh support from seat pan:

Unhook spring (1) from thigh support (2).

Fig. 146: Releasing Spring From Thigh Support
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove thigh support (2).

Fig. 147: Thigh Support And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, release screws (1) and remove guide rails (2) from seat pan (3).

Fig. 148: Guide Rails And Seat Pan

Courtesy of BMW OF NORTH AMERICA, INC.

52 16 000 REMOVING AND INSTALLING FRONT SEAT (SPORTS/ELECTRIC), LEFT OR RIGHT

Operation is identical to:

Removing and installing front seat (normal/manual), left or right.

52 16 025 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT SEAT MECHANISM (ON SPORT/ELECTRIC FRONT SEAT)

Remove seat pan and flexmat on front seat,

Remove backrest frame on front seat,

refer to **52 13 030**.

Remove seatbelt tensioner,

refer to **72 11 030** .

Disconnect all plug connections (1) from actuator drives.

Remove seat wiring harness from seat mechanism (2).

Fig. 149: Plug Connections And Seat Mechanism
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Perform function check:

Connect cable 61 2 071 to battery,

connect cable 61 2 074 to cable 61 2 071 and plug connection (1) to front seat.

Fig. 150: Plug Connection And Special Tool
 Courtesy of BMW OF NORTH AMERICA, INC.

52 16 030 REMOVING AND INSTALLING/REPLACING BACKREST FRAME ON LEFT OR RIGHT FRONT SEAT (SPORT/ELECTRIC)

Operation is identical to:

Replacing backrest frame on left or right front seat (sport/manual), see **52 15 030 Removing and installing/replacing backrest frame on left or right front seat (sport/manual)**

52 16 040 REMOVING AND INSTALLING/REPLACING OUTER COVER ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Unscrew bolt (1).

Fig. 151: Bolt
Courtesy of BMW OF NORTH AMERICA, INC.

Removing top cover:

Fig. 152: Pulling Rear Cover Outwards

Courtesy of BMW OF NORTH AMERICA, INC.

- A. Snap out catch (1) on front cover (2) towards bottom and pull cover (2) outwards a little.
- B. Snap out catch (3) on rear cover (2) towards front/bottom and pull cover (2) outwards a little.

Lever lugs (1) on cover (3) out of brackets (2).

Fig. 153: Removing Lugs On Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out cover (1) at rear, detach at front from guide and remove.

Fig. 154: Removing Front From Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Do not crush cables (1) during installation.

Insert lugs (2) into mounts (3) and snap into place.

Fig. 155: Crush Cables, Lugs And Mounts
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Lever out lugs (2) and detach switch combination (3).

Fig. 156: Out Lugs And Switch Combination
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) and catches (2) on switch combination (3) must not be damaged.

Fig. 157: Guides, Catches And Switch Combination
 Courtesy of BMW OF NORTH AMERICA, INC.

Model with lumbar supports:

If necessary, expose cable (1) and disconnect plug connection (2).

Replacement only:

If necessary, press down catches (3) on left/right and remove switch (4) from cover.

Fig. 158: Expose Cable, Catches And Switch
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts must not be damaged, replace cover (4) if necessary:

1. Mounts for switch combination
2. Guide, front
3. Tabs

Fig. 159: Guide, Tabs And Switch Combination
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement of switch combination only or in event of further work on front seat:

Disconnect plug connection (1) and remove switch combination (2).

Fig. 160: Plug Connection And Switch Combination
 Courtesy of BMW OF NORTH AMERICA, INC.

52 16 041 REMOVING AND INSTALLING/REPLACING INNER COVER ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Operation is identical to:

Replacing inner cover on left or right front seat (normal/electric), see **52 13 041 Removing and installing / replacing inner cover on left or right front seat backrest (normal/ manual).**

52 16 070 REMOVING AND INSTALLING/REPLACING SEAT ANGLE ADJUSTER ON LEFT OR RIGHT FRONT SEAT (SPORT/ELECTRIC)

Necessary preliminary tasks:

- Remove front seat, see **52 14 000 Removing and installing left or right front seat (normal/electric)**
- Remove outer cover, see **52 16 040 Removing and installing/replacing outer cover on front left or right seat (sports/electric)**

Release screws (1).

Release screw (2).

Unclip carrier (3) from seat mechanism at rear.

Fig. 161: Release Screw And Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug connection (1) on drive unit (2) and disconnect.

Fig. 162: Plug Connection And Drive Unit
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Installation:

Replace Taptite screws (1).

Tightening torque: 52 10 16AZ, see **52 10 FRONT SEATS** .

Release screw (2).

Fig. 163: Removing Seat Angle Adjuster
Courtesy of BMW OF NORTH AMERICA, INC.

Tightening torque: 52 10 17AZ, see **52 10 FRONT SEATS** .

Remove seat angle adjuster (3).

Installation:

Slide left and right O-rings onto shaft. Make sure O-rings are correctly located between seat angle adjuster and seat pan.

52 16 095 REMOVING AND INSTALLING/REPLACING THIGH SUPPORT HOLDER ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Unfasten thigh support and pull completely towards front.

Detaching cushion for thigh support:

Bend open retaining plates (1) and remove cover piping (2).

Fig. 164: Removing Retaining Plates And Cover Piping
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Cushion (1) is attached at front with double-sided adhesive tape (3) to holder (2).

Pull cushion (1) towards top off holder (2).

Fig. 165: Pulling Cushion Towards Top Off Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Lever trim wire (1) out of mounts (2).

Installation:

Stick new double-sided adhesive tape (4) to holder (3) or attach mount with spray adhesive.

Fig. 166: Lever Trim Wire And Mounts
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Removing cushion for thigh support" ends here.

Removal of "Thigh support holder" only:

Unhook spring (1) at bottom from holder (2) and seat frame (3).

Fig. 167: Releasing Spring At Bottom From Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Press operating lever (2) fully and detach holder (3) for thigh support towards front from seat frame (4).

Fig. 168: Pressing Operating Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts on holder (5) must not be damaged:

1. Mounts for trim wire
2. Holding-down elements for trim wire
3. Guide sleeves
4. Double-sided adhesive tape (replace or coat with spray adhesive for assembly)

Fig. 169: Holder, Guide Sleeves And Trim Wire
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, release screws (1) and remove guide rails (2) from seat frame (3).

Fig. 170: Release Screws And Seat Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

52 16 095 REMOVING AND INSTALLING/REPLACING THIGH SUPPORT HOLDER ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Necessary preliminary tasks:

- Move thigh support forwards fully

Unfasten plug connection (1) and disconnect.

Release screws (2).

Installation:

Insert screws (2) with Loctite.

Fig. 171: Plug Connection And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

Detach seat cover (1) in marked area from carrier (2) for thigh support.

Feed plug out of carrier (2) for thigh support.

Remove carrier (2) for thigh support.

Fig. 172: Detaching Seat Cover

Courtesy of BMW OF NORTH AMERICA, INC.

52 16 198 REMOVING AND INSTALLING/REPLACING REAR PANEL ON FRONT LEFT OR RIGHT SEAT BACKREST (SPORTS/ELECTRIC)

Operation is identical to:

Remove and install/replace rear panel on front left or right seat backrest (sports/manual),

refer to **52 15 198**.

52 16 390 REMOVING AND INSTALLING/REPLACING FRONT HEAD RESTRAINT (SPORTS/ELECTRIC) ON LEFT OR RIGHT

Operation is identical to:

Replacing front left or right head restraint (normal/manual), see **52 13 390 Removing and installing / replacing front headrest (normal/ manual)**

52 16 400 REPLACING SEAT COVER FOR LEFT OR RIGHT FRONT SEAT (SPORTS/ELECTRIC)

Special tools required:

- 52 0 050

Necessary preliminary tasks:

- Remove front seat, see **52 16 000 Removing and installing front seat (sports/electric), left or right**
- Remove outer cover with actuating unit, see **52 16 040 Removing and installing/replacing outer cover on front left or right seat (sports/electric)**

- Remove inner cover, see 52 16 041 Removing and installing/replacing inner cover on front left or right seat (sports/electric)

WARNING: US/CDN front passenger seat (with OC3 mat) only:
To avoid damaging the OC3 mat, it is essential to carry out the following operations with extra care.

When replacing seat cover:

If seat cover is defective, seat cover and padding with OC3 mat must be replaced together.

New seat cover is supplied with padding, OC3 mat and if necessary seat heating.

When replacing padding with OC3 mat:

If OC3 mat or padding is defective, both parts may only be replaced together.

These must be fitted with the seat cover from the car.

Enabling seat occupancy detector (OC3 mat):

- Connect BMW diagnosis system
- Release seat occupancy detector
- Clear fault memory if necessary

Version with seat heating:

If necessary, disconnect plug connection (1).

Release cable strap (2).

Detach cable (3) from holder (4).

Fig. 173: Cable Strap And Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Detach cable (1) from holder (2).

Fig. 174: Removing Cable From Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on inside/outside.

Unclip clips (3) towards bottom and pull trim (2) out a little.

Fig. 175: Releasing Screw On Inside/Outside
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Pull trim (2) out a little and release screw (3).

Release clip (5) from carrier (4).

Remove trim (2) and carrier (4).

Fig. 176: Releasing Clip From Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Cable holders (1) on carrier (2) must not be damaged.

Fig. 177: Cable Holder And Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) on sports seat trim (2) must not be damaged.

Fig. 178: Clips And Seat Trim

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Removing holder for actuation" ends here.

Version with seat occupancy detector:

If necessary, disconnect plug connection (1) from control unit (2).

Fig. 179: Plug Connection And Control Unit

Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heating:

If necessary, release locks (1) and detach plug housing (2).

Fig. 180: Locks And Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, press lock (1) downwards and detach cover (2).

Fig. 181: Pressing Lock Downwards
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) for seat heating from plug housing (2).

Fig. 182: Disconnecting Plug Connection For Seat Heating
Courtesy of BMW OF NORTH AMERICA, INC.

Pull cable (1) out of holders (2).

Fig. 183: Pulling Cable Out Of Holders
Courtesy of BMW OF NORTH AMERICA, INC.

E46 only:

Pull out tongue (1) on seat cover (2) on left/right.

Fig. 184: Pulling Out Tongue On Seat Cover On Left/Right
Courtesy of BMW OF NORTH AMERICA, INC.

Detach seat cover (1) from seat frame (2).

Fig. 185: Removing Seat Cover From Seat Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Pull out cover welt (1) completely from seat frame (2).

Fig. 186: Pulling Out Cover Welt Completely From Seat Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Fold in ends (1) on seat cover and push through under backrest (2) towards front.

Fig. 187: Pushing Through Under Backrest Towards Front
Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten thigh support and pull completely towards front.

Bend open retaining plates (1) and remove cover piping (2).

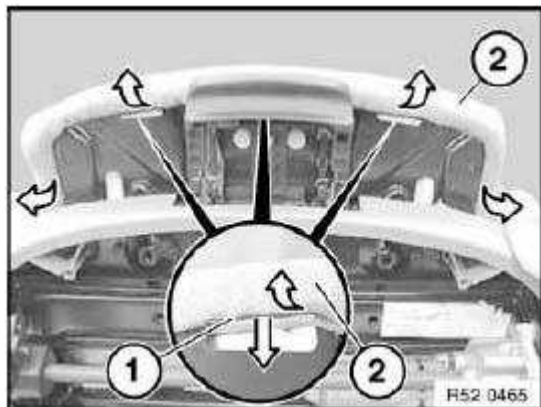

Fig. 188: Removing Retaining Plates And Cover Piping
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Cushion (1) is secured at front with double-sided adhesive tape (3) to carrier (2).

Pull cushion (1) towards top off carrier (2).

Fig. 189: Pulling Cushion Towards Top Off Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Lever trim wire (1) out of mounts (2).

Installation:

Stick new double-sided adhesive tape (4) to carrier (3) or attach mount with spray adhesive.

Fig. 190: Lever Trim Wire And Mounts
Courtesy of BMW OF NORTH AMERICA, INC.

Model without seat heating and without seat occupancy detector:

Remove seat cover (1) with thigh support (2) towards front/top.

Fig. 191: Removing Seat Cover With Thigh Support Towards Front/Top
Courtesy of BMW OF NORTH AMERICA, INC.

Model with seat heating and/or with seat occupancy detector:

Pull seat cover (1) forward a little and feed cable (2) out.

Remove seat cover (1) with thigh support towards front/top.

NOTE: **The operation "Removing complete seat cushion" ends here.**

Fig. 192: Seat Cover And Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Replacing padding or sensor mat:

Release clips (1) and (2) at rear left/right from support (3).

Fig. 193: Clips And Rear Left/Right
Courtesy of BMW OF NORTH AMERICA, INC.

Release all clips (1) on left/right and center (2) from support (3).

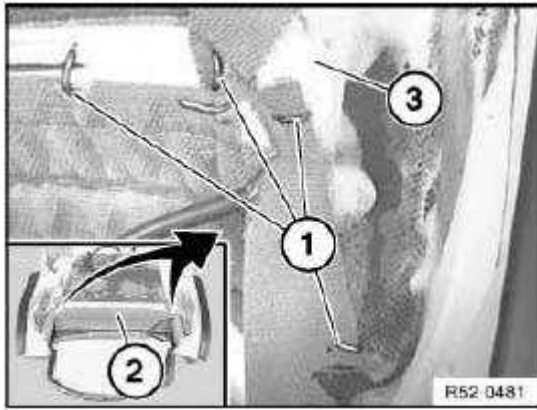

Fig. 194: Releasing All Clips On Left/Right
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heating:

Installation:

Note routing of seat heater cable (1).

Do not damage with clips.

Fig. 195: Locating Seat Heater Cable
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with OC3 mat:

- OC3 mat must not be kinked under any circumstances.

Detach all retainers in side area from longitudinal wires (1).

Pull trim wires (1) forward out of seat cover.

Carefully fold back seat cover and release retainers from cross - wires (2).

Remove seat cover from padding.

IMPORTANT: Remove all remnants of clips from seat cover and padding.

Fig. 196: Pulling Trim Wires

Courtesy of BMW OF NORTH AMERICA, INC.

Remove padding (1) from seat cover (2).

Fig. 197: Removing Padding From Seat Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heating:

Installation:

If necessary, detach heating mat (1) from adhesive tape (2) of thigh support.

3 Seat heater cable

Fig. 198: Removing Mat From Adhesive Tape Of Thigh Support
Courtesy of BMW OF NORTH AMERICA, INC.

Stick double-sided adhesive tape (2) to support (1) or coat with spray adhesive.

Fig. 199: Double-Sided Adhesive Tape
Courtesy of BMW OF NORTH AMERICA, INC.

Version with seat heater and/or with seat occupancy detector:

Installation:

Feed seat heater cable (1) through bore hole (3).

Feed seat heater cable (2) through bore hole (4).

Fig. 200: Seat Heater Cable And Bore Hole
 Courtesy of BMW OF NORTH AMERICA, INC.

Padding (1) with OC3 mat (2).

IMPORTANT: No retainer remainders may be fitted as well.
 Handle OC3 mat with extreme care.
 Do not kink OC3 mat.
 Do not clamp OC3 mat.
 OC3 mat must lie without folds under seat cover.

Fig. 201: Padding And OC3 Mat
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Bend new clips (2) with special tool 52 0 050.

1. Padding
2. Retainer
3. Trim thread in padding

4. Trim thread in cover
5. Seat cover

Fig. 202: Clips And Special Tool
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Support (2) must be coated with wax (1) to prevent grinding noises.

Do not remove wax (1) on support (2).

Fig. 203: Wax And Support
 Courtesy of BMW OF NORTH AMERICA, INC.

Passenger seat only (replacing sensor mat):

Installation:

In order to guarantee the function and fastening (adhesive strength) at the sticking surfaces of sensor mat (1), the foam most not show any traces of damage at all!

Replace the foam if it is hardened or damaged particularly in the area of the sticking surfaces.

Lay sensor mat connection without creasing into groove on support.

Fit new sensor mat (1) for passenger seat occupancy detector.

Align new sensor mat (1) on foam (2).

Feed plug (3) through bore hole (4).

Fig. 204: Locating Bore Hole

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Detach liner (1) at individual points and stick sensor mat (2) onto foam (3).

Fig. 205: Liner, Sensor Mat And Foam

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The operation "Replacing support or sensor mat" ends here.

Replacing seat cover:

Remove trim threads (1) from seat cover (2).

Cut new seat cover (2) to size and insert trim threads (1).

3 Seat heater cable

Fig. 206: Trim Threads, Seat Cover And Heater Cable
Courtesy of BMW OF NORTH AMERICA, INC.

52 16 405 REPLACING BACKREST COVER ON FRONT LEFT OR RIGHT SEAT (SPORTS/ELECTRIC)

Remove rear panel from front seat backrest,

refer to **52 15 198**.

Detach backrest cover (1) from backrest frame (2).

Fig. 207: Removing Backrest Cover From Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook ends of tensioning cord (1) from backrest frame (2).

Fig. 208: Tensioning Cord And Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Pass tensioning cord (1) with backrest cover (3) on left/right round clip mount (2).

Hook ends of tensioning cord to backrest frame, refer to previous work step.

Fig. 209: Tensioning Cord And Backrest Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation instruction for backrest width adjustment:

Lay tension cables (1...2) underneath hoses (3) and cables (4).

Fig. 210: Tension Cables And Hoses

Courtesy of BMW OF NORTH AMERICA, INC.

Exposing cable for seat heating on version with seat heating only:

Removing outer cover on front seat:

Manual controls, refer to **52 13 040**.

Electrical controls, refer to **52 16 040**.

Unfasten plug connection (1).

Pull cable (2) out of holder (3).

Fig. 211: Plug Connection And Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Model with seat heating only:

Pull out tongue (1).

Pull cable (2) out of holder (3).

Fig. 212: Pulling Cable Out Of Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Model with seat heating only:

Lift out Omega clip (1).

Pull out cable (2) from Omega clip (1).

Model with lumbar supports:

If necessary, disconnect plug connections (3) and (4).

Lift out Omega clip (1).

Fig. 213: Omega Clip, Cable And Plug Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Removal or replacement of backrest frame only:

CAUTION: Do not under any circumstances turn screw underneath screw (2), this would destroy the seat frame.

Press backrest cover (1) to one side and release screw (2) on left/right.

Detach backrest frame (3) with backrest cover upwards.

Installation:

Replace screws (2) (microencapsulation).

Tightening torque: 52 10 2AZ, see **52 10 FRONT SEATS** .

Fig. 214: Removing Backrest Frame With Backrest Cover Upwards
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **The work for "Removing complete backrest" ends here.**

Removal of backrest cover with padding or replacement of backrest frame only:

Remove both guides for head restraint at front,

refer to **52 13...**

Version with lumbar support only:

Disconnect hoses (2) and (3) from valve housing (1).

NOTE: **If necessary, gently heat air hose when firmly seated.**

Valve housing must not be unclipped: leakage. If the valve housing is unclipped, release screw and clip valve housing together.

Fig. 215: Hoses And Valve Housing
Courtesy of BMW OF NORTH AMERICA, INC.

2 Hose (blue), top cushion

3 Hose (red), bottom cushion

NOTE: For purposes of clarity, shown here without valve housing.

Installation:

Observe cable guide (1) for backrest heating.

Lay air hoses (2) without kinks through hole (3).

Fig. 216: Cable Guide And Hoses
Courtesy of BMW OF NORTH AMERICA, INC.

Version with lumbar support and backrest width adjustment only:

Detach hoses (1) and (2) at cutting line (heat with hot air blower if necessary).

1. Hose (blue) upper cushion (lumbar support)
2. Hose (red) lower cushion (lumbar support)
3. Hose (white) right cushion (backrest width adjustment)
4. Hose (white) left cushion (backrest width adjustment)
5. Motor pump unit

Fig. 217: Hoses And Cutting Line

Courtesy of BMW OF NORTH AMERICA, INC.

Detach backrest cover (1) at sides towards front and remove with support upwards from backrest frame (2).

Fig. 218: Removing Backrest Cover At Sides Towards Front

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The work for "Removing backrest cover with padding" ends here.

Removal of backrest cover from padding, replacing padding:

Release retainers (1) on left/right of backrest cover (2).

NOTE: Support (3) is reinforced in this area.

Note routing of tensioning strap (4).

Fig. 219: Retainers, Backrest Cover And Support
Courtesy of BMW OF NORTH AMERICA, INC.

First detach clips (1).

Fold back piping (2) with backrest cover (3).

Fig. 220: Clips, Backrest Cover And Back Piping
Courtesy of BMW OF NORTH AMERICA, INC.

Detach all remaining clips.

Remove backrest cover (1) from padding.

Remove all remnants of retainers from backrest cover (1) and padding.

Fig. 221: Locating Backrest Cover Clips
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fold in new clip (2) with special tool 52 0 050.

1. Support
2. Retainer
3. Trim thread in support
4. Trim wire in backrest cover
5. Backrest cover

Fig. 222: Support, Retainer And Backrest Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The work for "Replacing padding" ends here.

Replacement of backrest cover:

Pull trim threads (1) out of backrest cover.

Cut new backrest cover to size and insert trim threads (1).

2 Seat heater cable

Fig. 223: Trim Threads And Seat Heater Cable
Courtesy of BMW OF NORTH AMERICA, INC.

52 16 415 REPLACING SUPPORT FOR LEFT OR RIGHT FRONT SEAT (SPORT/ELECTRIC)

WARNING: US/CND front passenger seat (with OC3 mat) only:
The support can only be removed in conjunction with the OC3 mat.
If support is defective, both parts may only be replaced together.
After fitting new support, enable OC3 mat with BMW diagnosis system.

The operation for removing the support with/without OC3 mat is described in:

- Replacing seat cover on front seat, see **52 16 400 Replacing seat cover for left or right front seat (sports/electric)**

Enabling seat occupancy detector (OC3 mat):

- Connect BMW diagnosis system
- Release seat occupancy detector
- Clear fault memory if necessary

52 16 420 REPLACING PADDING FOR LEFT OR RIGHT FRONT SEAT BACKREST (SPORT/ELECTRIC)

This operation is described in section on:

Replace backrest cover for left or right front seat, see **52 16 405 Replacing backrest cover on front left or right seat (sports/electric)**

26 REAR SEAT THROUGH-LOADING

52 26... REMOVING AND INSTALLING/REPLACING FINISHING STRIP ON ARMREST FOR REAR SEAT

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Slide special tool 00 9 317 behind retaining pin of upper cover section underneath finishing strip and unclip strip towards rear.

Repeat procedure if necessary on other side.

Feed finishing strip out of armrest pins.

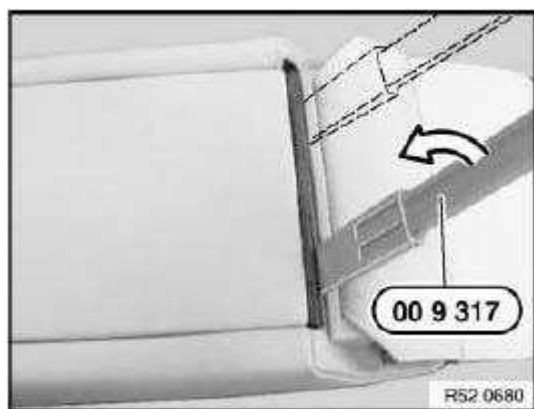

Fig. 224: Sliding Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

52 26... REMOVING AND INSTALLING/REPLACING FIXTURE FOR ROLLER BLIND ON REAR SEAT (THROUGH - LOADING SYSTEM) ON LEFT/RIGHT

Unclip cover (1) on both sides towards top.

Fig. 225: Removing Cover On Both Sides Towards Top

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws (2).

Installation:

Clips (1) must not be damaged.

Fit opening of cover for upper backrest edge.

Fig. 226: Clips And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

52 26... REMOVING AND INSTALLING/REPLACING SKI BAG WITH CASING ON REAR SEAT (THROUGH-LOADING SYSTEM)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove center armrest, see **52 26 030 Removing and installing/replacing armrest for rear seat backrest (through-loading system)**

Press ski bag (1) on rear side out of backrest.

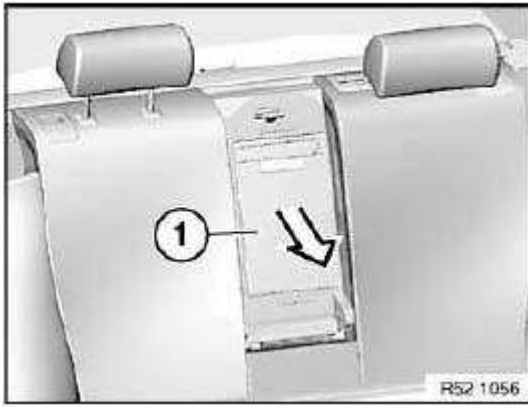

Fig. 227: Pressing Ski Bag On Rear Side Out Of Backrest
Courtesy of BMW OF NORTH AMERICA, INC.

Lift off cover (1).

Release screws (2).

Installation:

Make sure cover is correctly installed.

Fig. 228: Cover And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip mounting frame (1) on rear side with special tool 00 9 317.

Installation:

Do not damage plastic clips. Danger of kinking!

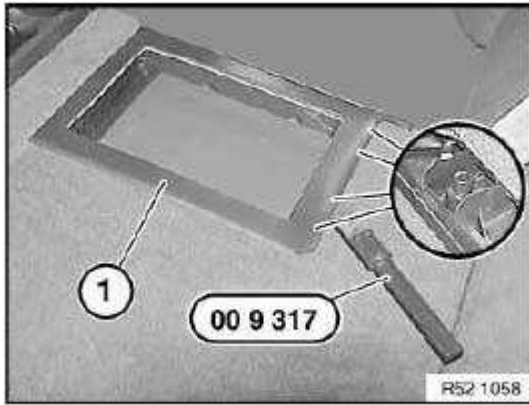

Fig. 229: Mounting Frame And Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Remove skibag trim (1).

Fig. 230: Removing Skibag Trim
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 005 REMOVING AND INSTALLING/REPLACING REAR SEAT (THROUGH-LOADING SYSTEM)

Unclip rear seat on left/right towards top.

For op. ext. seat heating only:

Unfasten plug connection.

Lift out rear seat.

Installation:

Feed belt buckles (1) through designated openings into correct location.

Make sure ISOFIX covers (2) are correctly engaged.

Fig. 231: Removing ISOFIX Covers

Courtesy of BMW OF NORTH AMERICA, INC.

52 26 008 REMOVING AND INSTALLING/REPLACING LEFT/RIGHT SIDES OF BACKREST ON REAR SEAT BACKREST (THROUGH-LOADING)

Necessary preliminary tasks:

- Release rear-seat backrest and fold forward.

Unclip rest side section (1) and pull out in direction of arrow (2).

Installation:

Make sure rest side section is correctly seated in guide.

Fig. 232: Removing Rest Side Section

Courtesy of BMW OF NORTH AMERICA, INC.

52 26 015 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT REAR SEAT BACKREST (THROUGH-LOADING SYSTEM)

Carry out following tasks beforehand:

- Remove armrest side section on rear seat backrest, see **52 26 008 Removing and installing/replacing left/right sides of backrest on rear seat backrest (through-loading)**
- Remove center seat belt (lower fastening), see **72 11 103 REMOVING AND INSTALLING/REPLACING REAR CENTER SEAT BELT**

Fold down backrests.

Release screws (1) of outer mount.

Release screws (2) of center mount.

Remove center mount (3).

Installation:

Correctly place center mount on bearing pedestal.

If necessary, replace faulty outer mount, see **52 26 412 Replacing backrest cover for right rear seat (through-loading system)**

Fig. 233: Backrests Screws And Center Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Lever both backrests out of center mount (1) and pull out left backrest (2) towards left. In the process, mounting shaft of right backrest is pulled out of left backrest.

Remove left backrest (2) from vehicle.

NOTE:

- **Removal of both backrests:**

Release screws on outer mount of right backrest and remove backrest.

- Removal of right backrest:

Proceed in mirror-inverted fashion to left backrest.

Fig. 234: Pulling Out Left Backrest Towards Left
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Bearing bushings (1) must not be damaged.

Replace faulty bearing bushings, see **52 26 412 Replacing backrest cover for right rear seat (through-loading system)**

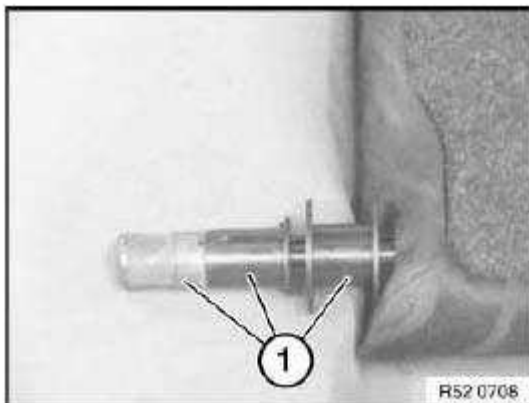

Fig. 235: Bearing Bushings
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 030 REMOVING AND INSTALLING/REPLACING ARMREST FOR REAR SEAT BACKREST (THROUGH-LOADING SYSTEM)

Fold down right backrest.

Unscrew bolt (1).

Remove armrest first towards front and then sideways.

Fig. 236: Removing Armrest

Courtesy of BMW OF NORTH AMERICA, INC.

52 26 033 REMOVING AND INSTALLING/REPLACING UPPER COVER SECTION ON ARMREST FOR REAR SEAT

Drive out two-part hinge pin (1) with a suitable tool (bar, etc.), pressing material in area (2) on both sides (risk of damage).

Installation:

Drive in one hinge pin each from right and left. Hinge pins must be flush with outer edge of hinge.

Fig. 237: Removing Upper Cover Section On Armrest

Courtesy of BMW OF NORTH AMERICA, INC.

52 26 080 REMOVING AND INSTALLING/REPLACING BACKREST FRAME FOR LEFT REAR SEAT (THROUGH - LOADING SYSTEM)

Necessary preliminary tasks:

- Remove backrest cover with padding on left, see **52 26 411 Replacing backrest cover for rear seat (through-loading system) on left**
- Remove mounting for roller blind, see **52 26... Removing and installing/replacing fixture for roller blind on rear seat (through - loading system) on left/right**
- Remove lock for rear seat backrest, see **52 26 309 Removing and installing/replacing lock for left rear seat backrest (through-loading system)**

Unclip retainers and remove.

Remove backrest frame (1).

Fig. 238: Removing Backrest Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement only:

Release screws (1).

Remove retaining hook (2).

Unscrew bolt (3).

Tightening torque: 72 11 15AZ, see **72 11 SEAT BELTS** .

Remove automatic reel (4) with Bowden cable.

Fig. 239: Retaining Hook, Bolt And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

52 26 085 REMOVING AND INSTALLING/REPLACING BACKREST FRAME FOR RIGHT REAR SEAT (THROUGH-LOADING SYSTEM)

Necessary preliminary tasks:

- Remove backrest cover with padding on right, see **52 26 412 Replacing backrest cover for right rear seat (through-loading system)**
- Remove mounting for roller blind, see **52 26... Removing and installing/replacing fixture for roller blind on rear seat (through - loading system) on left/right**
- Remove lock for rear seat backrest, see **52 26 309 Removing and installing/replacing lock for left rear seat backrest (through-loading system)**

Unclip retainers and remove.

Remove backrest frame (1).

Fig. 240: Removing Backrest Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

52 26 199 REMOVING AND INSTALLING/REPLACING REAR PANEL ON LEFT REAR SEAT BACKREST (THROUGH - LOADING SYSTEM)

Operation is described in:

- Removing and installing/replacing backrest frame for left rear seat backrest, see **52 26 080 Removing and installing/replacing backrest frame for left rear seat (through - loading system)**

52 26 200 REMOVING AND INSTALLING/REPLACING REAR PANEL ON RIGHT REAR SEAT BACKREST (THROUGH - LOADING SYSTEM)

Operation is described in:

- Removing backrest frame for right rear seat backrest, see **52 26 085 Removing and installing/replacing backrest frame for right rear seat (through-loading system)**

52 26 301 REMOVING AND INSTALLING /REPLACING ACTUATING MECHANISM FOR LEFT REAR SEAT BACKREST (THROUGH-LOADING SYSTEM)

Grasp trim (1) for release lever from inside and pry out upward.

Fig. 241: Releasing Lever From Inside
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining straps (1) must not be damaged.

Fig. 242: Retaining Straps

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Place cloth (1) over locking rod to prevent the rear seat backrest from locking down.

Pry out actuating mechanism (2) by pulling forwards and upwards.

Fig. 243: Prying Out Actuating Mechanism

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Locking tabs (1) on left/right sides (for trim on actuating mechanism) must not be damaged.

Locking tabs (2) at front and (3) back (for actuating mechanism) must not be damaged.

Actuating rod (4) must be correctly mounted and should not be bent.

Fig. 244: Locking Tabs And Actuating Rod
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 309 REMOVING AND INSTALLING/REPLACING LOCK FOR LEFT REAR SEAT BACKREST (THROUGH-LOADING SYSTEM)

Slide lock trim on edge of backrest side upwards slightly and clip out to one side, then slide trim section on rear side slightly to center, unclip and remove.

Fig. 245: Sliding Lock Trim On Edge Of Backrest Side Upwards Slightly
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips of trim must not be damaged.

Fig. 246: Locating Clips Of Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Partially lift cover (1) off rear seat backrest.

Fig. 247: Removing Lift Cover
Courtesy of BMW OF NORTH AMERICA, INC.

E46 only:

Remove lockplate (1) and unhook actuating rod (2) for seatback release.

E83 only:

Lockplate (1) omitted. Unhook actuating rod (2) for seatback release.

Installation:

Fit bush (3) and new lockplate (1).

Perform function check with rear seat back-rest folded forward.

Fig. 248: Removing Lockplate
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws and fold back backrest lock.

Fig. 249: Locating Backrest Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

Summary, backrest lock, left:

1. Actuating rod for backrest lock
2. Lower section, backrest lock, left
3. Bowden cable of safety belt
4. Backrest lock, left
5. Bush for mounting of actuating rod

backrest locking fixture

Fig. 250: Actuating Rod, Bowden Cable And Backrest Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

Unhooking seat belt Bowden cable from backrest lock:

Press lever (1) forwards in direction of arrow.

Remove sleeve for Bowden cable (2) from holder (3) in backrest lock.

Unhook Bowden cable from lever (1).

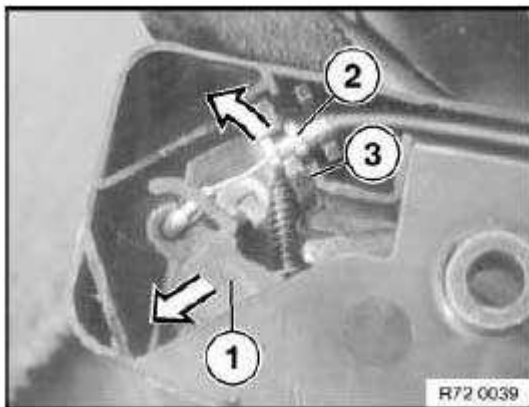

Fig. 251: Removing Sleeve For Bowden Cable From Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Summary, backrest lock, left:

1. Actuating lever for backrest lock in left backrest lock
2. Hole for Bowden cable of safety belt
3. Retaining lug for Bowden cable on actuating lever for backrest lock
4. Bracket for Bowden cable of safety belt
5. Bowden cable sleeve

6. Bowden cable of safety belt

Fig. 252: Actuating Lever And Bowden Cable
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 388 REMOVING AND INSTALLING/REPLACING REAR HEAD RESTRAINTS (THROUGH-LOADING SYSTEM), MIDDLE (COMPACT)

Operation is described in:

- Removing and installing rear head restraints (through-loading system), left or right, see **52 26 390 Removing and installing/replacing rear head restraint (through-loading system), left or right (Compact)**

52 26 388 REMOVING AND INSTALLING/REPLACING REAR MIDDLE HEAD RESTRAINT

Fold back head restraint (1) and move upwards to max. extent.

Press lock (2) and pull out head restraint.

Fig. 253: Pulling Out Head Restraint
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 390 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT REAR HEAD RESTRAINT

Move head restraint (1) upwards to maximum extent.

Press lock (2) and pull out head restraint.

Fig. 254: Pulling Out Head Restraint
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 390 REMOVING AND INSTALLING/REPLACING REAR HEAD RESTRAINT (THROUGH-LOADING SYSTEM), LEFT OR RIGHT (COMPACT)

Fold back head restraint and move upwards to max. extent.

If necessary, press gently on guides towards front and rear and pull out firmly.

Fig. 255: Folding Back Head Restraint
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 400 REPLACING SEAT COVER FOR REAR SEAT (THROUGH-LOADING SYSTEM)

Special tools required:

- 00 9 323

Necessary preliminary tasks:

- Remove rear seat, see **52 26 005 Removing and installing/replacing rear seat (through-loading system)**

Overview of attachment points of cover to seat pan:

- | | | | |
|---|-------------------|---|---------------|
| 1 | Cover lugs (28 x) | 2 | Clips |
| 3 | Cover lugs (2 x) | 4 | Plastic hooks |
| 5 | Piping | | |

Fig. 256: Cover Lugs, Plastic Hooks And Piping
 Courtesy of BMW OF NORTH AMERICA, INC.

Removing seat cover:

- Remove retainers (2).
- Unhook cover from plastic hooks (4)
- Detach retaining elements from cover tabs (1 & 3).

Feed out piping.

Fig. 257: Feeding Out Piping

Courtesy of BMW OF NORTH AMERICA, INC.

Slide cover lugs with special tool 00 9 323 through opening in seat pan.

Carefully remove seat pan.

Fig. 258: Sliding Cover Lugs With Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Feed cover lugs (1) through openings (2) in padding and before laying on seat pan pull through fully on rear side.

Push retaining elements back onto cover lugs.

Reattach seat cover to plastic hooks.

Attach new clips with pneumatic tacker.

Fig. 259: Cover Lugs

Courtesy of BMW OF NORTH AMERICA, INC.

52 26 411 REPLACING BACKREST COVER FOR REAR SEAT (THROUGH-LOADING SYSTEM) ON LEFT

Special tools required:

- 00 9 317
- 00 9 323

Necessary preliminary tasks:

- Remove and install left backrest **52 26 015 Removing and installing/replacing left or right rear seat backrest (through-loading system)**
- Remove and install rear head restraints, see **52 26 388 Removing and installing/replacing rear middle head restraint**
- Remove lock trim of left rear seat backrest, see **52 26 309 Removing and installing/replacing lock for left rear seat backrest (through-loading system)**

Release screw (1) of seat outer mount.

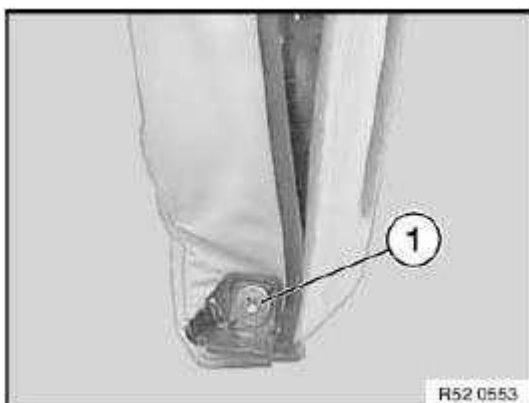

Fig. 260: Seat Outer Mount Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert screw (1) and plastic washer (2) as shown into bearing pedestal (3) and screw down.

Fig. 261: Plastic Washer And Bearing Pedestal

Courtesy of BMW OF NORTH AMERICA, INC.

Move backrest into installation position and pull out belt slightly.

Clamp belt firmly.

E46 only:

Unfasten screws.

Remove trim.

E83 only:

Trim not screwed down.

Lever out trim with special tool 00 9 317.

Fig. 262: Locating Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Separate webbing.

Fig. 263: Separating Webbing

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Feed out strap so that belt stopper (1) is located between upper guide (2) and lower guide (3) of belt finisher.

Fig. 264: Belt Stopper, Upper And Lower Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Lever cover with trim wires (1) out of metal clutches (2).

Fig. 265: Trim Wires And Metal Clutches
Courtesy of BMW OF NORTH AMERICA, INC.

Detach cover all round by lifting out piping (1).

Fig. 266: Removing Lift Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully pull cover towards front.

Slide all retaining tabs (1) in succession out of retaining fixture.

Fig. 267: Sliding Retaining Tabs

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Press tabs with special tool 00 9 323 into mounting on both sides.

Fig. 268: Pressing Tabs With Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

Grip under cover (1) and padding and gently press clips (2) together, pull out head restraint guide (3).

Remove cover and padding.

Installation:

Clips of head restraint guide (2) must not be damaged.

Fig. 269: Pulling Out Head Restraint Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement of backrest cover or padding only:

Pull cover out of padding.

Installation:

Feed cover lugs (1) into openings of padding (2).

Make sure piping (3) is resting in opening of padding (4).

Fig. 270: Cover Lugs And Padding
Courtesy of BMW OF NORTH AMERICA, INC.

52 26 412 REPLACING BACKREST COVER FOR RIGHT REAR SEAT (THROUGH-LOADING SYSTEM)

Special tools required:

- 00 9 317
- 00 9 323

Necessary preliminary tasks:

- Remove and install left rear seat (through-loading), see **52 26 005 Removing and installing/replacing rear seat (through-loading system)**
- Remove and install rear head restraints, see **52 26 390 Removing and installing/replacing rear head restraint (through-loading system), left or right (Compact)**
- Remove backrest for rear seat (through-loading system), see **52 26 015 Removing and installing/replacing left or right rear seat backrest (through-loading system)**
- Remove actuator trim for left rear seat, see **52 26 301 Removing and installing /replacing actuating mechanism for left rear seat backrest (through-loading system)**
- Remove lock trim, see **52 26 309 Removing and installing/replacing lock for left rear seat backrest (through-loading system)**

Release mounting for center and outer mounts.

Fig. 271: Releasing Mounting For Center And Outer Mounts
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Installation sequence for mounting kit for center mount (1) and outer mount (2).

Fig. 272: Center And Outer Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Move backrest into installation position and pull out belt slightly.

Clamp belt firmly.

E46 only:

Unfasten screws.

Remove trim.

E83 only:

Trim not screwed down.

Lever out trim with special tool 00 9 317.

Fig. 273: Locating Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Separate webbing.

Fig. 274: Separating Webbing
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Feed out strap so that belt stopper (1) is located between upper guide (2) and lower guide (3) of belt finisher.

Fig. 275: Belt Stopper, Upper And Lower Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out cover all round.

Fig. 276: Removing Lever Out Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Carefully pull cover over mounts towards front.

Slide all cover lugs (1) in succession in direction of backrest center (if necessary with cleaning wedge 00 9 323).

Fig. 277: Sliding Retaining Tabs
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Press tabs with special tool 00 9 323 into mounting on both sides.

Fig. 278: Pressing Tabs With Special Tool
Courtesy of BMW OF NORTH AMERICA, INC.

Grip lower cover (1) and padding and gently press clips (2) together, pull out head restraint guide (3).

Remove cover and padding.

Installation:

Clips of head restraint guide (2) must not be damaged.

Fig. 279: Pulling Out Head Restraint Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement of backrest cover or padding only:

Pull cover out of padding.

Installation:

Feed cover lugs (1) into openings of padding (2). Make sure piping (3) is resting in opening of padding (4).

ACCESSORIES & EQUIPMENT

Trailers & Equipment - Repair Instructions - X3

10 LOADING PLATFORM

00 00 ... BODY AND UNDERBODY: CHECKING FOR CORROSION AND DAMAGE

Inspect chassis, underbody and wheel arches and check for corrosion and damage.

NOTE: It is absolutely essential to rectify any identified faults after consulting the customer and to issue a separate invoice.

00 00 ... RAISING BMW MULTI-TRAILER

CAUTION: Twin-strut underfloor platforms and twin-pillar lifting platforms are suitable for raising the BMW multi-trailer.

Lifting platforms with drive-on surfaces are not suitable for raising in order to carry out maintenance and repair work.

The lifting platform must comply with the relevant statutory accident prevention regulations and be serviced according to the manufacturer's instructions. It is essential to follow the lifting platform operating instructions, in particular the safety instructions and carrying capacity!

Make sure you adhere to the BMW-recommended work area of 5 x 7 m and to an escape route of 0.6 m between two lifting platforms.

Before raising the BMW multi-trailer, please observe the following points:

- Raise the trailer only when it is unloaded
- Remove a supplied loading ramp from the loading ramp frame so that all chassis areas of the BMW multi-trailer are freely accessible
- There must be sufficient clearance between the carrier arms/flat girder bridges and the GFK aprons or the front guard of the BMW multi-trailer
- The BMW multi-trailer must always be positioned in the middle of the lifting platform.

CAUTION: You will need special additional supports for the lifting platform in order to bridge the difference in height between longitudinal member and lower edge of GFK side apron or front guard of the BMW multi-trailer. The minimum height of the additional supports is 145 mm. Use only the additional supports approved by the platform manufacturer or specified in these repair instructions.

You will find appropriate examples in the repair instructions for the

majority of lifting platforms present in BMW workshops. For lifting platforms that are not named, the relevant manufacturers will offer you appropriate additional supports. Please contact directly the manufacturer of the lifting platform used in your dealership.

CAUTION: The BMW multi-trailer may only be raised by its longitudinal members. Do not under any circumstances raise the BMW multi-trailer by the GFK aprons. Make sure the additional supports bear the longitudinal members over their entire width and no attachments or wiring harnesses are touched or jammed. Check the securing equipment of the additional supports for correct seating. Under no circumstances should any work be carried out underneath the BMW multi-trailer if it is not adequately secured against slipping off the lifting platform.

The areas (2) on the longitudinal members (1) marked in the adjacent diagram are the best areas for attaching the additional supports.

Fig. 1: Identifying Marked Areas On Longitudinal Members
Courtesy of BMW OF NORTH AMERICA, INC.

General Notes On Using Twin-Pillar Lifting Platforms

For the twin-pillar lifting platforms described, the BMW multi-trailer is positioned in the direction of travel on the platform. For lifting platforms which do not create sufficient clearance between disk wheel and carrier arms, move the BMW multi-trailer against the direction of travel onto the platform.

Becker & Sohne Twin-Strut Underfloor Platform

The BMW multi-trailer can only be raised if it is supported at right angles to the direction of travel. For raising, use the high additional supports (1) of Becker & Sohne.

Fig. 2: Identifying High Additional Supports
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Also lash the BMW multi-trailer to the flat girder bridges of the lifting platform. Flag the protruding tow hitch and the drawbar member of the BMW multi-trailer conspicuously so as to prevent injury, e.g. with a red cloth.

MAHA Twin-Pillar Lifting Platform

The BMW multi-trailer can only be raised if you use the support plate attachment sleeves for transporters (1). Position the axle of the BMW multi-trailer in the direction of travel in front of the pillars of the platform in order to obtain the specified lifting ranges and to establish sufficient clearance between disk wheel and carrier arms. The long carrier arms raise the front and the short carrier arms raise the rear of the BMW multi-trailer.

Fig. 3: Identifying MAHA Twin-Pillar Lifting Platform
Courtesy of BMW OF NORTH AMERICA, INC.

Romaico-Lift Twin-Pillar Lifting Platform

The BMW multi-trailer can only be raised if you use the 146 mm high attachments (1). Position the axle of the BMW multi-trailer in the direction of travel in front of the pillars of the platform in order to obtain the specified lifting ranges and to establish sufficient clearance between disk wheel and carrier arms. The long carrier arms raise the front and the short carrier arms raise the rear of the BMW multi-trailer.

Fig. 4: Identifying Romaico-Lift Twin-Pillar Lifting Platform
Courtesy of BMW OF NORTH AMERICA, INC.

Working Pit

The BMW multi-trailer can be serviced or repaired in conjunction with a working pit if the following measures are taken into consideration. The BMW multi-trailer must be secured against slipping/tilting sideways. The drawbar jockey wheel must be firmly secured against rolling.

86 10 ... ADJUSTING BRAKE SYSTEM

Proper adjustment of the brake system is only possible if the brake Bowden cables and all brake system moving parts move freely and are ready for operation.

The wheels must be completely fitted and able to rotate freely. Always adjust both brake sides. The left and right sides are adjusted in the same way.

Pull out overrunning equipment (1) fully in direction of arrow.

Fig. 5: Identifying Overrunning Equipment
 Courtesy of BMW OF NORTH AMERICA, INC.

Reversing lever (1) must rest directly on inner lying tow tube of overrunning brake.

Fig. 6: Identifying Reversing Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

Screw brake linkage (1) into nut (2) until distance (3) (nut (2) - end of brake linkage (1)), is 10 - 15 mm. Lock brake linkage (1) in position with nut (4). Check distance (3) and nuts (2, 4) with brake linkage installed.

Fig. 7: Identifying Screw Brake Linkage & Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Insert pull rod (1) in brake compensator (2) and screw nut (3) onto pull rod (2).

Tighten nut (3) until pull rod (1) is free of play.

Check pull rod (1) already fitted for zero play.

Fig. 8: Identifying Pull Rod, Brake Compensator & Screw Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Hook tension spring (1) to tension spring mount (2).

Installation:

The brake shoes are adjusted in two work steps. In the first step, the distance between the lower half of the brake shoes and the brake drum is adjusted. In the second step, the distance between the upper half of the brake shoes and the brake drum is adjusted.

Fig. 9: Identifying Hook Tension Spring & Tension Spring Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Rotate road wheel (1) in direction of travel and simultaneously turn adjusting screw (2) in direction of arrow.

Tighten adjusting screw (2) until road wheel (1) can no longer be turned.

Fig. 10: Identifying Adjusting Screw & Road Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Turn adjusting screw (1) in direction of arrow and release slowly until road wheel (2) can rotate.

Finish adjustment procedure when slight grinding noises can be heard in lower brake shoe halves.

Fig. 11: Identifying Adjusting Screw & Road Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Firmly tighten handbrake lever three to five times.

Depending on road wheel side, tighten nut (1) or (2) until slight grinding noises can be heard in upper brake shoe halves.

Fig. 12: Identifying Depending On Road Wheel Side, Nut
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... ADJUSTING SPRING FORCE ACCUMULATOR

The spring force accumulator requires no maintenance and generally does not need to be readjusted.

Adjustment dimension, spring force accumulator: distance between end of support tube-internal washer (1) is 90 mm.

Fig. 13: Identifying Distance Between End Of Support Tube-Internal Washer
Courtesy of BMW OF NORTH AMERICA, INC.

To tension spring force accumulator: turn nut (2) located in support tube (1) clockwise.

To relieve tension on spring force accumulator: turn nut (2) located in support tube (1) counterclockwise.

Fig. 14: Identifying Support Tube & Nut
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF CAMLOCK RETAINING CAM

Unscrew bolts (1).

Fig. 15: Identifying Camlock Retaining Cam Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF BASE PLATE

- NOTE:**
- Disassembly of bar, refer to 86 10 ... REPLACING BAR**
 - Disassembly of lashing plate, refer to 86 10 ... REPLACING LASHING PLATE AND LASHING EYE.**
 - Disassembly of 12 volt socket, refer to 86 10 ... REPLACING 12 VOLT SOCKET**
 - Remove plastic bush/metal bush, refer to 86 10 ... REMOVING PLASTIC BUSH/METAL BUSH.**

Disassembly of light guard, refer to 86 10 ... REPLACING REAR LIGHT

Disassembly of front apron, refer to 86 10 ... DISASSEMBLY OF FRONT APRON

Disassembly of left and right aprons, refer to 86 10 ... DISASSEMBLY OF LEFT AND RIGHT APRONS

Disassembly of left and right wheel boxes, refer to 86 10 ... DISASSEMBLY OF LEFT AND RIGHT WHEEL BOXES

Disassembly of rear apron, refer to 86 10 ... DISASSEMBLY OF REAR APRON

Disassembly of left and right lamp housings, refer to 86 10 ... DISASSEMBLY OF LEFT AND RIGHT LAMP HOUSINGS

Disassembly of rivet connection, rear support: refer to Disassembly procedure of rivet connection, rear support, see 86 10 ... REMOVING REAR SUPPORTS AND BRACKET

Unscrew bolts (1).

CAUTION: Before drilling out rivet heads, drive in rivet pins with a punch.

Drill out rivet connections (2).

Installation:

Tightening Torque: 86 10 32AZ, see 86 10 PLATFORM .

Fig. 16: Identifying Bolts & Rivet Connections
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF BRACKET ON PLATFORM BASE

Unscrew bolts (1).

Fig. 17: Identifying Bolts

Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF FRONT APRON

Drill out rivets (1) on lower apron edge.

Fig. 18: Identifying Rivets On Lower Apron Edge

Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealing compound (1).

Drill out rivets (2).

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 19: Identifying Sealing Compound & Rivets
 Courtesy of BMW OF NORTH AMERICA, INC.

Press side sections (1) to side in direction of arrow. Tilt center section (2) downwards and remove to side.

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 20: Press Side Sections To Side And Tilt Center Section Downward
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF FRONT PROTECTION BAR

Release screws (1) on cross-member (2).

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 4AZ, see **86 10 PLATFORM** .

Installation:

Tightening Torque: 86 10 5AZ, see 86 10 PLATFORM .

Fig. 21: Identifying Screws On Cross-Member
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on longitudinal member (2).

Installation:

Tightening Torque: 86 10 5AZ, see 86 10 PLATFORM .

Fig. 22: Identifying Screws On Longitudinal Member
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF JOCKEY WHEEL OR JOCKEY WHEEL MOUNT

Turn clamping lever (1) in direction of arrow and release clamping connection. Open clamping bracket (2) and remove jockey wheel (3). Release screws on mount (4) and remove screws.

Installation:

Tightening Torque: 86 10 11AZ, see **86 10 PLATFORM** .

Fig. 23: Identifying Clamping Lever & Jockey Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF LEFT AND RIGHT APRONS

NOTE: Remove position light, refer to **86 10 ... REPLACING POSITION LIGHT**.

Remove rear light, refer to **86 10 ... REPLACING REAR LIGHT**.

Remove plastic bush/metal bush, refer to **86 10 ... REMOVING PLASTIC BUSH/METAL BUSH**.

Drill out rivets (1) on lower apron edge.

Fig. 24: Identifying Rivets On Lower Apron Edge
Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealing compound (1).

Drill out all rivets (2) along apron edge.

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 25: Identifying Sealing Compound & Rivets
Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealing compound (1).

Drill out rivets (2) on lower apron edge.

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 26: Identifying Rivets On Lower Apron Edge
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF LEFT AND RIGHT LAMP HOUSINGS

Cut through sealing compound (1) and remove.

Drill out rivet connections (2).

Installation:

Use Sikaflex 221 as sealing compound.

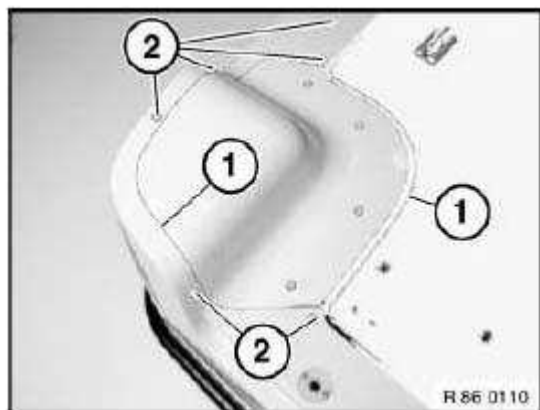

Fig. 27: Identifying Sealing Compound & Rivet Connections
Courtesy of BMW OF NORTH AMERICA, INC.

Drill out rivet connections (1).

Raise side sections (2, 3).

Pull out lamp housing (4) towards inside in direction of platform.

Fig. 28: Identifying Rivet Connections & Raise Side Sections
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF LEFT AND RIGHT WHEEL BOXES

Remove sealing compound (1).

Drill out rivets (2).

Raise side apron (3). Pull out wheel box (4) towards rear.

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 29: Identifying Sealing Compound, Raise Side Apron & Wheel Box
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF LICENSE PLATE MOUNTING PLATE

CAUTION: Once the connecting screws (1) have been removed, the closing spring of the hinge retracts. Risk of trapping!

Release screws (1) in loading ramp frame (2) on left and right sides.

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 7AZ, see **86 10 PLATFORM** .

Fig. 30: Identifying Screws In Loading Ramp Frame
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF LOADING RAMP FRAME/DISASSEMBLY OF RAIL, LEFT/RIGHT

NOTE: Two persons are required to disassemble the loading ramp frame.

Disassembly of license plate mounting plate, refer to 86 10 ... Disassembly of licence plate mounting plate

Disassembly of pull rod, refer to 86 10 ... Removing overrunning equipment/maintaining or replacing guide bush/installing overrunning equipment.

Release screws (1) of loading ramp frame (2) on cross-strut (3).

Installation:

Tightening Torque: 86 10 7AZ, see **86 10 PLATFORM** .

Fig. 31: Identifying Loading Ramp Frame On Cross-Strut
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1, 2) on left and right sides of loading ramp frame (3).

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 8AZ, see **86 10 PLATFORM** .

Fig. 32: Identifying Screws On Loading Ramp Frame
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1, 2, 3).

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 9AZ, see **86 10 PLATFORM** .

Fig. 33: Identifying Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISASSEMBLY OF REAR APRON

NOTE: Remove rear light, refer to **86 10 ... REPLACING REAR LIGHT**.

Remove plastic bush/metal bush, refer to 86 10 ... REMOVING PLASTIC BUSH/METAL BUSH.

Cut through sealing compound (1) on left and right and remove.

Drill out rivets (2) on left and right sides on lower apron edge.

Installation:

Use Sikaflex 221 as sealing compound.

Fig. 34: Identifying Rivets On Lower Apron Edge
Courtesy of BMW OF NORTH AMERICA, INC.

Cut through sealing compound (1) and remove.

Drill out rivets (2).

Installation:

Use Sikaflex 221 as sealing compound.

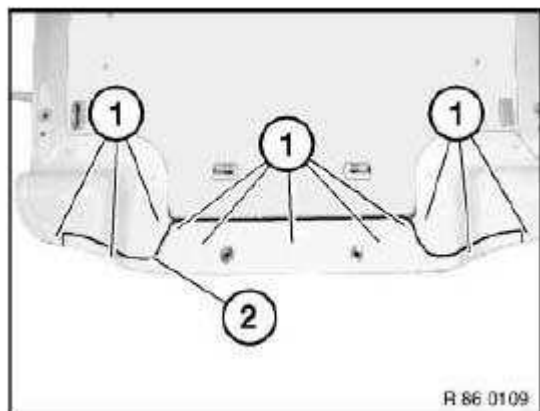

Fig. 35: Identifying Sealing Compound & Rivets
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... DISCONNECTING PLUG CONNECTION, WIRING HARNESS, FRONT/REAR

Spread levers (1) on socket housing apart in direction of arrow and disconnect female connector (2) in direction of arrow towards bottom.

Fig. 36: Identifying Spread Levers & Female Connector
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... INSTALLATION POSITION OF BMW LETTERING

Top edge of lettering at same height as recess for position light (1).

Distance between drawbar member and lettering (2) is 300 mm.

Installation:

Remove grease from gluing surfaces.

Fig. 37: Identifying Distance Between Drawbar Member & Lettering
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... POSITIONING OF MULTITRAILER HOOD FOR MAINTENANCE AND REPAIR WORK

IMPORTANT: At least two persons are needed to install and remove the hood from the platform.

Before installing and removing the hood, secure the BMW multitrailer and the

entire combination against rolling. For this purpose, use the parking brake and the chocks of the BMW multitrailer.

The hood can also be set up and lowered with the aid of the universal lift available from BMW in conjunction with the roof racks and the hood adapter. Under no circumstances should work of any kind be carried out below the suspended hood.

For maintenance and repair work, raise the hood using a lifting platform. Twin-column lifting platforms, body lifting platforms and twin-stamp underfloor platforms are suitable. The seating plates and areas of the lifting platform must be adjustable according to the dimensions of **Fig. 38**.

Fig. 38: Identifying Lifting Platform Adjustable Dimensions
Courtesy of BMW OF NORTH AMERICA, INC.

The lifting platform must conform to the relevant legal provisions of the accident prevention regulations and be serviced as specified. Comply with the lifting platform operating instructions, in particular the safety instructions and the carrying capacity.

Make sure you adhere to the BMW-recommended work area of 5 x 7 m and to an escape route of 0.6 m between two lifting platforms.

Please comply with the following instructions before raising the hood:

- Raise only when it is unloaded;
- Ensure sufficient clearance between the seating plates/seating areas and the GFP edge of the hood;
- The hood must always be positioned in the middle of the lifting platform.

IMPORTANT: The hood may only be raised at the pin (1). Under no circumstances may the hood be raised at the GFP edge of the hood (2). See **Fig. 39**. Exclusively for removal of pin (1), raise the hood in the GFP area.

Also refer to: **86 21 ... Removing centering pin from mounting bracket**

Fig. 39: Identifying Centering Pin & Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING CAMLOCK RETAINING CAM ON LOADING RAMP

Drill out rivets (1).

Fig. 40: Identifying Rivets
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING CAMLOCK SCREW CAP

Bend back edges (1) of tab washer (2). Remove tab washer (2) over cross pin (3) towards bottom.

Installation:

Replace lockplate.

Fig. 41: Bend Back Edges Of Tab Washer
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT COIL SPRING

Release screw (1) and remove, tilt shock absorber (2) in direction of arrow towards rear.

Installation:

Use new self-locking nut.

Hold shock absorber vertically and protective cap points upwards. Completely press in shock absorber once and pull out up to required installation length. Do not tilt shock absorber further than is needed for installation.

Tightening Torque: 86 10 21AZ, see **86 10 PLATFORM** .

Fig. 42: Remove Screw & Tilt Shock Absorber
 Courtesy of BMW OF NORTH AMERICA, INC.

The trailing arm folds down once the coil spring on the arm has been released.

No persons should be located underneath trailing arm. Risk of injury!

Release screw (1) between trailing arm (2) and coil spring.

Installation:

Tightening Torque: 86 10 22AZ, see **86 10 PLATFORM** .

Fig. 43: Identifying Screw & Trailing Arm
Courtesy of BMW OF NORTH AMERICA, INC.

Remove pressure plate (1) from coil spring (2).

Installation:

Use pressure plate with nut.

Fit pressure plate (1) according to its shape (3) into pressure spring (2).

Fig. 44: Identifying Pressure Plate & Coil Spring
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) between coil spring (2) and longitudinal member (3). Remove small pressure plate (4) and large pressure plate (5).

Installation:

Use pressure plate without nut.

Fit small pressure plate (4) according to its shape (6) into pressure spring (2).

Tightening Torque: 86 10 23AZ, see **86 10 PLATFORM** .

Fig. 45: Identifying Screw Between Coil Spring & Longitudinal Member
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Two persons are needed to install the coil spring correctly. One person presses down the pressure plate (2) seated inside the coil spring (1) and tightens the coil spring (1)/trailing arm (3) screw connection. At the same time, the second person levers the coil spring (1) with a screwdriver into its correct seat.

For coil spring (1)/trailing arm (3), Tightening Torque: 86 10 22AZ, see **86 10 PLATFORM** .

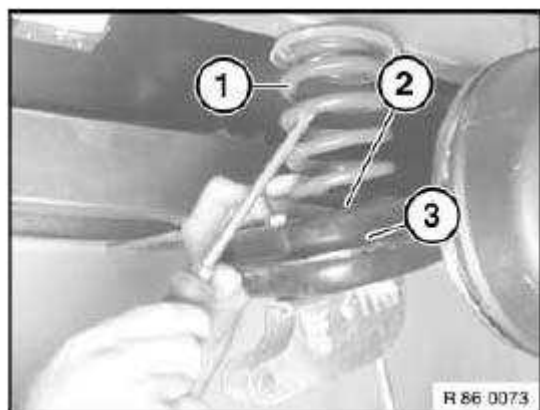

Fig. 46: Identifying Coil Spring & Pressure Plate
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING BOLT ON LOADING RAMP

Insert a drift into hole (1) of bolt (2) and turn clockwise.

Fig. 47: Identifying Bolt On Loading Ramp
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING BRAKE SHOES

The wheels of the multi-trailers must be able to rotate freely. Adjust and check brake system after installing brake shoes.

Unhook tension spring (1) from tension spring mount (2).

Fig. 48: Identifying Tension Spring & Tension Spring Mount
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Once nut (1) of pull rod (2) has been released, do not move handbrake lever. Handbrake lever can flick upwards.

Release nut (1) on pull rod (2) and remove hexagon nut. Slide brake compensator (3) towards rear.

Installation:

Use new self-locking nut.

Fig. 49: Identifying Nut On Pull Rod
Courtesy of BMW OF NORTH AMERICA, INC.

Grip openings (1) in wheel trim (2) with both hands and pull off wheel trim (2).

Fig. 50: Identifying Grip Openings & Wheel Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release wheel bolts (1) and remove disk wheel (2).

Installation:

Tightening Torque: 86 10 19AZ, see **86 10 PLATFORM** .

Fig. 51: Identifying Wheel Bolts & Disk Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Turn brake shoe adjusting screw (2) on brake carrier (1) in direction of arrow and release fully. The brake shoes do not rest against the drum.

Fig. 52: Identifying Brake Shoe Adjusting Screw On Brake Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Lever off cap (1).

Fig. 53: Levering Off Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Release nut (1) and remove. Pull off brake hub (2) with both hands.

Installation:

Only a new nut is permitted for reinstallation.

Tightening Torque: 86 10 20AZ, see **86 10 PLATFORM** .

Do not screw off brake hub under any circumstances.

Fig. 54: Identifying Nut & Brake Hub

Courtesy of BMW OF NORTH AMERICA, INC.

This procedure is not necessary for removing the brake shoes.

Push back cable (1).

Fig. 55: Identifying Back Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Remove shell (1).

Fig. 56: Identifying Shell
Courtesy of BMW OF NORTH AMERICA, INC.

Remove brake cable (1) from mounting (2).

Fig. 57: Identifying Brake Cable & Mounting
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook pressure spring (1) from fixed brake shoe (2) and brake carrier (3).

Fig. 58: Identifying Pressure Spring & Fixed Brake Shoe
Courtesy of BMW OF NORTH AMERICA, INC.

Remove tension spring (1) from both brake shoe fixtures (2).

Remove brake lever assembly (3).

Installation:

The fixed part of the brake lever assembly (3) is seated on the moving brake shoe. The moving part of the brake lever assembly is seated on the fixed brake shoe.

Fig. 59: Identifying Tension Spring & Brake Lever Assembly
Courtesy of BMW OF NORTH AMERICA, INC.

Pull brake shoes (1) apart in direction of arrow, tilt forward and remove from adjustment device (2).

Installation:

Always replace the four shoes and use the same make.

Minimum lining thickness: 1.5 mm

Fig. 60: Identifying Brake Shoes & Adjustment Device
Courtesy of BMW OF NORTH AMERICA, INC.

Check adjustment device (1).

Check wedge (2) and setting pins (3) for ease of movement and wear.

Apply grease if necessary.

Check brake cables for ease of movement and wear.

Fig. 61: Identifying Screws On Loading Ramp Frame
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING ENTRY PROFILE SECTION ON LOADING RAMP, LEFT, RIGHT AND CENTER

CAUTION: Before drilling out rivets, drive in rivet pins with a punch.

Drill out rivets (1). Remove entry profile section (2) towards front.

Fig. 62: Identifying Entry Profile Section On Loading Ramp
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING LEFT OR RIGHT SHOCK ABSORBER

Inspect the shock absorber while installed to ascertain whether it needs to be replaced.

Replace shock absorber if it is leaking. Replace shock absorber if it can be easily pushed in or pulled out when removed.

Release screw (1) and remove. Tilt shock absorber in direction of arrow. Release screw (2) and remove shock absorber.

Installation:

Hold shock absorber vertically: protective cap points upwards. Completely press in shock absorber once and pull out up to required installation length. Do not tilt shock absorber further than is needed for installation.

Tightening Torque: 86 10 21AZ, see **86 10 PLATFORM** .

Fig. 63: Identifying Screw & Shock Absorber
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING LOADING RAMP LOCK

Unscrew bolts (1).

Installation:

Tightening Torque: 86 10 28AZ, see **86 10 PLATFORM** .

Fig. 64: Identifying Bolts
 Courtesy of BMW OF NORTH AMERICA, INC.

Pass lever (1) of rotary striker lock (2) out of square hole (3) by twisting from side to side.

Fig. 65: Identifying Rotary Striker Lock & Hole
 Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolts (1).

Installation:

Opening for securing clip (2) points to front or rear.

Square-head nut (3) rests with its square surface parallel to bearing pedestal (4).

Tightening Torque: 86 10 29AZ, see **86 10 PLATFORM** .

Fig. 66: Identifying Square-Head Nut & Bearing Pedestal
 Courtesy of BMW OF NORTH AMERICA, INC.

Raise edge (1) of securing clip and slide in direction of arrow towards rear.

Detach bearing pedestal (2).

Fig. 67: Identifying Raised Edge & Bearing Pedestal
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Install bearing pedestal (1) on stub (2) of locking bracket (3).

Off-center bore (4) in bearing pedestal (1) points with short distance (A) to locking bracket (3).

Fig. 68: Identifying Bearing Pedestal On Stub
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING MOUNTING BRACKET SEALING CAP

Cut out mounting bracket (3) along markings (1, 2) and lever out of apron (4).

Installation:

For gluing, use two-component adhesive ICEMA R 101 and hardener 7.

Mixture ratio: ICEMA R 101 7 parts; hardener 7 1 part.

Fig. 69: Identifying Mounting Bracket Sealing Cap
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING MOUNTING BRACKET, CENTER, LEFT AND RIGHT

NOTE: Disassembly of Camlock retaining cam

refer to **86 10 ... DISASSEMBLY OF CAMLOCK RETAINING CAM**

Unscrew bolts (1).

Installation:

Tightening Torque: 86 10 31AZ, see **86 10 PLATFORM** .

Fig. 70: Identifying Bolts
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING OUTER PULL ROD MOUNT, LEFT AND RIGHT

Release screws (1) and remove pull rod mount (2).

Installation:

Tightening Torque: 86 10 30AZ, see 86 10 PLATFORM .

Fig. 71: Identifying Screws & Pull Rod Mount
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING OVERRUNNING EQUIPMENT/MAINTAINING OR REPLACING GUIDE BUSH/INSTALLING OVERRUNNING EQUIPMENT

After installing overrunning equipment, readjust brake system, refer to 86 10 ... ADJUSTING BRAKE SYSTEM

Check the guide bush while installed to ascertain whether it needs to be replaced. Raise ball end area and replace guide bush if play is detected in ball end area.

NOTE: **After installing, readjust and check brake system.**

Release round head screws (1) and remove running board (2) towards top.

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 10AZ, see 86 10 PLATFORM .

Fig. 72: Identifying Round Head Screws & Running Board
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook tension spring (1) from tension spring mount (2).

Fig. 73: Identifying Tension Spring & Tension Spring Mount
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Once nut (1) of pull rod (2) has been released, do not move handbrake lever. Handbrake lever can flick upwards.

Release screw (1) on pull rod (2) and remove hexagon nut. Slide brake compensator (3) towards rear.

Installation:

Use new self-locking nut.

Fig. 74: Identifying Brake Compensator, Screw & Rod
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on jockey wheel mount and remove.

Release wiring harness mount (2) and remove. Reinstall screw and tighten until hand-tight.

Installation:

Tightening Torque for jockey wheel mount (1), 86 10 311AZ, see **86 10 PLATFORM** .

Tightening Torque for wiring harness mount (2), 86 10 12AZ, see **86 10 PLATFORM** .

Fig. 75: Identifying Wiring Harness Mount & Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw on socket holder (1) and remove. Cut through strap (2) and lay wiring harness to one side. Pull gaiter (3) in direction of arrow.

Installation:

Use new self-locking nut.

Tightening Torque: 86 10 13AZ, see **86 10 PLATFORM** .

Fig. 76: Pulling Gaiter

Courtesy of BMW OF NORTH AMERICA, INC.

Remove protective caps (1).

Fig. 77: Identifying Protective Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and remove.

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 14AZ, see **86 10 PLATFORM** .

Fig. 78: Identifying Self-Locking Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

Tilt top reversing housing (1) in direction of arrow towards rear. Slide out top reversing housing (1) and bottom reversing housing with handbrake lever unit (2) in direction of arrow towards rear.

Fig. 79: Sliding Out Top Reversing Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Remove holder (1) towards bottom.

Fig. 80: Removing Holder

Courtesy of BMW OF NORTH AMERICA, INC.

Pull drawbar member (1) in direction of arrow and pull out overrunning equipment (2) in direction of arrow towards front.

Fig. 81: Removing Overrunning Equipment

Courtesy of BMW OF NORTH AMERICA, INC.

Remove spacer tubes (1) and threaded pins (2) from guide bush (3).

Fig. 82: Identifying Spacer Tubes, Threaded Pins & Guide Bush

Courtesy of BMW OF NORTH AMERICA, INC.

Press pins (1) inwards. Detach counter support (2) and guide bush (3).

Maintenance:

Grease tow tube (4) and attach guide bush (3).

Installation:

Secure counter support (2) with new clamping sleeves to tow tube (4).

Fig. 83: Identifying Pins, Counter Support & Guide Bush
 Courtesy of BMW OF NORTH AMERICA, INC.

Insert spacer tubes (1) and threaded pins (2) in guide bush (3).

Make sure spacer tubes (1) are correctly seated in guide bush (3).

Fig. 84: Identifying Spacer Tubes, Threaded Pins & Guide Bush
 Courtesy of BMW OF NORTH AMERICA, INC.

Using a screwdriver, link spacer tubes (1) and shock absorber located in tow tube. This ensures that the shock absorber remains in the correct installation position. Pull drawbar member (2) in direction of arrow and push in overrunning equipment (3) in direction of arrow towards rear.

Fig. 85: Pulling Drawbar Member
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING PLASTIC BUSH/METAL BUSH

Release countersunk metal screws (1).

Fig. 86: Identifying Countersunk Metal Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out plastic bush/metal bush (1) with a screwdriver.

Fig. 87: Identifying Plastic Bush/Metal Bush
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING REAR SUPPORTS AND BRACKET

Release screws (1) and remove rear support (2) from bracket (3).

Installation:

Tightening Torque: 86 10 26AZ, see **86 10 PLATFORM** .

Fig. 88: Identifying Screws, Rear Support & Bracket
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove cable holders (1) from bracket (2). Release screws (3) on left and right sides of bracket (2). Drill out rivets (4) from underside of platform. Drill out rivets (5) from upper side of platform.

Installation:

Tightening Torque: 86 10 27AZ, see **86 10 PLATFORM** .

Fig. 89: Identifying Cable Holders, Bracket, Screws & Rivets
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Feed cable for rear light (1) through opening (2). Fit cable holders (4) in holes (3).

Fig. 90: Identifying Screw & Tilt Shock Absorber
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING REFLECTING REAR LIGHT

From rear side of GFK apron, drive out plastic pins (1) with a drift.

Fig. 91: Identifying Plastic Pins

Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING REST ON LOADING RAMP, LEFT, RIGHT AND CENTER

CAUTION: Before drilling out rivets, drive in rivet pins with a punch.

Drill out rivets (1). Remove rest (2) towards front.

Installation:

Stick on new sealing tape.

Fig. 92: Identifying Rivets & Rest

Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING SHOCK ABSORBER FROM OVERRUNNING EQUIPMENT

Check the overrunning equipment shock absorber while installed to ascertain whether it needs to be replaced.

Apply handbrake. Push in and pull out tow ball end by hand. If it is very easy to pull out the tow ball end, the shock absorber must be replaced.

NOTE: Complete disassembly of overrunning equipment and guide bush, refer to **86 10 ... REMOVING OVERRUNNING EQUIPMENT/MAINTAINING OR REPLACING GUIDE BUSH/INSTALLING OVERRUNNING EQUIPMENT.**

Release screw (1) and remove. Pull out internal shock absorber (2) from opening in tow tube (3) towards rear.

Installation:

Tightening Torque: 86 10 15AZ, see **86 10 PLATFORM** .

Fig. 93: Identifying Shock Absorber, Tow Tube & Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Push in new shock absorber (1) through opening in tow tube (2).

Fig. 94: Identifying Shock Absorber & Tow Tube
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING TRAILING ARM, REMOVING AND INSTALLING OR REPLACING MOUNTING

Replace bearing in trailing arm if there is play in trailing arm.

NOTE: Remove brake cable, refer to 86 10 ... REMOVING BRAKE SHOES.

Remove shock absorber and coil spring, refer to 86 10 ... Removing and installing or replacing left or right coil spring.

Release screws (1) between wheel brake (2) and trailing arm (3) and remove complete wheel brake (2).

Installation:

Do not reuse screws (1). Use only the socket-head cap screws intended for this purpose. Stamped arrow on the reverse side of the brake carrier points in the direction of travel and stands at the 12 o'clock position.

Tightening Torque: 86 10 24AZ, see 86 10 PLATFORM .

Fig. 95: Identifying Screws, Wheel Brake & Trailing Arm
Courtesy of BMW OF NORTH AMERICA, INC.

The trailing arm folds down once the coil spring on the arm has been released.

No persons should be located underneath trailing arm. Risk of injury!

Release screws (1, 2). Use assembly hole (3) to release screw connection (2).

Press out screws (1, 2) with a mandrel.

Installation:

Use new self-locking nut.

Tightening Torque: 86 10 25AZ, see 86 10 PLATFORM .

Fig. 96: Identifying Screws & Hole
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Mount trailing arms (1) at rear mounts (4) only, viewed in direction of travel, with screws (2, 3).

Fig. 97: Identifying Trailing Arms, Rear Mounts & Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Do not damage trailing arm with drill when drilling.

Drill spacer tube (1) with a 4 mm drill at three evenly offset points. Place drill as near as possible to compensating bush (2).

Bores relieve tension on material of spacer tube.

Press out spacer tube (1) and compensating bush (2) with a drift.

Fig. 98: Identifying Spacer Tube & Compensating Bush
Courtesy of BMW OF NORTH AMERICA, INC.

Grease new spacer tube (1) for installation with Synthoso Glep I. Drive new spacer tube (1) with a rubber mallet into trailing arm mount (2).

Installation:

Make sure spacer tube (1) is not tilted when driven in.

Fig. 99: Identifying Spacer Tube & Trailing Arm Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Drive compensating bush (1) with a drift into spacer tube (2). Set compensating bush (1) and spacer tube (2) centrally in trailing arm mount (3).

Installation:

Make sure compensating bush (1) is not tilted when driven in.

Install coil spring, refer to **86 10 ... Removing and installing or replacing left or right coil spring.**

Fig. 100: Identifying Compensating Bush, Spacer Tube & Trailing Arm Mount
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING WHEEL BEARING

The angular-contact ball bearings do not require maintenance and have lifetime lubrication. The bearings cannot be readjusted.

Remove brake drum, refer to **86 10 ... REMOVING BRAKE SHOES.**

Lever out both snap rings (1).

Installation:

Replace expanded or damaged snap rings (1). Ensure correct seating.

Fig. 101: Identifying Snap Rings
 Courtesy of BMW OF NORTH AMERICA, INC.

Press out wheel bearing with special tool 24 1 010. See **24 1 010 INSTALLATION SLEEVE**

CAUTION: Do not reuse old wheel bearing.

Fig. 102: Identifying Wheel Bearing With Special Tool (24 1 010)
Courtesy of BMW OF NORTH AMERICA, INC.

Place new wheel bearing (1) with lathe-turned end (2) in center of bore in brake drum (3).

Installation:

Before pressing in new wheel bearing, check bearing seat for possible damage.

Make sure wheel bearing is not tilted when pressed in.

Fig. 103: Identifying Wheel Bearing, Lathe-Turned End & Center Of Bore In Brake Drum
Courtesy of BMW OF NORTH AMERICA, INC.

Press in new wheel bearing (1) with special tool 23 2 150 and 33 1 374. See **23 2 150 PRESSURE SLEEVE** .

Fig. 104: Identifying Wheel Bearing With Special Tool (23 2 150 & 33 1 374)
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REMOVING WOODEN REST ON LOADING RAMP, LEFT, RIGHT AND CENTER

CAUTION: Before drilling out rivets, drive in rivet pins with a punch.

Drill out rivets (1).

Fig. 105: Identifying Rivets
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPAIR WORK ON GFP COMPONENTS WITH GELCOAT SURFACE

Scratches in Gelcoat surface

Scratches in the Gelcoat surface which do not allow the GFP mat structure to show through can be touched up. Sand out scratches with water and 800 wet sandpaper. Then sand with water and 2000 wet sandpaper. Prepare repair area for polishing.

Cracks in Gelcoat surface

Sand the cracked area in a V shape beyond the end of the crack and clean.

There must be no grease or oil residues, moisture or dust remaining in the crack to be repaired.

When repairing holes such as e.g. rivet holes, deburr hole edge and heavily roughen large area around hole.

Prepare required amount of Gelcoat paste with 2% hardener and fill prepared repair area with spatula.

Apply Gelcoat paste in several applications to repair areas.

Adhere to mixture ratio (2 parts hardener to 100 parts Gelcoat paste) as precisely as possible.

Too much added hardener slows down the hardening time and changes the paint color.

The hardening period is at least 12 hours at 20°C room temperature.

The hardening period can be longer depending on the temperature.

Once the Gelcoat paste has hardened, sand the touched-up area with water and 800 wet sandpaper. Sand with water and 2000 wet sandpaper and prepare for polishing.

86 10 ... REPLACING 12 VOLT SOCKET

From underside of platform, cut through cable tie (1) and remove. Disconnect plug with grommet (2) from socket (3) towards bottom.

Installation:

Position all seals correctly. Also secure plug with grommet (2) using new cable tie to other socket.

Fig. 106: Identifying Cable Tie, Grommet & Socket
Courtesy of BMW OF NORTH AMERICA, INC.

On upper side of platform, release Phillips screws (1) on mounting bracket (2).

Fig. 107: Identifying Phillips Screws On Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Remove sealing compound along white marking (1).

Installation:

Make sure cable is correctly laid.

Use Sikaflex 221 as sealing compound.

Fig. 108: Identifying Sealing Compound Along White Marking
Courtesy of BMW OF NORTH AMERICA, INC.

Grip under mounting bracket (1) with a screwdriver and lever out bracket (1) towards top. Remove bracket (1).

Fig. 109: Identifying Grip Under Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Release nut (1). Remove socket (2) from mounting bracket (3).

Fig. 110: Identifying Nut, Socket & Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING BAR

NOTE: Disassembly of lashing eyes, refer to **86 10 ... REPLACING LASHING PLATE AND LASHING EYE.**

Remove lashing eyes (1).

Fig. 111: Identifying Lashing Eyes
Courtesy of BMW OF NORTH AMERICA, INC.

Remove protective caps (1) on left/right.

Fig. 112: Identifying Protective Caps
Courtesy of BMW OF NORTH AMERICA, INC.

Release hexagon screws (1) and countersunk head screws (2) on left/right.

Remove bar.

Installation:

For hexagon screw, Tightening Torque: 86 10 2AZ, see **86 10 PLATFORM** .

For countersunk head screw, Tightening Torque: 86 10 3AZ, see **86 10 PLATFORM** .

Fig. 113: Identifying Hexagon Screws & Countersunk Head Screws
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING DRAWBAR MEMBERS, LEFT AND RIGHT

Remove complete brake pull rod.

Removal of position light cable, refer to **86 10 ... REPLACING LICENSE PLATE LIGHT.**

Release screws (1) on cross-member (2). Pull out crossmember (2) towards rear.

Installation:

Tightening Torque: 86 10 16AZ, see **86 10 PLATFORM** .

Fig. 114: Identifying Screws On Cross-Member
Courtesy of BMW OF NORTH AMERICA, INC.

Release countersunk head screws (1) and remove.

Installation:

Tightening Torque: 86 10 3AZ, see **86 10 PLATFORM** .

Fig. 115: Identifying Countersunk Head Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Remove cable holder (1) and remove wiring harness (2) from drawbar member (3).

Fig. 116: Identifying Cable Holder, Wiring Harness & Drawbar Member
Courtesy of BMW OF NORTH AMERICA, INC.

Remove cable (1) from position light housing (2). Pull out cable (1) through drawbar member aperture (3).

Fig. 117: Identifying Cable, Housing & Drawbar Member Aperture

Courtesy of BMW OF NORTH AMERICA, INC.

Release all screws on cross-member (1) and remove crossmember (1).

If necessary, release screws on mounting brackets (2) and remove cross-members (3).

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 17AZ, see **86 10 PLATFORM** .

Fig. 118: Identifying Screws On Cross-Member
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolt (1). Grip nut from rear through assembly hole (2) in cross-member.

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 18AZ, see **86 10 PLATFORM** .

Fig. 119: Identifying Bolt & Assembly Hole

Courtesy of BMW OF NORTH AMERICA, INC.

Tilt drawbar member (1) down in direction of arrow A and pull out towards rear in direction of arrow B.

Fig. 120: Pulling Drawbar Member

Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING GAITER

Position brake lever fully towards rear.

Release screws (1) and (2) and remove. Pull off towing attachment (3) in direction of arrow.

Installation:

Tightening Torque: 86 10 15AZ, see **86 10 PLATFORM** .

Fig. 121: Identifying Screws & Towing Attachment

Courtesy of BMW OF NORTH AMERICA, INC.

Pull off gaiter (1) in direction of arrow.

Fig. 122: Identifying Gaiter
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING HOLDER FOR CHOCK

Pull bar (1) down in direction of arrow A. Pull out chock (2) in direction of arrow B at an angle towards bottom.

Fig. 123: Pulling Out Chock
Courtesy of BMW OF NORTH AMERICA, INC.

Release and unscrew cheese head tapping screws (1) on holder (2).

Fig. 124: Identifying Cheese Head Tapping Screws On Holder
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING LASHING PLATE AND LASHING EYE

Releasing lashing eye

Pull spring bar (1) upwards in direction of arrow A. Slide lashing eye (3) in direction of arrow B and remove from lashing plate (2).

Fig. 125: Identifying Spring Bar & Lashing Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Release countersunk head screws (1) and remove lashing plate.

Installation:

Tightening Torque: 86 10 3AZ, see **86 10 PLATFORM** .

Fig. 126: Identifying Countersunk Head Screws & Lashing Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Locking lashing eye

Position lashing eye (1) on circular openings on lashing plate (2). Press lashing eye (1) in direction of arrow A into lashing plate (2). In this position, slide lashing eye (1) in direction of arrow B. Spring bar (3) snaps in, anchors and secures lashing eye (1) in lashing plate (2).

Fig. 127: Identifying Lashing Eye & Lashing Plate
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING LICENSE PLATE LIGHT

Release screws (1) and remove license plate light (2) from mounting.

Fig. 128: Identifying Screws & License Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect flat connector (1) in direction of arrow.

Fig. 129: Identifying Flat Connector
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING POSITION LIGHT

Unclip cover (1) on side recess (arrow).

Fig. 130: Identifying Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Pull flat connector (1) from flat contact.

Fig. 131: Identifying Flat Connector
Courtesy of BMW OF NORTH AMERICA, INC.

Pull out cable (1) completely.

CAUTION: Before drilling out rivet heads, drive in rivet pins with a punch.

Drill out rivet heads (2) and remove position light housing from front.

Fig. 132: Identifying Cable & Rivet Heads
Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... REPLACING REAR LIGHT

Release thumb screws (1), slide light guard (2) in direction of middle of car and tilt out towards rear.

Fig. 133: Identifying Screws, Slide Light Guard
Courtesy of BMW OF NORTH AMERICA, INC.

Turn handwheel (1) counterclockwise in direction of arrow and remove base (2).

Fig. 134: Removing Base
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and press rear light (2) out towards front.

Installation:

Use new self-locking nuts.

Tightening Torque: 86 10 1AZ, see **86 10 PLATFORM**.

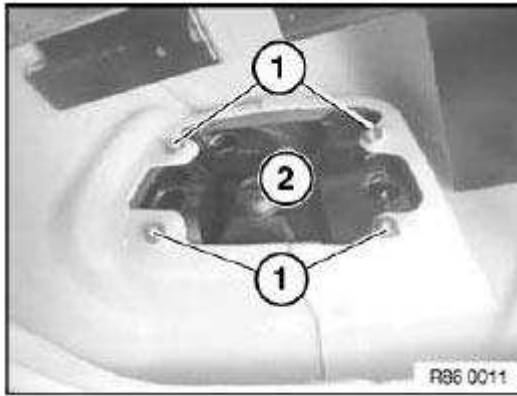

Fig. 135: Identifying Nuts & Rear Light
 Courtesy of BMW OF NORTH AMERICA, INC.

86 10 ... TROUBLESHOOTING ON MULTI-TRAILER

MULTI-TRAILER TROUBLESHOOTING TABLE

Fault	Cause	Remedy
Trailer already brakes when foot is taken off accelerator	Shock absorber of overrunning equipment faulty	Replace shock absorber of overrunning equipment
Reversing sluggish or not possible	Brake system adjusted too strongly	Adjust brake system
NOTE: When automatic reversing is activated, there is a residual braking torque caused by the design. This results	Brake shoes jammed	Free brake shoes, replace complete brake shoes with brake shoe carrier if necessary
in slightly heavier overrunning.	Cables overtensioned	Adjust brake system
Handbrake effect too weak	Faulty adjustment	Adjust brake system
-	Faulty spring force accumulator	Adjust spring force accumulator
-	Brake cables heavily contaminated, corroded or kinked	Free cables, replace if necessary
Wheel brakes overheating	Brake system incorrectly adjusted	Adjust brake system
-	Overrunning equipment is sluggish	Lubricate overrunning equipment
-	Brake cables heavily contaminated, corroded or kinked	Free cables, replace if necessary
-	Cables overtensioned	Adjust brake system
-	Wheel brakes contaminated	Clean wheel brakes

-	Reversing lever of overrunning equipment jammed	Remove reversing lever, clean and grease with conventional BMW lubricants
Braking effect too weak	Excessive play in brake system	Adjust brake system
-	Brake linings glazed, fouled by oil, damaged or worn	Replace complete brake shoes, clean brake drums, replace if necessary
-	Overrunning equipment is sluggish	Lubricate overrunning equipment
-	Brake cables heavily contaminated, corroded or kinked	Free cables, replace if necessary
Jolting braking or starting off	Excessive play in brake system	Adjust brake system
-	Shock absorber of overrunning equipment faulty	Replace shock absorber of overrunning equipment
-	Brake shoes jammed	Replace complete brake shoes with brake shoe carrier
Brakes squeal or rattle	Wheel brakes contaminated or worn	Clean wheel brakes, replace brake shoes and/or brake drums if necessary
-	Out-of-round or banging brake drum	Replace brake drums
-	Pad loose	Replace brake shoes
-	Wheel-bearing play excessive	Replace wheel bearings
Brakes pull to one side	Tire pressure incorrect	Correct tire pressure
-	Brake linings glazed, fouled by oil, damaged or worn	Replace complete brake shoes, clean brake drums, replace if necessary
-	Suspension shock absorber has no effect	Replace suspension shock absorber
Brake pads worn at angle	Wheel-bearing play excessive	Replace wheel bearings
-	Pads worn to less than minimum thickness	Replace brake shoes
Towing attachment fails to engage after connection	Internal attachment parts contaminated	Clean and lubricate attachment

21 HOOD

86 21 ... ADJUSTING HOOD PRETENSION - CAMLOC FASTENER WITH SPACERS

NOTE: At least two persons are needed to install and remove the hood. Before installing and removing the hood, secure the BMW multitrailer and the entire combination against rolling. For this purpose, use the parking brake and the chocks of the BMW multitrailer.

To help adjust the hood pretension, you will need four blocks with a minimum height of 60 mm.

Installation:

Before attaching the hood, thoroughly clean the top side of the GFP apron of the BMW multitrailer.

It is particularly important to clean the contact surface of the GFP apron (1) (marked in gray) on which the rubber seal of the hood rests. Refer to **Fig. 136**.

Fig. 136: Identifying GFP Apron
Courtesy of BMW OF NORTH AMERICA, INC.

The following text describes how to adjust the hood pretension as an example at one support area of the platform or at one hood fastener. The pretension is adjusted at the other support areas and fasteners in the same sequence.

The hood must be fixed on the platform in such a way that the rubber seal of the hood is placed under pretension or compressed. Only with this pretension is it possible to obtain a tight seal between hood and platform. Pretension is achieved with the Camloc fasteners and by using spacers.

Two different types of spacers (2) are available for each Camloc fastener (1): one thick and one thin. You can fit one, two or no spacer (2) on the Camloc fastener (1).

Fig. 137: Identifying Spacer On Camloc Fastener
 Courtesy of BMW OF NORTH AMERICA, INC.

Access to hood lighting plug (1):

Right side lid.

Open out spring-loaded cap (2) on socket (3) and remove hood lighting plug (1). Close cap (2). Insert hood lighting plug (1) into plug receptacle (4).

Fig. 138: Removing Hood Lighting Plug
 Courtesy of BMW OF NORTH AMERICA, INC.

Unlocking Camloc fastener:

Wing (1) of Camloc fastener (2) is parallel to outer edge of hood. Turn Camloc fastener (2) counterclockwise until it is heard and felt to unlock.

Locking

Press hood in lid frame downwards by hand. Turn Camloc fastener clockwise until it is heard and felt to lock into place. Wing (1) of Camloc fastener is parallel to outer edge of hood.

Fig. 139: Identifying Wing & Camloc Fastener
Courtesy of BMW OF NORTH AMERICA, INC.

Raise hood and place block (1) between centering pin (2) and platform. Lower hood and position centering pin (2) on block (1).

Fig. 140: Identifying Centering Pin On Block
Courtesy of BMW OF NORTH AMERICA, INC.

Remove spring nut (1) from Camloc fastener (2).

Installation:

Use new spring nut.

Fig. 141: Identifying Spring Nut & Camloc Fastener
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove Camloc fastener (1) from locating hole (2).

Installation:

Press Camloc fastener (1) downwards until contact is made with hood stop. Wing (3) of Camloc fastener points to middle of hood.

Fig. 142: Identifying Camloc Fastener & Locating Hole
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacing spacer:

Remove spacer (1) from Camloc fastener (4) by aligning opening (2) over lateral pin (3).

Reducing pretension:

Reduce spacer thickness, replace spacer or install Camloc fastener without spacer.

Increasing pretension:

Fit a thicker spacer or two spacers.

Installation:

Place spacer (1) on Camloc fastener (4) and turn until it is in a secure position.

Check that hood seal is correctly seated.

Check that Camloc fasteners are locked. Lift hood by handle recesses. Hood must not be able to move with respect to platform of BMW multitrailer.

Fig. 143: Identifying Spacer On Camloc Fastener
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... ADJUSTING REAR LID TO FIT

NOTE: The following text describes how to adjust the rear lid to fit at one mounting point as an example. Proceed in the same way for the other mounting points.

Height adjustment of rear lid:

Release screws (1) and move rear lid in direction of arrows.

Depth adjustment of rear lid:

Release screws (2) and move rear lid in direction of arrows.

Installation:

Tightening Torque, height adjustment,

refer to **86 21 HOOD** .

Tightening Torque, depth adjustment,

refer to **86 21 HOOD** .

Fig. 144: Identifying Rear Lid Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust gap (A) evenly all around without displacement and correct if necessary.

Fig. 145: Identifying Rear Lid Gap
Courtesy of BMW OF NORTH AMERICA, INC.

Check lid in transition (B) to hood for displacement and correct if necessary (flush).

Fig. 146: Identifying Lid In Transition To Hood

Courtesy of BMW OF NORTH AMERICA, INC.

To align lid in transverse direction, you can install or remove plastic washers (3) between hinge bracket (1) and mounting bracket (2).

Installation:

There must always be a plastic washer (3) fitted on left and right sides of mounting bracket (2). Plastic washers are available in thicknesses of 1 mm and 3 mm.

Fig. 147: Identifying Plastic Washer, Mounting Bracket & Hinge Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Check lid in transition (C) to hood (flush) and correct if necessary. Correction is made by inserting or omitting plastic washers (refer to Fig. 147).

Fig. 148: Identifying Lid In Transition To Hood
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... ADJUSTING ROTARY STRIKER LOCK

The following text describes how to adjust the rotary striker lock on the rear lid as an example. Proceed in the same way for the side lids. Adjust the lock while the lid is open.

Release screws (1) and adjust rotary striker lock (2) in elongated hole area in direction of arrows.

Installation:

Tightening Torque, refer to **86 21 HOOD** .

Fig. 149: Adjusting Rotary Striker Lock
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... ADJUSTING SIDE LID TO FIT

NOTE: The following text describes how to adjust the side lid to fit at one mounting point as an example. Proceed in the same way for all other mounting points.

Height adjustment of side lid:

Release screws (1) and move side lid in direction of arrows.

Installation:

Tightening Torque, refer to **86 21 HOOD** .

Fig. 150: Adjusting Side Lid Height Adjustment
Courtesy of BMW OF NORTH AMERICA, INC.

Depth adjustment of side lid:

Release screws (1) and move side lid in direction of arrows.

Installation:

Tightening Torque, refer to **86 21 HOOD** .

Fig. 151: Adjusting Side Lid Depth Adjustment
Courtesy of BMW OF NORTH AMERICA, INC.

Adjust gap (A) evenly all around and correct if necessary.

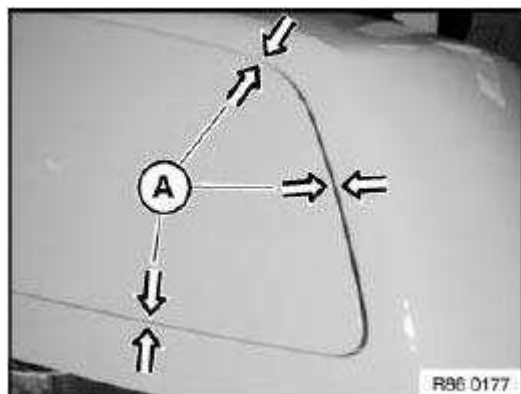

Fig. 152: Identifying Side Lid Gap
Courtesy of BMW OF NORTH AMERICA, INC.

Check lid in transition (B) to hood for displacement and correct if necessary (flush).

Fig. 153: Identifying Lid In Transition To Hood
Courtesy of BMW OF NORTH AMERICA, INC.

To align lid in direction of travel, you can install or remove a spacer plate (3) between mounting bracket (1) and hinge (2).

Fig. 154: Identifying Spacer Plate, Mounting Bracket & Hinge
Courtesy of BMW OF NORTH AMERICA, INC.

Check lid in transition (C) to hood for displacement and correct if necessary (flush). Correction is made by inserting or omitting spacer plates (refer to **Fig. 154**).

Fig. 155: Identifying Lid In Transition To Hood
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... ATTACHING/REPLACING BMW BADGE

Position of attachment: inside of rear lid

Remove plastic cover (1) from bore holes (2).

Fig. 156: Identifying Plastic Cover & Bore Holes
Courtesy of BMW OF NORTH AMERICA, INC.

Inserting a set of pointed pliers through bore holes (1), detach retaining washers (2) from pins of BMW badge.

Installation:

Use only new retaining washers.

Fig. 157: Identifying Bore Holes & Retaining Washers
 Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Instruction for removing BMW badge:

Slide a blunt object (e.g. a wooden wedge) under the BMW badge and carefully lever off the badge.

Position of attachment: outside of rear lid

The BMW badge must be attached at room temperature.

Degrease bonding area with petroleum ether.

Rub down bonding area with a dry cloth.

Peel off protective film on BMW badge (1).

Insert BMW badge (1) with pin (2) into bore hole (3). If bore holes (3) are considerably larger than pin (2), optically align BMW badge (1) exactly.

Press down BMW badge (1) firmly.

Fig. 158: Identifying BMW Badge, Pin & Bore Hole
 Courtesy of BMW OF NORTH AMERICA, INC.

Position of attachment: inside of rear lid

By inserting a 1/4" ratchet with extension and socket wrench insert (7 mm A/F) through bore holes (2), attach a retaining washer (1) in each case to pin of BMW badge. In so doing, press down on outside of rear lid with one hand on BMW badge and grip.

Push on relevant retaining washer (1) as far as it will go.

Fig. 159: Identifying Bore Holes & Retaining Washers
Courtesy of BMW OF NORTH AMERICA, INC.

Position of attachment: inside of rear lid

Insert plastic cover (1) in bore holes (2).

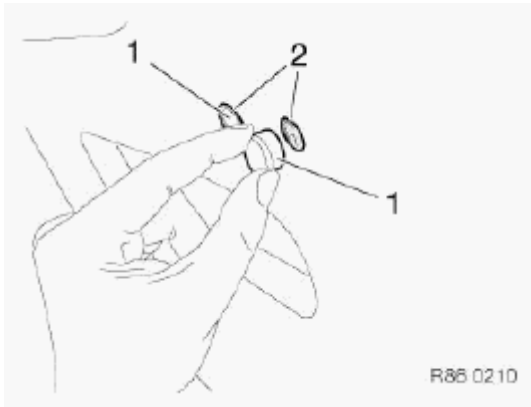

Fig. 160: Identifying Plastic Cover & Bore Holes
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... FITTING BMW LOGO

Distance between hood edge and lower edge of BMW logo (1) is 100 mm.

Distance between middle of lock and lettering (2) is 300 mm.

Installation:

Degrease bonding areas with benzine. Rub down bonding area with a dry cloth.

Position of BMW logo (1): parallel to lower edge.

Fig. 161: Identifying Distance Between Middle Of Lock & Lettering
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... INSTALLING HOOD SEAL

NOTE: Removing old seal: In a straight area of hood, grip old seal piping with a pair of pliers and pull off horizontally. Grip detached seal with both hands and uniformly pull away from hood ridge.

Push seal piping (1) by hand onto hood ridge (2). Using a rubber hammer, gently tap seal piping (1) as far as it will go onto hood ridge (2). Make sure piping is evenly positioned especially in radii of hood ridge.

Installation:

Position end face of seal at front end of hood in a straight area. Lay seal from front to rear.

Fig. 162: Identifying Seal Piping & Hood Ridge
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... INSTALLING RUBBER ROOF STRIP

NOTE: Pull off old rubber roof strip and remove remaining traces of adhesive with universal cleaner, refer to BMW Operating Fluids. Rub down with a dry cloth.

Select rubber roof strip according to length of roof recess (1). Arrange chamfered ends of rubber roof strip to match shape of roof recess (1).

Installation:

Pretreat bonding area and stick on rubber roof strip according to manufacturer's instructions.

Fig. 163: Identifying Roof Recess

Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... INSTALLING SEAL FOR REAR LID AND SIDE LID

NOTE: The following text describes how to install the seal for the rear lid as an example. Proceed in the same way for the side lids.

Removing old seal: Open lid. Grip seal piping with both hands and pull seal off hood ridge. Remove old seal over lid.

Push seal piping (1) by hand onto hood ridge (2). Using a rubber hammer, gently tap seal piping (1) as far as it will go onto hood ridge (2). Make sure piping (1) is evenly positioned especially in radii of hood ridge.

Installation:

Always position end face of seal in a straight area only:

e.g. on cross-member or on upper hood ridge of rear lid.

Suitable areas on side lids:

Upper and lower hood ridge.

Sealing lip of seal must point outwards.

After installing from inside and outside, check correct seating between lid seal and lid. Lid must rest without air on lid seal.

Fig. 164: Identifying Seal Piping & Hood Ridge
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... INSTALLING SPONGE RUBBER SEAL

NOTE: Removing old sponge rubber seal: Pull off old sponge rubber seal. Remove remaining traces of adhesive with universal cleaner, refer to BMW Operating Fluids.

Sponge rubber seal runs along area marked gray (1).

Fig. 165: Identifying Rubber Seal Area
Courtesy of BMW OF NORTH AMERICA, INC.

Lay sponge rubber seal (1) in middle of hood contact surface (2).

Installation:

Degrease contact surface (2) with benzine and rub down with a dry cloth. Stick on sponge rubber seal (1)

according to manufacturer's instructions. Position end face of seal (1) in a straight area.

Fig. 166: Identifying Seal End Face & Contact Surface
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING BALL PIVOT

NOTE: Remove gas spring, refer to **86 21 ... REMOVING GAS SPRING.**

NOTE: The following text describes how to remove the ball pivot from the hinge retaining bracket on the rear lid as an example. Proceed in the same way for the other ball pivots.

Make sure the attachments are reinstalled in the correct sequence. Only in this way will the gas springs open and close properly.

Grip ball pivot (1) at hexagon mount (2) and release nut (3).

Installation:

Use new self-locking nut.

Tightening Torque, refer to **86 21 HOOD** .

Fig. 167: Adjusting Rotary Striker Lock
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING CENTERING PIN FROM MOUNTING BRACKET

NOTE: Exclusively for removal of pin, raise the hood in the GFP area. For raising, use a wooden block with a maximum width of 35 mm and a height of 45 mm. The length must be selected depending on the lifting platform securing point. Ensure the hood is secure on the blocks.

Position block (1) so that it is only located in area of sponge rubber seal (2).

Fig. 168: Identifying Block & Rubber Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Insert a mandrel into hole (1) of pin (2) and turn counterclockwise.

Fig. 169: Identifying Mandrel Into Hole Of Pin
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING GAS SPRING

Only remove the gas spring while the lid is open. The gas spring will then not be subjected to load and the spring piston will not jump out of the spring housing. Prop the lid open with one hand to prevent it dropping closed. Remove the gas spring with your other hand.

NOTE: Side lids are each fitted with a gas spring. Rear lid is fitted with two gas springs. The following text describes how to remove the gas spring at one mounting point as an example. Proceed in the same way for all other mounting points.

Rear lid: Replace gas springs in pairs only.

Lever out retaining clip (1) in recess (2) and push on gas spring head (3) in direction of arrow. Detach spring head (3) from ball pivot.

Installation:

Push retaining clip (1) back into its original position. Press spring head (3) onto ball pivot until spring head (3) snaps audibly into place.

Fig. 170: Detaching Spring Head From Ball Pivot
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING GAS SPRING RETAINING BRACKET

NOTE: Remove gas spring, refer to **86 21 ... REMOVING GAS SPRING.**

Remove ball pivot, refer to **86 21 ... REMOVING BALL PIVOT.**

Release screws (1) and remove gas spring retaining bracket (2) from mounting bracket (3).

Installation:

Install retaining bracket so that it is centered in elongated holes.

Tightening Torque, refer to **86 21 HOOD .**

Fig. 171: Identifying Screws, Gas Spring Retaining Bracket & Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING HINGE BRACKET ON REAR LID

NOTE: Remove rear lid, refer to **86 21 ... REMOVING LID.**

Remove gas spring, remove gas spring on hinge side only, refer to **86 21 ... REMOVING GAS SPRING.**

Raise edge (1) of retaining clip (2) and slide in direction of arrow towards rear.

Fig. 172: Sliding Retaining Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Remove plastic washer (1). Pull hinge bracket (2) in direction of arrow out of mounting bracket (3).

Installation:

There must always be a plastic washer (1) fitted on left and right sides of mounting bracket (3).

Fig. 173: Removing Hinge Bracket From Mounting Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING LID

NOTE: Adjusting side lid to fit, refer to **86 21 ... ADJUSTING SIDE LID TO FIT.**

Adjusting rear lid to fit, refer to **86 21 ... ADJUSTING REAR LID TO FIT.**

NOTE: The text describes how to remove the lid at one rear lid mounting point as an example. Proceed in the same way for the side lids. Spare part lids are always supplied without complete locking systems.

Two persons are required for this task.

NOTE: **Open lid.**

Loosen screws (1). Remove lid (2).

Installation:

Rear lid: shoulder (3) points to middle of hood.

Side lid: shoulder (3) points to outside of hood.

Tightening Torque: refer to **86 21 HOOD** .

Fig. 174: Identifying Lid & Screws

Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING LOCK BARREL

NOTE: **The following text describes how to remove the lock barrel on the rear lid as an example.**

Proceed in the same way for the side lids. Remove the lock barrel while the lid is open.

Remove cover, spring nut and pull rod, refer to 86 21 ... REMOVING ROTARY STRIKER LOCK.

Slide retainer (1) in direction of arrow away from lock barrel (2). Remove lock barrel (2).

Installation:

Examine rubber backing for damage and replace if necessary. When replacing lock barrel, make sure coding of new lock barrel matches coding of fitted lock barrel (simultaneous closing).

Fig. 175: Sliding Retainer From Lock Barrel
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING LOCK STRIKER FIXTURE ON REAR LID

Grip rubber seal on seal piping (1) and pull off in area of lock striker fixture (2). Grip lid seal (3) on seal piping (4) and pull off in area of lock striker fixture (2).

Fig. 176: Identifying Lid Seal & Seal Piping
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Before drilling out rivets, drive in rivet pins with a punch.

Drill out rivets (1+2) and remove lock striker fixture (3).

Installation:

Rivets (1) have black heads and long shanks. Rivets (2) have silver heads and short shanks.

Fig. 177: Identifying Lock Striker Fixture & Rivets
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING PLUG FOR INSIDE LIGHT

NOTE: Two different types of plugs are used for the inside light. Both types function in the same way, only their designs are different.

Type 1:

Release screw (1) and separate housing plug (2).

Fig. 178: Identifying Housing Plug & Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and disconnect cables (2) from screw clamp.

Fig. 179: Identifying Cables & Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Type 2:

Release screw (1) and separate housing plug (2).

Fig. 180: Identifying Housing Plug & Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Remove contact parts (1+2).

Installation:

When installing, make sure contact parts (1+2) are in correct installation position.

Fig. 181: Identifying Contact Parts
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING ROOF RAILING

NOTE: The text describes how to remove the roof railing at one mounting point as an example. Proceed in the same way for the other mounting points.

Open cover (1) and fold down.

Fig. 182: Identifying Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolt (1).

After releasing three retaining screws, lift off roof railing (2).

Installation:

Check molded sealing parts for faults and replace if necessary. Pay attention to identification of molded sealing parts and position accordingly.

Check butylene tape seal.

Use new screws. Coat all screws with OKS 90 thread locking adhesive.

First screw down railing adapter in middle. Then press roof railing downwards with a force of approx. 50 N. Then screw down railing adapter at front and rear.

Tightening Torque for roof railing at front and rear, refer to **86 21 HOOD** .

Tightening Torque for roof railing in middle, refer to **86 21 HOOD** .

Fig. 183: Identifying Roof Railing And Bolt
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING ROOF RAILING ADAPTER

NOTE: Removing roof railing, refer to **86 21 ... REMOVING ROOF RAILING**

Remove molded sealing part (1).

Installation:

All molded sealing parts must rest flat on hood. Molded sealing parts are marked according to their position.

Fig. 184: Identifying Molded Sealing Part

Courtesy of BMW OF NORTH AMERICA, INC.

Cut butylene tape (1) out of railing adapter (2) along dotted line (3) with a knife.

Installation:

Use butylene tape, 5 mm round, for sealing railing adapter on hood roof.

Fig. 185: Identifying Butylene Tape & Railing Adapter
Courtesy of BMW OF NORTH AMERICA, INC.

Railing adapters at front and rear: Release screws (1) from inside of hood. Pull out railing adapter (2) and spacer plate (3) towards bottom.

Installation:

Use new screws. Coat all screws with OKS 90 thread locking adhesive. Install spacer plate (3) in its original position.

Tightening Torque for railing adapters at front and rear, refer to **86 21 HOOD** .

Fig. 186: Identifying Railing Adapter, Screws & Spacer Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Railing adapter in middle: Release screws (1) from inside of hood. Twist out railing adapter from outside.

Installation:

Use new screws. Tightening Torque for railing adapter in middle, refer to **86 21 HOOD** .

Fig. 187: Identifying Hood Screws

Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING ROTARY STRIKER LOCK

The following text describes how to remove the rotary striker lock on the rear lid as an example. Proceed in the same way for the side lids. Remove the lock while the lid is open.

Release screws (1) and remove cover (2). On rear lid, remove red cap (3).

Installation, rear lid only:

Place red cap back on pull rod. Red cap serves to indicate rear lid emergency unlocking facility.

Fig. 188: Identifying Screws, Cover & Red Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Remove spring nut (1) from pull rod (2).

Installation:

Use new spring nut.

Fig. 189: Identifying Spring Nut & Rod
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook pull rod (1) from rocker (2).

Fig. 190: Identifying Rod & Rocker
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove rotary striker lock (2) from opening (3).

Installation:

Tightening Torque, refer to **86 21 HOOD** .

Use new Stover nuts.

Fig. 191: Identifying Sealing Compound & Rivets
 Courtesy of BMW OF NORTH AMERICA, INC.

Detach spring nut (1) from pull rod (2). Remove pull rod (2) from rotary striker lock (3).

Installation:

Use new spring nut.

Fig. 192: Identifying Spring Nut, Rod & Rotary Striker Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REMOVING SIDE LID HINGE

NOTE: Remove side lid, refer to 86 21 ... REMOVING LID.

Remove gas spring, remove gas spring on hinge side only, refer to 86 21 ... REMOVING GAS SPRING.

Unscrew bolt (1). Remove hinge (2). If fitted, remove spacer plate(s) (3).

Installation:

Pass screws (1) again through spacer tubes. Reinstall existing spacer plate(s) in its/their original position(s). Use new self-locking nuts.

Tightening Torque, refer to **86 21 HOOD** .

Fig. 193: Identifying Hinge, Spacer Plate & Bolts
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REPLACING INSIDE LIGHT

Unclip cover (1) at side recess (arrowed) and remove towards bottom.

Fig. 194: Removing Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip lamp housing (1) at side recess (arrowed).

Fig. 195: Unclipping Lamp Housing At Side Recess
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect flat connector (1) from flat connector contact.

Fig. 196: Disconnecting Flat Connector From Flat Connector Contact
Courtesy of BMW OF NORTH AMERICA, INC.

CAUTION: Before drilling out rivets, drive in rivet pins with a punch. Drill out rivets (1). Pull off inside light mounting bracket (2) over flat connector (3).

Fig. 197: Identifying Rivets, Inside Light Mounting Bracket & Flat Connector
Courtesy of BMW OF NORTH AMERICA, INC.

86 21 ... REPLACING INSIDE LIGHT POWER CABLE

NOTE: Remove inside light cover and lamp housing,
refer to **86 21 ... REPLACING INSIDE LIGHT.**

Remove inside light plug, refer to **86 21 ... REMOVING PLUG FOR INSIDE LIGHT**

Carefully remove adhesive bonds of power cable (1) from hood surface.

Installation:

Carefully remove traces of old adhesive with a scraper. Use standard heat gun adhesive as adhesive.

Fig. 198: Identifying Power Cable
Courtesy of BMW OF NORTH AMERICA, INC.

Carefully remove adhesive bonds of power cable (1) from hood surface.

Installation:

Carefully remove traces of old adhesive with a scraper. Use standard heat gun adhesive as adhesive.

Fig. 199: Identifying Power Cable

Courtesy of BMW OF NORTH AMERICA, INC.

Remove flat connectors (1). Strip cable ends (2) and connect to a new cable. Feed cable connection through opening (3).

Fig. 200: Identifying Opening, Flat Connectors & Cable Ends

Courtesy of BMW OF NORTH AMERICA, INC.

Lay new power cable with old power cable through duct (1).

Fig. 201: Identifying Duct
Courtesy of BMW OF NORTH AMERICA, INC.

ACCESSORIES & EQUIPMENT

Body Cavity Sealing and Undercoating - Operating Fluids

1.0 GENERAL INFORMATION ON PRESERVATION MEASURES

The classic quality of BMW automobiles is based on the long-term comprehensive research and testing, the design, the applied materials and the manufacturing procedures in modern production plants.

BMW recommends cleaning the engine, engine compartment, vehicle underside, axles and engine/transmission at least twice annually, and then waxing the car or repairing the wax coating. This should be performed before or after the period of salt usage on streets.

New cars parked outdoors should be waxed at BMW centers before delivery to customers. This is to avoid deposits damaging to the paint finish, such as air-born rust particles, chemical dust, oil saturated soot, sulfur dioxide (acid) rain, etc. settling on the horizontal surfaces. Bird and insect droppings as well as tree resin could mar the paint finish, forming spots, swelling and pitting in the paint coat.

Wax films on the engine, engine compartment and A pillars (hinge areas) are intentional and prevent corrosion. Such wax film should not be removed.

Unwaxed cars should be washed at least once each week. Parked cars must never be protected with plastic or other nonporous material covers. This will damage the paint finish due to condensed water in conjunction with plastic softener diffusion and scratching.

2.0 BODY CAVITY SEALING

It is only necessary to re wax or seal the affected area after repairing the body.

Only BMW approved products may be used to comply with the six year warranty against rust perforation. These products protect cavities effectively and permanently against corrosion. Their excellent coating and waterproofing properties let them flow into all inaccessible corners and folds for unsurpassed overall protection.

Underbody and Body Cavity Sealing Compound

For sealing of body cavities, such as doors, A-pillars, front, side and cross members, etc.

(Former BMW Part No. 81 22 9 407 479)

3M Part No. 8891

Wurth Part No. 892080

Also: Wurth "Brushable Seam Sealer", Part No. 8901021.

3.0 BODY CORROSION PROTECTION

To comply with the six year warranty against rust, specially selected waxes and additives produce an elastic, temperature-proof, corrosion inhibiting protectant. The corrosion protection thickness should measure a maximum of 30 microns, but can be varied as desired by repeating the spraying procedures accordingly.

Procedure:

Clean underside of car to remove grease, oil and dirt. Cover rotating parts and parts not undercoated, such as driveshaft, brake discs, brake hoses, springs, exhaust pipes, etc.

After completion of body repairs, the affected areas must have corrosion protection reapplied. This applies, also, if the BMW Annual Check shows that the corrosion protection has to be repaired.

UNDERBODY SEALING

Quick-drying, rubber-based, paintable. Compatible with PVC-based undercoat, front apron and door sill coatings. (Former BMW Part Nos. 81 22 9 407 001, 81 22 9 407 521/522)

3M Part No. 8883

Wurth Part No. 892072

Loctite Part No. 81833 (or PX135EA)

CRC Part No. Siloo 28A

Also: Wurth "Body Seal, beige", Part No. 0892091 U.

BODY SEALANT, LIGHT

Sealing compound for all joints and seams, can be painted over. Good adhesion, free of shrinkage, resistant to heat and cold temperatures, permanently elastic.

(Former BMW Part Nos. 81 22 9 400 013 and 81 22 9 407 313)

3M Part No. 8361

Wurth Part No. 893430

SEAM SEALER, WHITE

Elasto-plastic sealing compound based on polyacrylate.

Applications: Protection of door and hood panel seams.

(Former BMW Part No. 81 22 9 407 675)

3M Part No. 8361

Würth Part No. 890100025

Also: Würth "Gray Seam Sealer", Part No. 089228 U.

TRANSPARENT WAX

Prevents corrosion on painted and non-painted metal surfaces. Serves mainly for treating edges and folded-over seams. (Former BMW Part No. 81 22 9 400 711)

3M Part No. 8892

Würth Part No. 893082

ANTI-CHIP COMPOUND

Sprayable coating compound for outside and inside. For sealing, noise-insulation and as protection against flying stones.

Quick-drying can be painted over, permanently elastic, heat and cold-resistant.

(Former BMW Part Nos. 81 22 9 407 001 and 81 22 9 407 416)

3M Part No. 8964

Würth Part No. 893075

Loctite Part No. 81833/PX135EA

4.0 OTHER FLUIDS

ADHESIVE REMOVER

(Former BMW Part No. 81 22 9 407 388)

3M Part No. 8984

RUST REMOVER

(Former BMW Part No. 81 22 9 407 121)

Würth Part No. 89091801

ACCESSORIES & EQUIPMENT

Body Equipment - Operating Fluids

1.0 ADHESIVES/SEALANTS FOR GLASS

Sikaflex 255 Adhesive is a single component polyurethane with a minimum curing time of 4 hours at 72°F/22°C and 38% relative humidity.

The windshield or rear window must be installed within 10 minutes of applying the adhesive or a skin will form on the adhesive's surface and reduce the adhesive effectiveness.

Sikaflex 255, BMW Part No. 81 22 9 407 497 Cold Kit, or

Sika Ultrafast, BMW Part No. 83 19 9 407 714 in conjunction with Heater, BMW Part No. 83 19 9 407 820.

2.0 OTHER FLUIDS

Cleaning E53 black glossy exterior ornamental trim please use Meguiar's Mirror Glaze Number 9 Professional Swirl Remover 2.0

Glass treatment, all models: Aquapel® Glass Treatment, BMW Part No. 83 19 9 408 523.

3.0 CONTACT CEMENT

A powerful adhesive for leather and leatherette, rubber moldings, felt linings, insulating materials, convertible top adhesive, etc.

(former BMW Part No. 81 22 9 407 524)

3M 1357 High Performance Contact Adhesive

4.0 INSTANT ADHESIVE FOR RUBBER, METAL AND PLASTIC SURFACES.

Applications: Rubber profiles on windows, doors, bumpers (soft and hard rubber), seals, inner covers, buttons and controls (plastic/plastic, plastic/steel), circuit elements (electronics), rear lights, turn indicators, ornamental strips and moldings.

(former BMW Part No. 81 22 9 407 143)

BMW PART NUMBER SPECIFICATION

3M	Part No. 8155
Loctite	Part No. 49450

5.0 LOCTITE 380

Black cyanoacrylate adhesive for joining metals, but also rubber, PVC etc.

Particularly recommended for attaching rubber door seals on the BMW 5 Series (E34). (former BMW Part No. 81 22 9 407 394)

BMW PART NUMBER SPECIFICATION

3M	Part No. 8155
Würth	Part No. 893 4103
Loctite	Part No. 38050

6.0 GLASS ADHESIVE

BMW Part No. 81 22 9 407 497.

7.0 PREMIUM LEATHER CARE KIT

BMW Part No. 81 11 024 455.

INTERIOR MIRROR WITH DIGITAL COMPASS

E70, E83, E90, E91, E92, E93

Fig. 1: Interior Mirror With Digital Compass
Courtesy of BMW OF NORTH AMERICA, INC.

INTRODUCTION

A digital compass in the interior mirror is offered as an optional extra (option 4NA) for the following BMW vehicles: 3 Series and X3 and X5.

> **Up to 09/2006**

A small LC display at top right in the interior mirror indicates the point of the compass in which the direction of travel is pointing: e.g. **SW** for South West.

> **From 09/2006**

The display is effected with transmitted light technology. An LC display (window) is no longer needed. The display can be deactivated.

The compass offers an additional benefit especially in the USA. In large cities the streets are frequently arranged according to the points of the compass. The points of the compass are also marked on signposts. The compass also makes orientation in European cities easier.

NOTE: Option 4NA only in conjunction with option 430 or 431.

Option 4NA "Interior mirror with digital compass" is offered only in conjunction with the following option:

- Option 430 "Interior mirror and exterior mirrors with automatic antiglare control"
- Option 431 "Interior mirror with automatic antiglare control"

Option 4NA **cannot** be combined with option 449 "Interior mirror with toll function for Japan".

Option 4NA **cannot** be combined with option 802 "Korea version".

Option 4NA **cannot** be combined with option 5AC "Main-beam assistant".

BRIEF DESCRIPTION OF COMPONENTS

The following components deliver signals for the digital compass:

- **Magnetic field sensor**

> **up to 09/2006**

The magnetic field sensor is installed in the mirror base. The magnetic field sensor measures the current alignment of the magnetic field. The signal is sent to the control electronics for the compass in the interior mirror.

> **from 09/2006**

The magnetic field sensor is on the PCB in the interior mirror.

- **Control electronics for the compass**

The interior mirror is electrically connected to the roof control panel (FZD).

The control electronics for the compass are integrated into the board for the interior mirror. The signals from the magnetic field sensor are received by the control electronics. The LCD display is activated directly by the control electronics.

The following components are controlled:

- **Display in interior mirror**

> up to 09/2006

The LC display (window) is situated at top right in the interior mirror.

The points of the compass are presented digitally on the LCD display (LCD: Liquid Crystal Display). The display is divided into eight compass points.

> from 09/2006

The point of the compass is displayed in transparent light technology in the interior mirror as well. The display is likewise situated at top right in the interior mirror. The display is divided into 8 points of the compass.

SYSTEM FUNCTIONS

The following system functions for the digital compass are described:

- Display
- Brightness control of display
- Adjustment of magnetic field zones and calibration
- from 09/2006: Further adjustments
- up to 09/2006: Fault display

Display

The 8 points of the compass are digitally displayed by abbreviations.

> From 09/2006

The display is available in English and German (delivery status: English LHD)

N: North

NE: North East

E: East

SE: South East

S: South

SW: South West

W: West

NW: North West

The changeover between displays is carried out as follows:

- The current vehicle position is the center of a 360° circle.
- The eight points of the compass divide these 360° into sixteen 22.5° segments.
- The display changes over if the direction of travel changes by more than 22.5°.

Brightness control of display

2 photocells in the electrochromic interior mirror record the surrounding brightness (1 photocell for the surrounding brightness coming from the front, 1 photocell for the surrounding brightness coming from the rear).

The photocells deliver the signals for the display brightness control.

The brightness of the display is adjusted by the interior mirror control electronics to suit the surrounding brightness.

Adjustment of magnetic field zones and calibration

The worldwide magnetic field zones are permanently stored in the interior mirror. The magnetic field zones represent the deviations in relation to an ideal magnetic field for earth. The orientation "North" is precisely determined by the magnetic field zones.

The current magnetic field zone may be adjusted according to the geographic location. For example, Germany is located in magnetic field zone "8".

A vehicle has its own magnetic field. This makes it possible for the magnetic field sensor to measure an overlapping of the magnetic field with the earth's magnetic field. This overlapping is "worked out" by calibrating the compass.

A changed magnetic field is normally calibrated "automatically".

The vehicle's magnetic field may change under the following special circumstances:

- Powerful vibration during an accident
- Very large external magnetic field - e.g. if a vehicle passes under a train when travelling through an underpass

However, a manual calibration may speed up the automatic calibration.

For procedure to be followed when setting the magnet field zones as well as manual calibration: see notes for service staff.

from 09/2006: Further adjustments

Different time-based adjustment menus can be obtained by means of the adjustment button:

- 0 to 3 seconds: Display ON/OFF

- 3 to 6 seconds: Adjustment of magnetic field zones (0 -15)
- 6 to 9 seconds: Calibration (C)
- 9 to 12 seconds: Left-hand drive or right-hand drive (L or R)
- 12 to 15 seconds: English or German (E or O)

Release the adjustment button when the correct menu is obtained. Select values in the menu by pressing briefly. After approx. 5 seconds the value is stored and the menu is automatically exited.

up to 09/2006: Fault display

The LC matrix for the LCD display lights up completely if a system fault develops. A fault is displayed under the following conditions:

- If the vehicle is highly magnetized (2,200-2,500 milligauss), the measuring range of the magnetic field sensor will be exceeded.
- If a fault develops in the circuitry of the magnetic field sensor.

NOTE: regarding the physical unit "gauss".

Gauss is the unit of measurement for magnetic flux density.

ACCESSORIES AND EQUIPMENT

Body Equipment - Special Tools - X3

51 BODY EQUIPMENT

51 0 010 TEST GAUGE FOR WINDSCREEN AND REAR WINDOW INSTALLATION

Minimum set: Mechanical tools

Note: (replaces special tool 51 3 210 from 06/2005)

Series: E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

SI number: 1 10 05 (189)

Order number: 51 0 010

Test gauge for windscreen and rear window installation

Fig. 1: Test Gauge For Windscreen And Rear Window (51 0 010)
Courtesy of BMW OF NORTH AMERICA, INC.

51 0 040 HOOD/BONNET STAY (2 X)

Minimum set: Mechanical tools

Note: For locking hood/bonnet in assembly position

Series: E83

Storage location: C48

SI number: 1 24 03 (040)

Order number: 51 0 040

Hood/bonnet stay (2 x)

51 0 101 SUPPORT, RIGHT

Note: Gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 101

Support, right

51 0 102 SUPPORT, LEFT

Note: Gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 102

Support, left

51 0 103 BRIDGE

Note: Gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 103

Bridge

51 0 104 WINDSCREEN/REAR WINDOW LOCATING FIXTURE

Note: Gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 104

Windscreen/rear window locating fixture

Fig. 2: Windscreen/Rear Window Locating Fixture (51 0 104)
Courtesy of BMW OF NORTH AMERICA, INC.

51 0 105 SIDE WINDOW LOCATING FIXTURE

Note: for gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 105

Side window locating fixture

Fig. 3: Side Window Locating Fixture (51 0 105)
Courtesy of BMW OF NORTH AMERICA, INC.

51 0 106 VACUUM PUMP

Note: for gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 106

Vacuum pump

51 0 107 HOISTING WINCH

Note: for windscreen/rear window locating fixture on gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 107

Hoisting winch

51 0 108 HOISTING WINCH

Note: for side window locating fixture on gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 108

Hoisting winch

51 0 109 SUCTION CUP

Note: Gantry crane

SI number: 6 04 03 (046)

Order number: 51 0 109

Suction cup

51 0 300 PRESSURE ROLLER

Note: For pressing sound insulation into doors, various rubber seals and trims

Series: E46, E52, E53, E60, E61, E63, E64, E65, E66, E67, E70, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1

SI number: 01 07 06 (271)

Order number: 51 0 300

Pressure roller

Consisting of:

1 = 51 0 301 Handle

2 = 51 0 302 Roller

Fig. 4: Pressure Roller (51 0 300)

Courtesy of BMW OF NORTH AMERICA, INC.

51 0 310 CLIP RELEASE TOOL

Note: For releasing trim panels and headliners.

Series: E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93

SI number: 1 03 07 337

Order number: 51 0 310

Clip release tool

Fig. 5: Clip Release Tool (51 0 310)
Courtesy of BMW OF NORTH AMERICA, INC.

51 2 100 CLAMPING LEVER

Note: For torsion bar springs of rear lid. Torsion bar spring for seat tilt adjustment (E46, E53, E83 and E84).

Series: E12, E21, E23, E24, E28, E30, E46, E46/16, E46/2, E46/3, E46/5, E53, E83, E85

Storage location: B5, C5

Order number: 51 2 100

Clamping lever

Fig. 6: Clamping Lever (51 2 100)

51 2 190 DOOR LOCK TENSIONER

Minimum set: Mechanical tools

Note: For pretensioning front and rear door locks during installation. Change to tool through use of noise-

optimized locks from 02/2004. Illustration items: 1 = Knurled nut 51 2 191 2 = Support 51 2 192 3 = Guard 51 2 196 4 = Mandrel 51 2 197

Series: E60, E61, E63, E64, E65, E66, E67, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, RR1

Storage location: B44, C44

SI number: 1 06 02 (864)

Order number: 51 2 190

Door lock tensioner

Consisting of:

1 = 51 2 191 Knurled nut

2 = 51 2 192 Support

3 = 51 2 196 Guard

Note: replaces guard 51 2 193

4 = 51 2 197 Mandrel

Note: replaces mandrel 51 2 194

Fig. 7: Door Lock Tensioner (51 2 190)

51 2 196 PROTECTION

Note: Replaces protection 51 2 193

Order number: 51 2 196

Protection

51 2 197 DRIFT

Note: Replaces drift 51 2 194

Order number: 51 2 197

Drift

51 2 220 TORX

Minimum set: Mechanical tools

Note: For removing door handles and window glass

Series: E60, E61, E63, E64, E83, E93, R52, RR2

Storage location: B47, C47

SI number: 1 08 03 (988)

Order number: 51 2 220

Torx

Fig. 8: Torx (51 2 220)

51 3 010 SUCTION LIFT (2 X)

Minimum set: Mechanical tools

Note: For removing and installing window glass

Series: E12, E21, E23, E24, E28, E30, E30/C, E30tou, E31, E32, E32/3, E34, E34tou, E36, E36/2, E36/3, E36/5, E36/7, E36/C, E36tou, E38, E38/3, E39, E39PL, E39tou, E46, E46/16, E46/2, E46/3, E46/5, E46/C, E52, E53, E60, E61, E63, E64, E65, E66, E67, E68, E70, E81, E83, E85, E86, E87, E90, E91, E92, E93, R50, R52, R53, R56, RR1, RR2

SI number: 1 05 86(604)

Order number: 51 3 010

Suction lift (2 x)

Consisting of:

1 = 51 3 011 Suction cup

Note: With elongated hole, suspension moveable about all axes

2 = 51 3 012 Suction cup

Note: With bore, suspension only moveable in longitudinal direction

3 = 51 3 013 Grab handle

Fig. 9: Suction Lift (2 x) (51 3 010)

ACCESSORIES AND EQUIPMENT

Exterior/Interior Trim - Repair Instructions - X3

00 GENERAL

51 00 ... INSTRUCTIONS ON STICKING FILM

1. General notes

- Bonding at room and object temperature of 18 to 25°C.
- Newly painted parts may only be bonded after a drying time of at least 24 hours.
- Optimal attachment of the film to the background surface is achieved after approx. 48 hours. Film must not be exposed to mechanical strain beforehand (car wash, strength test, etc.).

2. Auxiliary materials and tools

- Spirit, plastic squeegee, needle, cleaning cloth
- Low-surface-tension water

NOTE: Mixture ratio: 3 drops low-surface-tension detergent to 1 liter tap water.

3. Preparations

- If necessary, heat defective/old film with hot air blower and detach
- Remove all remnants of adhesive or clean new part thoroughly
- Clean the areas to be bonded with spirit immediately before bonding to remove silicone and grease residues.

NOTE: Observe ventilation time greater than 1 minute.

4. Bonding

1. Moist bonding

- Thoroughly moisten the background surface to be bonded with low-surface-tension water.
- Pull off the backing film, position the film on the background surface and slide into position.

NOTE: In the case of small-size film, the backing film can be pulled off completely and the adhesive side of the film can be moistened with low-surface-tension water.

- Press film down with plastic squeegee in overlapping strokes from inside outwards.
- Remove remaining water with a clean cloth.
- If necessary, carefully and slowly pull off protective film flat.
- Check film for bubbles and folds. If necessary, remove bubbles or folds with plastic squeegee or pierce with a needle and force out air or water.

2. Dry bonding

- Pull off backing film on adhesive side.
- Align film in correct position on car.
- Press film down with plastic squeegee in overlapping strokes (watch out for formation of bubbles and folds).
- If necessary, carefully and slowly pull off protective film flat.
- If necessary, pierce bubbles with a needle and force out air with plastic squeegee.

51 00 ... NOTES ON BONDING/ATTACHING COMPONENTS WITH DOUBLE-SIDED ADHESIVE TAPE

1. General notes

- Bonding at room and object temperature of 18 to 25°C.
- Newly painted parts may only be bonded after a drying time of at least 24 hours.
- Optimal bonding/attachment to the background surface is achieved after approx. 48 hours. Components must not be exposed to mechanical strain beforehand (car wash, strength test, etc.).
- Do not touch bonding area.
- It is not the length of time that pressure is applied but rather the level of pressure applied that is crucial.
- Detaching the adhesive tape after pressing destroys the adhesive layer.
- After being pressed on gently, adhesive tape can be pulled off again up to 3 times.

2. Auxiliary materials and tools

- Spirit, fluff-free cleaning cloths
- Pressure roller

3. Preparations

- Remove all remnants of adhesive or clean new part thoroughly
- Clean the areas to be bonded with spirit immediately before bonding to remove silicone and grease residues.

NOTE: Observe ventilation time greater than 1 minute.

4. Bonding

1. Components without pre-fitted adhesive tape

- Pull off liner* from adhesive tape.
- Position adhesive tape on component and stick on.
- Press down adhesive tape over entire bonding area.
- Continue with Point 4.2

* Liner is the protective film on the adhesive tape

2. Components with pre-fitted adhesive tape

- Pull off liner on adhesive side.

- Align component in correct position on vehicle.
- Press down component over entire bonding area.

51 00 ... SAFETY INSTRUCTIONS FOR WORKING ON CARS WITH AIRBAG SYSTEMS

WARNING: If work is carried out in area of airbag systems, e.g. on:

- Door trim panels
- Interior trims
- Instrument panel etc.

the ignition must be turned off in each case.

- The ignition must always be off.
- The ignition key must be removed from the ignition lock.

This eliminates the risk of injury.

51 00 ... SERVICE POSITION OF ENGINE HOOD/BONNET

Special tools required:

- **51 0 040 HOOD/BONNET STAY (2 X)**
- 51 2 160
- 51 2 170
- 51 2 180
- 51 2 240

NOTE: Only the special tool pertaining to the model series can be selected.

SPECIAL TOOL CHART

Model series	Special tool
E46, R50, R52, R53	51 2 160
E53, E60, E61, E63, E64, E81, E85, E86, E87, E90, E91, E92, E93	51 2 170
E65, E66, E67	51 2 180
E83	51 0 040
E70	51 2 240

**WARNING: Risk of injury and damage!
Engine hood/bonnet must be held by a second person helping.**

NOTE: The illustrations below serve as examples for all corresponding vehicles. The operation is described on the left side; proceed in the same way for the right side.

Special tool can only be used on housing (1) of gas spring strut (thick part).

NOTE: Gas spring strut can also be installed the other way round (housing on hood/bonnet).
Special tool can be used in both directions.

Fig. 1: Rubber Pad, Catches, Spring And Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Release gas spring strut on left/right housing side.

Slide special tool (1) over housing (2) of gas spring strut.

Clip ball socket of special tool on ball stud.

Proceed in same way on other side.

Fig. 2: Special Tool And Housing

Courtesy of BMW OF NORTH AMERICA, INC.

11 FRONT BUMPER

51 11 ... REMOVING AND INSTALLING/REPLACING COVER FOR HEADLIGHT WASHER SYSTEM ON LEFT OR RIGHT (FROM 09/2006)

Slowly pull out spray nozzle (1) by cover (2).

IMPORTANT: Risk of damage!

When releasing cover (2), grip spray nozzle (1) firmly and then allow to slide back slowly

Release cover (2) sideways from spray nozzle (1).

Fig. 6: Cover And Spray Nozzle
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) on cover (2) must not be damaged.

Fig. 7: Guides And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 11 ... REMOVING AND INSTALLING/REPLACING FRONT COVER FOR HEADLIGHT WASHER SYSTEM ON LEFT OR RIGHT (M TECHNIC AERODYNAMIC KIT)

Slowly pull out spray nozzle (1) by cover (2).

IMPORTANT: Risk of damage!

When releasing cover (2), grip spray nozzle (1) firmly and then allow to slide back slowly

Fig. 8: Cover And Spray Nozzle
Courtesy of BMW OF NORTH AMERICA, INC.

Release cover (2) sideways from spray nozzle (1).

Installation:

Guides (1) on cover (2) must not be damaged.

Fig. 9: Guides And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 11 ... REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT FRONT FOG LAMP TRIM (M TECHNIC AERODYNAMIC KIT)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Release catches (1) on trim (2) with special tool 00 9 317 and remove trim (2).

Fig. 10: Catches And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining lugs (1) on trim (3) must not be damaged.

Fig. 11: Lugs And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 11 050 REMOVING AND INSTALLING / REPLACING CARRIER FOR FRONT BUMPER TRIM

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (from 09/2006)**

Release cable holders (1) from carrier (3).

Disconnect plug connections (2) for fanfare horns.

If necessary, feed out line for headlight washer system.

Installation:

If necessary, replace cable holders (1).

Fig. 12: Cable Holders And Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw connection (1).

Remove screws and shims (3).

Remove carrier (2).

Tightening torque: 51 11 5AZ, see **51 11 FRONT BUMPER**

Fig. 13: Screw Connection, Shims And Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- A. Release nuts (2) and remove fanfare horns (1).
- B. Release screws or rivets (3) and remove holder (4)

NOTE: Depending on build date, different holders (4) are installed with different attachments:

Fig. 14: Nuts, Rivets And Fanfare Horns
Courtesy of BMW OF NORTH AMERICA, INC.

Standard bumper:

- Holder (4) at front riveted to carrier (5)

M Technic aerodynamic kit up to 02/2006:

- Holder (4) at rear screwed to carrier (5)

M Technic aerodynamic kit from 03/2006:

- Holder (4) at front screwed to carrier (5)

51 11 140 REMOVING AND INSTALLING/REPLACING BUMPER TRIM UPPER SECTION (FROM 09/2006)

Necessary preliminary tasks:

- Remove both fog lamps, see **63 17 060 REMOVING AND INSTALLING (REPLACING) LEFT OR RIGHT FRONT FOG LAMP**
- Remove top grille, see **51 11 182 Removing and installing/replacing upper grille in bumper trim (from 09/2006)**
- Remove both middle radiator grilles, see **51 13 001 Removing and installing/replacing front radiator grille, middle left or right**

Version with headlight washer system:

- Remove both covers for headlight washer system, see **51 11 ... Removing and installing/replacing cover for headlight washer system on left or right (from 09/2006)**

Release catches (1) on back of bumper trim (2).

Remove bumper trim upper section (3).

Installation:

Catches (1) must not be damaged.

Fig. 15: Catches And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 140 REMOVING AND INSTALLING/REPLACING BUMPER TRIM UPPER SECTION (UP TO 09/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**
- Remove both fog lamps, see **63 17 060 REMOVING AND INSTALLING (REPLACING) LEFT OR RIGHT FRONT FOG LAMP**
- Remove radiator grille for bumper trim, see **51 11 180 Removing and installing/replacing grille in bumper trim (M Technic aerodynamic kit)**
- Remove center insert for bumper trim, see **51 11 145 Removing and installing/replacing center insert for bumper trim**

NOTE: The operation is described on the left side; proceed in the same way for the right side.

Release screws (1).

Unhook catches (2) on bumper trim (3).

Fig. 16: Catches, Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release catches (1) and remove upper section of bumper trim (2).

Fig. 17: Catches And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty metal nuts (1) on upper section of bumper trim (2).

Replacement:

Remove center radiator grille, see **51 13 001 Removing and installing/replacing front radiator grille, middle left or right**

Version with headlight washer system:

If necessary, remove spray nozzles (3), see **61 67 045 REMOVING AND INSTALLING/REPLACING SPRAY NOZZLES FOR LEFT OR RIGHT HEADLIGHT CLEANING SYSTEM**

Fig. 18: Metal Nuts And Bumper Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

**51 11 141 REMOVING AND INSTALLING/REPLACING BUMPER TRIM LOWER SECTION
 (FROM 09/2006)**

Necessary preliminary tasks:

- Remove middle grille, see **51 11 180 Removing and installing/replacing grille in bumper trim (M Technic aerodynamic kit)**
- Remove both side grilles, see **51 11 185 Removing and installing/replacing side grille in bumper trim (from 09/2006)**

Release catches (1) on back of bumper trim (2).

Remove bumper trim lower section (3).

Installation:

Catches (1) must not be damaged.

Fig. 19: Catches And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 141 REMOVING AND INSTALLING/REPLACING BUMPER TRIM LOWER SECTION (UP TO 09/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**
- Remove both fog lamps, see **63 17 060 REMOVING AND INSTALLING (REPLACING) LEFT OR RIGHT FRONT FOG LAMP**
- Remove radiator grille for bumper trim, see **51 11 180 Removing and installing/replacing grille in bumper trim (M Technic aerodynamic kit)**
- Remove center insert for bumper trim, see **51 11 145 Removing and installing/replacing center insert for bumper trim**

Release screws (1) on left/right.

Unhook catches (2) on left/right from bumper trim (3).

Fig. 20: Catches, Screws And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Release catches (1) and remove lower section of bumper trim (2).

Fig. 21: Catches And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Lever cover (1) in direction of arrow out of lower section of bumper trim (2).

Fig. 22: Cover And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on lower section of bumper trim (2) must not be damaged.

Fig. 23: Catches And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty metal nuts (1) on lower section of bumper trim (3).

When replacing with Park Distance Control version:

Remove ultrasonic transducer (2) from lower section of bumper trim (3).

Remove locators (4) and spacer rings (5).

Fig. 24: Locators, Spacer Rings And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, cut out openings for ultrasonic sensors (2) on lower section of bumper trim (1) at moldings.

Fig. 25: Ultrasonic Sensors And Bumper Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 11 145 REMOVING AND INSTALLING/REPLACING CENTER INSERT FOR BUMPER TRIM

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**
- Remove center radiator grille, see **51 13 001 Removing and installing/replacing front radiator grille, middle left or right**

NOTE: **The operation is described on the left side; proceed in the same way for the right side.**

Version with headlight washer system:

Release lock (1).

Feed hose (2) in direction of arrow out of holder (3).

Fig. 26: Hose And Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Release catches (1) and remove center insert (2) in direction of arrow.

Fig. 27: Catches And Centre Insert
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on bumper trim (2) must not be damaged.

Fig. 28: Catches And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 11 156 REMOVING AND INSTALLING FRONT BUMPER TRIM (FROM 09/2006)

Special tools required:

- **00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Release screws (1).

Remove air duct (2).

Installation:

Make sure air duct (2) is in correct position.

Fig. 29: Air Duct And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bumper trim (2).

Installation:

Height adjustment, refer to Gap dimensions, body.

Fig. 30: Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Release screws (2) on wheel arch cover.

Fig. 31: Screws And Wheel Arch Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Release retaining elements (1 to 3) on wheel arch cover (4).

Lever out wheel arch cover (4) at side.

Installation:

Make sure wheel arch cover (4) is in correct position.

Fig. 32: Retaining Elements And Wheel Arch Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on bumper trim (2).

Fig. 33: Screw And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not damage bumper trim when pulling off.

Lever out bumper trim (1) with special tool 00 9 317 in direction of arrow.

Version without headlight cleaning system:

Pull bumper trim (1) forwards a little.

If necessary, disconnect plug connections on ultrasonic sensors and/or front fog lamps.

Remove bumper trim (1) towards front with aid of a 2nd person.

Fig. 34: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Version with headlight washer system:

**NOTE: Have a rubber plug on hand.
Pull bumper trim (3) forwards a little.**

Unlock hose (1), detach and seal pump outlet (2).
Remove bumper trim (3) towards front with aid of a 2nd person.

Fig. 35: Hose, Bumper Trim And Seal Pump Outlet
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tabs (1) on bumper trim (2) must not be damaged.

Fig. 36: Tabs And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 11 156 REMOVING AND INSTALLING FRONT BUMPER TRIM (UP TO 09/2006)

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Release screws (1).

Remove air duct (2).

Installation:

Make sure air duct (2) is in correct position.

Fig. 37: Air Duct And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bumper trim (2).

Installation:

Height adjustment, refer to Gap dimensions, body.

Fig. 38: Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Lever trim (1) with special tool 00 9 317 out of bumper trim (2) in direction of arrow.

Fig. 39: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1 and 2).

Fig. 40: Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1 to 3) on wheel arch trim (4).

Lever out wheel arch trim (4) at side.

Installation:

Make sure wheel arch trim (4) is in correct position.

Fig. 41: Retaining Elements And Wheel Arch Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on bumper trim (2).

Fig. 42: Screw And Bumper Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not damage bumper trim when pulling off.

Lever out bumper trim (1) with special tool 00 9 317 in direction of arrow.

Version without headlight cleaning system:

Pull bumper trim (1) forwards a little.

If necessary, disconnect plug connections on ultrasonic sensors and/or front fog lamps.

Remove bumper trim (1) towards front with aid of a 2nd person.

Fig. 43: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Version with headlight washer system:

NOTE: Have a rubber plug on hand.

Pull bumper trim (3) forwards a little.

Unlock hose (1), detach and seal pump outlet (2).

Remove bumper trim (3) towards front with aid of a 2nd person.

Fig. 44: Hose, Bumper Trim And Seal Pump Outlet
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tabs (1) on bumper trim (2) must not be damaged.

Fig. 45: Tabs And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 156 REMOVING AND INSTALLING/REPLACING FRONT BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)

Special tools required:

- **00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove both fog light trims, see **51 11 ... Removing and installing/replacing left or right front fog lamp trim (M Technic aerodynamic kit)**

Version with headlight washer system:

- Remove both covers for headlight washer system, see **51 11 ... Removing and installing/replacing cover for headlight washer system on left or right (from 09/2006)**

Release screws (1).

Remove air duct (2).

Installation:

Make sure air duct (2) is in correct position.

Fig. 46: Air Duct And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bumper trim (2).

Installation:

For adjustment, refer to Body gap dimensions.

Fig. 47: Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1 and 2).

Fig. 48: Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws or rivets (1 to 3) on wheel arch trim (4).

Lever out wheel arch trim (4) at side.

Installation:

Make sure wheel arch trim (4) is in correct position.

Fig. 49: Retaining Elements And Wheel Arch Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on bumper trim (2).

Fig. 50: Screw And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not damage bumper trim when pulling off.

Lever out bumper trim (1) with special tool 00 9 317 in direction of arrow.

Pull bumper trim (1) forwards a little.

If necessary, disconnect plug connections on ultrasonic sensors and/or front fog lamps.

Remove bumper trim (1) towards front with aid of a 2nd person.

Fig. 51: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tabs (1) on bumper trim (2) must not be damaged.

Fig. 52: Tabs And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 157 REPLACING FRONT BUMPER TRIM

Necessary preliminary tasks:

- Unscrew and remove license plate
- Remove holder for license plate, see **51 11 158 Replacing baseplate for license plate**
- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**
- Remove upper section of bumper trim, see **51 11 140 Removing and installing/replacing bumper trim upper section (from 09/2006)**
- Remove lower section of bumper trim, see **51 11 141 Removing and installing/replacing bumper trim lower section (from 09/2006)**

Build date from 09/2006:

- If necessary, remove side marker
- If necessary, remove spray nozzles
- If necessary, remove ultrasonic transducer

51 11 158 REPLACING BASEPLATE FOR LICENSE PLATE

Unscrew and remove license plate.

Release screws (1) and remove baseplate (2) for license plate.

Fig. 53: Screws And Baseplate

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 180 REMOVING AND INSTALLING/REPLACING GRILLE IN BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Release catches (1) and remove grille (2).

Installation:

Catches (1) on bumper trim (3) must not be damaged.

Fig. 54: Catches, Grille And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 180 REMOVING AND INSTALLING/REPLACING MIDDLE TRIM GRILLE IN BUMPER TRIM (UP TO 09/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Release catches (1) and remove grille (2).

Installation:

Catches (1) must not be damaged.

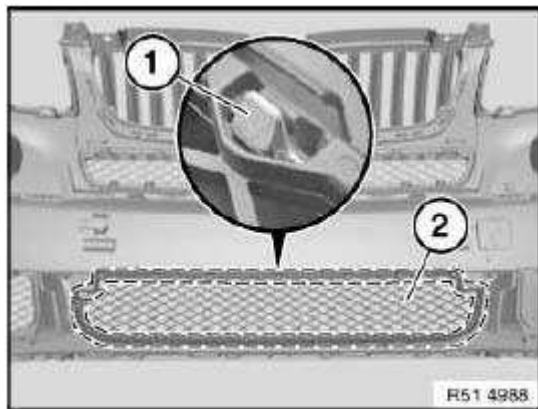

Fig. 55: Catches And Grille

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 180 REMOVING AND INSTALLING/REPLACING TRIM GRILLE FOR BUMPER TRIM (UP TO 09/2006)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Unhook grille (1) from bumper trim (2) with special tool 00 9 317 in direction of arrow.

Fig. 56: Special Tool (00 9 317)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Hooks (1) of trim (2) must not be damaged.

Fig. 57: Hooks And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 11 182 REMOVING AND INSTALLING/REPLACING UPPER GRILLE IN BUMPER TRIM (FROM 09/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Release catches (1) and remove grille (2).

Installation:

Catches (1) must not be damaged.

Fig. 58: Catches And Grille

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 185 REMOVING AND INSTALLING/REPLACING SIDE GRILLE IN BUMPER TRIM (FROM 09/2006)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Release catches (1) and remove grille (2).

Installation:

Catches (1) must not be damaged.

Fig. 59: Catches And Grille

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 701 REPLACING LEFT OR RIGHT BRACKET FOR FRONT BUMPER

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Version with M Technic aerodynamic kit:

- Remove headlight bracket, see **51 11 710 Removing and installing/replacing left or right headlight bracket (M Technic aerodynamic kit)**

Release screws (1) and feed out and remove bracket (2) in direction of arrow.

Fig. 60: Screws And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) on bracket (2) must not be damaged.

Fig. 61: Guides And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 710 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT HEADLIGHT BRACKET (M TECHNIC AERODYNAMIC KIT)

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Version with headlight washer system:

- Remove high-pressure nozzle, see **61 67 083 REMOVING AND INSTALLING/REPLACING HIGH - PRESSURE NOZZLE OF LEFT OR RIGHT HEADLIGHT WASHER SYSTEM (M AERODYNAMIC KIT)**

Release screws (1) and remove bracket (2).

Fig. 62: Screws And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

51 11 770 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT DEFORMATION ELEMENT FOR FRONT BUMPER

Necessary preliminary tasks:

- Remove carrier for bumper trim at front, see **51 11 050 Removing and installing / replacing carrier for front bumper trim**

Release screws (1).

Feed air duct (2) out of tension strut (3).

Installation:

Make sure air duct (2) is in correct position.

Fig. 63: Air Duct And Tension Strut
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on deformation element (2).

Fig. 64: Screw And Deformation Element
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For height adjustment, mark position of deformation element (4).

Release bolts (1) on supplementary cooler bracket.

Release bolts (2).

Release nuts (3) and remove deformation element (4).

Installation:

Height adjustment, refer to Gap dimensions, body.

Tightening torque: 51 11 6AZ, see **51 11 FRONT BUMPER**

Fig. 65: Nuts, Bolts And Deformation Element
Courtesy of BMW OF NORTH AMERICA, INC.

12 REAR BUMPER

51 12 ... OVERVIEW OF REAR BUMPER (FROM 09/2006)

R51 4997

- | | | | |
|---|-------------------------------|----|--|
| 1 | Carrier | 7 | Trim, rear |
| 2 | Holder, side | 8 | Cover, trailer tow hitch |
| 3 | Guide, side | 9 | Cover on towing eye |
| 4 | Guide, middle | 10 | Reflector |
| 5 | Bumper trim | 11 | Ultrasonic transducer |
| 6 | Trim, side | 12 | Trim, loading sill |

Fig. 66: Rear Bumper (From 09/2006) Components
 Courtesy of BMW OF NORTH AMERICA, INC.

51 12 ... OVERVIEW OF REAR BUMPER (UP TO 09/2006)

R51 3930

- | | | | |
|---|---|---|--|
| 1 | Carrier, rear | 6 | Guide, middle |
| 2 | Holder, side | 7 | Cover, trailer tow hitch |
| 3 | Guide, side | 8 | Cover on towing eye |
| 4 | Cover/trim, loading sill | 9 | Bumper trim, rear |

Fig. 67: Rear Bumper (Up To 09/2006) Components
 Courtesy of BMW OF NORTH AMERICA, INC.

51 12 ... REMOVING AND INSTALLING/REPLACING DIFFUSER ON REAR BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing/replacing rear bumper trim (M Technic aerodynamic kit)**

Release catches (1) on reverse side of bumper trim (2) with special tool 00 9 317 and remove diffuser (3).

Installation:

Catches (1) must not be damaged.

Fig. 68: Catches And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, remove rear reflector.

Version with trailer coupling:

Remove rib (1) from diffuser (2) with diagonal cutting pliers.

Fig. 69: Rib And Diffuser

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 ... REMOVING AND INSTALLING/REPLACING TRIM FOR BUMPER TRIM AT REAR

Special tools required:

- 00 9 322 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove both rear reflectors

Release clip (1) on left/right.

Fig. 70: Clip
Courtesy of BMW OF NORTH AMERICA, INC.

Release trim (1) at catches (2).

Fig. 71: Trim And Catches
Courtesy of BMW OF NORTH AMERICA, INC.

Slide special tool 00 9 322 between trim (1) and bumper trim (2) and press down catches (3).

Unclip trim (1) towards rear.

Pull trim (1) towards rear slightly and release all further catches (3) with special tool 00 9 322.

Installation:

Catches (3) must not be damaged.

Fig. 72: Special Tool (00 9 322)

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 ... REMOVING AND INSTALLING/REPLACING TRIM ON LOADING SILL FOR REAR BUMPER (M TECHNIC AERODYNAMIC KIT)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Unclip trim (1) over entire length with special tool 00 9 317 towards top and remove towards rear.

Installation:

If necessary, replace faulty retainers (2).

Install trim (1) with fitted retainers (2).

Fig. 73: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 050 REMOVING AND INSTALLING / REPLACING CARRIER FOR REAR BUMPER TRIM

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Release nuts (1) on left and right.

Remove carrier (2).

Tightening torque: 51 12 3AZ, see **51 12 REAR BUMPER**

Fig. 74: Carrier And Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 080 REMOVING AND INSTALLING/REPLACING TRIM ON LOADING SILL FOR REAR BUMPER (FROM 09/2006)

NOTE: Trim (1) is if necessary secured to bumper with double-sided adhesive tape (3).

Lever out trim (1) from bumper (2).

Installation:

Make sure trim (1) is correctly seated on bumper (2).

Fig. 75: Trim And Bumper
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Engage trim (1) in bumper (2).

Fig. 76: Trim And Bumper
Courtesy of BMW OF NORTH AMERICA, INC.

51 12 156 REMOVING AND INSTALLING REAR BUMPER TRIM (FROM 09/2006)

Necessary preliminary tasks:

- Remove trim on loading sill, see **51 12 080 Removing and installing/replacing trim on loading sill for rear bumper (from 09/2006)**

Release screws (1) on bumper trim (2).

Fig. 77: Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and nut (2) on left and right.

Installation:

Make sure wheel arch trim (3) is in correct position.

Fig. 78: Screws, Nut And Wheel Arch Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Press wheel arch trim slightly to one side and release screw (1) on bumper trim (2) on left and right.

Fig. 79: Screw And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bracket (2).

Fig. 80: Screws And Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Release nuts (2) and feed bracket out of stud.

Fig. 81: Nut And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage!

Do not detach bumper trim (1) at sides in outward direction.

Pull off bumper trim (1) for side panel in direction of arrow.

Fig. 82: Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Pull out bumper trim (1) in direction of arrow and remove with aid of a 2nd person.

NOTE: Version with Park Distance Control:

If necessary, pull off bumper trim (1) a little and disconnect plug connections of ultrasonic transducers.

Fig. 83: Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 156 REMOVING AND INSTALLING REAR BUMPER TRIM (UP TO 09/2006)

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

NOTE: The operation is described on the left side; proceed in the same way for the right side.

Release screws (1) and nuts (2).

Installation:

Make sure wheel arch trim (3) is in correct position.

Fig. 84: Screws, Nut And Wheel Arch Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Press wheel arch trim slightly to one side and release screw (1) on bumper trim (2).

Fig. 85: Screw And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bracket (2).

Fig. 86: Screws And Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) and nuts (2).

Fig. 87: Nut And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Lever out trim (1) with special tool 00 9 317 in direction of arrow.

Fig. 88: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (1) and guides (2) of trim (3) must not be damaged.

Fig. 89: Catch, Guides And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on bumper trim (2) on left and right.

Fig. 90: Screw And Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage!

Do not detach bumper trim (1) at sides in outward direction.

Pull off bumper trim (1) for side panel in direction of arrow.

Fig. 91: Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Pull out bumper trim (1) in direction of arrow and remove with aid of a 2nd person.

NOTE:

Version with Park Distance Control:

If necessary, pull bumper trim off a little and disconnect plug connections of ultrasonic transducers (2).

Remove bumper trim (1) with aid of a second person.

Fig. 92: Ultrasonic Transducers And Bumper Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 12 156 REMOVING AND INSTALLING/REPLACING REAR BUMPER TRIM (M TECHNIC AERODYNAMIC KIT)

Necessary preliminary tasks:

- Remove trim on loading sill, see **51 12 080 Removing and installing/replacing trim on loading sill for rear bumper (from 09/2006)**

Release screws (1) on bumper trim (2).

Fig. 93: Screws And Bumper Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and nut (2) on left and right.

Installation:

Make sure wheel arch trim (3) is in correct position.

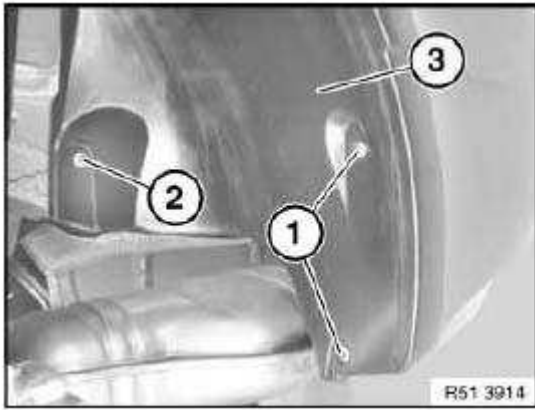

Fig. 94: Screws, Nut And Wheel Arch Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Press wheel arch trim slightly to one side and release screw (1) on bumper trim (2) on left and right.

Fig. 95: Screw And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on bracket (2).

Fig. 96: Screws And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Release nuts (2) and feed bracket out of stud.

Fig. 97: Nut And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage!
Do not detach bumper trim (1) at sides in outward direction.

Pull off bumper trim (1) for side panel in direction of arrow.

Fig. 98: Bumper Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Pull out bumper trim (1) in direction of arrow and remove with aid of a 2nd person.

NOTE: Version with Park Distance Control:
If necessary, pull off bumper trim (1) a little and disconnect plug connections of

ultrasonic transducers (2).

Fig. 99: Ultrasonic Transducers And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 12 157 REPLACING REAR BUMPER TRIM

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing rear bumper trim (from 09/2006)**

Version with M Technic aerodynamic kit:

- Remove diffuser, see **51 12 ... Removing and installing/replacing diffuser on rear bumper trim (M Technic aerodynamic kit)**

Build date from 09/2006:

- Remove trims on left and right, see **51 12 185 Removing and installing/replacing trim for bumper trim on left or right**
- Remove rear trim, see **51 12 ... Removing and installing/replacing trim for bumper trim at rear**

Remove cover cap (1) for tow lug.

If necessary, remove flap for towing hitch (2)

Version with Park Distance Control (PDC):

Remove all ultrasonic transducers (3).

Build date up to 09/2006: Remove locators (4) and spacer rings (5).

Fig. 100: Cover Cap, Towing Hitch, Locators And Spacer Rings
Courtesy of BMW OF NORTH AMERICA, INC.

Version with PDC up to build date 09/2006:

Cut out openings for ultrasonic sensors (1) on lower section of bumper trim (2) at moldings.

Fig. 101: Ultrasonic Sensors And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, remove impact absorber (1).

Fig. 102: Impact Absorber

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 185 REMOVING AND INSTALLING/REPLACING TRIM FOR BUMPER TRIM ON LEFT OR RIGHT

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing rear bumper trim (from 09/2006)**
- Remove rear reflector

Release clip (1).

Fig. 103: Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Release catches (1) and remove trim (2).

Installation:

Catches (1) must not be damaged.

Fig. 104: Catches And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 801 REPLACING BRACKET FOR REAR BUMPER AT LEFT OR RIGHT

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing rear bumper trim (from 09/2006)**

If necessary, disconnect plug connection at RDC trigger transmitter.

Release screw (1) and remove bracket (2).

Fig. 105: Screw And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty metal nuts (1) on bracket (2).

Replacement:

If necessary, remove RDC trigger transmitter.

Fig. 106: Metal Nuts And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

51 12 825 REMOVING AND INSTALLING/REPLACING GUIDE FOR REAR CENTER BUMPER

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing rear bumper trim (from 09/2006)**

Version with Park Distance Control:

If necessary, release cable holders (1) and lay cable to one side.

Unfasten screws (2).

Remove guide (3).

Installation:

If necessary, replace damaged cable straps (1).

Tightening torque: 51 12 10AZ, see **51 12 REAR BUMPER**

Fig. 107: Cable Straps, Guide And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

51 12 828 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT GUIDE FOR REAR BUMPER

Necessary preliminary tasks:

- Remove rear bumper trim, see **51 12 156 Removing and installing rear bumper trim (from 09/2006)**

Release screws (1).

Remove guide (2).

Tightening torque: 51 12 9AZ, see **51 12 REAR BUMPER**

Fig. 108: Guide And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

13 TRIM, COVERS, HANDLE TRIM

51 13 ... REPLACING FRONT RADIATOR GRILL, MIDDLE LEFT OR RIGHT

NOTE: Representation created using the E85 as an example. There may be differences in detail in the case of other vehicle models.

Lever out upper catches (3) and separate inner section (2) from chrome ring (1).

Fig. 109: Upper Catches And Chrome Ring
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check inner section (1) for damage.

Retaining lugs (3) and (4) along line (2) must not be damaged.

Fig. 110: Lugs And Inner Section
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check chrome ring (1) for damage.

Catches (4) and guides (3) along line (2) must not be damaged.

Fig. 111: Catches, Chrome Ring And Guides
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Assemble chrome ring (1) and inner section (2).

Make sure catch (3) is correctly assembled.

Fig. 112: Upper Catches And Chrome Ring
 Courtesy of BMW OF NORTH AMERICA, INC.

51 13 001 REMOVING AND INSTALLING/REPLACING FRONT RADIATOR GRILLE, MIDDLE LEFT OR RIGHT

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**

Lever out catches (1) and (2) and remove front grille (3) towards front.

Fig. 113: Catches And Front Grille
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

All catches and guides on front grille (2) must not be damaged.

Press on chrome ring to push front radiator grille (2) into bumper trim.

Fixtures (1) must engage correctly.

Fig. 114: Radiator Grille And Fixtures
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- Replace front radiator grille, middle left or right, see **51 13 ... Replacing front radiator grill, middle left or right**

51 13 115 REMOVING AND INSTALLING/REPLACING COWL PANEL COVER

Necessary preliminary tasks:

- Remove both windscreen wiper arms, see **61 61 100 REMOVING AND INSTALLING/REPLACING BOTH WINDSCREEN WIPER ARMS**
- Remove microfilter for passenger compartment ventilation, see **64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION**

Unclip cover (1) on cowl panel.

Fig. 115: Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty clips (1) on cover (3).

Ensure retainers (2) are correctly seated.

Fig. 116: Clips And Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, remove seal (1) from cover (2) for cowl panel.

Fig. 117: Seal And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

51 13 280 REMOVING AND INSTALLING/REPLACING TRIM STRIP ON ROOF FRAME AT LEFT OR RIGHT

Special tools required:

- 00 9 321 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- If necessary, remove railing, see **51 13 305 Removing and installing/replacing left or right rail**

Lever out trim strip (1) with special tool 00 9 321 starting at rear.

Unclip trim strip (1) up to front and if necessary pull out of seal (2) towards rear.

Fig. 118: Special Tool (00 9 321)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) of clips (2) must not be damaged.

If necessary, replace clips (2).

Fig. 119: Catches And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of trim strip (3) must not be damaged or missing:

1. Seals
2. End piece, front/rear

Replacement:

Moisten seals (1) with water and slide into trim strip (3).

Fit end pieces (2) at front and rear.

Fig. 120: Seals And Trim Strip

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

E83 only: Push trim strip (2) at front into seal (1).

Trim strip (2) must be flush with edge (3) at rear.

Clip trim strip (2) into place completely.

Fig. 121: Trim Strip And Seal

Courtesy of BMW OF NORTH AMERICA, INC.

51 13 305 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT RAIL

WARNING: Read and comply with safety regulations for handling airbag modules and pyrotechnical belt tensioners, see 51 00 ... Safety instructions for working on cars with airbag systems

Incorrect handling can activate airbag and cause injury.

Disconnect battery.

Necessary preliminary tasks:

- Remove roofliner, see 51 44 002 Removing and installing roofliner (on version without panorama sunroof)
- Partially remove head airbag, see 72 12 045 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT AHPS2 HEAD AIRBAG (VERSION WITHOUT SLIDE/TILT SUNROOF)

Detach water drainage hose (1 and 2).

Release screws (3) on holder (4).

Lever out cover (5) underneath.

Fig. 122: Water Drainage Hose, Screws And Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1 and 2).

Installation:

- A. Tighten down nuts (1) to tightening torque: 51 13 3AZ, see **51 13 TRIM PARTS, COVERS, HANDLE TRIM**
- B. Adhere to settling time, refer to 51 13 3AZ, see **51 13 TRIM PARTS, COVERS, HANDLE TRIM**
- C. Tighten down nut (1) at rear and middle again to tightening torque 51 13 3AZ.
- D. Release nut (2) at front and tighten down again to tightening torque 51 13 3AZ plus angle of rotation.

IMPORTANT: Observe tightening specifications without fail (water ingress).

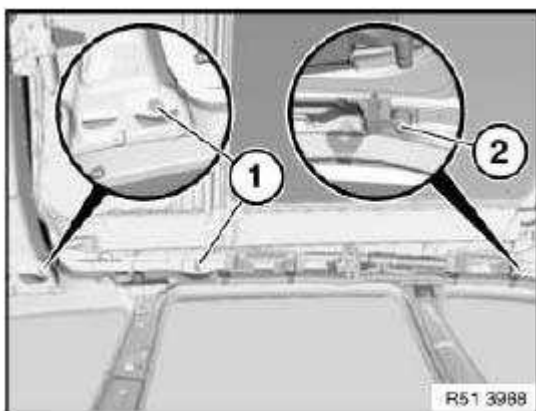

Fig. 123: Nuts
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove rail (1) in direction of arrow.

Fig. 124: Rail
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seal (2) on rail (3) must not be damaged.

IMPORTANT: Replace foam seals (1) after each removal.

Fig. 125: Seal And Rail
Courtesy of BMW OF NORTH AMERICA, INC.

51 13 402 REMOVING AND INSTALLING/REPLACING HANDLE STRIP (ON REAR LID)

Necessary preliminary tasks:

- Remove rear finisher trim, see **51 13 420 Removing and installing/replacing center rear-end trim section**

Release catches (1 and 2) on handle strip (3).

Fig. 126: Catches And Handle Strip

Courtesy of BMW OF NORTH AMERICA, INC.

Feed handle strip (1) in direction of arrow out of rear finisher (2).

Fig. 127: Handle Strip And Rear Finisher

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seal (1) on handle strip (2) must not be damaged.

Replacement:

If necessary, replace seal (1).

Fig. 128: Seal And Handle Strip

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, lever out license plate lights (1) at openings (2) in direction of arrow and remove from handle strip (3).

Fig. 129: License Plate Lights And Handle Strip

Courtesy of BMW OF NORTH AMERICA, INC.

51 13 412 REMOVING AND INSTALLING (REPLACING) LOWER TRIM ON REAR LID

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

IMPORTANT: Build date from 09/2006 (painted lower trim):

Due to the risk of damage to the lower trim, the clips must be cut through from the inside.

During replacement, the lower trim can be removed from the outside (see Fig. 131).

Build date from 09/2006 (painted lower trim):

Remove panel for rear lid, see **51 49 008 Removing and installing/replacing panel for rear lid**

Cut through all clips (1) from the inside.

Unclip and remove lower trim from the outside.

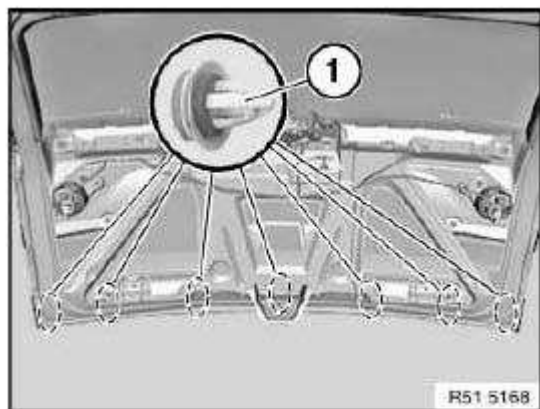

Fig. 130: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Build date up to 09/2006 or M aerodynamic kit:

Open rear lid.

Unclip clips (1) for trim (2) with special tool 00 9 317.

Fig. 131: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts must not be damaged or missing:

- 1 Clips with seal
- 3 Seal

If necessary, replace faulty parts.

Fig. 132: Clips With Seal

Courtesy of BMW OF NORTH AMERICA, INC.

51 13 420 REMOVING AND INSTALLING/REPLACING CENTER REAR-END TRIM SECTION

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove number/license plate.

Release screws (1).

Tightening torque: 51 13 4AZ, see **51 13 TRIM PARTS, COVERS, HANDLE TRIM**

Fig. 133: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Attach adhesive tape (1) underneath center rear-end trim section (2) (risk of damage).

Unclip clips (3) with special tool 00 9 317.

Pull off center rear-end trim section (2) in direction of arrow a little.

Fig. 134: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) at center rear-end trim section (2).

Remove center rear-end trim section (2).

Fig. 135: Centre Rear-End Trim Section And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fit all clips (1) with sealing ring.

If necessary, replace faulty clips (1).

Replacement:

Remove handle strip (3).

Fig. 136: Handle Strip And Clips
 Courtesy of BMW OF NORTH AMERICA, INC.

14 BMW EMBLEMS, MODEL EMBLEMS

51 14 ... INSTRUCTIONS FOR ATTACHING NUMBER/LETTER DESIGNATION COMBINATION

NOTE: The model designation is attached with adhesive and cannot be re-used.
 The model designation must be attached at room temperature.

The model designation must be removed at stove - enameling temperatures exceeding 80°C.

NOTE: The following work steps are described using the "316 i" as the example.

Removing:

Coat nylon string or strong yarn with tensides (e.g. washing-up liquid).

Cut through adhesive layer and remove model designation (1) from rear lid (2).

Remove remainder of adhesive layer with adhesive remover (sourcing reference: BMW Parts Service).

Fig. 137: Model Designation And Rear Lid
Courtesy of BMW OF NORTH AMERICA, INC.

Assembly:

Number and letter combinations (1) of the model designation are not connected to each other and are supplied on a carrier film (2).

IMPORTANT: Adhesive areas must be dry and free of dust and grease.
Once it has been cleaned, do not touch the adhesive area with bare hands.

Remove liner (3) (protective strip for adhesive surface).

Press on model designation firmly.

Remove carrier film (2).

Fig. 138: Carrier Film And Liner

Courtesy of BMW OF NORTH AMERICA, INC.

51 14 000 REMOVING AND INSTALLING/REPLACING FRONT BMW BADGE

Special tools required:

- 00 9 318 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Lever out badge with special tool 00 9 318 and remove towards top.

Fig. 139: Special Tool (00 9 318)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of badge (1) must not be damaged or missing:

- 2 Guide pins
- 3 Grommets

Fig. 140: Guide Pins And Grommets

Courtesy of BMW OF NORTH AMERICA, INC.

51 14 008 REPLACING (REMOVING AND INSTALLING) NUMBER/LETTER COMBINATION ON FRONT LEFT OR RIGHT SIDE PANEL

IMPORTANT: The "Instructions for number/letter combination cementing" serve as the basis for these repair instructions and must be followed without fail., see 51 14 ... Instructions for attaching number/letter designation combination

NOTE: Procedure and dimensions are also mandatory for right side, outer edge of number is then positioned.

NOTE: Number/letter combination is stuck on at a height level with turn indicator.

Stick on adhesive tape (1) for contour edge (2) to side panel up to turn indicator lamp.

Mark measurement "B" from side edge (3) on adhesive tape.

Dimensions:

A= 30 mm

B= 22 mm

Fig. 141: Adhesive Tape And Contour Edge
Courtesy of BMW OF NORTH AMERICA, INC.

51 14 010 REMOVING AND INSTALLING/REPLACING REAR BMW BADGE

Operation is identical to:

51 14 000 Removing and installing/replacing front BMW badge

51 14 110 REMOVING AND INSTALLING/REPLACING REAR MODEL DESIGNATION

IMPORTANT: The "Instructions for number/letter combination cementing" serve as the basis for these repair instructions and must be followed without fail, see 51 14 ... Instructions for attaching number/letter designation combination

Stick on top edge of adhesive tape (1) to bottom edge of rear lid (2) at distance "A" and "B".

Mark measurement "C" from side edge (3) measured on top edge of adhesive tape.

Dimensions:

A= 50 mm

B= 55 mm

C= 77 mm

Fig. 142: Adhesive Tape And Rear Lid
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Measurements "D" and "E" are for information purposes only, as they are determined by carrier film.

D= 15.6 mm

E = 170 mm

16 MIRRORS/COVERS/ASHTRAYS/SHELVES/TRAYS

51 16 ... CALIBRATING COMPASS IN INTERIOR REARVIEW MIRROR

NOTE: It may be necessary to alter the magnetic deflection zone if the vehicle is more than two ranges away from the set deflection zone.

For numbers of magnetic deflection zone, refer to Owner's Handbook.

If may be necessary to calibrate the compass if:

- vehicle battery has been disconnected for an extended period of time
- "C" appears in compass display
- there is no compass display

Setting magnetic deflection zone:

- Switch ignition on.
- Using a suitable tool (1), press pushbutton in area (A) of mirror (2) until a number appears in compass display (B)
- Press pushbutton repeatedly until number of desired zone appears
- Wait until direction display appears
- Magnetic deflection zone is now set

Fig. 143: Suitable Tool And Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Calibrating compass:

- Switch ignition on.
- Using a suitable tool (1), press pushbutton in area (A) of mirror (2) until "C" appears in compass display (B)
- Drive vehicle 2 to 3 times in a circle at approx. 10 mph
- Calibration process is completed when direction display appears

Fig. 144: Suitable Tool And Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 ... CEMENTING OF MIRROR BASE

Material Requirements:

Repair set for cementing of mirror base (Sourcing Reference: BMW Parts Service)

Primer XW 775 (Sourcing Reference: BMW Parts Service)

1. Preparations

1. Cement at room temperature and make sure that, in cold weather, the window glass and base are brought to room temperature in the workshop long enough to prevent moisture forming on the surface.
2. Mark location of the mirror mount on the outside of the windshield.

Scratch off cement residue on glass and base with a sharp tool.

3. Clean cement area on window and base with clean non-fluffing cloth and alcohol/cetone and allow to dry! Never use paint thinners!

2. Primer Coat

Apply colorless, diluted primer to surface of windshield intended for cementing with help of cotton buds (Q-Tips or similar).

Specified ventilation time at least 10 minutes, maximum 1 hour

3. Cement Coat

1. Mixing Cement

Trim off sealing tips on containers of cement and hardener using a knife.

Make sure that both openings are equal in size, as otherwise there would be mistakes in mixing.

The sealing cap for subsequent plugging of the double injector is located between both pistons of the injector.

Break off sealing cap.

The required amount of cement and hardener is removed by applying light pressure on the pistons.

The mixing ratio for cement and hardener is 1 : 1 (weight and volume). It is important that the same volumes of cement and hardener are removed (increase size of openings if necessary).

Both components react chemically with each other. Thorough, intensive and homogenous mixing is a requirement for this reaction and for the quality of cementing.

Consequently both components must be mixed in such a way that there is a uniform, seam-free color mixture.

2. Application

At 20 ... 25°C the mix can be processed after approx. 5 ... 10 minutes (pot time).

Apply thin (approx. 0.5 mm), uniform coat of cement on base with spatula and press base onto glass in such a way that cement obtains good contact with windshield across the entire surface area.

NOTE: The temperature for the hardening process should not be lower than +18°C.

3. Fixing Bonded Parts

Epoxide resin cement does not have an initial strength property. It is therefore necessary to fix all bonded parts (cement tape or similar). The joining and fixing of bonded parts must be accomplished within the potlife). Check that the arresting button is located correctly on the mirror base to ensure that the mirror, when it is attached, is seated straight.

(Long side of mirror base hexagon parallel to upper edge of window).

4. Hardening of cement

Hardening speed depends on the ambient temperature.

For this reason, the mirror base must be secured with adhesive tape or similar for at least 3 ... 4 hours.

After 12 hours have elapsed, clip mirror into place as soon as possible.

4. Working Hygiene

CAUTION: Cement is dangerous for health when vapors are inhaled or through contact with the skin.

As is the case for all epoxide resins, sensitive persons might be confronted with an allergy through contact with the skin.

If the product gets on the skin, wash off with soap and water immediately.

If it gets in an eye, rinse the eye thoroughly in water and consult doctor.

Make sure that the room is well ventilated and gloves are worn for the application of cement.

51 16 ... REMOVING AND INSTALLING/REPLACING COVER FOR CENTER ARMREST (STORAGE COMPARTMENT WITH CD CHANGER)

Necessary preliminary tasks:

- Remove storage compartment, see **51 16 200 Removing and installing/replacing storage compartment (with CD changer)**

Release screws (1).

Remove cover (2) towards top.

Fig. 145: Cover And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement (version without telephone):

Remove insert (1) and release screws (2) underneath.

Unclip trim (3) towards top.

Fig. 146: Insert, Trim And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement (version with telephone):

Remove eject box.

Remove insert (1) and release screws (2).

Unclip trim (3) towards top.

Fig. 147: Insert, Trim And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 000 REMOVING AND INSTALLING/REPLACING MIRROR ON LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 Removing and installing left or right front door trim panel**

Press cover (1) and guide rubber (2) to one side.

Disconnect plug connection (3).

Release screws (4).

Tightening torque: 51 16 1AZ, see **51 16 MIRRORS, FINISHERS, ASHTRAYS, CONSOLES**

Replacement:

Due to the self-tapping screws, the tightening torque of the new mirror is increased by 2 Nm.

Fig. 148: Cover, Plug Connection And Guide Rubber
Courtesy of BMW OF NORTH AMERICA, INC.

Remove mirror (1) outwards.

Fig. 149: Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Sound insulation (1) on mirror (2) must not be damaged.

Check function.

Fig. 150: Sound Insulation And Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- If necessary, convert mirror glass, see **51 16 026 Replacing mirror glass**
- If necessary, convert housing on door mirror, see **51 16 040 Removing and installing/replacing housing on left or right door mirror**

- If necessary, convert retaining ring on door mirror, see **51 16 045 Removing and installing/replacing retaining ring on left or right door mirror**

51 16 026 REPLACING MIRROR GLASS

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

WARNING: Move mirror glass with hand carefully and slowly.
If mirror glass is damaged:
Wear protective goggles and cut-proof gloves.
Risk of injury by flaking-off glass splinters.

IMPORTANT: Bring door mirror to room temperature to prevent catches from breaking off.

Press mirror glass (1) on side vehicle by hand to full extent.

NOTE: Secure mirror glass (1) against falling out.

Unclip mirror glass (1) from outer side with special tool 00 9 317 all round.

Unlock and disconnect associated plug connections, remove mirror glass (1).

Fig. 151: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retaining lugs (1) must not be damaged.

Fit mirror glass (2) with retaining lugs (1) flush on mirror adjusting drive and clip into place.

Ensure correct locking.

Make sure mirror adjusting drive functions correctly.

Fig. 152: Mirror Glass And Retaining Lugs

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 040 REMOVING AND INSTALLING/REPLACING HOUSING ON LEFT OR RIGHT DOOR MIRROR

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove mirror glass, see 51 16 026 Replacing mirror glass

NOTE: Retaining ring (1) and housing (2) are engaged against each other in area (A).

Fig. 153: Retaining Ring And Housing

Courtesy of BMW OF NORTH AMERICA, INC.

Release catch (1) and carefully snap housing (2) forwards out of retaining ring (3).

If necessary, use special tool 00 9 317 as an aid.

Fig. 154: Catch And Snap Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1 to 3) must not be damaged.

Fig. 155: Catches
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 045 REMOVING AND INSTALLING/REPLACING RETAINING RING ON LEFT OR RIGHT DOOR MIRROR

Necessary preliminary tasks:

- Remove housing on door mirror, see **51 16 040 Removing and installing/replacing housing on left or right door mirror**

Release catches (1) and remove retaining ring (2) towards rear.

Fig. 156: Catches And Retaining Ring
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1 and 2) must not be damaged.

1. Retaining ring catches on door mirror
2. Retaining ring catches on housing

Fig. 157: Catches
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 060 REMOVING AND INSTALLING/REPLACING INTERIOR REARVIEW MIRROR (OVERVIEW)

NOTE: Version with cable (X) for:

- Automatic dim action (electro-chrome technology) for interior rearview mirror
- Fogging sensor

- Remote control (infrared or radio)
- Autobeam
- Garage door opener
- Compass
- Rain sensor

Version without cable (X) with full foot (1), see **51 16 060 Removing and installing/replacing interior rearview mirror (with full foot)**

Fig. 158: Full Foot
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with cable (X) and plug trim cover (1).

Fig. 159: Cable And Plug Trim Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with mirror arm end caps (1), see **51 16 060 Removing and installing/replacing interior rearview mirror (with mirror arm end caps)**

Fig. 160: Mirror Arm End Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Version with rain sensor, see **51 16 060 Removing and installing/replacing interior rearview mirror (with rain sensor)**

Fig. 161: Rain Sensor

Courtesy of BMW OF NORTH AMERICA, INC.

Version with Autobeam.

Fig. 162: Autobeam

Courtesy of BMW OF NORTH AMERICA, INC.

Version with toll mirror for Japan, see **51 16 060 Removing and installing/replacing interior rearview mirror (with Japanese toll mirror)**

Fig. 163: Toll Mirror

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 060 REMOVING AND INSTALLING/REPLACING INTERIOR REARVIEW MIRROR (WITH JAPANESE TOLL MIRROR)

IMPORTANT: Work may only be carried out at a room/object temperature of 18 ... 28°C.
If this cannot be guaranteed (cold/hot countries), it is necessary to equalize the temperature of the windscreen, mirror foot and rearview mirror (e.g. car left to stand indoors or in the shade for at least 30 minutes).

Version with remote control for central locking:

If necessary, disconnect negative lead from battery.

Version with compass:

Check compass function if replacing or after disconnecting interior mirror plug connection or battery.

If necessary, calibrate compass in interior rearview mirror, see **51 16 ... Calibrating compass in interior rearview mirror**

E60 Security version:

Rain sensor is not installed, cable connection is tied back in roofliner.

IMPORTANT: To avoid breaking windscreen:
Screw rearview mirror off mirror mount.

Mirror must not be pulled or pressed off towards front or rear.

Press on end caps (1) and at same time pull them apart; this releases clip connection of both caps (1).

Fig. 164: Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Turn mirror (1) to right and left and feed out end caps (2).

Fig. 165: Mirror And Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) and guides (2) of end caps (3) must not be damaged, replace if necessary.

Fig. 166: Catches And Guides

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plugs (1 and 2).

NOTE: Pay attention to cable guide for rain sensor.

E60 Security version:

Rain sensor is not installed, cable connection is tied back in roofliner.

Fig. 167: Plugs

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not pull or press rearview mirror off towards front or rear.
Because of altered mirror foot, rearview mirror must be twisted off.

Twist mirror foot approx. 45° to right until mirror foot is released from mirror mount.

Fig. 168: Mirror Foot Angle
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

1. Twist mirror foot by approx. 45° and fit to mirror mount.
2. Turn mirror foot until it engages on mirror base.

Fig. 169: Mirror Foot Angle
 Courtesy of BMW OF NORTH AMERICA, INC.

Only replace with version with remote control for central locking:

If necessary, initialize all transmitters (ignition keys), refer to Owner's Handbook.

51 16 060 REMOVING AND INSTALLING/REPLACING INTERIOR REARVIEW MIRROR (WITH FULL FOOT)

IMPORTANT: Work may only be carried out at a room/object temperature of 18 ... 28°C.
 If this cannot be guaranteed (cold/hot countries), it is necessary to equalize the temperature of the windscreen, mirror foot and rearview mirror (e.g. car left to stand indoors or in the shade for at least 30 minutes).

IMPORTANT: To avoid breaking windscreen:

Snap out (press) rearview mirror only in direction of travel towards windscreen. Do not under any circumstances twist the mirror foot when removing. Twisting the mirror off the mirror mount will damage the rear catch. If the rear catch is damaged, the mirror will be loose when installed and must be replaced.

IMPORTANT: Risk of damage!

Do not pull off rearview mirror (1) from windscreen against direction of travel and or snap out by turning.

Snap out interior mirror (1) from mirror mount (2) towards front with increasing pressure (not abruptly) and remove.

Fig. 170: Interior Mirror And Mirror Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

1. Twist mirror foot by approx. 45° and fit to mirror mount.
2. Turn mirror foot until it engages on mirror base.

Fig. 171: Mirror Foot Angle

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 060 REMOVING AND INSTALLING/REPLACING INTERIOR REARVIEW MIRROR (WITH MIRROR ARM END CAPS)

IMPORTANT: Work may only be carried out at a room/object temperature of 18 ... 28°C.
If this cannot be guaranteed (cold/hot countries), it is necessary to equalize the temperature of the windscreen, mirror foot and rearview mirror (e.g. car left to stand indoors or in the shade for at least 30 minutes).

Version with remote control for central locking:

If necessary, disconnect negative lead from battery.

Version with compass:

Check compass function if replacing or after disconnecting interior mirror plug connection or battery.

If necessary, calibrate compass in interior rearview mirror, see **51 16 ... Calibrating compass in interior rearview mirror**

IMPORTANT: To avoid breaking windscreen:
Snap out (press) rearview mirror only in direction of travel towards windscreen.
Do not under any circumstances twist the mirror foot when removing.
Twisting the mirror off the mirror mount will damage the rear catch.
If the rear catch is damaged, the mirror will be loose when installed and must be replaced.

NOTE: Do not exert any pressure on mirror foot when removing end caps (1).

Press end caps (1) towards mirror housing (2); this releases clip connection of both caps (1).

In order not to create any tension at the mirror foot, simultaneously apply counterpressure to the mirror housing when removing the end caps.

Fig. 172: End Caps And Mirror Housing
Courtesy of BMW OF NORTH AMERICA, INC.

Twist mirror (1) at an angle towards front and right/top.

Swivel left end cap (2) off ball neck in direction of arrow; this detaches the engagement clip (3) from the metal foot.

Fig. 173: Mirror And End Cap
Courtesy of BMW OF NORTH AMERICA, INC.

Twist mirror (1) at an angle towards front and left/top.

Swivel right end cap (2) off ball neck in direction of arrow; this detaches the engagement clip from the metal foot.

Fig. 174: Mirror And End Cap
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) and retaining hooks (2) of end caps (3) must not be damaged, replace if necessary.

Fig. 175: Clips, Hooks And End Caps
Courtesy of BMW OF NORTH AMERICA, INC.

Version with cable (X):

Disconnect plug connection (1).

Fig. 176: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage!

Do not pull off rearview mirror (1) from windscreen against direction of travel and or snap out by turning.

Snap out interior mirror (1) from mirror mount (2) towards front with increasing pressure (not abruptly) and remove.

Fig. 177: Interior Mirror And Mirror Mount

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

1. Twist mirror foot by approx. 45° and fit to mirror mount.
2. Turn mirror foot until it engages on mirror base.

Fig. 178: Mirror Foot Angle

Courtesy of BMW OF NORTH AMERICA, INC.

Only replace with version with remote control for central locking:

Initialize all transmitters (ignition keys), refer to Owner's Handbook.

51 16 060 REMOVING AND INSTALLING/REPLACING INTERIOR REARVIEW MIRROR (WITH RAIN SENSOR)

IMPORTANT: Work may only be carried out at a room/object temperature of 18 ... 28°C.
If this cannot be guaranteed (cold/hot countries), it is necessary to equalize the temperature of the windscreen, mirror foot and rearview mirror (e.g. car left to stand indoors or in the shade for at least 30 minutes).

Version with remote control for central locking:

If necessary, disconnect negative lead from battery.

Version with compass:

Check compass function if replacing or after disconnecting interior mirror plug connection or battery.

If necessary, calibrate compass in interior rearview mirror, see **51 16 ... Calibrating compass in interior rearview mirror**

E60 Security version:

Rain sensor is not installed, cable connection is tied back in roofliner.

IMPORTANT: To avoid breaking windscreen:
Snap out (press) rearview mirror only in direction of travel towards windscreen.
Do not under any circumstances twist the mirror foot when removing.
Twisting the mirror off the mirror mount will damage the rear catch.

If the rear catch is damaged, the mirror will be loose when installed and must be replaced.

Press on end caps (1) and at same time press them apart; this releases clip connection of both caps (1).

Fig. 179: End Caps

Courtesy of BMW OF NORTH AMERICA, INC.

Twist mirror (1) at an angle towards front and right/top.

Swivel left end cap (2) off ball neck in direction of arrow; this detaches the engagement clip (3) from the metal foot.

Fig. 180: Mirror And Left End Cap

Courtesy of BMW OF NORTH AMERICA, INC.

Twist mirror (1) at an angle towards front and left/top.

Swivel right end cap (2) off ball neck in direction of arrow; this detaches the engagement clip from the metal foot.

Fig. 181: Mirror And Right End Cap
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) and retaining hooks (2) of end caps (3) must not be damaged, replace if necessary.

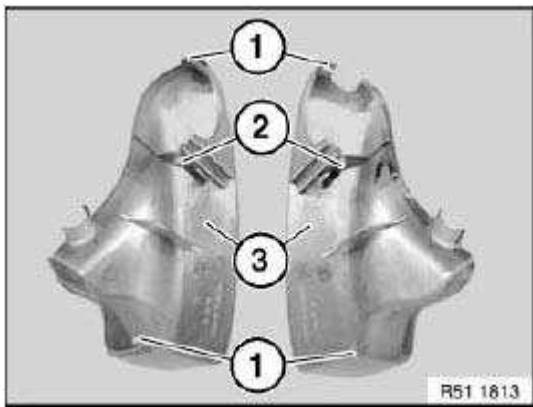

Fig. 182: Clips, Retaining Hooks And End Caps
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

NOTE: Pay attention to cable guide (2) for rain sensor.

Fig. 183: Plug Connection And Cable Guide
Courtesy of BMW OF NORTH AMERICA, INC.

E60 Security version:

Rain sensor is not installed, cable connection is tied back in roofliner.

IMPORTANT: Risk of damage!

Do not pull off rearview mirror (1) from windshield against direction of travel and or snap out by turning.

When snapping out, do not damage control unit (3) for rain sensor.

E60 Security version:

Rain sensor is not installed.

Snap out interior mirror (1) from mirror mount (2) towards front with increasing pressure (not abruptly) and remove.

Fig. 184: Interior Mirror And Mirror Mount
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

1. Twist mirror foot by approx. 45° and fit to mirror mount.
2. Turn mirror foot until it engages on mirror base.

Fig. 185: Mirror Foot Angle

Courtesy of BMW OF NORTH AMERICA, INC.

Only replace with version with remote control for central locking:

If necessary, initialize all transmitters (ignition keys), refer to Owner's Handbook.

51 16 080 REMOVING AND INSTALLING OR REPLACING SUN VISOR AND LEFT OR RIGHT COUNTER SUPPORT

NOTE: The operation is shown on the left side; proceed in the same way for the right side.

Fold down sun visor (5).

Lever out trim (2) on counter support (1) and release screw underneath.

Release screws (3) on holder (4).

Fig. 186: Trim And Counter Support
 Courtesy of BMW OF NORTH AMERICA, INC.

Lift out sun visor (1).

If necessary, pull out cable (2) slightly and disconnect plug connection (3).

Installation:

Perform function check on lighting.

Fig. 187: Sun Visor, Cable And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

51 16 194 REMOVING AND INSTALLING/REPLACING FRONT SIDE LEFT OR RIGHT CUP HOLDER

Special tools required:

- 00 9 318 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove right glovebox, see **51 16 366 Removing and installing right glovebox with housing**
- Remove right fresh-air grill, see **64 22 136 REMOVING AND INSTALLING/REPLACING RIGHT FRESH-AIR GRILL**

Release screw (1) on instrument panel at bottom.

Fig. 188: Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Unclip cup holder (1) with special tool 00 9 318 all round and remove in direction of arrow.

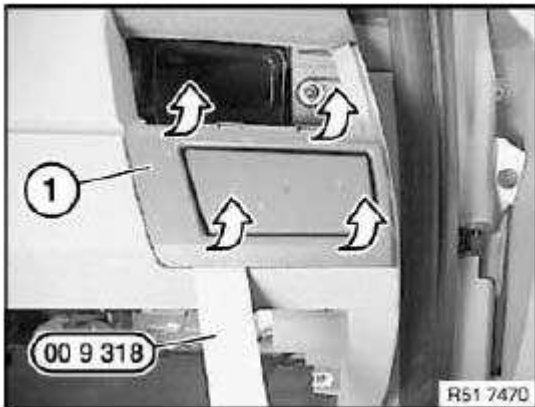

Fig. 189: Special Tool (00 9 318)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on cup holder (2) must not be damaged or missing.

Fig. 190: Catches And Cup Holder

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 196 REMOVING AND INSTALLING/REPLACING COVER FOR CENTER ARMREST

NOTE: On version with CD changer, operation is described in:
Removing and installing/replacing cover for center armrest (storage compartment with CD changer), see 51 16 ... Removing and installing/replacing cover for center armrest (storage compartment with CD changer)

Open cover for center armrest.

Lift out storage compartment (1).

Fig. 191: Storage Compartment

Courtesy of BMW OF NORTH AMERICA, INC.

Version with telephone:

Disconnect plug connection (1).

Release protective sleeve (2) and disconnect plug connection underneath.

Fig. 192: Protective Sleeve And Plug Connection
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Remove cover (2) towards top.

Fig. 193: Cover And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement (version without telephone):

Remove insert (1) and release screws (2) underneath.

Unclip trim (3) towards top.

Fig. 194: Insert, Trim And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement (version with telephone):

Remove eject box.

Remove insert (1) and release screws (2).

Unclip trim (3) towards top.

Fig. 195: Insert, Trim And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

51 16 200 REMOVING AND INSTALLING STORAGE COMPARTMENT

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove function carrier, see 51 45 106 Removing and installing/replacing function carrier on instrument panel trim

Open cover for center armrest.

Lift out storage compartment (1).

NOTE: For purposes of clarity, all the following operations are shown with the center armrest removed.

Fig. 196: Storage Compartment

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1).

Unclip catches (2) on housing for cigarette lighter (3).

Remove housing (3) in direction of arrow.

Installation:

Catches (2) must not be damaged

Fig. 197: Catches, Plug Connection And Cigarette Lighter
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and screws (2) on rear storage compartment.

Fig. 198: Nuts And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip catches (1) on gaiter (2) with special tool 00 9 317. Pull off gaiter (2) towards top.

Fig. 199: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1 and 2).

Feed out storage compartment (3) past gaiter (4) and remove towards top rear.

Fig. 200: Storage Compartment, Past Gaiter And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 200 REMOVING AND INSTALLING/REPLACING STORAGE COMPARTMENT (WITH CD CHANGER)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove function carrier, see **51 45 106 Removing and installing/replacing function carrier on instrument panel trim**

Unclip trim (1) towards top.

Remove compartment (2).

Installation:

Clips (3) must not be damaged.

Fig. 201: Trim, Compartment And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

When installing compartment (1), make sure guides (2) are inserted into guides (3) on storage compartment (4).

Fig. 202: Compartment, Guides And Storage Compartment
Courtesy of BMW OF NORTH AMERICA, INC.

Version with telephone:

Disconnect plug connection (1).

Release protective sleeve (2) and disconnect plug connection underneath.

Fig. 203: Plug Connection And Protective Sleeve
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip catches (1) on gaiter (2) with special tool 00 9 317.

Detach gaiter (2) with handle towards front.

Fig. 204: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Carefully snap out trim (1) towards rear.

Disconnect associated plug connection and remove trim light (1).

Fig. 205: Trim Light
Courtesy of BMW OF NORTH AMERICA, INC.

Release nuts (1) and screws (2) on rear storage compartment.

Fig. 206: Nuts And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1 and 2).

Feed out storage compartment (3) upwards over handbrake lever (4) and remove.

Fig. 207: Storage Compartment And Handbrake Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

51 16 201 REPLACING STORAGE COMPARTMENT

Necessary preliminary tasks:

- Remove storage compartment, see **51 16 200 Removing and installing storage compartment**
- Remove drinks holder, see **51 16 202 Removing and installing/replacing front cup holder**
- Remove cover for center armrest, see **51 16 ... Removing and installing/replacing cover for center armrest (storage compartment with CD changer)**

51 16 202 REMOVING AND INSTALLING/REPLACING FRONT CUP HOLDER

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Lever out cup holder (1) with special tool 00 9 317 in direction of arrow and remove.

Fig. 208: Special Tool (00 9 317)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) and catches (2) must not be damaged.

Fig. 209: Guides And Catches

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 210 REMOVING AND INSTALLING/REPLACING TRIM FOR PRESELECTOR LEVER

Necessary preliminary tasks:

- Apply parking brake
- Move selector lever into N position
- Remove gaiter for shift block

Unclip trim for preselector lever (1) towards top.

Disconnect associated plug connections and remove trim for preselector lever (1).

Fig. 210: Preselector Lever

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Retainers (1) must not be damaged or missing.

Make sure retainers (1) are correctly seated in appropriate mounts of trim for preselector lever (2).

Fig. 211: Retainers And Preselector Lever
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 340 REMOVING AND INSTALLING/REPLACING LOCK FOR RIGHT GLOVEBOX

Open glovebox.

Release screws (1).

Remove lower section (3) and upper section (2) of lock.

Fig. 212: Lower Section And Upper Section Of Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Insert ignition key (1) in lock cylinder (3).

Turn ignition key (1) slightly, carefully raise catches (2) and pull out lock cylinder (3) with ignition key (1) in direction of arrow.

If necessary, force catches (2) open.

Fig. 213: Ignition Key, Catches And Lock Cylinder
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 342 REMOVING AND INSTALLING/REPLACING LOCK CYLINDER FOR PASSENGER AIRBAG DEACTIVATION

Individual parts, switch for passenger airbag deactivation

R51 4978

- | | | | |
|---|----------------|---|---------------|
| 1 | Ignition key | 6 | Switch unit |
| 2 | Lock cylinder | 7 | PCB |
| 3 | Switch housing | 8 | Housing cover |
| 4 | Sealing ring | 9 | Screws |
| 5 | Guide | | |

Fig. 214: Individual Parts, Switch For Passenger Airbag Deactivation
 Courtesy of BMW OF NORTH AMERICA, INC.

Necessary preliminary tasks:

- Remove switch for passenger airbag deactivation

Release screws (1).

Remove housing cover (2) and PCB (3) underneath.

Fig. 215: Housing Cover, Screws And PCB
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove switch unit (1) in upward direction.

Installation:

Switch unit (1) can only be installed in one position.

PCB (4) can be inserted turned through 180°.

Position of magnet sensor (3) of PCB (4) must match up with permanent magnet (2) of switch unit (1).

Fig. 216: Magnet Sensor, PCB And Switch Unit
 Courtesy of BMW OF NORTH AMERICA, INC.

Remove guide (1) in upward direction.

Installation:

Guide (1) can only be installed in one position.

Fit seal (2) on guide (1) and insert in switch housing.

Fig. 217: Seal And Guide

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Ignition key must be inserted in lock cylinder, otherwise this will be destroyed when removed.

Insert ignition key in lock cylinder (2).

Carefully release catches (1) in outward direction and press out lock cylinder (2) with ignition key.

Installation:

Lock cylinder (2) can only be inserted in "ON" or "OFF" switch position.

Lock cylinder

Fig. 218: Catches And Lock Cylinder

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 360 REMOVING AND INSTALLING RIGHT GLOVEBOX

NOTE: Open glovebox.

Unclip pin (1) from retaining strap (2).

Fig. 219: Pin And Retaining Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip pin (1) from shock absorber (2).

Fig. 220: Pin And Shock Absorber
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Close glovebox (3) and secure against falling out.

Release screws (1) and remove counter-support (2).

Open glovebox (3) and remove.

Fig. 221: Screws, Glovebox And Counter-Support
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure counter-support (1) is correctly seated on chamfered faces of shaft (2).

If necessary, turn shaft (2) accordingly.

Fig. 222: Counter-Support And Shaft
 Courtesy of BMW OF NORTH AMERICA, INC.

51 16 361 REPLACING RIGHT GLOVEBOX

Necessary preliminary tasks:

- Remove right glovebox, see **51 16 366 Removing and installing right glovebox with housing**
- Remove lock for right glovebox, see **51 16 340 Removing and installing/replacing lock for right glovebox**

Release screws (1).

Remove holders (2) from glovebox (3).

Fig. 223: Holders, Screws And Glovebox
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connections (1).

Detach adhesive tape (2).

Feed out cable (3) with glovebox (4).

Fig. 224: Plug Connections, Cable And Glovebox
Courtesy of BMW OF NORTH AMERICA, INC.

51 16 366 REMOVING AND INSTALLING RIGHT GLOVEBOX WITH HOUSING

Open glovebox.

Lever glovebox light (1) out of opening (2).

Disconnect plug connection and remove glovebox light (1).

Fig. 225: Glovebox Light
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip pin (1) from retaining strap (2).

Fig. 226: Pin And Retaining Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Unclip pin (1) from shock absorber (2).

Fig. 227: Pin And Shock Absorber
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Pull off glovebox (2) with insert towards front and position downwards.

Fig. 228: Glovebox And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Feed cables (1) and (2) out of guides on glovebox carrier (3).

Fig. 229: Cables And Glovebox Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connections (1) and (2).

Fig. 230: Plug Connections

Courtesy of BMW OF NORTH AMERICA, INC.

51 16 450 REMOVING AND INSTALLING/REPLACING REAR LEFT/RIGHT GRAB HANDLE

Operation is identical to:

51 16 480 Removing and installing or replacing front grab handle

51 16 480 REMOVING AND INSTALLING OR REPLACING FRONT GRAB HANDLE

Carefully lever out trims (1).

Release screws underneath and remove grab handle (2).

Fig. 231: Grab Handle And Trims

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: When replacing or when lowering or removing the roofliner, it is necessary to remove the intermediate plate (1) beforehand.

If necessary, pull off door seal (2) and feed out intermediate plate (1).

Fig. 232: Door Seal And Intermediate Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Intermediate plate (2) must be installed in correct position. Guide in area (A) of grab handle (1) must fit in groove in area (B) of intermediate plate (2).

Fig. 233: Grab Handle And Intermediate Plate
Courtesy of BMW OF NORTH AMERICA, INC.

51 45 .. OVERVIEW OF INSTRUMENT PANEL

- | | | | |
|---|---|----|---|
| 1 | Fresh-air grille, left | 6 | Fresh-air grille, right |
| 2 | Dashboard trim panel | 7 | Glovebox |
| 3 | Storage compartment in instrument panel | 8 | Instrument panel trim, bottom right |
| 4 | Fresh-air grille, middle | 9 | Function carrier on instrument panel trim |
| 5 | Airbag cover, passenger side | 10 | Panel for pedals |

Fig. 234: Instrument Panel Components
Courtesy of BMW OF NORTH AMERICA, INC.

17 LIDS

51 17 400 REMOVING AND INSTALLING/REPLACING BUMP STOP WITH EJECTOR FOR FILLER FLAP

Release cover (1).

Press catches (2) together and pull out ejector (3).

Installation:

Install ejector (3) with fitted cover (1).

Fig. 235: Catches, Cover And Ejector
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on ejector (2) must not be damaged.

Make sure cover (3) is correctly seated on ejector (2).

Fig. 236: Catches, Cover And Ejector
 Courtesy of BMW OF NORTH AMERICA, INC.

21 FRONT DOOR LOCKS, HANDLES, FITTINGS

51 21 ... REMOVING WINDOW CAVITY COVER STRIP WITH SPECIAL TOOL 00 9 324 AT FRONT OR REAR

Special tools required:

- 00 9 318 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)
- 00 9 324 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Open complete door window glass.

Front door:

Insert special tool 00 9 324 at front (at A-pillar) in window cavity (1) (letters TOP pointing upwards).

Rear door:

Insert special tool 00 9 324 at rear (at C-pillar) in window cavity (2) (letters TOP pointing upwards).

Fig. 237: Special Tool (00 9 324)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For purposes of clarity, picture shows inner door panel and door window glass removed.

Special tool 00 9 324 must be correctly guided under window cavity cover strip (1).

2 Short leg, bottom

3 Long leg, top (TOP)

Fig. 238: Special Tool (00 9 324)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Start at the front or rear, depending on the model.

IMPORTANT: Risk of damage!

Raise window cavity cover strip (3) no more than 5 mm in each levering operation, otherwise the strip will be bent.

Position special tool 00 9 318 on door trim panel (1).

Slide screwdriver (2) into special tool 00 9 324 and lever window cavity cover strip (3) upwards no more than 5 mm.

Guide special tools 00 9 324 and 00 9 318 towards front/rear and lever out window cavity cover strip (3) in the process.

Fig. 239: Special Tool (00 9 318) And (00 9 324)
Courtesy of BMW OF NORTH AMERICA, INC.

51 21 003 REPLACING DOOR DETENT (LOCK STRIKER), FRONT LEFT OR RIGHT

Release screws (1) and remove door detent (3).

Installation:

Basic adjustment via crosswire on B-pillar (4) and notches (2) on door detent (3).

Tightening torque: 51 21 3AZ, see **51 21 FRONT DOOR LOCKS**

Adjust door detent.

Fig. 240: B-Pillar, Notches And Door Detent
Courtesy of BMW OF NORTH AMERICA, INC.

51 21 004 ADJUSTING FRONT LEFT OR RIGHT DOOR DETENT (LOCK WEDGE)

Operation is described in:

41 51 004 ADJUSTING FRONT LEFT OR RIGHT DOOR

51 21 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT FRONT DOOR

Special tools required:

- **51 2 190 DOOR LOCK TENSIONER**

Necessary preliminary tasks:

- Close door windows
- Detach sound insulation in rear area only, see **51 48 060 Removing and installing/replacing sound insulation in left or right front door**

Security version:

- Remove complete sound insulation

Disconnect Bowden cable at bottom (1) and top (3) from door lock (2).

IMPORTANT: Bowden cable must be correctly located in mounts on door lock (2). Seal (4) must be correctly positioned on Bowden cable.

NOTE: The operations for "Removing Bowden cable from door lock" end here.

Fig. 241: Bowden Cable, Door Lock And Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug connection (1) at lugs (2) and detach from door lock (3).

Unclip locking rod (4) from door lock (3).

Fig. 242: Plug Connection And Door Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Version with Soft Close Automatic:

Disconnect plug connection (1).

Unfasten cable tie (2).

Release screw (3) and nuts (4).

Tightening torque: 51 21 11AZ, see **51 21 FRONT DOOR LOCKS**

Fig. 243: Plug Connection, Cable Tie, Screw And Nuts
 Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not damage door lock seal during removal.

Release screws (1).

Feed out door lock (2) from inside.

IMPORTANT: To avoid leakage and electrical malfunction:
 Pull door lock (2) with special tool into corner (3), see [Fig. 247](#) and [Fig. 248](#).

Fig. 244: Door Lock, Corner And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Driver's door only:

Installation:

Insert inside door lock (1) correctly into paddle (2) of lock cylinder (3).

Fig. 245: Inside Door Lock, Paddle And Lock Cylinder
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seal (1) on door lock (2) must not be damaged.

Fig. 246: Seal And Door Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Install door lock and insert screws (1), do not tighten down.
- Slide special tool 51 2 190 into opened rotary latch until latch engages in first stage.

Fig. 247: Door Lock, Corner And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Pretension door lock (1) with knurled screw (2) until special tool 51 2 190 just contacts corner points (3).

**IMPORTANT: To tension door lock (1), it is only permitted to turn knurled screw (2) by a further 1 to 1.5 turns (max.) (risk of damage).
 Door lock seal must rest uniformly on inner door plate (water ingress).**

- Tighten down door lock screws 51 21 1AZ, see **51 21 FRONT DOOR LOCKS**

Fig. 248: Door Lock, Corner And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement with Soft Close Automatic:

Release nuts (1) and remove bracket (2).

Tightening torque: 51 21 12AZ, see **51 21 FRONT DOOR LOCKS**

Fig. 249: Nuts And Bracket

Courtesy of BMW OF NORTH AMERICA, INC.

51 21 125 REMOVING AND INSTALLING/REPLACING CARRIER FOR LEFT OR RIGHT OUTSIDE DOOR HANDLE WITH LOCK CYLINDER

Necessary preliminary tasks:

- Remove cover on outside handle, see **51 21 180 Removing and installing/replacing cover on outside handle**
- Disconnect Bowden cable from door lock, see **51 21 090 Removing and installing/replacing door lock in left or right front door**

Driver's side only:

- Remove door lock on front door, see **51 21 090 Removing and installing/replacing door lock in left or right front door**

NOTE: **Version with Comfort Access/CA:
CA sensor (4) must not be damaged.**

Unlock catches (2) on carrier (1).

Press lock cylinder (5) behind door outer skin (3).

Fig. 250: Catches, Carrier, Lock Cylinder And Door Outer Skin
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, disconnect plug on CA module.

Pull carrier (3) towards rear/top until screw (1) of sheet metal slot (2) is free.

Remove carrier (3) for outside door handle.

Fig. 251: Carrier, Screw And Sheet Metal Slot
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seals (1) on carrier (3) must not be damaged.

IMPORTANT: Water drainage channel (2) must not be fouled/clogged.

Fig. 252: Seals And Carrier

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

- Remove Bowden cable for outside door handle on front door, see **51 21 233 Removing and installing/replacing Bowden cable for outside door handle on left or right front door**

Version with Comfort Access/CA:

- Carry out programming/coding using appropriate BMW service tool.

51 21 126 REMOVING AND INSTALLING/REPLACING CARRIER FOR LEFT OR RIGHT OUTSIDE DOOR HANDLE WITHOUT LOCK CYLINDER

NOTE: Operation is (except for tasks relating to removing door lock) identical to:

- **51 21 125 Removing and installing/replacing carrier for left or right outside door handle with lock cylinder.**

51 21 140 REMOVING AND INSTALLING/REPLACING COMPLETE LOCK CYLINDER IN LEFT OR RIGHT FRONT DOOR

Operation is identical to:

51 21 125 Removing and installing/replacing carrier for left or right outside door handle with lock cylinder

51 21 170 REMOVING AND INSTALLING OR REPLACING OUTSIDE HANDLE FROM LEFT OR RIGHT FRONT DOOR

Special tools required:

- **51 2 220 TORX**

Necessary preliminary tasks:

- Remove cover on outside handle, see **51 21 180 Removing and installing/replacing cover on outside handle**

Removal:

NOTE: Installation is described separately from removal.

Remove plate (1).

Installation:

If necessary, replace faulty trim (1).

Fig. 253: Plate And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Protect bore (1) against scratching (risk of corrosion).

IMPORTANT: If screw (3) is not correctly secured, the lock mechanism can jump back and the sound insulation must be removed.

Pull outside handle (2) outwards/upwards and hold.

Using special tool 51 2 220 , turn screw (3) in counterclockwise direction and thereby secure outside handle (2).

Tightening torque: 51 21 5AZ, see **51 21 FRONT DOOR LOCKS**

Fig. 254: Special Tool (51 2 220)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: For removal, outside handle (1) must remain secured with a screwdriver.

- A. Pull off outside handle (1) from rear lock actuator (2).
- B. Pull off outside handle (1) downwards/outwards (in direction of arrow) from front lock actuator (3).

Fig. 255: Outside Handle, Front Lock Actuator And Rear Lock Actuator

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts on outside handle (4) must not be damaged or missing:

1. Rear mounting
2. Front mounting
3. Felt strip (if available for refitting/replacement no longer required)

Fig. 256: Outside Handle

Courtesy of BMW OF NORTH AMERICA, INC.

Insert outside handle with bore hole correctly in mounting (1).

Snap rear mounting on outside handle correctly into lock actuator (2).

Fig. 257: Mounting And Lock Actuator

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Remove seals (2 and 3) in direction of arrow.

If necessary, replace faulty seals (2 and 3).

Fig. 258: Seals And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Protect bore (1) against scratching (risk of corrosion).

IMPORTANT: If screw (3) is not correctly secured, the lock mechanism can jump back and the sound insulation must be removed.

Grip outside handle (2) and, using special tool 51 2 220 , screw down screw (3) in clockwise direction.

Tightening torque: 51 21 5AZ, see **51 21 FRONT DOOR LOCKS**

Carry out function check only with door open.

Fig. 259: Special Tool (51 2 220)

Courtesy of BMW OF NORTH AMERICA, INC.

51 21 180 REMOVING AND INSTALLING/REPLACING COVER ON OUTSIDE HANDLE

Remove trim (1).

Installation:

If necessary, replace faulty trim (1).

Fig. 260: Plate And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Fig. 261: Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Pull off cover (1) in direction of arrow.

Fig. 262: Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out catches (1) and detach cover (2) from filler element (3).

Installation:

Catches (1) of cover (2) must not be damaged.

Fig. 263: Catches And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 21 200 REMOVING AND INSTALLING/REPLACING OUTSIDE HANDLE AND LOCK ACTUATION OF LEFT OR RIGHT FRONT DOOR

NOTE: Operation is described in:

- **51 21 125 Removing and installing/replacing carrier for left or right outside door handle with lock cylinder**

51 21 225 REMOVING AND INSTALLING OR REPLACING INSIDE DOOR OPENER IN LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 Removing and installing left or right front door trim panel**

Unhook Bowden cable for release lever:

- Tighten release lever (1).
- Lever out lock (2).
- Detach Bowden cable (3) towards rear/top.

Installation:

For fitting, press release lever (1) fully onto door trim panel.

Fig. 264: Bowden Cable And Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Drive out spindle (1) in upward direction.

Remove door opener (3).

Installation:

Spindle (1) must be flush with housing (2).

Fig. 265: Spindle, Housing And Door Opener
 Courtesy of BMW OF NORTH AMERICA, INC.

51 21 233 REMOVING AND INSTALLING/REPLACING BOWDEN CABLE FOR OUTSIDE DOOR HANDLE ON LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Remove carrier for outside door handle, see **51 21 125 Removing and installing/replacing carrier for left or right outside door handle with lock cylinder**

Lever holder (2) out of catch (3).

Disconnect Bowden cable (1) from fixtures (4 and 5) and detach from carrier (6).

Fig. 266: Bowden Cable And Fixtures And Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

51 21 235 REMOVING AND INSTALLING/REPLACING BOWDEN CABLE FOR INSIDE DOOR OPENER ON LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 Removing and installing left or right front door trim panel**

Unhook Bowden cable for release lever:

- Tighten release lever (1).
- Lever out lock (2).
- Detach Bowden cable (3) towards rear/top.

Installation:

For fitting, press release lever (1) fully onto door trim panel.

Fig. 267: Bowden Cable And Lever
 Courtesy of BMW OF NORTH AMERICA, INC.

51 21 280 REMOVING AND INSTALLING OR REPLACING DOOR BRAKE ON LEFT OR RIGHT FRONT DOOR

Necessary preliminary tasks:

- Close door windows
- Remove sound insulation in front area only, see **51 48 060 Removing and installing/replacing sound insulation in left or right front door**

Release screw (1) on door retainer (2).

Lever out seal (3) in direction of arrow.

Fig. 268: Screw, Seal And Door Retainer
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Feed out seal (1) in direction of arrow.

Fold back screw plate (2) in direction of arrow.

Release screws (3) and feed out door retainer (4) to inner door panel.

Installation:

Seal (1) must not be damaged.

Fig. 269: Screws, Door Retainer And Screw Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

To install door retainer (1), fold back screw plate (2) in direction of arrow.

Fig. 270: Door Retainer And Screw Plate
 Courtesy of BMW OF NORTH AMERICA, INC.

51 21 300 REMOVING AND INSTALLING OR REPLACING WINDOW CAVITY COVER STRIP ON OUTSIDE OF LEFT OR RIGHT FRONT DOOR

Special tools required:

- 00 9 324 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

IMPORTANT: Observe procedure for using special tool 00 9 324. , see 51 21 ... Removing window cavity cover strip with special tool 00 9 324 at front or rear

IMPORTANT: If reusing the existing window cavity cover strip (1), make sure it is not bent.

Lever out window cavity cover strip (1) with special tool 00 9 324 (starting at B-pillar).

Slide window cavity cover strip (1) towards rear and feed out of guide (2) and door mirror (3).

Fig. 271: Window Cavity Cover Strip, Guide And Door Mirror
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Coat window cavity cover strip (1) with water before fitting.

Feed in window cavity cover strip (1) first at guide (2) and door mirror (3), and then press into door.

Window cavity cover strip (1) must be flush at rear to door edge.

Fig. 272: Window Cavity Cover Strip, Guide And Door Mirror
Courtesy of BMW OF NORTH AMERICA, INC.

51 21 330 REMOVING AND INSTALLING/REPLACING WINDOW CAVITY COVER STRIP ON INNER FRONT DOOR

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 Removing and installing left or right front door trim panel**

Release expander rivet (1) on cover (2).

Fig. 273: Expander Rivet And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out cover (1) at rear slightly.

Start at rear with removal of window cavity cover strip (2).

Fig. 274: Window Cavity Cover Strip And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Pull off window cavity cover strip (1) towards top.

Installation:

If necessary, replace faulty clips (2).

Fig. 275: Window Cavity Cover Strip And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Insert window cavity cover strip (1) below cover (2).

Foam (3) on window cavity cover strip (1) must not be damaged.

Fig. 276: Window Cavity Cover Strip And Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Coat window cavity cover strip (1) with water before fitting.

Start with installation at front.

Fig. 277: Window Cavity Cover Strip
 Courtesy of BMW OF NORTH AMERICA, INC.

51 21 360 REPLACING SEAL FOR DOOR SEAM/ROOF FRAME ON LEFT OR RIGHT FRONT DOOR

Operation is identical to:

51 32 211 Replacing front left or right rubber guide for left or right door window

51 21 370 REMOVING AND INSTALLING/REPLACING COVER AT BOTTOM LEFT OR RIGHT ON FRONT DOOR

Detach cover (1) in direction of arrow from front door (2).

Fig. 278: Cover And Front Door

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) of cover (2) must not be damaged.

Cover (2) has an aluminium insert (3).

Only press on catches (1) when installing otherwise cover (2) will become uneven.

Fig. 279: Catches And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

22 REAR DOOR LOCKS, HANDLES, FITTINGS

51 22 001 REPLACING DOOR DETENT (LOCK STRIKER), REAR LEFT OR RIGHT

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Operation up to "cover on rear door detent" is identical to:

Replacing front left or right door detent, see **51 21 003 Replacing door detent (lock striker), front left or right**

Unclip cover (1) with special tool 00 9 317 from door detent (2) and remove towards front.

Fig. 280: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on cover (2) must not be damaged.

Fig. 281: Catches And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

51 22 004 ADJUSTING REAR LEFT OR RIGHT DOOR DETENT (LOCK WEDGES)

Operation is described in:

41 51 004 ADJUSTING FRONT LEFT OR RIGHT DOOR

51 22 090 REMOVING AND INSTALLING/REPLACING DOOR LOCK IN LEFT OR RIGHT REAR DOOR

Special tools required:

- **51 2 190 DOOR LOCK TENSIONER**

Necessary preliminary tasks:

- Remove sound insulation in rear area only, see **51 48 070 Removing and installing/replacing sound insulation on left or right rear door**

Disconnect Bowden cable at bottom (1) and top (3) from door lock (2).

**IMPORTANT: Bowden cable must be correctly located in mounts on door lock (2).
Seal (4) must be correctly positioned on Bowden cable.**

NOTE: The operations for "Removing Bowden cable from door lock" end here.

Fig. 282: Bowden Cable, Door Lock And Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock plug connection (1) at lugs (2) and detach from door lock (3).

Unclip locking rod (4) from door lock (3).

Fig. 283: Plug Connection And Door Lock

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Do not damage door lock seal during removal.

Release screws (1).

Remove door lock (2) from inside.

IMPORTANT: To avoid leakage and electrical malfunction:

Pull door lock (2) with special tool into corner (3), see [Fig. 286](#) and [Fig. 287](#).

Fig. 284: Door Lock And Corner

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seal (1) on door lock (2) must not be damaged.

Fig. 285: Seal And Door Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Install door lock and insert screws (1), do not tighten down.
- Slide special tool 51 2 190 into opened rotary latch until latch engages in first stage.

Fig. 286: Door Lock, Corner And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

- Pretension door lock (1) with knurled screw (2) until special tool 51 2 190 just contacts corner points (3).

IMPORTANT: To tension door lock (1), it is only permitted to turn knurled screw (2) by a further 1 to 1.5 turns (max.) (risk of damage).

Door lock seal must rest uniformly on inner door plate (water ingress).

- Tighten down door lock screws, tightening torque: 51 21 1AZ, see **51 21 FRONT DOOR LOCKS**

Fig. 287: Door Lock, Corner And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check function of child lock (1) on door lock (2).

Fig. 288: Child Lock And Door Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

51 22 126 REMOVING AND INSTALLING/REPLACING CARRIER FOR OUTSIDE DOOR HANDLE ON LEFT OR RIGHT REAR DOOR

Necessary preliminary tasks:

- Remove outside handle on rear door, see **51 22 170 Removing and installing / replacing outside handle on left or right back door**
- Disconnect Bowden cable from door lock, see **51 21 090 Removing and installing/replacing door lock in left or right front door**

Release screw (1) on carrier (5).

Feed out seals (2 and 3) in direction of arrow and remove.

Unlock catches (4) on carrier (5).

Fig. 289: Catches, Carrier, Seals And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Pull carrier (3) towards rear/top until screw (1) of sheet metal slot (2) is free.

Remove carrier (3) for outside door handle.

Fig. 290: Carrier, Screw And Sheet Metal Slot
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Seals (1) on carrier (3) must not be damaged.

IMPORTANT: Water drainage channel (2) must not be fouled/clogged.

Replacement:

If necessary, remove Bowden cable for outside door handle, see [51 22 233 Removing and installing/replacing Bowden cable for outside door handle on left or right rear door](#)

Fig. 291: Seals And Carrier

Courtesy of BMW OF NORTH AMERICA, INC.

51 22 170 REMOVING AND INSTALLING / REPLACING OUTSIDE HANDLE ON LEFT OR RIGHT BACK DOOR

Special tools required:

- **51 2 220 TORX**

Necessary preliminary tasks:

- Remove cover on front outside handle, see [51 22 180 Removing and installing/replacing cover on outside handle, left or right](#)

Removal:

NOTE: Installation is described separately from removal.

Remove plate (1).

Installation:

If necessary, replace faulty trim (1).

Fig. 292: Plate And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Protect bore (1) against scratching (risk of corrosion).

IMPORTANT: If screw (3) is not correctly secured, the lock mechanism can jump back and the sound insulation must be removed.

Pull outside handle (2) outwards/upwards and hold.

Using special tool 51 2 220 , turn screw (3) in counterclockwise direction and thereby secure outside handle (2).

Tightening torque: 51 22 5AZ, see **51 22 REAR DOOR LOCKS**

Fig. 293: Special Tool (51 2 220)

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: For removal, the outside handle (1) must remain secured with a screwdriver (4).

- A. Pull off outside handle (1) from rear lock actuator (2).
- B. Pull off outside handle (1) downwards/outwards (in direction of arrow) from front lock actuator (3).

Fig. 294: Outside Handle And Rear Lock Actuator
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts on outside handle (4) must not be damaged or missing:

1. Rear mounting
2. Front mounting
3. Felt strip (if available for refitting/replacement no longer required)

Fig. 295: Outside Handle
 Courtesy of BMW OF NORTH AMERICA, INC.

Insert outside handle with bore hole correctly in mounting (1).

Snap rear mounting on outside handle correctly into lock actuator (2).

Fig. 296: Mounting And Lock Actuator
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Remove seals (2 and 3) in direction of arrow.

If necessary, replace faulty seals (2 and 3).

Fig. 297: Seals And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Protect bore (1) against scratching (risk of corrosion).

IMPORTANT: If screw (3) is not correctly secured, the lock mechanism can jump back and the sound insulation must be removed.

Grip outside handle (2) and, using special tool 51 2 220 , screw down screw (3) in clockwise direction.

Tightening torque: 51 22 5AZ, see **51 22 REAR DOOR LOCKS**

Carry out function check only with door open.

Fig. 298: Special Tool (51 2 220)

Courtesy of BMW OF NORTH AMERICA, INC.

51 22 180 REMOVING AND INSTALLING/REPLACING COVER ON OUTSIDE HANDLE, LEFT OR RIGHT

Remove trim (2).

Installation:

If necessary, replace faulty trim (2).

Fig. 299: Plate And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Fig. 300: Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Pull off cover (1) in direction of arrow.

Fig. 301: Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out catches (1) and detach cover (2) from filler element (3).

Installation:

Catches (1) of cover (2) must not be damaged.

Fig. 302: Catches And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

51 22 225 REMOVING AND INSTALLING/REPLACING INSIDE DOOR OPENER OF REAR LEFT OR RIGHT DOOR

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**

Unhook Bowden cable for release lever:

- Tighten release lever (1).
- Lever out lock (2).
- Detach Bowden cable (3) towards rear/top.

Installation:

For fitting, press release lever (1) fully onto door trim panel.

Fig. 303: Bowden Cable And Lever

Courtesy of BMW OF NORTH AMERICA, INC.

Drive out spindle (1) in upward direction.

Remove door opener (3).

Installation:

Spindle (1) must be flush with housing (2).

Fig. 304: Spindle, Housing And Door Opener
Courtesy of BMW OF NORTH AMERICA, INC.

51 22 233 REMOVING AND INSTALLING/REPLACING BOWDEN CABLE FOR OUTSIDE DOOR HANDLE ON LEFT OR RIGHT REAR DOOR

Necessary preliminary tasks:

- Remove carrier for outside door handle, see **51 21 125 Removing and installing/replacing carrier for left or right outside door handle with lock cylinder**

Lever holder (2) out of catch (3).

Disconnect Bowden cable (1) from fixtures (4 and 5) and detach from carrier (6).

Fig. 305: Bowden Cable And Fixtures And Carrier
Courtesy of BMW OF NORTH AMERICA, INC.

51 22 235 REMOVING AND INSTALLING/REPLACING BOWDEN CABLE FOR INSIDE DOOR OPENER ON LEFT OR RIGHT REAR DOOR

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**

Unhook Bowden cable for release lever:

- Tighten release lever (1).
- Lever out lock (2).
- Detach Bowden cable (3) towards rear/top.

Installation:

For fitting, press release lever (1) fully onto door trim panel.

Fig. 306: Bowden Cable And Lever
Courtesy of BMW OF NORTH AMERICA, INC.

51 22 280 REMOVING AND INSTALLING/REPLACING DOOR RETAINER ON REAR LEFT OR RIGHT DOOR

Necessary preliminary tasks:

- Raise the door window.
- Remove sound insulation in front area only, see **51 48 070 Removing and installing/replacing sound insulation on left or right rear door**

Release screw (1) on door retainer (2).

Fig. 307: Screw And Door Retainer
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on inner door panel (2).

Feed out door retainer (3) to inner door panel.

If replacing seal:

If necessary, pull off seal (4) in direction of arrow.

Fig. 308: Screws, Door Retainer And Inner Door Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

If replacing seal:

If necessary, unclip catches (1) on cover (2) and remove in direction of arrow.

Installation:

Catches (1) on cover (2) must not be damaged.

Fig. 309: Catches And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fold back screw plate (2) in order to install door retainer (1).

Fig. 310: Back Screw Plate And Door Retainer

Courtesy of BMW OF NORTH AMERICA, INC.

51 22 300 REMOVING AND INSTALLING/REPLACING WINDOW CAVITY COVER STRIP ON REAR DOOR ON LEFT OR RIGHT

Special tools required:

- 00 9 324 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

IMPORTANT: Observe procedure for using special tool 00 9 324. , see 51 21 ... Removing window cavity cover strip with special tool 00 9 324 at front or rear

IMPORTANT: If reusing the existing window cavity cover strip (1), make sure it is not bent.

Lever out window cavity cover strip (1) with special tool 00 9 324 (starting at B-pillar).

If necessary, carefully lever out window cavity cover strip (1) in area of fixed side window with assembly wedge.

NOTE: Carefully feed guides (2 and 3) of window cavity cover strip (1) out of rear door.

Fig. 311: Window Cavity Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Coat window cavity cover strip (1) with water before fitting.

Feed guides (2 and 3) of window cavity cover strip (1) into rear door first.

Window cavity cover strip (1) must be flush at front and rear with door edge.

Fig. 312: Window Cavity Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

INSIDE REAR DOOR

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**

Pull window cavity cover strip (1) off rear door.

Installation:

If necessary, replace faulty clips (2).

Fig. 313: Window Cavity Cover Strip And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

51 22 351 REPLACING WINDOW CAVITY SEAL ON INNER LEFT OR RIGHT REAR DOOR

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**

Pull window cavity seal (1) off rear door.

Installation:

If necessary, replace faulty retainer (2).

Fig. 314: Window Cavity Seal And Retainer
 Courtesy of BMW OF NORTH AMERICA, INC.

51 22 360 REPLACING SEAL FOR DOOR SEAM/ROOF FRAME ON LEFT OR RIGHT REAR DOOR

Operation is identical to:

51 34 211 Replacing rubber guide for rear left or right door window

51 22 370 REMOVING AND INSTALLING/REPLACING COVER AT BOTTOM LEFT OR RIGHT ON REAR DOOR

Detach cover (1) in direction of arrow from rear door (2).

Fig. 315: Cover And Rear Door
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) of cover (2) must not be damaged.

Cover (2) has an aluminium insert (3).

Only press on catches (1) when installing, otherwise cover (2) will become uneven.

Fig. 316: Catches And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

23 HOOD LATCH, LOCKS

51 23 ... ADJUSTING/REPLACING BUMP STOPS

The illustrations are schematic representations and are to be applied to the relevant vehicle type.

Version 1:

Following parts must not be damaged:

- Bump stop

R41 2156

Fig. 317: Bump Stop

Courtesy of BMW OF NORTH AMERICA, INC.

Adjust bump stop (1) to correct height by turning left or right.

Version 2:

Replace damaged bump stops:

Fig. 318: Adjusting Bump Stop
Courtesy of BMW OF NORTH AMERICA, INC.

- o Bump stop with ejector

Fig. 319: Bump Stop With Ejector
Courtesy of BMW OF NORTH AMERICA, INC.

Press ejector (1) into bump stop and, in this position, twist approx. 90° counterclockwise with a Phillips screwdriver.

This locks the ejectors (1) in the bump stops.

Adjust bump stop (2) to correct height by turning left or right.

Unlock the ejector (1) again after completing adjustment.

Fig. 320: Ejectors And Bump Stop
Courtesy of BMW OF NORTH AMERICA, INC.

Version 3:

Replace damaged bump stops:

- Bump stop

Fig. 321: Bump Stop
Courtesy of BMW OF NORTH AMERICA, INC.

Turn lock (1) 45° counterclockwise.

Pull bump stop (2) upwards.

Close lid slowly until it is at the same height as the side panel.

Open lid and turn lock (1) clockwise.

Installation:

Press bump stop into panel and drive in expanding pins (3).

Fig. 322: Bump Stop And Lock

Courtesy of BMW OF NORTH AMERICA, INC.

51 23 ... REMOVING/INSTALLING BALL SOCKETS WITH CLIP

WARNING: Risk of injury! When installed, the gas pressurised shock absorber is under preload. Minimise preload as far as possible before removing.

IMPORTANT: Never lift off ball socket with engaged retainer.

Disassembly/assembly:

1. Push on retainer in direction of groove with screwdriver
2. Lift off ball socket from ball pin
3. Slide retainer back
4. Fit ball socket on ball stud and snap into place with force

Fig. 323: Identifying Ball Socket With Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Installation: Replace overstretched clips. Pack grease into two opposite positions in socket. The grease spreads after installation on the ball pin all round in the ball socket.

51 23 004 ADJUSTING HOOD/BONNET LOCK

Operation is identical to:

- **41 61 014 ADJUSTING ENGINE BONNET/HOOD**

51 23 100 REMOVING AND INSTALLING/REPLACING RIGHT ENGINE HOOD LOCK

Operation is identical to:

51 23 110 Removing and installing/replacing left engine hood lock

51 23 110 REMOVING AND INSTALLING/REPLACING LEFT ENGINE HOOD LOCK

Necessary preliminary tasks:

- Remove front bumper trim, see **51 11 156 Removing and installing front bumper trim (up to 09/2006)**
- Remove front air duct, see **51 11 770 Removing and installing/replacing left or right deformation element for front bumper**

NOTE: Engine hood lock (2) shown without attachment parts for purposes of clarity.

Disengage Bowden cable (1) in direction of arrow from engine hood lock (2).

Fig. 324: Bowden Cable And Engine Hood Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove engine hood lock (2) at an angle towards front.

Fig. 325: Screws And Engine Hood Lock
 Courtesy of BMW OF NORTH AMERICA, INC.

51 23 131 ADJUSTING LEFT OR RIGHT STRIKER ON ENGINE HOOD

Operation is described in:

- **41 61 014 ADJUSTING ENGINE BONNET/HOOD**

51 23 160 REMOVING AND INSTALLING/REPLACING ARRESTER HOOK ON ENGINE HOOD

Raise bonnet/hood lid.

Release screws (1) and remove arrester hook (2).

Tightening torque: 51 23 1AZ, see **51 23 HOOD/BONNET LOCKS**

Fig. 326: Screws And Arrester Hook
 Courtesy of BMW OF NORTH AMERICA, INC.

51 23 211 REMOVING AND INSTALLING/REPLACING CABLE FOR FRONT ENGINE HOOD/BONNET LOCKS (TO PASSENGER COMPARTMENT)

Necessary preliminary tasks:

- Remove trim panel for pedal assembly, see **51 45 185 Removing and installing/replacing trim for pedal assembly**
- Remove footwell side trim panel on A-pillar, see **51 43 070 Removing and installing/replacing side trim panel, footwell, on A-pillar, left**
- Disengage cable for front engine hood/bonnet locks (to locks), see **51 23 212 Removing and installing/replacing cable for front engine hood locks (to locks)**
- Partially detach front carpet lining

Disengage Bowden cable (1) from release lever (2) and feed out in direction of arrow.

Fig. 327: Bowden Cable And Lever

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on equipment carrier cover (2).

Feed out equipment carrier cover (2) in direction of arrow and remove.

Fig. 328: Screws And Carrier Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Feed Bowden cable (1) in direction of arrow out of clip (2).

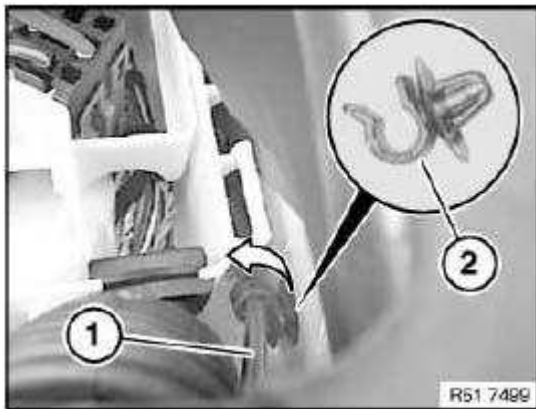

Fig. 329: Bowden Cable And Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Feed out Bowden cable (1) in direction of engine compartment.

IMPORTANT: Check that grommet (2) is correctly seated (water ingress).

Installation:

Lay Bowden cable (1) without kinks.

Fig. 330: Bowden Cable And Grommet

Courtesy of BMW OF NORTH AMERICA, INC.

Feed grommet (1) in direction of arrow out of bulkhead (2) and remove Bowden cable (3) towards front.

Installation:

Check that grommet (1) is correctly seated

Lay Bowden cable (3) without kinks.

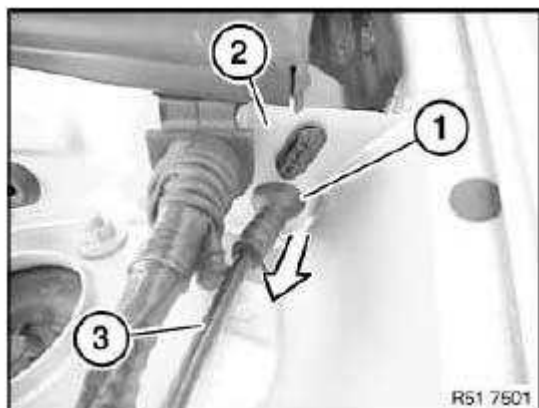

Fig. 331: Bowden Cable, Bulkhead And Grommet
Courtesy of BMW OF NORTH AMERICA, INC.

51 23 212 REMOVING AND INSTALLING/REPLACING CABLE FOR FRONT ENGINE HOOD LOCKS (TO LOCKS)

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove engine hood locks on left and right, see **51 23 100 Removing and installing/replacing right engine hood lock**

Lever out cover (1) from clutch (2) in direction of arrow and remove.

Lever out Bowden cable (3) in direction of arrow.

Fig. 332: Cover, Clutch And Bowden Cable

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip cable for engine hood locks (1) with special tool 00 9 317 in direction of arrow and feed out of front panel.

Fig. 333: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1 and 2) on cable for engine hood locks (3) must not be damaged.

Fig. 334: Catches And Engine Hood Locks
Courtesy of BMW OF NORTH AMERICA, INC.

51 23 265 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT GAS STRUT FOR ENGINE BONNET/HOOD

WARNING: Risk of injury and damage!
For the following tasks, you must take the appropriate measures to support the engine bonnet/hood.
As an alternative, you can enlist the help of a second person to hold the

bonnet/hood.

Raise bonnet/hood lid.

Removing gas spring strut at top and bottom:

1. Push retainer spring to end of gas spring strut.
2. Remove gas spring strut from ball head.

Fig. 335: Retainer Spring And Gas Spring Strut
Courtesy of BMW OF NORTH AMERICA, INC.

24 TRUNK LATCH, LOCKS

51 24 004 ADJUSTING REAR LID LOCK

Necessary preliminary tasks:

- Remove trim on tail panel at top, see **51 46 050 Removing and installing/replacing top trim on rear apron**

Prerequisite:

Rear lid must be correctly adjusted to fit; if necessary, adjust rear lid, see **41 62 014 ADJUSTING REAR LID**

For ideal adjustment, refer to Body gap dimensions.

Screw in buffer stops for rear lid on left/right completely.

NOTE: **Operation is described in:**

- **Removing and installing/replacing buffer stops on rear lid, see 51 24 165**
Removing and installing/replacing side left or right buffer stops on rear lid

Fig. 336: Locating Buffer Stops
Courtesy of BMW OF NORTH AMERICA, INC.

Check fulcrum pads on lower section of rear lid lock for damage and replace if necessary.

Fig. 337: Locating Fulcrum Pads
Courtesy of BMW OF NORTH AMERICA, INC.

Check striker (1) on rear lid for damage, replace if necessary.

Unclip cover (2).

Fig. 338: Locating Striker And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Loosen screws on striker until it is just able to move and centers itself.

IMPORTANT: Striker must not scrape against the lower section of the rear lid lock.

Close trunk lid.

This automatically adjusts the striker correctly.

Fig. 339: Locating Striker

Courtesy of BMW OF NORTH AMERICA, INC.

Open trunk lid.

Tighten down screws on striker.

Check adjustment of rear lid and striker, repeating adjustment if necessary.

Fig. 340: Locating Striker

Courtesy of BMW OF NORTH AMERICA, INC.

Adjust buffer stops on rear lid.

NOTE: Operation is described in:

- **Removing and installing/replacing buffer stops on rear lid, see 51 24 165 Removing and installing/replacing side left or right buffer stops on rear lid**

Fig. 341: Locating Buffer Stops

Courtesy of BMW OF NORTH AMERICA, INC.

51 24 105 REMOVING AND INSTALLING/REPLACING REAR LID LOCK (LOWER SECTION OF LOCK)

Necessary preliminary tasks:

- Remove trim on tail panel, see **51 46 050 Removing and installing/replacing top trim on rear apron**

Installation:

Mark position of lower section of rear lid lock on tail panel.

Release screws (1) on lower section of lock (2).

Fig. 342: Screws And Lower Section Of Lock

Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) on actuator drive (2) and remove lower section of lock (3).

Fig. 343: Plug Connection, Actuator Drive And Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Release screws (1) for actuator drive (2).

Fig. 344: Screws And Actuator Drive
Courtesy of BMW OF NORTH AMERICA, INC.

Remove emergency release mechanism (2) of actuator drive (1) from mount (3) on rear lid lock (4).

Fig. 345: Emergency Release Mechanism, Actuator Drive, Mount And Rear Lid Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Only if replacing actuator drive:

Detach emergency release lever (1) from actuator drive (2).

Fig. 346: Emergency Release Lever And Actuator Drive
Courtesy of BMW OF NORTH AMERICA, INC.

51 24 130 REMOVING AND INSTALLING/REPLACING STRIKER FOR REAR LID LOCK (TOURING)

Necessary preliminary tasks:

- Open rear lid.

Remove trim (1) on rear lid.

Fig. 347: Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on striker (2).

Fig. 348: Screw And Striker
Courtesy of BMW OF NORTH AMERICA, INC.

Screw threaded pin (1) into threaded plate of striker (2).

Unscrew bolt (3).

Remove striker (2) from rear lid panel (4).

Fig. 349: Threaded Pin, Striker And Rear Lid Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Threaded pin (1) remains in threaded plate (2) until striker is fitted.

IMPORTANT: Do not close trunk lid, risk of damage.

Installation:

Adjust striker to lower section of trunk lid lock.

Fig. 350: Threaded Pin, Striker And Rear Lid Panel
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Striker and rear lid lock must not be greased.

51 24 145 REMOVING AND INSTALLING/REPLACING BUTTON FOR REAR LID ACTUATION

Operation is identical to:

- **51 13 402 Removing and installing/replacing handle strip (on rear lid)**

51 24 165 REMOVING AND INSTALLING/REPLACING SIDE LEFT OR RIGHT BUFFER STOPS ON REAR LID

Necessary preliminary tasks:

- Remove panel for roof pillar at rear (D-pillar), see **51 43 252 Replacing trim panel for rear left or right roof pillar (D-pillar)**

NOTE: **The operation is described on the left side; proceed in the same way for the right side.**

Adjustment, refer to:

Last 3 work steps.

Release lock nut (1) on buffer stop.

NOTE: **Grip guide in water gutter.**

Release nut (2) on buffer stop guide.

Installation:

1. Tightening torque: 41 62 4AZ, see **41 62 REAR LID**
2. Tightening torque: 41 62 3AZ, see **41 62 REAR LID**

Fig. 351: Lock Nut And Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Remove buffer stops outwards.

Fig. 352: Locating Buffer Stops

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of buffer stops must not be missing or damaged:

1. Adjustable buffer stop
2. O-ring
3. Guide
4. Guide O-ring
5. Guide nut
6. Lock nut

Fig. 353: Adjustable Buffer Stop, O-Ring, Guide, Guide Nut And Lock Nut

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Both O-rings must be fitted (water ingress).

Adjusting buffer stops:

If necessary, release lock nut (1) on buffer stop.

NOTE: Nut (2) on guide remains tightened down.

Use Allen key to bring adjustable buffer stop into contact with rear lid and then pretension by 1 turn.

Fig. 354: Lock Nut And Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew buffer stop until closed rear lid rests on buffer stops on left/right sides.

IMPORTANT: The rear lid must not be higher than the side panels, otherwise there is preload on height adjustment!

Fig. 355: Locating Buffer Stops
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: If the pretension results in poor rear lid closing comfort, the pretension can be turned back to 0.5 turns.

IMPORTANT: Rear lid must not generate any noises while engine is idling (pay particular attention to this in diesel models).

WARNING: Support rear lid in fully opened position with suitable apparatus. Risk of injury.

Make a written record of the installation position of the gas pressure support(s) before removing.

Slide stop spring (1) to end of gas pressure spring (2) and lever out gas pressure spring. Repeat the procedure at the other end of the gas strut (2) and remove.

Fig. 356: Stop Spring And Gas Pressure Spring
Courtesy of BMW OF NORTH AMERICA, INC.

31 FRONT AND REAR WINDOW

51 31 ... INSTRUCTIONS ON GLUING WINDSCREEN

IMPORTANT: The following topics were included or amended in March 2005:

Storage temperature of all adhesive products of 5°C to 25°C must be observed.

Special instructions for hot processing must be observed:

- Temperature of cartridge oven must be checked every morning with DIS or GT1
- Temperature of cartridge < 80°C results in the formation of bubbles/blisters (gluing/cementing not permitted)
- Insufficient heating (< 1 hour) results in the formation of bubbles/blisters (gluing/cementing not permitted)
- Heating time of a cartridge max. 8 hours
- Mistake in mixing in event of an interruption in application >1 minute (gluing/cementing not permitted)
- A test bead of 50...70 mm must be rejected after an interruption in application
- Cartridge may only be heated up once; if the lower label is black, this adhesive may only still be used cold without accelerator while adhering to the Best before date.

These instructions are not applicable to door window cementing (door "center") on the E38/L7:

Work steps for removing and installing windscreens:

- is displayed at the end of this document by clicking on the "framed cross-reference"

General:

The windscreen and rear window (also the rear side windows if necessary) are bonded to the body. This gluing will increase the torsional strength of the vehicle. To obtain perfect bonding, comply with the installation procedure described in the following.

It is possible to tow or drive without windscreen or rear window.

The windscreen must be secured with yellow plastic adhesive tape (sourcing reference: BMW Parts Service) after being installed. The paint must be completely hardened after painting work.

- Set down window glass and process on BMW-approved X-universal stand.
- In winter, the vehicles must stand in a room with a temperature of at least 15°C.

On-the-job safety:

When working with adhesive products (adhesive, cleaning agent, bonding agent etc.):

- Wear protective goggles, protective gloves and if necessary an apron.
- Ensure rooms are well ventilated.
- Change work clothing contaminated with adhesive immediately.
- Change work clothing contaminated with solvents and swelling agents immediately (keep spare work clothing on hand).
- Take skin protection measures, provide washing facilities including hot water, use silicone-free skin creams
- Provide eye bath facilities, change water regularly (once a month).
- Comply with the relevant safety regulations
- Do not eat, drink or smoke in areas of PUR processing.

Replacement of windscreens:

Version with head-up display (HUD):

- Marking for HUD must be present on the windscreen

Version with front passenger airbag:

- Stick on reminder label

Tools for cutting through adhesive bead:

TOOLS FOR CUTTING THROUGH ADHESIVE BEAD

Type	Model	Order/part number
Special cutter (manufacturer: Fein) with oscillating blade	Pneumatically operated	81 43 9 429 183
	Electrically operated	81 43 9 427 786
BMW blade set	All required blades	81 43 9 428 596
Blade (U-shape)	19.5 mm ⁽¹⁾	6 39 03 118 01 3
	24 mm	6 39 03 076 01 6
	36 mm	6 39 03 079 01 2
	45 mm	6 39 03 154 01 0
Blade (straight with stop roller)	16 to 35 mm (adjustable)	6 39 03 143 01 3
	10 mm (fixed) ⁽¹⁾	6 39 03 189 01 0
	14 mm (fixed)	6 39 03 082 01 6

Scalpel	for heavy-duty applications (1)	
Handles for cutting wire	Self-locking ⁽¹⁾	special tool 51 3 270
(1) Not included in BMW blade set		

Storage temperature:

Storage temperature of all adhesive products of 5°C to 25°C must be observed.

Adhesive:

The BMW-approved 1-component polyurethane adhesive must be used for bonding.

- Adhesive cartridge* (part number BMW 83 19 0 152 031, MINI 83 19 0 152 032)

* Sourcing reference: BMW Parts Service

Adhesive is applied to window glass with cartridge gun (pneumatically or electrically operated, sourcing reference: BMW Workshop Equipment and Planning Documentation).

When using accelerator (hot processing):

- Temperature (min. $80 \pm 5^\circ\text{C}$) of cartridge oven must be checked every morning. Connect temperature sensor to DIS or GT1 (in conjunction with MIB (Measurement Interface Box))
- Heat adhesive for at least 1 hour in cartridge oven (sourcing reference: BMW Parts Service) to $80 \pm 5^\circ\text{C}$
 - Write date and time on adhesive when inserting into cartridge oven

- Insufficient heating (< 1 hour) results in the formation of bubbles/blisters (gluing/cementing not permitted)
- Temperature $80 \pm 5^{\circ}\text{C}$ results in the formation of bubbles/blisters (gluing/cementing not permitted)
- Remove cured adhesive prior to further processing.
- Mistake in mixing in event of an interruption in application >1 minute (gluing/cementing not permitted)
 - A test bead of 50...70 mm must be rejected after an interruption in application
- Best before dates of accelerator and adhesive must not be more than 3 months apart
 - Best before date >3 months results in the formation of bubbles/blisters (gluing/cementing not permitted)

Sealed adhesive:

- May only be stored for a maximum of 8 hours once it has been heated up to $80 \pm 5^{\circ}\text{C}$.
- The adhesive will be damaged if this time is exceeded (gluing/cementing not permitted)
- Damaged adhesive must not be used and must be disposed of in compliance with national regulations
- Cartridge may only be heated up once
 - If the lower label is black, this adhesive may only still be used cold without accelerator while adhering to the Best before date.

**IMPORTANT: Not all window glass may be bonded with accelerator (hot processing).
If hot processing is not permitted, this is described in the relevant document.**

Adhesive Best before date:

Repair kit and adhesive cartridges are marked with a date (Best before).

The adhesive cannot be used after this date.

Adhesive disposal:

Pure hardened adhesive is handled as normal waste.

The adhesive is disposed of in paper bags so that it can react with moisture.

Non-hardened adhesive, cartridges and mixtures of adhesive and solvents and the like must be disposed of as special waste.

Accelerator:

Accelerator is screwed onto the adhesive cartridge and contains a reaction paste which is mixed with the heated adhesive.

IMPORTANT: The accelerator may only be paired with the adhesive cartridge of an unopened

**package (bubbling). Adhesive and accelerator must be paired while taking into account the Best before dates.
The accelerator may no longer be used if the Best before dates are more than 3 months apart.**

Bonding agent (activator):

The BMW-approved bonding agents must be used to treat bonding areas:

- "Glass Activator 1" (on glass ceramic material)
- "Paint Activator A" (on sheet metal flange or residual adhesive bead)

Bonding agent Best before date:

Repair kit and bonding agent are marked with a date (Best before).

- The bonding agent may only be used up to this date (if not already opened previously).
- Once it has been opened (locking ring broken), use for 1 week only even if the Best before date has not been reached.

NOTE: Write the date on the bottle when opening the bonding agent for the first time.

Close the bottle immediately after extracting the bonding agent (reaction with air).

Removal of window glass:

IMPORTANT: As of E63 and E87 it will only be possible to remove the rear window with the "Roll Out 2000".

Cover side panels, roof antenna and if necessary interior trim with protective covers.

Tape off body with fabric adhesive tape (e.g. Tesa) in areas where the oscillating blade could damage the window glass or the paint.

When using cutting wire, pull cutting wire ends through special tool 51 3 270, bend and tape off with fabric adhesive tape (e.g. Tesa) (risk of injury and damage).

When removing the windscreen:

- Wear protective goggles and gloves.

Cut through adhesive bead of window glass:

- with "Roll Out 2000"* (wire cutting system); no paint is damaged here in the case of narrow gaps, see **51**
31 ... REMOVING WINDSCREEN WITH "ROLL OUT 2000"

- with special cutter* and oscillating blade*
- *Sourcing reference: BMW Workshop Equipment and Planning Documentation

Prior to each use, regrind the blade with a grinding stone while the machine is running (new blades also).

Avoid damage to paintwork on body cutout.

Guide blade carefully between body and window glass.

Run blade of knife parallel to glass.

Cut through adhesive bead as closely as possible to window glass.

To remove adhesive bead in body cutout (and on window glass if reusing):

- Use a scalpel for heavy-duty applications
- Cut off residual adhesive to a thickness of approx. 0.5 mm
- Remove residual bead only briefly before bonding

Damage to paintwork in body aperture:

To ensure long-term corrosion protection, it is absolutely essential to touch up damage to paintwork!

The "BMW Color System" painting handbook forms the basis of these repair instructions and must be observed without fail.

Touch up damage to paintwork on body cutout with BMW multibase filler.

Grind out scratches in non-visible areas and touch up with BMW multibase filler. Grind extensive areas of damage down to the bare metal and coat with BMW multibase filler.

Hardening time:

- With infrared, at least 10 minutes
- Without infrared for at least 60°C, at least 30 minutes
- Without infrared for at least 20°C, at least 24 hours

If a complete build-up of paint is required in the visible area:

- Tape off primed bonding flange before applying top coat

IMPORTANT: Observe hardening time of BMW multibase filler otherwise a perfect bond cannot be guaranteed!

Treatment of glued area in body:

TREATMENT OF GLUED AREA IN BODY

Glue	Treatment
Bonding and sealing compound for car window glass	<ol style="list-style-type: none">Clean with spirit (available in pharmacies).Observe an air drying time of at least 1 minute (at least 15 minutes when applied to residual bead)Apply "Paint Activator A" to paint and residual beadObserve an air drying time of at least 1 minute (at least 10 minutes when applied to residual bead)

IMPORTANT: Do not use Sika remover 208 for cleaning in the bonding area.

Preparation for assembly:

Prepare plastic nozzle(s) for shaping adhesive bead (when not using the standard nozzle), can be cut to size during the air drying time.

Lay a test bead of approx. 50 mm - watch out for formation of bubbles/blisters when hot cementing; if OK, apply immediately to window glass.

- Interruption must be < 5 second (incorrect mixture ratio).

Cartridge must be vertical to window glass.

Black ceramic material impermeable to UV light is located on the peripheral zone of the inside edge of the window to protect the adhesive bead.

Glass ceramic material must not be damaged and must be treated as follows.

Treatment of glass ceramic surface (inside of window):

TREATMENT OF GLASS CERAMIC SURFACE

Adhesive (with part numbers)	Treatment
Hot cementing: <ul style="list-style-type: none">○ BMW 83 19 0 147 370, MINI 83 19 0 147 372 Cold cementing: <ul style="list-style-type: none">○ BMW 83 19 0 147 369, MINI 83 19 0 147 371 Adhesive cartridge: <ul style="list-style-type: none">○ BMW 83 19 0 152 031, MINI 83 19 0 152	<ol style="list-style-type: none">Clean with spirit (available in pharmacies).Observe an air drying time of at least 1 minuteApply a thin coating of "Glass Activator 1"Observe an air drying time of at least 10 minutes

Version with inspection window for vehicle identification number in windscreen only (all except US/GB):

- Seal inspection window (bottom left) with Sika primer 206 G+P

Adhesive quantities:

Approx. 1 1/4 adhesive cartridges are needed to cement 7 Series windscreens.

In the case of hot cementing (with accelerator), the missing residual bead is applied from a second adhesive cartridge (not contained in the repair kit) but while cold and without accelerator (bubbling).

Minimum hardening period is thus not increased.

IMPORTANT: If a second cartridge is required for cementing:

- **First apply cold adhesive to cowl panel at bottom (skin formation time)**
- **Accelerator from repair kit must not be used with the second cartridge (bubbling)**

Bubbling results in leakage and insufficient bonding strength (torsional rigidity, passenger airbag).

Effect of differing adhesive quantities:

EFFECT OF DIFFERING ADHESIVE QUANTITIES

Too little adhesive:	Too much adhesive:
<ul style="list-style-type: none"> ○ Windscreen rests too low in body cutout ○ Strains/tensions may occur (windscreen breakage) ○ Insufficient squeezing of adhesive bead (leaking) 	<ul style="list-style-type: none"> ○ Windscreen rests too high in body cutout ○ Wind noise may occur ○ Strains/tensions may occur (windscreen breakage) ○ Fouling of add-on parts by emerging adhesive ○ Adhesive on uninsulated strainer pressure lines of antenna(s) (interference of reception)

Spacer buffers:

Before sticking on new spacer buffers, remove all remaining traces of old spacer buffers completely.

Position of spacer buffers must be observed exactly.

Incorrectly fitted spacer buffers will result in:

- Windscreen glass breakage
- Leakage (if the spacer buffer is in the adhesive area)
- Wind noises

Assembly:

To prevent a pressure increase in the vehicle interior when the doors are closed:

- Open a window/IT

IMPORTANT: After the adhesive bead has been applied, the window glass must be fitted within 5 to 10 minutes (depending on air humidity, temperature and use of accelerator).

After 5 to 10 minutes the adhesive bead forms a skin which can no longer guarantee a perfect bond.

To secure the windscreen, use only the yellow plastic adhesive tape (sourcing reference: BMW Parts Service, part number 83 19 9 410 979).

The glass will slip down if other adhesive tapes are used.

Windscreen slippage will result in leaks and wind noises.

Remove adhesive residue immediately with adhesive remover (Sika remover 208, sourcing reference: BMW Parts Service). Do not press out the window glass again.

Hardened adhesive can only be removed by machine.

Check height of windscreen/rear window with special tool 51 0 010 or 51 3 210. Assemble car.

Hardening:

The adhesive hardens as it reacts with air humidity (with accelerator also due to mixed-in reaction paste) at room temperature.

Minimum hardening time (table) is obtained from 22°C and 38 % relative air humidity.

At ambient temperatures above 23°C and 50 % relative air humidity (hot countries), the adhesive open time is shortened to approx. 5 minutes (skin formation time).

The adhesive hardening process is interrupted completely at ambient temperatures below 5°C. In this event, there will be no increase in the strength of the adhesive bond.

Do not subject the vehicle to load on one side during the minimum hardening time (see table, without passenger airbag), such as e.g.:

- one wheel on kerb
- lifting platform
- etc.

Maneuvering inside garage/workshop:

- only permitted on level ground
- do not under any circumstance driver over access ramps, e.g. into multi-store car parks

Remove adhesive tapes after hardening time.

If you fail to adhere to the minimum hardening times (see table, without passenger airbag):

- leaks and wind noises will occur when the windscreen is moved

Glues and their minimum hardening times:

GLUES AND THEIR MINIMUM HARDENING TIMES

Glue	Minimum hardening time "without passenger airbag" (after which vehicle can be moved)	Minimum hardening time "with passenger airbag" (countries where seatbelt use is not required by law)
Hot processing with accelerator	2 hours	3 hours ⁽¹⁾
Cold processing	9 hours	20 hours ⁽¹⁾

NOTE:
(1) Vehicles with passenger airbag:
The vehicle can be handed over to the customer after the hardening period (vehicle can be moved, adhesive-dependent) with the following warning:
Once the windscreen glass has been bonded, all occupants must travel with their seatbelts attached for "... hours"!
The time is taken from the "Minimum hardening period" table for countries where seatbelt use is not required by law.

IMPORTANT: If the minimum hardening time is not adhered to:

- the front passenger together with the windscreen may fall out of the vehicle in the event of an accident after the front passenger airbag has been triggered

Locate leaks:

- by spraying water underneath sealing lips
- with ultrasonic leak detector (sourcing reference: BMW Parts Service)

If necessary, seal leakage with appropriate nozzle.

Version with GPS navigation system 1 (up to 9/97):

After installation of rear window:

- Recalibrate magnetic field sensor

Version with rain sensor or rain/light sensor:

Removing rain sensor or rain/light sensor, refer to repair instructions.

After replacing windscreen:

- Initialize rain sensor or rain/light sensor

Version with fogging sensor:

After replacing windscreen:

Replace fogging sensor, refer to repair instructions.

Version with head-up display (HUD):

Before bonding, install windscreen with seal(s) and check HUD; if necessary, press expanding foam tape down with hand roller.

After bonding windscreen, check and if necessary adjust HUD.

Work steps for removing and installing windscreens:

refer to repair instructions.

NOTE: If no document is displayed after you have clicked on a "framed cross-reference":

It is not necessary or permitted for the model selected in the TIS.

51 31 ... REMOVING WINDSCREEN WITH "ROLL OUT 2000"

Special tools required:

- **51 3 270 PULL HANDLES**

Windscreen removal system "Roll Out 2000"

- | | | | |
|---|---------------------|----|---------------------------|
| 1 | Wire starter | 8 | Extension (short) |
| 2 | Parabolic tool | 9 | Extension (long) |
| 3 | Plastic washer | 10 | Reversible ratchet |
| 4 | Wire cutting roller | 11 | Plastic wedge |
| 5 | Windlasses | 12 | Guide needles |
| 6 | Protective gloves | 13 | Windlass with double coil |
| 7 | Protective goggles | | |

Fig. 357: Windscreen Removal System "Roll Out 2000"

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Using the "Roll Out 2000" system (sourcing reference: BMW Workshop Equipment and Planning Documentation) minimizes paintwork and ergonomic damage as well as damage that is hazardous to health.

WARNING: Follow safety instructions for working on cars with airbag systems (risk of injury), see 51 00 ... Safety instructions for working on cars with airbag systems

IMPORTANT: Take care when handling sharp-edged tools and cutting wire (risk of damage to head airbag).

IMPORTANT: Always keep both suckers dry and clean to ensure their optimum adhesion on the windscreen.

Lubricate coil if interlock rattling becomes too loud.

Always wear protective goggles and gloves for your own safety.

Preparatory work:

- To avoid paintwork damage, tape off working area over large area at outlet of wire starter (2) with fabric adhesive tape (1)
- Cut off required length (A) from cutting wire

(A) = Window diagonal x 4

- Check whether wire can get caught on rivets or retainers; if necessary, insert guide needles in bonding joint and guide cutting wire past

Fig. 358: Wire Starter And Fabric Adhesive Tape
Courtesy of BMW OF NORTH AMERICA, INC.

Pulling cutting wire into car:

- Push wire starter (2) from inside at a suitable point through adhesive bead
- Feed wire end (1) into hole of wire starter (2) and bend back
- Pull in both wires in succession crossways

NOTE: Crossing the wires cuts through the adhesive bead completely.

Fig. 359: Wire End And Wire Starter
 Courtesy of BMW OF NORTH AMERICA, INC.

Laying cutting wire around windscreen:

- Starting from pull-in point, lay wire eyelet created on the outside counterclockwise around the windscreen
- Pull excess wire into car interior

IMPORTANT: Make sure the cutting wire is located at all four corner points below the windscreen.

**Check that the cutting wire is not caught on retainers or body.
 Secure window on outside with adhesive tape against slipping**

Fig. 360: Laying Cutting Wire Around Windscreen
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Windows (1) with fitted seals (3) or sprayed-on surrounds:

- Moisten cutting wire (4) and seals (3) on window (1) with water
- Insert cutting wire (4) in bend (without kinking) between window (1) and body cutout (2)

Fig. 361: Cutting Wire, Seals And Window
 Courtesy of BMW OF NORTH AMERICA, INC.

Protecting car interior:

- To avoid damage and if necessary dirt, protect A-pillars, roof and instrument panel by means of parabolic tool (1) or plastic washer (2)
- Move parabolic tool (1) during removal so that wire cannot get caught
- Always guide plastic washer (2) between wire and panel

Fig. 362: Parabolic Tool And Guide Plastic Washer
 Courtesy of BMW OF NORTH AMERICA, INC.

Starting removal:

- Place windlass (1) on windscreen
- Feed wire end into coil of windlass (1)

NOTE: Coil can only be turned in one direction.

- Make sure the wire is always situated in the guide channel of the windlass (1)

- Fit reversible ratchet (2) on coil and tension wire
- Start by cutting lower adhesive bead
- Grip second wire end in special tool 51 3 270

Fig. 363: Windlass And Reversible Ratchet
 Courtesy of BMW OF NORTH AMERICA, INC.

Moving windlass:

- Before moving windlass, remove reversible ratchet, extension and parabolic tool
- Release sucker on windlass
- Pull and hold black locking button (1)
- Turn windlass and move with sucker
- Refit reversible ratchet, parabolic tool and if necessary extension
- When cutting the corner points, make sure the wire is situated in the guide channel of the windlass; this makes the cutting job easier

Fig. 364: Black Locking Button
 Courtesy of BMW OF NORTH AMERICA, INC.

Installing second windlass:

- Secure second windlass by suction on windscreen
- Feed second wire end into coil
- Cut left side and top left corner point, as described above
- Finish removal
- Remove "Roll Out 2000"

Fig. 365: Securing Second Windlass
 Courtesy of BMW OF NORTH AMERICA, INC.

Windlass with double coil:

For use with small windows.

- Attach windlass firmly to window so that both coils are turned away from application point of wire
- Feed either the upper wire end into the lower coil or the lower wire end into the upper coil
- Fit reversible ratchet on coil and tension wire
- Cut through approx. 10 cm of bonding joint

Fig. 366: Windlass With Double Coil
 Courtesy of BMW OF NORTH AMERICA, INC.

- Feed other wire end into free coil so that the wires cross
- Continue cutting bonding joint by alternately using the coils
- Both wires meet ahead of both coils when removal is completed
- Remove "Roll Out 2000"

Fig. 367: Locating Cutting Bonding Joint

Courtesy of BMW OF NORTH AMERICA, INC.

51 31 000 REMOVING AND INSTALLING / REPLACING WINDSCREEN

IMPORTANT: The "Instructions for window cementing" serve as the basis for these repair instructions and must be followed without fail, see 51 31 ... Instructions on gluing windscreen

51 31 015 REPAIRING DAMAGE TO WINDSCREENS CAUSED BY PITTING (STONE CHIPS) (CLEAR AND TINTED LAMINATED SAFETY GLASS)

Field of vision (no repairs acceptable):

36 51 031

- A 50 mm (gap between field of view / centre of vehicle)
- B Up to end of wiper range, outside (field of view width)
- C Restriction by wiper range (height of field of view)

Fig. 368: Field Of Vision

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Repairs must only be carried out outside of the field of vision (refer to sketch).

51 31 021 REMOVING AND INSTALLING/REPLACING RUBBER FRAME FOR WINDSCREEN (TOP)

Necessary preliminary tasks:

- Remove both gutter strips on windscreen, see **51 31 030 Removing and installing or replacing left or right gutter along windshield**

**IMPORTANT: Rubber frame (1) features an aluminium section inlay (2).
Detach adhesive tape on outside from windscreen and at top from roof outer skin.
Carefully unwind rubber frame (1) (windscreen breakage).**

Fig. 369: Rubber Frame And Aluminium Section Inlay
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Spacers (8) are attached to rubber frame (1).

Tear-off lip (5) may be stuck to adhesive (4).

When rubber frame (1) is removed, tear-off lip (5) can tear off and remain in vehicle.

Attach adhesive tape correctly in area (A).

- 3 Windscreen
- 6 Bridge
- 7 Pinched butyl

Installation:

In area (A) on left/right:

- there is no sealing lip (5)
- there is adhesive tape (7) for windscreen (8)
- buffer stop is molded on

When replacing without removing windscreen:

Detach tear-off lip (3) from rubber frame (1).

If adhesive leaks over tear-off lip (3), this area must be cut out partially.

To facilitate installation, coat rubber frame (1) and body cutout with water.

Fig. 370: Tear-Off Lip, Rubber Frame, Adhesive Tape And Windscreen
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement with removed/new windscreen:

Fit rubber frame (1) with tear-off lip (3).

- 2 Aluminum strip
- 4 Butyl
- 6 Adhesive tape (for attaching to roof at top)

51 31 030 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT GUTTER ALONG WINDSHIELD

Unclip gutter strip (1) towards top.

**IMPORTANT: Replace clips (2) after each removal.
 Note part number.**

Installation:

Locks (3) of clips (2) must not be damaged.

Fig. 371: Gutter Strip, Locks And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

51 31 200 REMOVING AND INSTALLING/REPLACING REAR WINDOW

IMPORTANT: The "Instructions for window cementing" serve as the basis for these repair instructions and must be followed without fail, see 51 31 ... Instructions on gluing windscreen

32 FRONT MANUALLY OPERATED WINDOWS

51 32 160 REMOVING AND INSTALLING/REPLACING HOUSING COVER ON INNER LEFT OR RIGHT DOOR WINDOW FRAME

Necessary preliminary tasks:

- Remove front door trim panel, see 51 41 000 Removing and installing left or right front door trim panel

Release expansion rivets (1).

Fig. 372: Expansion Rivets

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip cover (1) on front door

- A. inwards from retainer (2),
- B. lever out and remove

IMPORTANT: Cover (1) must not be kinked (risk of damage).

Fig. 373: Cover And Retainer

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of cover (3) must not be damaged or missing:

1. Retainer
2. Sound insulation

Fig. 374: Sound Insulation, Retainer And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

51 32 170 REMOVING AND INSTALLING / REPLACING DOOR WINDOW GLASS, FRONT LEFT OR RIGHT

Necessary preliminary tasks:

- Open door window to 105 mm.
- Remove sound insulation in front door, see **51 48 060 Removing and installing/replacing sound insulation in left or right front door**
- Remove outer window cavity cover strip, see **51 21 300 Removing and installing or replacing window**

cavity cover strip on outside of left or right front door

Door window glass (1) must be opened to dimension (A).

A = approx. 105 mm

IMPORTANT: Disconnect plug connection (2) from power window motor (3) (risk of trapping).

Lever out catches (4) with screwdriver (5) in direction of arrow.

Fig. 375: Door Window Glass, Plug Connection And Power Window Motor
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catch (4) must be correctly clipped into place.

Carry out function check on power window unit and anti - trapping protection.

If necessary, normalize power window unit.

Installation:

Following parts of window guide (3) must not be damaged or missing:

1. Catch
2. Buffer stop

Fig. 376: Buffer Stop, Catch And Window Guide
 Courtesy of BMW OF NORTH AMERICA, INC.

Turn door window glass and lift out towards rear/top.

Fig. 377: Lifting Door Window Glass
 Courtesy of BMW OF NORTH AMERICA, INC.

51 32 211 REPLACING FRONT LEFT OR RIGHT RUBBER GUIDE FOR LEFT OR RIGHT DOOR WINDOW

Necessary preliminary tasks:

- Remove front door window glass, see **51 32 170 Removing and installing / replacing door window glass, front left or right**
- Remove window cavity cover strip on outside of front door, see **51 21 300 Removing and installing or replacing window cavity cover strip on outside of left or right front door**
- Remove mirror, see **51 16 000 Removing and installing/replacing mirror on left or right front door**
- Remove cover on inside of door window frame, see **51 32 160 Removing and installing/replacing housing cover on inner left or right door window frame**
- Partially detach trim on front door window frame, see **51 32 420 Removing and installing/replacing trim on front door window frame, left or right**

Detach trim (1).

Feed rubber guide (2) on front door

- A. upwards out of guide (3),
- B. feed out of window guide rails and remove.

Installation:

Insert rubber guide at front/bottom into window guide rail.

Fig. 378: Rubber Guide, Trim And Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Sound insulation (1) in front door (2) must be fitted and must not be damaged.

Fig. 379: Sound Insulation And Front Door
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Rubber guide (1) must not be damaged in corners (2).

Fig. 380: Rubber Guide And Corners

Courtesy of BMW OF NORTH AMERICA, INC.

51 32 420 REMOVING AND INSTALLING/REPLACING TRIM ON FRONT DOOR WINDOW FRAME, LEFT OR RIGHT

Necessary preliminary tasks:

E83 only:

- Remove window cavity cover strip on outside of front door, see **51 21 300 Removing and installing or replacing window cavity cover strip on outside of left or right front door**

Partially detach rubber window seal (1) at rear.

Fig. 381: Rubber Window Seal

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Remove finisher (2) and press approx. 3 mm towards rear.

Fig. 382: Finisher And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Remove trim (1) towards top.

Fig. 383: Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts must not be damaged or missing:

1. Plastic nuts
2. Sound insulation
3. Seal

Fig. 384: Sound Insulation, Plastic Nuts And Seal
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Check trim (1) for damage, replace if necessary.

Fig. 385: Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

33 FRONT ELECTRICALLY OPERATED WINDOWS

51 33 000 REMOVING AND INSTALLING (REPLACING) POWER WINDOW UNIT IN LEFT OR RIGHT FRONT DOOR

NOTE: When removing door lock, snap door window glass out only, do not remove, secure in door window frame.

Necessary preliminary tasks:

- Remove front door window glass, see **51 32 170 Removing and installing / replacing door window glass, front left or right**

Unscrew nuts (1).

Feed out rear section of power window unit (2) in direction of arrow.

Installation:

Tightening torque: 51 33 2AZ, see **51 33 POWER WINDOWS, FRONT**

Fig. 386: Power Window Unit And Nuts

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The work step "Removing and installing/replace door lock" ends here.

Feed out front section of power window unit (1) with flat motor (2) in direction of arrow from front door.

Replacement:

Remove flat motor for power window unit, see **67 62 000 REMOVING AND INSTALLING / REPLACING FLAT MOTOR FOR FRONT LEFT OR RIGHT POWER WINDOW UNIT**

Fig. 387: Power Window Unit And Flat Motor

Courtesy of BMW OF NORTH AMERICA, INC.

34 REAR MANUALLY OPERATED WINDOWS

51 34 ... REMOVING AND INSTALLING/REPLACING TRIM ON WINDOW FRAME OF REAR DOOR (REAR), LEFT OR RIGHT

Necessary preliminary tasks:

- Remove cover on door window frame (rear door), see **51 34 160 Removing and installing/replacing housing cover on inner left or right door window frame**

Remove rubber guide (1) from trim (2).

Fig. 388: Rubber Guide And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Grip trim firmly and release screws (1).

Fig. 389: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Push trim (1) downwards from rubber guide (2) and remove towards top.

Fig. 390: Trim And Rubber Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Threads (1) of trim (2) must not be damaged.

Fig. 391: Threads And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Foam section (1) must be fitted.

Fig. 392: Foam Section

Courtesy of BMW OF NORTH AMERICA, INC.

51 34 160 REMOVING AND INSTALLING/REPLACING HOUSING COVER ON INNER LEFT OR RIGHT DOOR WINDOW FRAME

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Open door window.
- Remove rear door trim panel, see 51 42 000 Removing and installing left or right rear door trim panel

Release expansion rivets (1).

Fig. 393: Expansion Rivets

Courtesy of BMW OF NORTH AMERICA, INC.

Lever out fixed cover (1) in area of door window with special tool 00 9 317.

Unclip rest of cover (1) in direction of arrow, lever out and remove.

NOTE: Do not tear off cover (1) in area (2).

Fig. 394: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of cover (1) must not be damaged or missing:

- 2 Connection point
- 3 Clips
- 4 Guides

Fig. 395: Connection Point, Clips And Guides

Courtesy of BMW OF NORTH AMERICA, INC.

51 34 171 REPLACING REAR LEFT OR RIGHT DOOR WINDOW

Necessary preliminary tasks:

- Open door window to 105 mm.
- Remove sound insulation in rear door, see **51 48 070 Removing and installing/replacing sound insulation on left or right rear door**
- Remove outer window cavity cover strip, see **51 21 300 Removing and installing or replacing window cavity cover strip on outside of left or right front door**
- Remove cover on door window frame, see **51 34 160 Removing and installing/replacing housing cover on inner left or right door window frame**
- Remove trim on rear door window frame, see **51 34 ... Removing and installing/replacing trim on window frame of rear door (rear), left or right**
- Remove rubber guide for rear door window glass, see **51 34 211 Replacing rubber guide for rear left or right door window**

Open door window glass (1) down to distance (A)

A = approx. 105 mm

Fig. 396: Door Window Glass

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Disconnect plug connection (1) from power window motor (2) (risk of trapping).

Lever out catches (3) with screwdriver (4) in direction of arrow.

Installation:

Catch (3) must be correctly clipped into place.

Fig. 397: Plug Connection, Catches And Power Window Motor
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts of window guide (3) must not be damaged or missing:

1. Catch
2. Buffer stop

Fig. 398: Buffer Stop, Catch And Window Guide
Courtesy of BMW OF NORTH AMERICA, INC.

Remove door window glass (1) towards top.

Installation:

Door window glass does not need to be adjusted.

Fig. 399: Door Window Glass

Courtesy of BMW OF NORTH AMERICA, INC.

51 34 191 REPLACING LEFT OR RIGHT FIXED DOOR WINDOW IN REAR WINDOW FRAME

IMPORTANT: The "Instructions for window cementing" serve as the basis for these repair instructions and must be followed without fail, see 51 31 ... Instructions on gluing windscreen

51 34 211 REPLACING RUBBER GUIDE FOR REAR LEFT OR RIGHT DOOR WINDOW

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove cover on inside door window frame, see 51 34 160 Removing and installing/replacing housing cover on inner left or right door window frame

NOTE: Rubber guide must be replaced after every complete removal.

Lever out rubber guide (1) on door window frame at front (2) with special tool 00 9 317.

Fig. 400: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Feed out rubber guide (1) towards top.

Fig. 401: Door Window Glass
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Close door window glass (1) a little.

Push rubber guide (2) onto door window glass (1) and into window guide (3).

Moisten rubber guide (2) with water.

Fig. 402: Rubber Guide, Door Window Glass And Window Guide
 Courtesy of BMW OF NORTH AMERICA, INC.

51 34 420 REMOVING AND INSTALLING/REPLACING TRIM ON WINDOW FRAME OF REAR DOOR (FRONT), LEFT OR RIGHT

NOTE: For removal and installation only, not for adjustment:

Necessary preliminary tasks:

- Remove window cavity cover strip on outside of rear door
- Open door window.

Partially detach rubber seal (1) and rubber guide (2).

Fig. 403: Rubber Seal And Rubber Guide
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Detach trim (2) towards front/top.

Fig. 404: Trim And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty plastic nuts (1).

Fig. 405: Plastic Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Trim (1) must not be damaged.

Fig. 406: Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Acoustic insulation pieces (1) must be fitted on window frame (2) (rattling noises).

Fig. 407: Acoustic Insulation Pieces And Window Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

To prevent wind noises.

Check gap with a 0.05 mm feeler gauge.

Slide feeler gauge between B-pillar trims on front and rear doors.

When the finishers are correctly adjusted, it must be possible to feel a slight suction resistance over the entire length of the finisher.

If the gap is too big, this may result in wind noises.

Fig. 408: Feeler Gauge Between B-Pillar Trims On Front And Rear Doors
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, release screws (1).

Press trim (2) towards front and tighten down screws (1).

If gap is still too big, adjust trim on window frame of front door, see **51 32 420 Removing and installing/replacing trim on front door window frame, left or right**

Fig. 409: Trim And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

51 34 425 REMOVING AND INSTALLING/REPLACING TRIM ON WINDOW FRAME OF REAR DOOR, REAR LEFT OR RIGHT

Necessary preliminary tasks:

- Detach rubber guide for rear door window glass in area of trim, see **51 34 211 Replacing rubber guide for rear left or right door window**

E1 and E83 only:

- Remove outer window cavity cover strip, see **51 21 300 Removing and installing or replacing window cavity cover strip on outside of left or right front door**

Release screws (1).

Remove trim (2) towards rear.

Fig. 410: Trim And Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty clips (1).

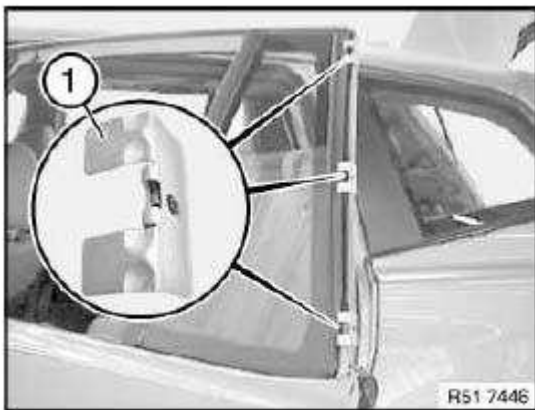

Fig. 411: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

E83 and E91 only:

Installation:

Fit rubber guide (1) before screwing trim (2) into place.

Make sure trim (2) is correctly seated on rubber guide (1) (area A) and on window glass (3).

Fig. 412: Rubber Guide, Trim And Window Glass
Courtesy of BMW OF NORTH AMERICA, INC.

36 HINGED WINDOW

51 36 ... FIRMLY TENSIONING REAR LEFT OR RIGHT SIDE WINDOW

Special tools required:

- **51 3 010 SUCTION LIFT (2 X)**
- **51 3 090 CLAMPING STRAP**

Dampen down suction faces.

Fit special tool 51 3 010 to tool trolley and secure side window.

Secure special tool 51 3 010 (without joint) to inside of window.

Fig. 413: Special Tool (51 3 010) And (51 3 090)
Courtesy of BMW OF NORTH AMERICA, INC.

Secure special tool 51 3 010 (without joint) opposite to inside of window.

Secure special tool 51 3 090 (tensioning belt) at top to special tool 51 3 010 (1). Hook tensioning belt at bottom diagonally in lashing eyes and pull tight (2).

Fig. 414: Special Tool (51 3 010) And (51 3 090)
Courtesy of BMW OF NORTH AMERICA, INC.

Tighten middle belt tensioner (4) so that special tool 51 3 090 is at a 90° angle to side window.

Tighten top belt tensioner (3) until eye can be pulled approx. 20 mm toward rear (4).

Fig. 415: Special Tool (51 3 010) And (51 3 090)
Courtesy of BMW OF NORTH AMERICA, INC.

**51 36 030 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT TRIM ON C-PILLAR
(OUTSIDE ON REAR SIDE WINDOW)**

Raise trim (1) at rear approx. 2 mm and pull off in stages by approx. 2 mm from top downwards from door window (2) in direction of arrow.

Fig. 416: Trim And Door Window

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Fold (1) and retaining lug (2) of trim (3) must not be bent up.

Fig. 417: Fold, Lug And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 36 040 REMOVING AND INSTALLING/REPLACING STRIP ON SIDE WINDOW AT REAR BOTTOM LEFT OR RIGHT

Special tools required:

- 00 9 318 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Carefully lever out strip (1) with special tool 00 9 318, starting at front, in direction of arrow.

Installation:

Clean bonding area with adhesive remover (sourcing reference: BMW Parts Service).

Air drying time: 1 minute

**IMPORTANT: Adhesive areas must be dry and free of dust and grease.
Once it has been cleaned, do not touch the adhesive area with bare hands.**

Fig. 418: Special Tool (00 9 318)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Stick double-sided adhesive tape (1) (sourcing reference: BMW Parts Service) on middle of strip (2).

Remove protective film.

Press strip (2) firmly onto body (3).

Manual contact pressure: approx. 10 N/cm²

NOTE: Firm thumb pressure creates approx. 50 Nm/cm².

Fig. 419: Double-Sided Adhesive Tape And Strip
Courtesy of BMW OF NORTH AMERICA, INC.

Double-sided adhesive tape (1):

Measurement

a=7.0 mm

Measurement

b=0.8 mm

Replacement:

Adhesive tape (1) already attached to strip (2).

51 36 070 REMOVING AND INSTALLING / REPLACING LEFT OR RIGHT REAR SIDE WINDOW

IMPORTANT: The "Window cementing instructions" serve as the basis for this repair instruction and must be observed without fail, see 51 31 ... Instructions on gluing windscreen

37 ELECTRICAL POWER WINDOWS, BODY

51 37 000 REMOVING AND INSTALLING/REPLACING COMPLETE REAR LEFT OR RIGHT POWER WINDOW UNIT

Necessary preliminary tasks:

- Remove rear door window glass, see 51 34 171 Replacing rear left or right door window

Unclip cable holder (1) from power window motor (2).

Unscrew nuts (3).

Tightening torque: 51 35 2AZ, see 51 35 POWER WINDOWS, REAR

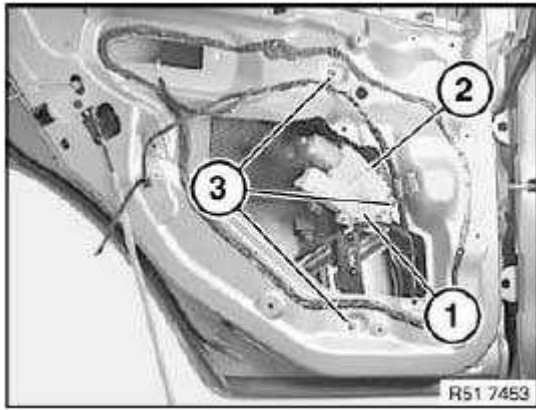

Fig. 420: Cable Holder And Power Window Motor
 Courtesy of BMW OF NORTH AMERICA, INC.

Feed power window unit (1) in direction of arrow out of rear door.

Replacement:

Remove flat motor

Fig. 421: Power Window Unit
 Courtesy of BMW OF NORTH AMERICA, INC.

51 37 261 REMOVING AND INSTALLING/REPLACING WINDOW CAVITY COVER STRIP FOR DOOR WINDOW, REAR LEFT OR RIGHT

Necessary preliminary tasks:

- Remove roller cover for luggage compartment, refer to Owner's Manual
- Fold rear seat backrest forwards
- Remove panel for roof pillar at rear (C-pillar), see **51 43 251 Removing and installing/replacing trim panel for rear left or right roof pillar (C - pillar)**
- Remove panel for roof pillar at rear (D-pillar), see **51 43 252 Replacing trim panel for rear left or right**

roof pillar (D-pillar)

- Release covers on seat belt at top rear, see **72 11 100 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT SEAT BELTS**

Release screw (1) on window cavity cover strip (2).

Fig. 422: Screw And Window Cavity Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

Remove window cavity cover strip (1) towards top.

Fig. 423: Window Cavity Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) on window cavity cover strip (2) must not be damaged.

Fig. 424: Guides And Window Cavity Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

41 FRONT DOOR TRIM PANEL WITH ARM REST

51 41 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT DOOR TRIM PANEL

Special tools required:

- **00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

WARNING: Model with side airbag:

Follow safety instructions for working on cars with airbag systems (risk of injury), see 51 00 ... Safety instructions for working on cars with airbag systems

**Side airbag is mounted on door trim panel:
Disconnect battery.**

IMPORTANT: Do not use any sharp-edged tools to remove the panel - risk of damage to airbag.

Lever out airbag emblem (1) and clip (2) with special tool 00 9 317 and release screw underneath.

Lever out clip (3) and cover on door handle (4), see **51 41 017 Removing and installing/replacing cover on door handle, front left or right**

Release screws underneath.

Tightening torque: 51 41 1AZ, see **51 41 FRONT DOOR TRIM PANEL WITH ARMRESTS**

Fig. 425: Airbag Emblem And Clip

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Start by unclipping door trim panel (2) at bottom.

Unclip clips (1) of door trim panel with special tool 00 9 317 (trim panel wedge).

Fig. 426: Door Trim Panel And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully unclip door trim panel (1) at top from retainers (2).

Fig. 427: Door Trim Panel And Retainers
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook Bowden cable (1) from door lock (2).

Fig. 428: Bowden Cable And Door Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Model with side airbag:

WARNING: Disconnect plug connection on side airbag.

Disconnect remaining plug connections.

Version with speaker:

If necessary, disconnect plug connection (1).

Remove door trim.

Installation:

Connect all plugs to original locations.

Fig. 429: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) are longer than the other clips.

Clips (1) are gray, the other clips are white.

Fit all clips with sealing ring.

If necessary, replace faulty clips.

Fig. 430: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

After assembling the door trim panel proceed as follows:

- Open door window.
- Lock with vehicle key.
- Check for ease-of-movement on retaining button linkage
- If necessary, align linkages

51 41 017 REMOVING AND INSTALLING/REPLACING COVER ON DOOR HANDLE, FRONT LEFT OR RIGHT

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Lever out cover (1) with special tool 00 9 317.

Fig. 431: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) and retainers (2) on cover (3) must not be damaged.

Fig. 432: Catches, Retainers And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 41 018 REPLACING SPEAKER TRIM ON FRONT LEFT OR RIGHT DOOR TRIM PANEL

Necessary preliminary tasks:

- Remove front door trim panel, see **51 41 000 Removing and installing left or right front door trim panel**
- Remove speaker

Removal on initial fitting:

Open welding spots (1).

Release catches (2) and remove speaker trim.

Fig. 433: Welding Spots And Catches
Courtesy of BMW OF NORTH AMERICA, INC.

Removal of repair solution:

Release locking washers (1).

Release catches (2) and remove speaker trim.

Fig. 434: Locking Washers And Catches
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Shorten plastic pins (1) by measurement (A).

A = 9 mm

Snap speaker trim (2) into door trim panel.

Push locking washers (3) onto plastic pins.

Fig. 435: Speaker Trim, Locking Washers And Plastic Pins
 Courtesy of BMW OF NORTH AMERICA, INC.

42 REAR DOOR TRIM PANEL WITH ARM REST

51 42 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR TRIM PANEL

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

WARNING: Model with side airbag:

Follow safety instructions for working on cars with airbag systems (risk of injury), see 51 00 ... Safety instructions for working on cars with airbag systems

Side airbag is mounted on door trim panel:
Disconnect battery.

IMPORTANT: Do not use any sharp-edged tools to remove the panel - risk of damage to airbag.

If necessary, lever out airbag emblem (1) and clip (2) with special tool 00 9 317 and release screw underneath.

Tightening torque: 51 42 4AZ, see 51 42 REAR DOOR TRIM PANEL WITH ARMRESTS

Fig. 436: Airbag Emblem And Clip

Courtesy of BMW OF NORTH AMERICA, INC.

Lever out clip (3) and cover on door handle (2), see 51 42 017 Removing and installing/replacing cover on door handle, rear left or right

Release screws underneath.

Tightening torque: 51 42 1AZ, see 51 42 REAR DOOR TRIM PANEL WITH ARMRESTS

Fig. 437: Clip And Door Handle

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Start by unclipping door trim panel (2) at bottom.

Unclip clips (1) of door trim panel with special tool 00 9 317.

Fig. 438: Door Trim Panel And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully unclip door trim panel (1) at top from retainers (2).

Fig. 439: Door Trim Panel And Retainers
Courtesy of BMW OF NORTH AMERICA, INC.

Unhook Bowden cable (1) from door lock (2).

Fig. 440: Bowden Cable And Door Lock
Courtesy of BMW OF NORTH AMERICA, INC.

Model with side airbag:

WARNING: Disconnect plug connection on side airbag.

Disconnect remaining plug connections.

Version with speaker:

If necessary, disconnect plug connection (1).

Remove door trim.

Installation:

Connect all plugs to original locations.

Fig. 441: Plug Connection

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

All clips (1) are white.

If necessary, replace faulty clips (1).

Fig. 442: Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

After assembling the door trim panel proceed as follows:

- Open door window.
- Lock with vehicle key.
- Check for ease-of-movement on retaining button linkage
- If necessary, align linkages

51 42 001 REPLACING LEFT OR RIGHT REAR DOOR TRIM PANEL

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**
- Remove rear speaker
- Remove airbag module from rear door, see **72 12 015 REMOVING AND INSTALLING/REPLACING AIRBAG MODULE ON LEFT OR RIGHT REAR DOOR**

51 42 017 REMOVING AND INSTALLING/REPLACING COVER ON DOOR HANDLE, REAR LEFT OR RIGHT

Operation is identical to:

Removing cover on door handle, front left or right, see **51 41 017 Removing and installing/replacing cover on door handle, front left or right**

51 42 018 REPLACING SPEAKER TRIM ON REAR LEFT OR RIGHT DOOR TRIM PANEL

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**
- Remove speaker

Removal on initial fitting:

Open welding spots (1).

If necessary, lever out cover (2), release catch underneath and remove speaker trim.

Fig. 443: Welding Spots And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Removal of repair solution:

Release locking washers (1).

If necessary, lever out cover (2), release catch underneath and remove speaker trim.

Fig. 444: Locking Washers And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Shorten plastic pins (1) by measurement (A).

A = 9 mm

Snap speaker trim (2) into door trim panel.

Push locking washers (3) onto plastic pins.

Fig. 445: Plastic Pins And Speaker Trim
Courtesy of BMW OF NORTH AMERICA, INC.

43 SIDE COVERING WITH ARMRESTS

51 43 070 REMOVING AND INSTALLING/REPLACING SIDE TRIM PANEL, FOOTWELL, ON A-PILLAR, LEFT

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove front entrance cover strip, see **51 47 000 Removing and installing/replacing front (inside) left or right entrance cover strip**
- Remove trim panel for pedal assembly, see **51 45 185 Removing and installing/replacing trim for pedal assembly**

Detach mocket (1) in area of footwell trim.

Release screw (2) and remove release lever (3).

Fig. 446: Mocket, Screw And Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1).

Unclip clips (2) with special tool 00 9 317.

Remove trim panel (3) towards inside.

Fig. 447: Special Tool (00 9 317)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) on trim panel (2) must not be damaged.

Fig. 448: Clips And Trim Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

51 43 075 REMOVING AND INSTALLING/REPLACING SIDE TRIM PANEL, FOOTWELL, ON A-PILLAR, RIGHT

Necessary preliminary tasks:

- Remove front entrance cover strip, see **51 47 000 Removing and installing/replacing front (inside) left or right entrance cover strip**

Release door mocket (1) in area of footwell side trim panel on A-pillar on right (2).

Unclip footwell side trim panel on A-pillar on right (2) in direction of arrow from retaining points (3).

Remove footwell side trim panel on A-pillar on right (2).

Fig. 449: Door Mocket And Footwell Side Trim Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, lever out clips (1) remaining in bores.

If necessary, replace faulty clips (1).

Place footwell side trim panel on A-pillar on right (2) preinstalled with clips (1) on associated bores and clip into place.

Fig. 450: Footwell Side Trim Panel And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

51 43 148 REMOVING AND INSTALLING OR REPLACING TRIM ON LEFT OR RIGHT DOOR PILLAR (TOP)

Necessary preliminary tasks:

- Remove panel for door pillar (bottom), see **51 43 150 Removing and installing or replacing trim for**

left or right door pillar (bottom)

Release seatbelt screw (1) on front seat and feed out seatbelt strap (2).

Tightening torque: 72 11 1AZ, see **72 11 SEAT BELTS**

Fig. 451: Seatbelt Screw And Seatbelt Strap
Courtesy of BMW OF NORTH AMERICA, INC.

Release expansion rivets (1) on panel (2).

Fig. 452: Expansion Rivets And Panel
Courtesy of BMW OF NORTH AMERICA, INC.

Pull off panel (1) towards bottom.

Feed out seatbelt strap (2).

Fig. 453: Panel And Seatbelt Strap
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Locator (1) and guide (2) on trim (3) must not be damaged.

Fig. 454: Locator, Guide And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 43 150 REMOVING AND INSTALLING OR REPLACING TRIM FOR LEFT OR RIGHT DOOR PILLAR (BOTTOM)

Necessary preliminary tasks:

- Remove front entrance cover strip, see **51 47 000 Removing and installing/replacing front (inside) left or right entrance cover strip**

Snap trim (2) out of clips (1) at bottom.

Feed out trim (2) for door pillar from entrance cover strip (3).

Fig. 455: Trim And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Partially detach mocket in area of B-pillar panel.

Carefully feed out bottom trim (1) from top trim (2).

Fig. 456: Bottom Trim And Top Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty clips (1).

Guides (2) on trim (3) must not be damaged.

Fig. 457: Guides And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 43 201 REMOVING AND INSTALLING/REPLACING PANEL FOR ROOF PILLAR AT FRONT (A-PILLAR), LEFT OR RIGHT

WARNING: Follow safety instructions for working on cars with airbag systems (risk of injury), see 51 00 ... Safety instructions for working on cars with airbag systems

IMPORTANT: Do not use any sharp-edged tools to remove trim (risk of damage to head airbag).

Detach mallet (1) in area of panel (6).

Unclip protective cap (2) and remove.

Release screw (3).

Tightening torque: 51 43 2AZ, see 51 43 SIDE TRIM PANEL WITH ARMRESTS

Unclip panel (6) at fastening point (4).

Feed out panel (6) from instrument panel (5) and remove.

Fig. 458: Mocket, Panel, Protective Cap And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, lever out clip (1) remaining in bore.

If necessary, replace faulty clip (1).

Make sure guides (3) of panel (2) are correctly seated in associated mountings.

Position panel (2) preinstalled with clip (1) on associated bore and clip into place.

Fig. 459: Guides, Clips And Panel
 Courtesy of BMW OF NORTH AMERICA, INC.

51 43 251 REMOVING AND INSTALLING/REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (C - PILLAR)

Detach mocket (1) in area of trim panel for roof pillar (4).

Lever out trim (3) and remove.

Release screw (2), tightening torque: 51 43 1AZ, see **51 43 SIDE TRIM PANEL WITH ARMRESTS**

Unclip trim panel for roof pillar (4) from mounting point (5) in direction of arrow.

Feed trim panel for roof pillar (4) upwards out of mounting (6) and remove.

NOTE: **Make sure trim panel for roof pillar (4) is correctly seated in mounting (6).**

Fig. 460: Roof Pillar, Mounting Point And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, lever out clip (1) remaining in bore.

If necessary, replace faulty clip (1).

Feed in trim panel for roof pillar (2) preassembled with clip (1) first at bottom, then position on associated bore and clip into place.

Fig. 461: Roof Pillar And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

51 43 252 REPLACING TRIM PANEL FOR REAR LEFT OR RIGHT ROOF PILLAR (D-PILLAR)

Necessary preliminary tasks:

- Remove flap in luggage compartment panel, see **51 47 172 Removing and installing/replacing flap in luggage compartment trim, left or right**
- Remove luggage compartment light, see **63 31 080 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT LIGHT (D-PILLAR)**

Detach mocket (1) in area of trim panel for roof pillar (4).

Remove screws (2) and (3).

Unclip trim panel for roof pillar (4) at mounting points (5) in direction of arrow.

Feed trim panel for roof pillar (4) upwards out of trim (6) and remove.

Installation:

Make sure trim panel for roof pillar (4) is correctly seated in trim (6).

Fig. 462: Roof Pillar, Trim, Mocket And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, lever out clips (1) remaining in bore.

If necessary, replace faulty clips (1).

Feed in trim panel for roof pillar (2) preassembled with clips (1) first at bottom, then position on associated bores and clip into place.

Fig. 463: Roof Pillar And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

44 ROOF TRIM PANEL

51 44 ... REMOVING AND INSTALLING FRONT ROOFLINER TRIM

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Unclip trim (1) with special tool 00 9 317 in direction of arrow.

Disconnect associated plug connections and remove trim (1).

Installation:

Make sure all-round catches of trim (1) are correctly seated.

Fig. 464: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Disconnecting the plug connection for the hands-free microphone or emergency SOS call button results in fault memory entries in the telephone control unit (limitation in the emergency SOS call system).

After fitting, read out fault memory and if necessary delete entries.

51 44 002 REMOVING AND INSTALLING ROOFLINER (ON VERSION WITHOUT PANORAMA SUNROOF)

Except for the steps relating to the panorama sunroof, the work is identical to:

51 44 013 Removing and installing roofliner (on version with panorama sunroof)

51 44 013 REMOVING AND INSTALLING ROOFLINER (ON VERSION WITH PANORAMA SUNROOF)

Necessary preliminary tasks:

- Remove both sun visors and counter supports, see **51 16 080 Removing and installing or replacing sun visor and left or right counter support**
- Remove all handles, see **51 16 450 Removing and installing/replacing rear left/right grab handle**
- Remove both trim panels for front roof pillar (A-pillar trim panel), see **51 43 201 Removing and installing/replacing panel for roof pillar at front (A-pillar), left or right**
- Remove both trim panels for top door pillar (B-pillar trim panel), see **51 43 148 Removing and installing or replacing trim on left or right door pillar (top)**
- Remove both trim panels for rear roof pillar (C-pillar trim panel), see **51 43 251 Removing and installing/replacing trim panel for rear left or right roof pillar (C - pillar)**
- Remove both trim panels for rear roof pillar (D-pillar trim panel), see **51 43 252 Replacing trim panel for rear left or right roof pillar (D-pillar)**
- Remove trim on front roofliner, see **51 44 ... Removing and installing front roofliner trim**
- Remove front and rear head restraints
- Remove all ceiling lights

Version with dividing net mounts:

If necessary, remove all dividing net mounts:

Unclip trim (1) towards bottom and remove.

Fig. 465: Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guide (1) and catches (2) of trim (3) must not be damaged.

Fig. 466: Guide, Catches And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

- Move both front seat backrests as far back as possible.
- Remove roller cover from luggage compartment.
- Fold both rear-seat backrests forward.
- Pull off mucket of front and rear doors.

**IMPORTANT: The following tasks must be carried out with a second person assisting:
 Unclip clips (1) in sunroof frame area towards bottom.**

Extend rear roofliner towards bottom out of guide.

Turn headliner and remove towards rear.

Fig. 467: Clips
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) and guide (2) must not be damaged.

If necessary, replace clips (1) and guide (2).

Fig. 468: Clips And Guide
Courtesy of BMW OF NORTH AMERICA, INC.

45 INSTRUMENT CLUSTER TRIM PANEL

51 45 .. OVERVIEW OF INSTRUMENT PANEL

- | | | | |
|---|---|----|---|
| 1 | Fresh-air grille, left | 6 | Fresh-air grille, right |
| 2 | Dashboard trim panel | 7 | Glovebox |
| 3 | Storage compartment in instrument panel | 8 | Instrument panel trim, bottom right |
| 4 | Fresh-air grille, middle | 9 | Function carrier on instrument panel trim |
| 5 | Airbag cover, passenger side | 10 | Panel for pedals |

Fig. 469: Instrument Panel Components

Courtesy of BMW OF NORTH AMERICA, INC.

51 45 ... REMOVING AND INSTALLING STORAGE TRAY IN INSTRUMENT PANEL

Necessary preliminary tasks:

- Remove center fresh air grill, see **64 22 162 REMOVING AND INSTALLING/REPLACING CENTER FRESH-AIR GRILL**

Release screws (1).

Feed storage tray in instrument panel (2) in direction of arrow out of upper guides (3) and remove.

Fig. 470: Instrument Panel, Screw And Upper Guides
 Courtesy of BMW OF NORTH AMERICA, INC.

51 45 ... REMOVING AND INSTALLING/REPLACING BOTTOM RIGHT TRIM FOR INSTRUMENT PANEL

NOTE: Move front passenger seat completely towards rear.

Press bottom right instrument panel trim (1) forwards slightly and feed downwards out of guides (2).

Disconnect associated plug connection and remove bottom right instrument panel trim (1).

Fig. 471: Instrument Panel Trim And Guides
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Attachments (1) on bottom right instrument panel trim (2) must not be damaged.

Replacement:

Press catches (3) and remove footwell light (4).

Fig. 472: Catches, Instrument Panel Trim And Footwell Light
 Courtesy of BMW OF NORTH AMERICA, INC.

51 45 030 REMOVING AND INSTALLING INSTRUMENT PANEL TRIM

NOTE: Observe the following instructions to facilitate removal of the instrument panel trim:

- Move front seats back completely and lower
- Move steering column into "lower" and "extended" position

Necessary preliminary tasks:

- Remove both trims for front roof pillar, see 51 43 201 Removing and installing/replacing panel for roof pillar at front (A-pillar), left or right
- Remove fixture for steering column stalks, see 61 31 005 REMOVING AND INSTALLING/REPLACING FIXTURE FOR STEERING COLUMN STALK
- Remove instrument cluster, see 62 11 280 REMOVING AND INSTALLING (REPLACING) INSTRUMENT CLUSTER
- Remove light operator unit, see 61 31 037 REMOVING AND INSTALLING/REPLACING LIGHT CONTROL UNIT
- Remove footwell side trim panel on A-pillar left, see 51 43 070 Removing and installing/replacing side trim panel, footwell, on A-pillar, left
- In appropriate version:
 - Remove storage compartment in instrument panel, see 51 45 ... Removing and installing storage tray in instrument panel
 - Remove Central Information Display, see 65 50 055 REMOVING AND INSTALLING/REPLACING CENTRAL INFORMATION DISPLAY
- Remove radio receiver, see 65 11 045 REMOVING AND INSTALLING/REPLACING RADIO/NAVIGATION CONTROL PANEL
- Remove finisher for preselector lever, see 51 16 210 Removing and installing/replacing trim for preselector lever

- Remove storage compartment, see [51 16 200 Removing and installing storage compartment](#)
- Remove right glovebox with housing, see [51 16 366 Removing and installing right glovebox with housing](#)
- Remove front right cup holder, see [51 16 194 Removing and installing/replacing front side left or right cup holder](#)
- Remove footwell side trim panel from right A-pillar, see [51 43 075 Removing and installing/replacing side trim panel, footwell, on A-pillar, right](#)
- Remove trim for instrument panel, bottom left, see [51 45 ... Removing and installing/replacing bottom right trim for instrument panel](#)
- Remove airbag module on front passenger side, see [72 12 000 REMOVING AND INSTALLING / REPLACING AIRBAG MODULE ON PASSENGER SIDE](#)

Open locks (1) and pull down fuse carrier (2).

Fig. 473: Locks And Fuse Carrier
 Courtesy of BMW OF NORTH AMERICA, INC.

Open cover for passenger airbag (2).

NOTE: **The mounting plate may fall into the passenger footwell when screws (1) are released.**

Release screws (1), tightening torque: 72 12 10AZ, see [72 12 AIRBAG MODULES](#)

Remove complete passenger airbag cover (2) with associated mounting plate.

Fig. 474: Passenger Airbag Cover And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure mounting plate (1) is correctly seated in retaining strap (2) of passenger airbag cover.

Fig. 475: Mounting Plate And Retaining Strap (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 476: Mounting Plate And Retaining Strap (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Release mocket (1) in area of instrument panel trim (5).

Release screws (2).

Unscrew nuts (3).

Disconnect plug connection for solar sensor (6).

Pull back trim for instrument panel (5) and remove.

Installation:

Make sure foam insulation (4) is correctly seated before fitting instrument panel trim (5).

Installation:

Make sure guides (1) and (2) of instrument panel trim (3) are correctly seated in associated mountings.

Make sure seals are correctly seated on air ducts.

Fig. 477: Guides And Instrument Panel Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 45 031 REPLACING INSTRUMENT PANEL TRIM

Necessary preliminary tasks:

- Remove instrument panel trim, see **51 45 031 Replacing instrument panel trim**

Release screws (1) on gap cover for steering column (2).

Carefully pull off light switch wiring harness (3) secured with double-sided adhesive tape.

Installation:

Re-lay light switch wiring harness (3) in designated notch of instrument panel trim (4).

Fig. 478: Light Switch Wiring Harness And Instrument Panel Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Remove trim from cutout for instrument cluster (2).

Remove gap cover for steering column (3).

Fig. 479: Instrument Cluster And Steering Column
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, release screws (1) and remove trim (2).

Remove all metal nuts (3) from instrument panel trim (4).

Fig. 480: Screws And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 45 055 REMOVING AND INSTALLING/REPLACING AIRBAG COVER ON PASSENGER SIDE

Special tools required:

- **64 1 020 RELEASE HOOK**

WARNING: Each time the passenger airbag is triggered, it is necessary to replace its airbag cover.

**We cannot guarantee that the retaining straps of the airbag cover will not be damaged when the airbag is triggered.
If a damaged airbag cover is reused, we cannot guarantee that the retaining straps will work properly.**

Necessary preliminary tasks:

- Disconnect battery negative lead

Lever out airbag cover (1) with special tool 64 1 020.

Fig. 481: Special Tool (64 1 020)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: If necessary, remove felt.

Fig. 482: Airbag Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Remove adhesive residue and clean adhesive area with isopropanol.

Apply 5 mm dia. butylene tape (Terostat 2460) on left and right in groove.

$A = 30 \text{ mm} \pm 2$

$B = 15 \text{ mm} +5/-0$

$C = 40 \text{ mm} \pm 2$

Fig. 483: Adhesive Area

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clean adhesive area on airbag cover (3) with isopropanol.

Remove backing paper from butyl.

Lug (2) of airbag cover (3) must snap into groove (1) in instrument panel.

Fig. 484: Airbag Cover And Groove

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove airbag cover (2).

Tightening torque: 72 12 10AZ, see **72 12 AIRBAG MODULES**

Fig. 485: Screws And Airbag Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure turning lock of fitting (1) is correctly seated in bore hole.

Fig. 486: Lock Of Fitting
Courtesy of BMW OF NORTH AMERICA, INC.

51 45 106 REMOVING AND INSTALLING/REPLACING FUNCTION CARRIER ON INSTRUMENT PANEL TRIM

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

Version with automatic transmission:

- Remove trim for preselector lever, see **51 16 210 Removing and installing/replacing trim for preselector lever**

Version with manual transmission:

- Remove gaiter for gear lever

Lever out retainers (1) in direction of arrow and remove.

Fig. 487: Retainers

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip trim (1) with special tool 00 9 317 in lower area only.

Fig. 488: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) on trim (2).

Fig. 489: Screws And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and pull trim (2) forwards slightly.

Fig. 490: Screws And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Depending on version, disconnect plug connections (1 and 2) and remove trim (3).

Replacement:

Remove switch unit in center console, see **61 31 057 REMOVING AND INSTALLING/REPLACING SWITCH UNIT IN CENTER CONSOLE**

Fig. 491: Plug Connections And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 45 185 REMOVING AND INSTALLING/REPLACING TRIM FOR PEDAL ASSEMBLY

Release screws (1).

Unclip trim for pedal assembly (4) at retaining points (2).

Remove rotary clip (3) and pull back trim for pedal assembly (4) in direction of arrow.

Disconnect associated plug connections and remove trim for pedal assembly (3).

Fig. 492: Rotary Clip And Pedal Assembly
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Locator tabs (1) of trim for pedal assembly (2) must not be damaged.

Replacement:

- Unclip gong (3) and remove.
- Remove footwell light (4).

Fig. 493: Tabs, Pedal Assembly And Footwell Light
 Courtesy of BMW OF NORTH AMERICA, INC.

46 PARCEL SHELF TRIM PAN/ROLLER SUN BLIND

51 46 050 REMOVING AND INSTALLING/REPLACING TOP TRIM ON REAR APRON

Necessary preliminary tasks:

- Remove luggage compartment floor trim (luggage compartment mat), see **51 47 102 Removing and installing/replacing luggage compartment floor trim panel**
- Remove both trims for roof pillars at rear (D-pillar), see **51 43 252 Replacing trim panel for rear left or right roof pillar (D-pillar)**

Release screws (1).

Lever out protective caps (3) at openings (2), remove and release screws underneath.

Lever out trim (4) inwards/upwards.

Installation:

If necessary, replace damaged protective caps (3).

Fig. 494: Protective Caps And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

47 FLOOR/LUGGAGE COMPARTMENT/ENGINE COMPARTMENT/TRIM PANELS

51 47 ... REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT UNDERBODY PANNELLING

Necessary preliminary tasks:

- Remove tension strut, see **33 32 170 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT TENSION STRUT**

Release screws (1).

Release expander rivet (2) and remove cover (3).

Fig. 495: Expander Rivet, Screws And Cover

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten screws (1) and nuts (2).

Release expander rivets (3).

Feed out underbody panelling (4) in direction of arrow and remove.

Fig. 496: Expander Rivets, Underbody Panelling And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

51 47 ... REMOVING AND INSTALLING/REPLACING STORAGE COMPARTMENT IN LUGGAGE COMPARTMENT ON RIGHT

Necessary preliminary tasks:

- Remove flap in luggage compartment panel on right, see **51 47 172 Removing and installing/replacing flap in luggage compartment trim, left or right**
- Remove right luggage compartment wheel arch trim, see **51 47 161 Removing and installing/replacing right luggage compartment wheel arch trim**

Release screws (1) and remove storage compartment (2) in direction of arrow.

Fig. 497: Screws And Storage Compartment
Courtesy of BMW OF NORTH AMERICA, INC.

51 47 000 REMOVING AND INSTALLING/REPLACING FRONT (INSIDE) LEFT OR RIGHT ENTRANCE COVER STRIP

Remove entrance cover strip (1) with clips (2) towards top.

If necessary, lever out clips from floor plate.

Fig. 498: Entrance Cover Strip And Clips
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Push clips (1) onto entrance cover strip (2).

If necessary, replace faulty clips (1).

Fig. 499: Clips And Entrance Cover Strip
Courtesy of BMW OF NORTH AMERICA, INC.

51 47 030 REMOVING AND INSTALLING/REPLACING REAR (INSIDE) LEFT OR RIGHT ENTRANCE COVER STRIP

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove rear seat (through-loading system)

Unclip clips (1) on entrance cover strip (2) with special tool 00 9 317.

Remove entrance cover strip (2) towards top rear.

Fig. 500: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Clips (1) and guide (2) on entrance cover strip (3) must not be damaged.

If necessary, replace faulty clips (1).

Fig. 501: Clips, Guide And Entrance Cover Strip

Courtesy of BMW OF NORTH AMERICA, INC.

51 47 102 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT FLOOR TRIM PANEL

Unlock luggage compartment floor trim panel (1) at handle (2) and remove in direction of arrow.

Fig. 502: Luggage Compartment Floor Trim Panel And Handle
Courtesy of BMW OF NORTH AMERICA, INC.

51 47 131 REPLACING FRONT TRIM FOR LUGGAGE COMPARTMENT FLOOR

Necessary preliminary tasks:

- Remove backrest for rear seat
- Remove rear luggage compartment floor trim, see **51 47 102 Removing and installing/replacing luggage compartment floor trim panel**

Release expander rivets (1) and nuts (2) and remove trim (3) in direction of arrow.

Installation:

If necessary, replace faulty expander rivets (1) and/or nuts (2).

Fig. 503: Expander Rivets, Nuts And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) and catches (2) on trim (4) must not be damaged.

Replacement:

If necessary, detach sound insulation (3) from trim (4) and fit on new part.

Fig. 504: Guides, Catches And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 135 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT LASHING RAIL IN LUGGAGE COMPARTMENT FLOOR

Necessary preliminary tasks:

- Remove inner window cavity cover strip, see **51 37 261 Removing and installing/replacing window cavity cover strip for door window, rear left or right**
- Remove rear luggage compartment floor trim, see **51 47 102 Removing and installing/replacing**

luggage compartment floor trim panel

- Remove front trim for luggage compartment floor, see **51 47 131 Replacing front trim for luggage compartment floor**
- Remove top trim from tail panel, see **51 46 050 Removing and installing/replacing top trim on rear apron**
- Remove luggage compartment wheel arch trim on left or right, see **51 47 151 Removing and installing / replacing left luggage compartment wheel arch trim**

Right side only:

- Remove storage compartment in luggage compartment on right, see **51 47 ... Removing and installing/replacing storage compartment in luggage compartment on right**

NOTE: The operation is described on the left side; proceed in the same way for the right side.

Release screws (1).

Lashing rail (2):

- A. Slide approx. 2 cm towards rear
- B. Feed out towards top front

Fig. 505: Rail And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, remove reinforcement plate (1) with guide (2) from lashing rail (3) and fit on new part.

Fig. 506: Reinforcement Plate, Guide And Lashing Rail
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 151 REMOVING AND INSTALLING / REPLACING LEFT LUGGAGE COMPARTMENT WHEEL ARCH TRIM

Necessary preliminary tasks:

- Remove inner window cavity cover strip, see **51 37 261 Removing and installing/replacing window cavity cover strip for door window, rear left or right**
- Remove front trim for luggage compartment floor, see **51 47 131 Replacing front trim for luggage compartment floor**

Release screws (1).

Right side only: Release screw in area (2).

Lever out trim (3) in direction of arrow and remove.

Feed luggage compartment wheel arch trim (4) at top out of roller sun blind mounting and remove from passenger compartment in direction of arrow.

Fig. 507: Luggage Compartment Wheel Arch Trim, Trim And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) and catches (2) on trim (3) must not be damaged.

Fig. 508: Guides, Catches And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, detach sound insulation (1) from trim (2) and fit on new part.

Fig. 509: Sound Insulation And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

51 47 161 REMOVING AND INSTALLING/REPLACING RIGHT LUGGAGE COMPARTMENT WHEEL ARCH TRIM

Operation up to work on 12 V socket is identical to:

Removing and installing/replacing left luggage compartment wheel arch trim, see **51 47 151 Removing and installing / replacing left luggage compartment wheel arch trim**

Lever out socket (1) in direction of arrow and pull off a little.

Fig. 510: Socket
Courtesy of BMW OF NORTH AMERICA, INC.

Disconnect plug connection (1) on socket (2).

Remove socket (2).

Fig. 511: Plug Connection And Socket
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guide (1) and catches (2) on socket (3) must not be damaged.

Fig. 512: Guide, Catches And Socket
Courtesy of BMW OF NORTH AMERICA, INC.

If replacing 12 V socket:

Open cover (1) of socket housing.

Turn socket insert (2) approx. 30° to right.

Turn socket insert (2) under tension back into initial position and pull out of socket housing.

Fig. 513: Cover And Socket Insert
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Align socket insert (1) with retaining lugs (2) to groove (3) of socket housing and slide in until it is felt snapping into place.

Fig. 514: Socket Insert, Retaining Lugs And Groove
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 172 REMOVING AND INSTALLING/REPLACING FLAP IN LUGGAGE COMPARTMENT TRIM, LEFT OR RIGHT

Press button (1), open flap in luggage compartment trim (2) and remove.

Fig. 515: Button And Luggage Compartment Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 315 REMOVING AND INSTALLING/REPLACING FRONT CARPET FOR PASSENGER COMPARTMENT

Necessary preliminary tasks:

- Remove instrument panel trim, see **51 45 030 Removing and installing instrument panel trim**
- Remove left/right front seat
- Remove front left/right entrance cover strip, see **51 47 000 Removing and installing/replacing front (inside) left or right entrance cover strip**
- Remove accelerator pedal module

Cut out carpet (1) at cutting edge (2) on left/right.

**IMPORTANT: Make the cut as far as possible in the direction of the middle of the car to ensure that the cutting edges are covered by the storage compartment/instrument panel.
Pay attention to cables when cutting (risk of damage).**

If necessary, guide cable back through carpet (1).

Feed out carpet (1) towards rear/top.

Fig. 516: Carpet And Cutting Edge
Courtesy of BMW OF NORTH AMERICA, INC.

Cutting edges (1) shown on removed carpet (2).

Replacement:

Place removed carpet on new carpet and carry over cuts to new carpet.

Installation:

Apertures (3) serve as alignment points for fitting the carpet (2).

Fig. 517: Carpet, Apertures And Cutting Edge
 Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

Detach stowage net (1).

Remove clips (2) for stowage net (1).

Fig. 518: Clips And Stowage Net
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 440 REMOVING AND INSTALLING/REPLACING REAR CARPET ON SEAT PAN

Necessary preliminary tasks:

- Remove left/right front seat
- Remove rear seat
- Remove handbrake lever
- Remove trim panel for door pillars on left/right, see **51 43 150 Removing and installing or replacing trim for left or right door pillar (bottom)**

- Remove front inside entrance cover strip, see **51 47 000 Removing and installing/replacing front (inside) left or right entrance cover strip**
- Remove entrance cover strip at rear inside, see **51 47 030 Removing and installing/replacing rear (inside) left or right entrance cover strip**
- Remove airbag control unit, see **65 77 016 REMOVING AND INSTALLING/REPLACING AIRBAG CONTROL UNIT**

Remove holder (1) for storage compartment.

Feed out cable (2) through carpet (3) and lay back.

Remove carpet (3).

Installation:

Make sure openings for air duct and attachment points are correctly positioned.

Make sure cable (2) is in correct position.

Fig. 519: Cable, Carpet And Holder
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 490 REMOVING AND INSTALLING / REPLACING FRONT UNDERBODY PROTECTION

NOTE: Illustration created using 3.0d as an example. There may be differences in detail in the case of other models.

Release expansion rivet (1).

Unfasten screws (2).

Pull out underbody protection (3) towards rear.

Fig. 520: Underbody Protection, Expansion Rivet And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

51 47 491 REMOVING AND INSTALLING/REPLACING REAR UNDERBODY PROTECTION

NOTE: Illustration created using 3.0d as an example. There may be differences in detail in the case of other models.

Unfasten screws (1) and nuts (2).

Feed out assembly underside protection (3) towards rear and remove.

Installation:

Ensure correct seating.

Centre assembly underside protection (3) and tighten down with screws (1) and nuts (2).

Fig. 521: Centre Assembly Underside Protection, Screws And Nuts
 Courtesy of BMW OF NORTH AMERICA, INC.

48 FRONT LID INSULATION LINING

51 48 001 REMOVING AND INSTALLING/REPLACING INSULATION LINING ON HOOD/BONNET

NOTE: Illustration created using the E87 as an example. There may be differences in detail in the case of other vehicle models.

Release threaded rivets (1) on insulation lining (2).

Remove insulation lining (2).

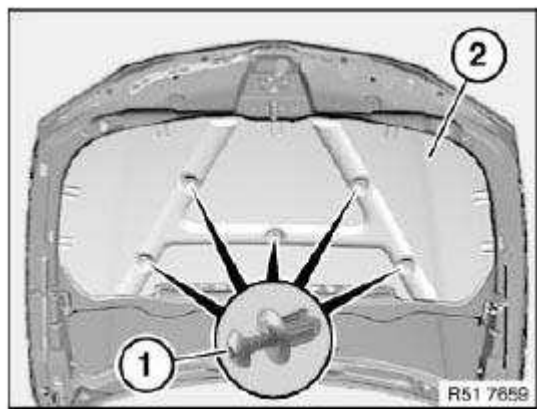

Fig. 522: Threaded Rivets And Insulation Lining
Courtesy of BMW OF NORTH AMERICA, INC.

51 48 060 REMOVING AND INSTALLING/REPLACING SOUND INSULATION IN LEFT OR RIGHT FRONT DOOR

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove front door trim panel, see 51 41 000 Removing and installing left or right front door trim panel

Using special tool 00 9 317, lever out sealing bead (1) of sound insulation (2) completely or if necessary partially.

Disconnect plug connection (3) at door lock.

Feed wires (4) out of sound insulation (2).

Fig. 523: Special Tool (00 9 317)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

In case of replacement or partial detachments, lay butylene tape (sourcing reference: BMW Parts Service) depending on the conditions on inner door panel or sound insulation.

Seal cable penetrations with butylene tape.

NOTE: Position of butylene tape (1) on inner door plate.

IMPORTANT: Do not damage Bowden cable (2) and lock knob control rod (3).

Fig. 524: Butylene Tape, Bowden Cable And Lock Knob Control Rod
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Position of butylene tape (1) on sound insulation (2).

Fig. 525: Butylene Tape And Sound Insulation
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: A marking (2) is provided all round on the sound insulation (1).
Butylene tape (3) rests on or inside the marking (2).

Fig. 526: Butylene Tape And Marking
Courtesy of BMW OF NORTH AMERICA, INC.

Clean bonding area with adhesive remover (sourcing reference: BMW Parts Service).

Air drying time: 1 minute

IMPORTANT: Adhesive areas must be dry and free of dust and grease.
Once it has been cleaned, do not touch the adhesive area with bare hands.

Lay single row of 6 mm dia. butylene tape or double row of 3 mm dia. tape (sourcing reference: BMW Parts Service) in specified adhesive area.

Heat butylene tape (hot air blower) and press down firmly on sound insulation all round.

Contact pressure with hand roller: approx. 30 N/cm²

Manual contact pressure: approx. 10 N/cm²

NOTE: Firm thumb pressure has approx. 50 N/cm²

51 48 070 REMOVING AND INSTALLING/REPLACING SOUND INSULATION ON LEFT OR RIGHT REAR DOOR

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove rear door trim panel, see **51 42 000 Removing and installing left or right rear door trim panel**

Disconnect plug connection (1).

Unclip clip (2).

Using special tool 00 9 317 (trim panel wedge), lever out sealing bead (3) of sound insulation (4) completely or if necessary partially.

Feed wires (5) out of sound insulation (4).

Fig. 527: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

In case of replacement or partial detachments, lay butylene tape (sourcing reference: BMW Parts Service) depending on the conditions on inner door panel or sound insulation.

Seal cable penetrations with butylene tape.

NOTE: Position of butylene tape (1) on inner door plate.

IMPORTANT: Do not damage Bowden cable (2) and lock knob control rod (3).

Fig. 528: Bowden Cable, Butylene Tape And Lock Knob Control Rod
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Position of butylene tape (1) on sound insulation (2).

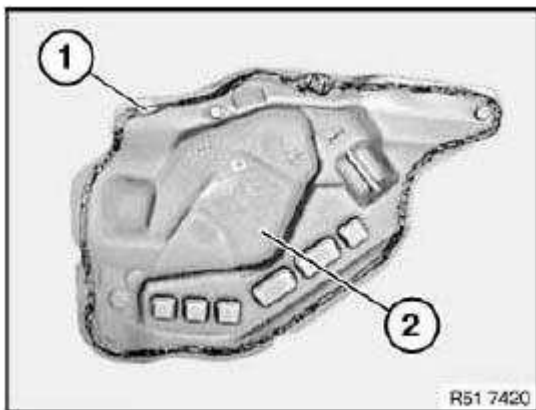

Fig. 529: Butylene Tape And Sound Insulation
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: A marking (2) is provided all round on the sound insulation (1).
Butylene tape (3) rests on or inside the marking (2).

Fig. 530: Butylene Tape And Marking
Courtesy of BMW OF NORTH AMERICA, INC.

Clean bonding area with adhesive remover (sourcing reference: BMW Parts Service).

Air drying time: 1 minute

IMPORTANT: Adhesive areas must be dry and free of dust and grease.

Once it has been cleaned, do not touch the adhesive area with bare hands.

Lay single row of 6 mm dia. butylene tape or double row of 3 mm dia. tape (sourcing reference: BMW Parts Service) in specified adhesive area.

Heat butylene tape (hot air blower) and press down firmly on sound insulation all round.

Contact pressure with hand roller: approx. 30 N/cm²

Manual contact pressure: approx. 10 N/cm²

NOTE: Firm thumb pressure has approx. 50 N/cm²

49 REAR LID TRIM PANEL

51 49 003 REMOVING AND INSTALLING/REPLACING TRIM FOR REAR WINDOW FRAME ON LEFT OR RIGHT

Special tools required:

- 00 9 317 00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)

Necessary preliminary tasks:

- Remove trim for rear window frame at top, see 51 49 015 Removing and installing/replacing trim for

rear window frame at top

Unclip trim (1) with special tool 00 9 317 from retainers (2) and remove in direction of arrow.

Installation:

If necessary, detach clips (2) from trim (1) and insert in rear lid.

If necessary, replace faulty clips (2).

Fig. 531: Special Tool (00 9 317)

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) on trim (2) must not be damaged.

Fig. 532: Guides And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Necessary preliminary tasks:

- Remove luggage compartment light, see **63 31 080 REMOVING AND INSTALLING/REPLACING LUGGAGE COMPARTMENT LIGHT (D-PILLAR)**

Release expansion rivets (1).

Installation:

If necessary, replace faulty expander rivets (1).

Fig. 533: Expander Rivets

Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1).

Unclip clips (2) and remove trim (3) towards bottom.

Fig. 534: Clips And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

All clips (1) are white.

If necessary, replace faulty clips (1).

Remove insulating mat (2) from old trim (3) and insert in new trim.

Fig. 535: Insulating Mat And Trim

Courtesy of BMW OF NORTH AMERICA, INC.

51 49 015 REMOVING AND INSTALLING/REPLACING TRIM FOR REAR WINDOW FRAME AT TOP

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Unclip trim (1) with special tool 00 9 317 from retainers (2) and remove in direction of arrow.

Installation:

If necessary, detach clips (2) from trim (1) and insert in rear lid.

If necessary, replace faulty clips (2).

Fig. 536: Special Tool (00 9 317)
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

.Guides (1) on trim (2) must not be damaged.

Fig. 537: Guides And Trim
 Courtesy of BMW OF NORTH AMERICA, INC.

71 GASKETS/SEALS/LOOSE BODY PARTS

51 70 ... FITTING SEALS

NOTE: All seals on the vehicle must be removed with the utmost care. Incorrect fitting may result in among other things wind noises and water ingress, and may compromise closing and opening comfort.

The following instructions always apply:

- Seals which are attached to the side frame can be removed and fitted as often as desired.
- Seals must not be damaged or cracked.

- The clamping area must be pressed together by hand to such an extent that rigid attachment to the side flange is still possible. The sides of the seal are permitted to touch each other slightly. A fully compressed seal is not permitted.

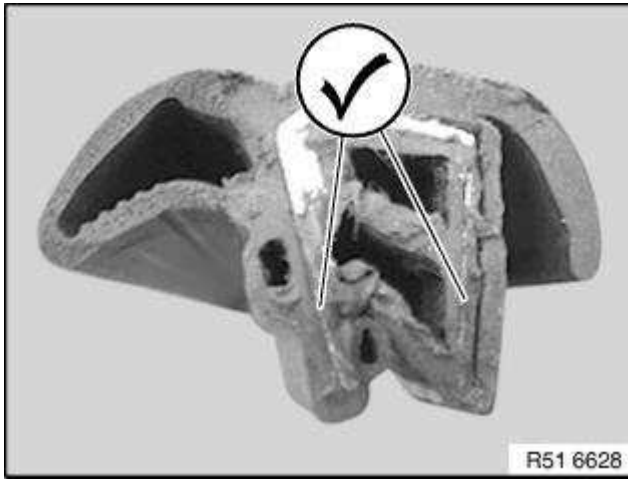

Fig. 538: Identifying Sides Of Seal (Good Seal)
 Courtesy of BMW OF NORTH AMERICA, INC.

- A special tool to press the clamping area together is not needed. Careful fitting by hand is sufficient.
- The seals must always be fitted over their full extent. There is no defined pressing force.
- If seals are repeatedly removed and fitted in the rear lid area, a new seal must be fitted (water ingress in event of sheet flaws).
- Seals must be checked after fitting for correct seating. If necessary, the seals must be lifted over the adjacent components with a suitable tool. Adjacent components must not be damaged.
- Seals must be replaced when the metal insert in the seal is visible (corrosion).

Fig. 539: Identifying Sides Of Seal (Bad Seal)
 Courtesy of BMW OF NORTH AMERICA, INC.

- The clamping area must be uniform.

Fig. 540: Clamping Area Must Be Uniform
 Courtesy of BMW OF NORTH AMERICA, INC.

- Joint seals which are fitted with plastic clips must rest rigidly on the body. Otherwise, the clips or the joint seal must be replaced.

Fig. 541: Joint Seals Fitted With Plastic Clips Must Rest Rigidly On Body
 Courtesy of BMW OF NORTH AMERICA, INC.

51 71 040 REMOVING AND INSTALLING/REPLACING FRONT LEFT OR RIGHT WHEEL ARCH COVER

Necessary preliminary tasks:

- Remove front wheel

NOTE: The operation is described on the left side; proceed in the same way for the right side.

Drill off blind rivets (1).

Unfasten screws (2).

Carefully feed out wheel arch cover (3).

Installation:

Ensure wheel arch cover (3) is correctly seated.

Fig. 542: Wheel Arch Cover, Rivets And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

51 71 041 REMOVING AND INSTALLING/REPLACING REAR LEFT OR RIGHT WHEEL ARCH COVER

Necessary preliminary tasks:

- Remove rear wheel

NOTE: The operation is described on the left side; proceed in the same way for the right side.

Drill off blind rivets (1).

Unfasten screws (2) and nuts (3).

Carefully feed out wheel arch cover.

Installation:

Make sure wheel arch cover is correctly seated.

Fig. 543: Screws, Rivets And Nuts
 Courtesy of BMW OF NORTH AMERICA, INC.

51 71 080 REMOVING AND INSTALLING/REPLACING HEATER BULKHEAD

Necessary preliminary tasks:

- Remove microfilter for passenger compartment ventilation, see **64 31 010 REPLACING MICROFILTER FOR INTERIOR VENTILATION**

Unclip retainers (1) and feed cable out of cable duct.

Fig. 544: Retainers
 Courtesy of BMW OF NORTH AMERICA, INC.

Release screws (1) and remove microfilter housing towards front.

Installation:

Seals on microfilter housing must not be damaged or missing.

Fig. 545: Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Detach rubber strip (1).

Release locks (2) and pull side trim forwards a little.

Fig. 546: Rubber Strip And Locks
Courtesy of BMW OF NORTH AMERICA, INC.

Remove screws (1) and (2).

Lift out heater bulkhead.

Fig. 547: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

51 71 200 REMOVING AND INSTALLING / REPLACING SEAL ON REAR DOOR, LEFT OR RIGHT

NOTE: Follow repair instructions for bonded seals, see 54 0 ... REPAIR INSTRUCTIONS FOR BONDED SEALS

Detach seal (1) from rear door (2).

Clean adhesive area.

Installation:

- Pull protective film (liner) off seal to half-way point
- Feed seal at top into rubber guide (3)
- Gently press seal without stretching
- Check positioning of seal, correct if necessary and firmly press.
- Pull remaining protective film (liner) off seal.
- Press remaining seal without stretching.
- Check positioning of seal, correct if necessary and firmly press.

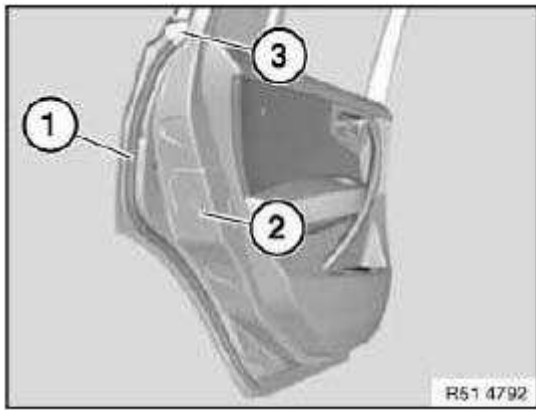

Fig. 548: Seal And Rear Door

Courtesy of BMW OF NORTH AMERICA, INC.

- IMPORTANT:**
- Do not grip bonding surface.
 - It is not the length of pressing in time but rather the level of pressing (approx. 10 ... 15 N/cm²) which is decisive here.
 - Separation of seal after pressing destroys the adhesive layer.

NOTE: After being pressed on gently, seal can be pulled off again up to 3 times. Do not dirty adhesive area.

51 71 373 REMOVING AND INSTALLING/REPLACING TENSION STRUT ON SPRING STRUT DOME

IMPORTANT: Vehicles must not be driven without tension struts.
Driving without tension struts may damage the vehicle body.

Release screws (1) and remove tension strut (2).

Tightening torque: 51 71 4AZ, see 51 71 SEALS AND LOOSE BODY PARTS

Fig. 549: Screws And Tension Strut

Courtesy of BMW OF NORTH AMERICA, INC.

51 71 407 REPLACING REAR SPOILER

Necessary preliminary tasks:

- Remove rear spoiler, see **51 71 412 Removing and installing rear spoiler**
- Remove auxiliary brake light, see **63 25 000 REMOVING AND INSTALLING/REPLACING AUXILIARY BRAKE LIGHT**
- If necessary, remove aerial/antenna
- If necessary, remove spray nozzle for rear window washer unit, see **61 62 110 REMOVING AND INSTALLING/REPLACING SPRAY NOZZLE FOR REAR WINDOW WIPER**

51 71 412 REMOVING AND INSTALLING REAR SPOILER

Necessary preliminary tasks:

- Remove trim for rear window frame at top, see **51 49 015 Removing and installing/replacing trim for rear window frame at top**

Detach hose in area (1).

Disconnect plug connection (2).

Unclip lines at points (3).

Disconnect plug connection (4).

Press rubber grommet (5) upwards out of rear lid (6).

Installation:

Make sure rubber grommet (5) is correctly seated.

Fig. 550: Rubber Grommet, Rear Lid And Plug Connection
 Courtesy of BMW OF NORTH AMERICA, INC.

Lever out rubber plug (1).

Unscrew nuts (2).

Tightening torque: 51 71 2AZ, see **51 71 SEALS AND LOOSE BODY PARTS**

IMPORTANT: Carefully remove rear spoiler (3) in upwards direction from rear lid (4) (with aid of a 2nd person) and place on a clean surface.

Fig. 551: Rubber Plug, Nuts And Rear Spoiler
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Lines may get caught as they are pulled out. If necessary, support lines as the are being fed out.

Installation:

Sealing washers (1) and side buffer stops must not be damaged.

Make sure there is a uniform gap all round.

If necessary, carry out height adjustment of rear spoiler (3) using adjusting screws (2).

Fig. 552: Rear Spoiler, Adjusting Screws And Washers

Courtesy of BMW OF NORTH AMERICA, INC.

51 71 470 REMOVING AND INSTALLING/REPLACING TRIM ON FRONT LEFT OR RIGHT WHEEL ARCH

Necessary preliminary tasks:

- Remove cover on sill, see **51 71 472 Removing and installing/replacing cover on left or right sill**

Build date up to 09/2004:

- Remove trim on front side panel

Release blind rivets (1) and expander rivet (2).

Snap out trim (4) at clips (3) and feed out.

Installation:

If necessary, replace expander rivet (2) and/or clip (3).

Make sure trim (4) is correctly seated on underbody protection and bumper.

Fig. 553: Blind Rivets, Clip And Expander Rivet
 Courtesy of BMW OF NORTH AMERICA, INC.

Version with M Technic aerodynamic kit:

Release blind rivets (1) and screw (2).

Snap out trim (4) at clips (3) and feed out.

Installation:

If necessary, replace faulty clips (3).

Make sure trim (4) is correctly seated on underbody protection and bumper.

Fig. 554: Blind Rivets, Trim And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

51 71 472 REMOVING AND INSTALLING/REPLACING COVER ON LEFT OR RIGHT SILL

Necessary preliminary tasks:

- Remove trim on rear wheel arch, see 51 71 478 Removing and installing/replacing trim on rear left or right wheel arch

Release blind rivet (1) and screw (2) on cover (3).

Fig. 555: Blind Rivet, Screw And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Release all blind rivets (1) on cover (2).

Fig. 556: Blind Rivets And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Version without M Technic aerodynamic kit:

Unclip cover (1) from running board (2) starting at rear and remove.

Fig. 557: Cover And Running Board
Courtesy of BMW OF NORTH AMERICA, INC.

Version with M Technic aerodynamic kit:

Snap cover (1) out of clips (2) and feed out towards bottom rear.

Installation:

If necessary, replace faulty clips (2).

Feed cover (1) correctly into trim on front wheel arch.

Fig. 558: Screws And Bumper Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) and clips (2) on cover (3) must not be damaged.

If necessary, replace faulty clips (2).

Fig. 559: Guides, Clips And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Version with M Technic aerodynamic kit:

To avoid chafing marks on cover (2), stick protective film (1) onto cover (2).

If necessary, stick protective film (1) in a moist bonding process, see **51 00 ... Instructions on sticking film** onto cover (2).

Fig. 560: Protective Film And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 71 473 REMOVING AND INSTALLING/REPLACING TAKE-UP FOR COVER ON LEFT OR RIGHT SILL

Special tools required:

- 00 9 317 **00 9 310 ASSEMBLY WEDGES (SET IN PLASTIC CASE)**

Necessary preliminary tasks:

- Remove cover on sill, see **51 71 472 Removing and installing/replacing cover on left or right sill**

Drill out blind rivet (1).

Loosen screws (2).

Installation:

Tightening torque: 51 71 16AZ, see **51 71 SEALS AND LOOSE BODY PARTS**

Feed take-up (4) in direction of arrow out of trim (3).

Fig. 561: Blind Rivet, Trim And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Replacement:

If necessary, release screws (1) on running board (2).

Feed out running board (2) in direction of arrow.

Installation:

Guides (3) on take-up (4) must not be damaged.

Fig. 562: Guides And Running Board
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace nuts (1) on take-up (2).

Guides (3) on running board (4) must not be damaged.

Fig. 563: Guides, Running Board And Nuts
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, unclip clips (1) on cover (2) with special tool 00 9 317.

Fig. 564: Clips And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

If necessary, replace faulty clips (1) on cover (2).

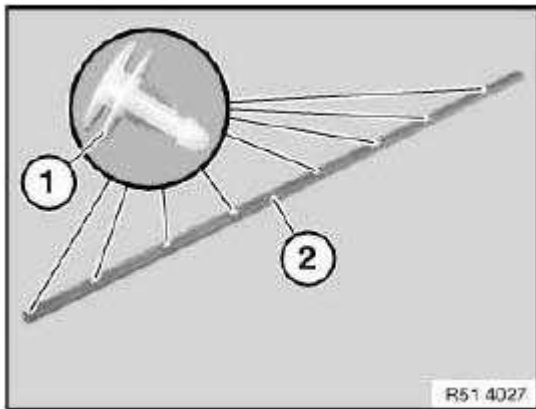

Fig. 565: Clips And Cover
Courtesy of BMW OF NORTH AMERICA, INC.

51 71 478 REMOVING AND INSTALLING/REPLACING TRIM ON REAR LEFT OR RIGHT WHEEL ARCH

Release blind rivets (1) and remove trim (2) towards top rear.

Fig. 566: Blind Rivets And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Guides (1) on trim (2) must not be damaged.

Fig. 567: Guides And Trim
Courtesy of BMW OF NORTH AMERICA, INC.

Version with M Technic aerodynamic kit:

Release blind rivets (1).

Release trim (3) from clips (2) and feed out of sill and bumper.

Installation:

If necessary, replace faulty clips (2).

Trim (3) must be correctly fed into sill trim and bumper.

Fig. 568: Trim, Clips And Blind Rivets
 Courtesy of BMW OF NORTH AMERICA, INC.

51 71 495 REMOVING AND INSTALLING/REPLACING EMERGENCY WHEEL PAN

Necessary preliminary tasks:

- Remove emergency wheel (refer to Owner's Manual)

Pull up emergency wheel pan and secure with handle (1).

Release plastic nut (3).

Release screw (2).

Extend handle (1) sideways.

Fig. 569: Plastic Nut, Handle And Screw
 Courtesy of BMW OF NORTH AMERICA, INC.

Turn holder (1).

Grip emergency wheel pan and release plastic nut (2).

Lower emergency wheel pan onto floor.

Fig. 570: Holder And Plastic Nut
Courtesy of BMW OF NORTH AMERICA, INC.

Lift vehicle.

Release screws (1).

Remove emergency wheel pan (2) towards bottom.

Fig. 571: Emergency Wheel Pan And Screws
Courtesy of BMW OF NORTH AMERICA, INC.

41 00 ... BONDING PLASTIC PARTS

IMPORTANT: Conform with safety precautions! See 41 00 ... Information on hazards

Plastic repair box:

(Sourcing reference through BMW Parts Service picture board 83-0288 Plastic repair box)

Detailed information can be found in the:

- Current painting handbook
- ASAP portal

41 00 ... BONDING STEEL PARTS

IMPORTANT: Conform with safety precautions! See 41 00 ... Information on hazards

Overview of topics:

1. Equipment

2. Expiry date of adhesive
3. Grinding and cleaning
4. Gluing coat
5. Hardening times
6. Aftertreatment of bonding surfaces
7. Disposing of adhesive

1.0 Equipment

- Emery paper
- Cleaning agent: Isopropanol, acetone or spirit
- Adhesive cartridge (sourcing reference via BMW Parts Service picture board Aluminium and steel/bonding and welding)
- Adhesive gun (standard cartridge gun)
- Spatula for applying adhesive

2.0 Expiry date of adhesive:

- The adhesive cartridge is marked with a date.
- Do not use the adhesive after this date.

3.0 Grinding and cleaning:

- For better adhesion, remove oxide film, rust, paint and scale from the adhesive areas with a wire brush or emery paper.
- Clean adhesive areas with isopropanol, acetone or spirit.
- Allow cleaned surfaces to dry for approx. 5 minutes.

Adhesive areas must be completely dry.

4.0 Adhesive application:

- Processing temperature of adhesive cartridge 15°C - 25°C.
- Insert adhesive cartridge in adhesive gun, remove cap and allow both adhesive components to emerge. Strip adhesive components uniformly and attach mixing tube.
- Allow approx. 10 cm of mixed adhesive to emerge and then apply the mixed adhesive first on one side of the adhesive area.
- After applying the adhesive, check whether an adhesive component has emerged at the back of the cartridge. If yes, break off the bonding procedure. Clean new component. Use new adhesive cartridge. Contact national hotline.
- Use a spatula to spread the adhesive over the adhesive area. Thickness of layer approx. 2 mm (dependent on adhesive gap).
- Potlife of mixed adhesive approx. 2 hours. A change of mixer is only necessary if over a period of 1 hour no material has flowed through the mixer.
- Join, secure and rivet and/or weld new parts in accordance with repair instructions.
- Remove excessive glue with paper or cloths.

5.0 Hardening times:

The hardening time is:

- Either 48 hours at a minimum of 15°C (room temperature) up to vehicle operational strength.
- Or 1 hour in the spraying booth (booth temperature 80°C/ object temperature 60°C) up to vehicle operational strength
- Do not use radiant heaters for hardening. Risk of adhesive being destroyed at temperatures of greater than 120°C.
- Do not apply load to glued parts until they have hardened!

6.0 Aftertreatment of bonding surfaces:

- Seal all bonding surfaces with cavity sealant.

7.0 Disposing of adhesive:

- Small amounts of mixed and hardened adhesive residue can be disposed of as domestic waste.

These regulations apply to the Federal Republic of Germany.

For other countries, comply with the (possibly differing) nationally applicable regulations.

41 00 ... CORROSION PROTECTION

NOTE: Following repairs, the corrosion protection work already begins with the correct removal of the PVC undercoating, antinoise compound and seam seals.

1.0 Removing sealing materials:

- IMPORTANT:**
- **Do not burn off PVC material with a gas burner or similar or heat to temperatures above 180°C. This would generate highly corrosive hydrochloric acid and release harmful fumes.**
 - **The new lining does not form a satisfactory bond with burnt PVC material which means that subsequent sub-surface rust may set in.**

Remove PVC material with a rotating steel brush, or heat PVC to maximum 180°C with a hot air blower and scrape off with a spatula.

2.0 Corrosion protection of sheet-metal parts:

All weld joints sealed off with body sealing compound in original state must be primed and sealed off again thoroughly after repairing. Replace damaged or removed antinoise compounds.

NOTE: Spray gun required for body sealing compound (order no. 81 49 0 300 887).

Concluding cavity protection is the most important part of all corrosion protection measures.

Use the cavity protection spray only for smaller-scale straightening work where the parts in question are easily accessible. Use the HRS spray gun with pressure container for all other repairs. Cavity protection agent is available in different container sizes.

Use the relevant probes with tubes for the different cavity areas.

Required tools are featured on the Workshop Equipment Planning CD (WEP).

IMPORTANT: Incorrectly performed cavity protection can, especially in the case of steel/aluminium joints, give rise to a non-calculable product liability and safety risk.

The best repair is worth nothing if the subsequent cavity protection measures are not conscientiously carried out.

2.1 Cavity protection of steel parts:

New doors and lids must be sealed with cavity protection agent after being painted.

New sheet-metal parts or cavities, weld seams and folds formed by new sheet-metal parts must be sealed with cavity protection agent after being painted.

The cavities affected must be sealed with cavity protection agent after all straightening work.

2.2 Cavity protection of aluminium parts:

New doors, lids and side panels made of aluminium are not sealed with cavity protection agent.

After all straightening work on aluminium components, the cavities affected must be sealed with cavity protection agent after being painted.

After all welding work (E52 only) on aluminium components, the cavities affected must be sealed with cavity protection agent after being painted.

Cavities, seams and folds formed from new sheet-metal parts must be sealed with cavity protection agent after being painted.

41 00 ... FRAME ALIGNMENT CONTROL DIMENSIONS, BODY

Dimensions in mm.

Measurement tolerances:

- less than 1000 mm \pm 1 mm
- Greater than 1000 mm \pm 2 mm

The control points shown serve to check the body and the straightening attachment.

The specified dimensions/measurements always refer to the centrepoint of the bore/screw.

Underbody view 1

R41 2570

Fig. 1: Frame Alignment Control Dimensions - Underbody View (1 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Underbody view 2

R41 2571

Fig. 2: Frame Alignment Control Dimensions - Underbody View (2 Of 2)
Courtesy of BMW OF NORTH AMERICA, INC.

Top view, front end

Fig. 3: Frame Alignment Control Dimensions - Top View, Front End
Courtesy of BMW OF NORTH AMERICA, INC.

View, B-pillar

Fig. 4: Frame Alignment Control Dimensions - View, B-pillar
Courtesy of BMW OF NORTH AMERICA, INC.

Measurement a=1533 mm between screw-on points of door brakes.

41 00 ... GENERAL CEMENTING INSTRUCTIONS

IMPORTANT: Conform with safety precautions! See 41 00 ... Information on hazards

- The bonding surfaces must be kept free of all types of dirt and contamination. Avoid leaving fingerprints.
- Cleanliness is the golden rule for all bonds!
- Cleaning agent: Isopropanol, acetone or spirit

Expiry date of adhesive and primer

- The adhesive cartridge and the primer are marked with a date.
- Do not use the adhesive or primer after this date.

2-component adhesive application:

- Insert adhesive cartridge in adhesive gun, remove cap and allow some adhesive to emerge. Strip adhesive components uniformly and attach mixing tube.
- Allow approx. 1 mixer length of mixed adhesive to emerge (there must be no smearing of colours). Only then apply the mixed adhesive to one side of the bonding surface.

Adhesive disposal:

- Hardened adhesive is disposed of as normal waste.
- Empty adhesive cartridges are disposed of as normal waste.
- Non-hardened adhesives and mixtures of adhesive and solvent and the like must be disposed of as hazardous waste.

These regulations apply to the Federal Republic of Germany.

For other countries, comply with the (possibly differing) nationally applicable regulations.

41 00 ... GRINDING STEEL PARTS

1.0 Recommended tools and equipment

- Tools are recommended for manual grinding work.
- Machines/equipment are recommended for machine grinding work.

2.0 Grinding outer shell and structure

Always replace abrasives which have already been used to treat aluminum (risk of corrosion).

Do not grind the material thin.

41 00 ... HANDLING AIRBAGS AND RESTRAINT SYSTEMS

1.0 Airbags and restraint systems

- On vehicles with airbags and restraint systems, observe the relevant safety instructions, see **41 0 Contents of Body, General.**
- During straightening work on the body, you will be exposed to the risk of accidental airbag triggering when the battery is connected.

Due to this potential hazard, it is essential to disconnect the battery negative lead prior to welding and straightening work. Prior to disconnecting the negative lead, interrogate the fault memories of the control units if necessary.

41 00 ... HANDLING ELECTRICAL AND ELECTRONIC EQUIPMENT

1.0 Battery

- There is a risk of explosion when welding or grinding work is carried out in the vicinity of the battery. The battery must be removed. Prior to removing the battery, interrogate the fault memories of the control units if necessary.

2.0 Control units

- The following hazards are present when the battery is connected:
 - Damage to control units during welding work on the body.
 - Accidental triggering of airbags during straightening work on the body.

Due to these potential hazards, it is essential to disconnect the battery negative lead prior to welding and straightening work. Prior to disconnecting the negative lead, interrogate the fault memories of the control units if necessary.

- Control units are designed for a temperature of 65°C. The temperatures in a spraying booth do not pose any problems. If a vehicle is inside the spraying booth at an indicated temperature of 80°C, the actual temperature of the vehicle will be greater than 60°C (object temperature).
- Protects control units against the effects of heat at temperatures > 65°C (e.g. during welding and drying with an infrared radiator or hot air blower).

3.0 Electric cables and wiring harnesses

- Protect electric cables and wiring harnesses against damage (e.g. during straightening and grinding work).
- Protect electric cables and wiring harnesses against the effects of heat at temperatures > 65°C (e.g. during welding and drying with an infrared radiator or hot air blower).
- Do not kink electric cables.

4.0 Optical fibers

- Follow instructions for handling optical fibers.

41 00 ... INFORMATION / WARNING LABELS

Missing or damaged information/warning labels (e.g. tyre inflation pressure) must be replaced.

--> Overview of installation locations, see **00 00 ... INFORMATION/WARNING LABELS**

41 00 ... INFORMATION ON HAZARDS

1.0 Aluminum

INFORMATION ON HAZARDS CHART

Hazards / effects	Measures / regulations
Repair stage 1: (replacement of bolted parts, dent removal) Repair stage 2: (structural repairs with bonding and riveting)	<ul style="list-style-type: none">○ When a vehicle outer shell is ground, aluminum dust accumulates in small amounts. This dust can be removed with conventional extractor systems.
Repair stage 3: (structural repairs with welding) <ul style="list-style-type: none">○ Explosion hazard due to high concentration of fine aluminum dust. Arising e.g. during straight-through grinding of coated parts in the base material and large-surface grinding of bright-finish parts.○ Explosion hazard due to swirling up of fine aluminum dust in cavities. Created by the necessary, thorough cleaning of machining surfaces and tools before and after machining aluminum.	<ul style="list-style-type: none">○ Avoid high concentration of fine aluminum dust by means of continuous extraction.○ Use explosion-proof extractor systems.○ Do not use compressed air when cleaning the work bay.○ Avoid swirling up dust when cleaning the work area.
<ul style="list-style-type: none">○ Spontaneous combustion of fine aluminum dust when ignition and fire sources are drawn in. E.g.: hot splinters, grinding sparks, cigarettes etc.	<ul style="list-style-type: none">○ Do not operate ignition and fire sources in the intake area of extractor systems.

41 00 ... INFORMATION ON VEHICLE PROTECTION

- Vehicle components which are situated in the repair area or exposed to heat, flying sparks or dust must be removed or covered.

IMPORTANT: Do not use combustible or contaminated coverings.

41 00 ... INSTALLATION OF A CAVITY SEAL WITH CAVITY FOAM

IMPORTANT: The cavity foam may only be use for cavity sealing at the points at which cavity sealing is present as standard!

The following repair represents the replacement of a shaped part for the cavity seal by the use of cavity foam.

This type of cavity sealing is used at points at which shaped parts cannot be used for repairs.

This is the case when large amounts of heat occur (e.g. due to welding, soldering or tin-plating) in the direct vicinity or at the point of the standard cavity sealing.

It is not possible here to install shaped parts for the cavity seal because of the fire risk!

To replace shaped parts with cavity foam at further locations, adopt the procedure shown here and adapt it to the relevant conditions.

It must be ensured that the cavity is completely sealed off.

NOTE: Check the accessibility for the spraying pipe of the cavity foam to the affected cavity after removing the damaged part.

Properties of cavity foam:

- 2K-PUR foam, solvent-free.
- Excellent flow capacity, enabling complete sealing of cavities.
- Good strength, preventing slipping in cavities.
- Low water absorption, preventing corrosion.

IMPORTANT: Observe processing instructions and safety precautions on the spray can!

- **Use by date on can.**

Do not use the spray can after the use-by date has expired as the properties of the cavity foam would no longer meet the requirements of the BMW Group.

- **Before applying to the vehicle, fill a clearly visible cavity of corresponding size with foam on a used part.**

This enables an optimal dosage (i.e. spraying time) to be specified for filling the cavity on the vehicle with foam.

- **Backing surface must be clean and free from dust, grease, oil and stripping agent.**
- **Tape off open passages to visible areas with adhesive tape to prevent foam from escaping.**
- **Application time after mixing: within 8 minutes.**
- **Do not eat, drink or smoke during this operation.**
- **Completely empty open can after use.**

- **Cavity sealing of repair area possible after an air drying time of 1 hour.**

41 00 ... INSTALLING A CAVITY BULKHEAD (EXPANDED)

NOTE: Carry over schematic representation to the relevant vehicle type.

The following repair represents the procedure for an already expanded cavity bulkhead.

The cavity bulkhead remains on the body in this instance.

Before these work steps, prepare the new part so that it is ready to install (adapting, cutting to size, applying welding primer etc.).

Clean contact surface (1) with spirit.

Apply an approx. 15 mm high bead (2) of original BMW window adhesive to contact surface (1).

Fit, secure and weld up new part.

Fig. 5: High Bead And Contact Surface
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Ensure adequate ventilation over entire processing period.

41 00 ... INSTALLING A CAVITY BULKHEAD (NOT EXPANDED)

NOTE: Carry over schematic representation to the relevant vehicle type.

The following repair represents replacement of a cavity bulkhead.

Before these work steps, prepare the new part so that it is ready to install (adapting, cutting to size, applying

welding primer etc.).

Sand contact surface of cavity bulkhead (1) with coarse-grained abrasive paper (grain 50 - 100).

Clean contact surface (1) with spirit.

Apply an approx. 15 mm high bead of original BMW window adhesive to contact surface (1).

Attach cavity bulkhead in specified position (see old part).

Fit, secure and weld up new part.

Fig. 6: High Bead And Contact Surface
Courtesy of BMW OF NORTH AMERICA, INC.

WARNING: Ensure adequate ventilation over entire processing period.

41 00 ... MATERIALS SCIENCE

1. Aluminum

1. Chassis and suspension components

Read and observe the Notes on chassis and suspension components before handling aluminum.

2. Material influences

MATERIAL INFLUENCES REFERENCE

Causes	Effects / remedies
	This plating process causes aluminium to be removed from the joint. This results in surface corrosion or pitting. New parts and accessory parts which have been

A galvanic element is created under the effects of moisture by contact with materials such as copper, tin, nickel, iron and zinc.	approved by the BMW Group for aluminum (screws, washers, nuts etc.) have undergone special surface treatment. Such parts must not be replaced by conventional parts. NOTE: Damaged parts lose this protection and must be specially coated or replaced. Damage caused by contact corrosion is excluded from the warranty.
Materials also used for work on steel components can implant steel particles in the softer surface of an aluminium component.	Surface corrosion or pitting occurs. A separate tool kit is available for processing/machining aluminum.
Surfaces are attacked when fluxing agents are used.	Soldering is not permitted for joining aluminum components. Risk of corrosion from chemical factors.
Aluminum/steel grinding dust from adjoining work areas.	This results in surface corrosion. Erection of protective barriers.

3. Machining properties

MACHINING PROPERTIES CHART

Properties of aluminum compared with steel	Effects
Aluminum parts are magnetically neutral.	Attachment with magnetic tools/working aids is not possible.
Elasticity is only 1/3 as high. Elongation failure is approx. 50% slighter.	Convertibility is limited in comparison with steel. Overstretching the material results in strain-hardening and an increased tendency of cracking.
Electrical conductivity is almost 4 times higher.	Electric welding procedures require different equipment (MIG welding).
Material expansion during heating is twice as high.	The material expands more markedly. Shorter heat treatment is necessary for removing dents.
Thermal conductivity is 3 times higher.	Heat is drained more quickly. Adjoining working areas are affected more heavily e.g. during welding.
Microstructural change between 200°C and 250°C.	Elongation characteristics and thus plasticity are improved. Strength is reduced. IMPORTANT: No heat treatment when working on the vehicle structure! Temperature cannot be monitored to sufficiently exact levels in garages.
	The melting point is 650°C. Once the melting temperature has been reached, the material begins to flow without any further indications.

Aluminum shows no annealing colors.

The temperature can only be estimated by means of the paint coloring and the surface warpage.

IMPORTANT:

Do not use thermal applicators. Not suitable for garage use because the paint runs too quickly.

4. Mounting

MOUNTING REFERENCE

Characteristic features of aluminum	Special measures
Corrosion (ageing) in damp environments.	Store aluminum parts in a dry place.
Contact corrosion in event of contact e.g. with steel parts.	Always store aluminum parts separately or in isolation from steel parts.
Susceptibility to paint infiltration.	Do not damage protective surface layer since this would cause oxidation. Failure to comply with this requirement would result in more painting work.

41 00 ... NOTES ON REPAIRING THREADS

IMPORTANT: Install Helicoil thread inserts so that they are flush with the original thread.

NOTE: Damaged threads may be repaired with Helicoil thread inserts. Comply with the procedure described in the example.

SCREW/BOLT SPECIFICATION

Screw/bolt connection	Vehicle	Screw/bolt fastening point(s)	Helicoil thread insert
Front axle carrier to engine carrier	E46	All	M12x1.5x18
	E53	All	M12x1.5x18
	E60, E61, E63, E64	Front, middle	
		Rear	M12x1.5x18

41 00 ... OPENING ADHESIVE BONDS

1. Opening spot-weld bonds

- Set punch mark in centre of weld spot. Set 8 mm dia. weld spot drill bit on punch mark and drill through top metal sheet.

Or open weld spot with Vario Drill spot welding cutter.

NOTE: Because the weld spots may have surface-hardened, grind them if necessary with an angle grinder and paper grinding disk.

- Heat connecting flange with a hot air blower.

CAUTION: Extract vapours and gases.

- Release connection flange with chisel.
- Grind off residual adhesive from connecting flange.

CAUTION: Wear a grinding dust mask.

2. Opening adhesive bonds on aluminium parts

- Remove punch rivets or blind rivets, see **41 00 ... Riveting aluminium parts.**
- Roughly cut out damaged component. The component can be peeled with the aid of pliers. If necessary, heat bonding flange with hot air blower.

**CAUTION: Heat only the damaged component with a hot air blower.
Extract vapours and gases.**

-

- Grind off residual adhesive from connecting flange.

CAUTION: Wear a grinding dust mask.

- If engine carrier part replacement on the GRAV is carried out repeatedly, cut the damaged part at the existing cutting line. Heat bonding flanges with a hot air blower. Peel off remnants of expander elements with pliers.

3. Opening adhesive bonds on carbon-fibre-reinforced plastic parts

Procedure is described in detailed in the relevant repair instructions.

41 00 ... OPENING WELD JOINTS

1. **Opening weld spots (resistance pressure spot welding):**

- Set punch mark in center of weld spot. Set 8 mm dia. weld spot drill bit on punch mark and drill through top metal sheet.

Or open weld spot with Vario Drill spot welding cutter.

NOTE: Because the weld spots may have surface-hardened, grind them if necessary with an angle grinder and paper grinding disk.

2. **Opening laser weld seams:**

- Place angle grinder with grinding disk on laser weld seam and grind through top metal sheet. Be careful not to cut through and damage sheet metal underneath.

41 00 ... QUALITY STANDARD

- The overall requirements relating to a vehicle can only be implemented by including "all" components. This applies in particular to the body. With regard to an optimum crash result, it is necessary to maintain the structural measures.

It is absolutely essential to observe the procedures set out in the repair instructions. Any deviation from these procedures will only be permitted after prior consultation with and approval by BMW. Should you have any questions, please contact the country-specific Hotline.

The use of non-approved repair steps or tools may have serious consequences for the structure of the vehicle (e.g. in the event of a crash). In the end, this can result in safety and product liability risks which cannot be calculated.

Corrosion protection measures during and after repairs are absolutely essential to maintain the value of the vehicle.

- Use only genuine BMW parts and approved auxiliary devices, materials and operating fluids when

carrying out repairs.

41 00 ... RIVETING ALUMINIUM PARTS

1.0 Recommended tools and equipment

- Stud welding apparatus with gas bottle containing inert gas (82 % argon, 18 % CO₂)
- Stainless steel stud
- Universal riveting tool
- Hand riveting tool for blind rivet nuts and blind rivet bolts

2.1 Extracting punch rivets:

- Grind off paint and dark grey coating of punch rivets.
- Position bolt centrally on the rivet and weld on vertically. The area in which the bolts are welded on should be between the two grounding terminals. Position both terminals, if possible, on the top side of the metal plate on which the rivet is located.
- Extract bolt with welded-on rivet using universal riveting tool. Use a large plastic nose piece if not otherwise specified in the repair instructions. Check plastic nose piece prior to use for wear.
- Plastic nose piece must rest on sheet metal all round; if necessary, grind off plastic nose piece in collision area.

Do not push riveting tool forcefully onto special-steel bolts.

Do not use riveting tool to bend special-steel bolts.

- Pay particular attention to central positioning of the bolt when using the small plastic mouthpiece.
- Follow the equipment manufacturer's instructions for use.

2.2 Drilling out punch rivets:

Only if extraction proves repeatedly unsuccessful or the rivet cannot be accessed with the universal riveting tool.

- Drill out rivets with a 6 mm dia. carbide drill bit.
- Punch rivets can be drilled out on both sides. When drilling from the protruding rear side, spot-drill the rivet shank only and remove the rest with a rivet punch.
- Use a drift punch to remove all punch rivet remnants in the aluminium (risk of corrosion).
- Clean vehicle to remove all traces of chips (risk of corrosion).

2.3 Drilling out blind rivets:

Only when a part is repeatedly replaced.

- Drill out **rivet head only** with 6 mm dia. metal drill bit. Knock out rivet remnants with a drift. Use existing 6.7 mm hole for blind rivet.
- Clean vehicle to remove all traces of chips and rivet remnants (risk of corrosion).

3.0 Blind riveting in conjunction with bonding

- The standard punch rivets are always replaced by blind rivets in conjunction with bonding.
- The required strength of the connection is only achieved through a combination of bonding and riveting.

4.0 Setting blind rivets:

- Refer to repair instructions for rivet size (size 13 or size 15 with 6.5 mm dia. or 4.0 mm dia.).
- Position blind rivets in the same locations as the extracted punch rivets. Exceptions are described in the relevant repair instruction. If necessary, carry over the positions of the rivets to the new component.
- Drill holes (4.2 mm dia. for 4 mm rivet and 6.7 mm dia. for 6.5 mm rivet).
- Apply adhesive.
- Insert blind rivet. The riveting direction is the same as the line of vision in the picture shown in the repair instruction (e.g. from wheel arch into engine carrier).
- Universally rivet blind rivet with riveting tongs.
- Seal blind rivet with PU sealing material (risk of corrosion).
- Seal cavities with preserving agent (risk of corrosion).

5.0 Setting blind rivet nuts and blind rivet bolts:

- Standard stud welding is always replaced by blind rivet bolts.
- Drill holes (0.2 mm larger than the outside diameter of the blind rivet nuts or blind rivet bolts).
- For corrosion reasons, blind rivet nuts and bolts must have a special coating.

Use the blind rivet nuts and bolts supplied in the case of the manual riveting tool for steel only!

- Insert blind rivet nuts or bolts and tighten down with the riveting tool.
- It will no longer be possible to set a blind rivet nut if the drilled hole is too big. In this case, set a clip nut. This nut tightens itself automatically when screwed to the component.
- Seal blind rivet nuts and bolts with PU sealing material (risk of corrosion).

41 00 ... RIVETING STEEL PARTS

1.0 Recommended tools and equipment

- Manual riveting tool for blind rivet nuts and bolts.

2.0 Setting blind rivet nuts and blind rivet bolts:

- Drill holes (0.2 mm larger than the outside diameter of the blind rivet nuts or blind rivet bolts).
- Blind rivet nuts and bolts must have a special coating for corrosion reasons.

Use the blind rivet nuts and bolts supplied in the case of the manual riveting tool for steel only!

- Insert blind rivet nuts or bolts and tighten down with the riveting tool.

41 00 ... SAFETY AT WORK

1.1 Working with aluminum dust:

- Wear a fine dust mask.
- E52 only: Use an explosion-proof extractor system.
- Note national regulations.

1.2 Removing sealing materials

- Hydrochloric acid is created when PVC sealing material is heated to temperatures in excess of 180° C.
- Remove PVC sealing material with a rotating wire brush only or heat material with a hot air blower to max. 180°C and remove with a spatula.
- Ensure that all enclosed areas are well ventilated or are provided with direct extractor facilities.

1.3 Arc welding and brazing:

IMPORTANT: The extremely bright arc during welding may cause serious injury to the eyes if appropriate protective measures are not taken.

- Use a special welding screen* for the relevant welding process (MAG or MIG).
- Partition off the work bays with beam protection screens*.
- Use a welding-emissions extractor facility*.
- The welder must wear protective clothing* and gloves* which are suitable for welding (i.e. flameproof).
- A fire extinguisher must be located within reach of the welding area.
- Do not carry out any welding work in the proximity of a fuel tank e.g. when it is installed.
- Note national regulations.

1.4 Working with adhesive products (adhesives, cleaning agents, primers etc.):

IMPORTANT: Handling adhesives can trigger off allergic skin and breathing reactions.

- Do not eat, drink or smoke during this operation.
- Avoid direct contact with eyes and skin.
- Wear protective goggles, protective gloves and if necessary an apron.
- Ensure that all enclosed areas are well ventilated or are provided with direct adhesive fume extractor facilities.
- Work clothing which has been contaminated with adhesive or solvent must be changed immediately.
- After finishing work, wash your hands and apply protective skin cream.
- Always keep an eye bath on hand, change the water regularly (once a month).
- Store adhesive products in a secure cabinet only.
- Keep adhesive products away from naked flames and other ignition sources.
- Protect adhesive products against strong heat sources and direct sunlight.
- Note national regulations.

First Aid:

In the event of eye contact, flush immediately with running water for approx. 10-15 minutes and, if necessary, visit eye specialist.

In the event of skin contact and where applicable an allergic skin reaction, clean the affected areas immediately with soap and water and then apply silicone-free skin cream. If necessary, consult a doctor.

If an adhesive product is swallowed, rinse mouth/parts of mouth thoroughly with running water. Drink 1-2 glasses of water. Do not induce vomiting. Consult a doctor.

If adhesive fumes are inhaled, ensure a constant supply of fresh air, keep calm, keep respiratory tracts unobstructed and consult a doctor.

41 00 ... SPOT-WELD BONDING STEEL PARTS

IMPORTANT: Comply with the following topics from "Body, General":

Safety regulations, see 41 00 ... Information on hazards.

Handling electrical/electronic equipment, airbags and restraint systems, see 41 00 ... Handling airbags and restraint systems.

Welding steel parts, see 41 00 ... Welding and soldering steel parts.

- The spot-weld bonding process is used starting from the E65 to increase vehicle rigidity. In partial bodywork areas, a 1-component adhesive is applied to the spot flanges and this is followed by resistance pressure spot welding. The adhesive is hardened only after the paint drying process (at approx. 180°C).
- In the case of repairs, adhesive is not applied to the spot flanges. The number of welding spots is doubled as a substitute for the omitted adhesive.
- The following processes are used as a substitute for spot-weld bonding:
 - MAG welding (**M**etal **A**ctive **G**as welding)
 - Resistance pressure spot welding (referred to in the following and in the repair instructions as spot welding).
- Adhesive is not applied between the spot flanges on new parts in the case of 2 - or multi-sheet joints. Areas which cannot be reached by the spot-welding tongs can be joined by MAG spot welding. The number of welding spots is doubled as a substitute for the omitted adhesive.

Exceptions (e.g. E65) are described in the relevant repair instructions. Apply welding spots to existing welding spots on new part. This is necessary because the adhesive between the spot flanges of the new part acts as an insulator.

CAUTION: Extract smoke and fumes during welding work.

○

41 00 ... STAMPING VEHICLE IDENTIFICATION NUMBER

Special tools required:

- **41 0 000 PUNCH NUMBERS/LETTERS/SPECIAL CHARACTERS**
- **41 1 130 FIXTURE**
- 41 1 131 **41 1 130 FIXTURE**
- 41 1 132 **41 1 130 FIXTURE**
- 41 1 133 **41 1 130 FIXTURE**

NOTE: If the stamped vehicle identification number is removed during repair work, it must be stamped in again.

Read and comply with General Information .

Necessary preliminary tasks:

- Remove battery positive terminal

Special tool kit 41 1 130 for stamping vehicle identification number consists of:

Basic body 41 1 131

Die-plate 41 1 132

Spindle 41 1 133

Fig. 7: Special Tool

Courtesy of BMW OF NORTH AMERICA, INC.

Slide special tool 41 1 130 over assembly compartment partition wall (1).

Tighten screws (2).

Fig. 8: Compartment Partition Wall And Screws
 Courtesy of BMW OF NORTH AMERICA, INC.

Insert stamp numbers 41 0 000 individually into die-plate.

Position spindle 41 1 133 centrally over stamp number 41 0 000 and tighten spindle to 20 Nm.

Repeat procedure for each number.

Fig. 9: Special Tool (41 0 000 And 41 1 133)
 Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: In the event of component or body replacement by the workshops/garages, clearly delimit the vehicle identification number at front and rear by stamping a "+" in place of the BMW emblem.

Note national regulations.

41 00 ... STRAIGHTENING STEEL PARTS

1.0 Recommended tools

Only use those tools designed for steel repairs.

2.0 Straightening outer shell

- "Cold" straightening: Press dents out from their centre and smooth in an inwards direction with gentle taps.

In the case of small, soft dents (hail and parking damage), this is also possible without damaging the paintwork. This work requires a special tool and a trained worker.

- "Hot" straightening: Heat dents in their central point only with a gas flame until bright red hot. Then quench the material with a wet cloth.
- Stud welding can be used in the case of damage where access is only possible from one side. Weld on the stud in the middle of the damaged area. The steel pin or shim is driven out using a hammer until the depression is removed. The stud, pin or shim is then ground or twisted off.
- Avoid cracking.
- Avoid hardening and overstretching.
- Avoid heating and overheating the outer shell over large areas.
- If, after steel parts have been straightened, the surface shows no dents larger than 2 mm, these dents may be touched up with knifing filler.

Dents larger than 2 mm must be treated with filling solder.

NOTE: Only applicable within the European Union!

European used-car regulations prohibit the use of tin containing lead in motor vehicles introduced after 01.07.2003!

- For safety vehicles, follow the special notes and information in the repair instructions.

3.0 Straightening structure

- Repairs affecting the mounting points of assemblies and chassis/suspension components must be carried out on the straightening bench with the matching straightening attachment set or specification sheet for the vehicle.

Straightening attachments and specification sheets are also available for the top section, e.g.: door pillars, convertible top mounts, cowl, rear lid hinges, etc.

- Check windshield and rear window apertures for curvature by inserting the original glass.
- Take the gap dimensions for doors, engine hood and rear lid from the vehicle-specific gap dimension diagram.
- Bearing body components such as e.g. engine carriers, door pillars, frame side members etc. with deformations which can no longer be returned to their original shape by "cold straightening" must be replaced.

Heating bearing body components for better reshaping is not permitted!

Failure to comply with this requirement would result in a loss of original strength of up to 40 %.

- High-strength and super-high-strength steel plates as a rule cannot be reshaped. Reshaping only serves as a preparatory measure to replacing the component in order to achieve optimal joining of the connection points.
- **The body must be anchored as follows for reshaping:**

If using vehicle-specific/universal straightening attachment sets (Carbench/ Celette), it is necessary to secure the body **additionally** with 4 retaining clips to the spot flange of entrance or to the 4 jacking points. The spot flange (if available) is to be preferred.

If using universal electronic or mechanical straightening systems (Car-O-liner/ Celette), it is necessary to secure the body with 4 retaining clips to the spot flange of entrance or to the 4 jacking points. The spot flange (if available) is to be preferred. **In addition** anchor at least 2 points with the securing set.

Failure to comply with these instructions will result in damage to the body during reshaping in non-damaged areas. Vehicle-specific straightening attachments and universal mounts may be damaged.

41 00 ... USE OF MATERIALS IN OUTER SHELL

The following illustration is a schematic representation of all the body variants.

Apply this illustration to the relevant vehicle.

R41 1959

Fig. 10: Side Panel, Front Panel And Engine Hood
 Courtesy of BMW OF NORTH AMERICA, INC.

All components not listed in the table below are composed of established sheet steel qualities.

COMPONENTS MATERIALS CHART

Component	Vehicle	Material
(1) Side panel, front	E52 (Z8)	Aluminium
	E60, E61	Aluminium
	E63, E64	Plastic (thermoplastic)
	E65, E66:	Aluminium
	E70, E92, E93	Plastic (thermoplastic)
(2) Front door	E36/C (M3)	Aluminium or steel
	E36/2 (M3)	Aluminium or steel
	E52 (Z8)	Aluminium
	E63, E64	Aluminium
(4) Side panel, rear	E52 (Z8)	Aluminium
(5) Engine hood	E38 (750i)	Aluminium or steel
	E46/C (M3)	Aluminium
	E46/2 (M3)	Aluminium
	E52 (Z8)	Aluminium
	E60, E61, E63, E64	Aluminium

	E65, E66, E70	Aluminium
	E85 (Z4)	Aluminium
(6) Hardtop/ roof	E36/C	Aluminium
	E36/7 (Z3)	Plastic (glass fibre / epoxy resin)
	E46/C	Aluminium
	E46/2 (M3 CSL)	Plastic (CFK)
	E52 (Z8)	Plastic (PU)
	E85 (Z4)	Plastic (SMC)
	E63 (M6)	Plastic (CFK)
(7) Soft top lid	E46/C	Magnesium
	E64	Plastic (SMC)
(8) Rear lid	E46/2 (M3 CSL)	Plastic (SMC)
	E52 (Z8)	Aluminium
	E63, E64	Plastic (SMC)

41 00 ... VEHICLE IDENTIFICATION NUMBER, GENERAL

The vehicle identification number must be stamped with a special tool. There are different special tool numbers and stamping procedures for the various vehicles. Refer to the relevant repair instructions.

In repair work, the vehicle identification number is always stamped into a replacement vehicle identification number surface. The replacement surface is usually situated under the original VIN surface.

The IGEF number (bodyshe'll number) is omitted when the wheel arch is replaced.

In the event of component or body replacement by the BMW garages/workshops, clearly delimit the vehicle identification number at front and rear by stamping a + in place of the BMW emblem.

If a VIN is stamped into the replacement surface in addition to the original VIN (e.g. if the original VIN has been tampered with), the following applies: The original VIN must be crossed out. To do so, stamp the letter I from the punch digits lengthways through the original VIN.

IMPORTANT: Do not use an angle grinder in conjunction with a cutting disk!

The protective film used as standard is omitted after the VIN has been manually stamped in. Paint area in accordance with BMW Painting Handbook. Ensure that layer thicknesses are small.

Observe country-specific regulations.

41 00 ... WELDING AND SOLDERING STEEL PARTS

IMPORTANT: Comply with the following topics from "Body, General":

Safety regulations, see 41 00 ... Information on hazards.

Handling electrical/electronic equipment, airbags and restraint systems, see 41

00 ... Handling airbags and restraint systems.

A. Welding steel parts:

1. General information

- The following procedures are used for repairs:
 - MAG welding (**M**etal **A**ctive **G**as welding)
 - Resistance pressure spot welding (referred to in the following and in the repair instructions as spot welding).
- Take the number and location of weld spots and MAG weld seams from the separated part. Replace areas inaccessible to spot-welding tongs with MAG plug/spot welds at the same distance. Diameter of bores for plug/spot welds 8 mm.
- In the case of emissions extraction, observe a minimum distance of 30 cm for MAG welding during the welding process. Otherwise the inert gas would be drawn off.
- Follow the equipment manufacturer's instructions for use.

2. Work materials

- MAG welding:
 - Steel welding apparatus.
 - Steel welding wire - G3SI1 (SG2) or alternatively G4SI1 (SG3)
 - Welding mask
 - Gas bottle containing inert gas (82 % argon, 18 % CO₂)
- Resistance pressure spot welding:
 - Spot-welding apparatus.
 - Protective goggles

3. Preparations for MAG and spot-welding

- Remove the paint coating in an area of approx. 30 mm around the weld seam or spot.
 - The zinc coating underneath must be removed during the MAG welding operation.
 - It is not necessary to remove the zinc coating underneath during spot-welding.
- Remove the paint coating on the reverse side of the weld seam or spot.
 - Contaminants will otherwise enter the weld pool via the root of the weld seam.
 - An insufficient electron flow prevents an optimum spot-weld joint.
- Coat all metal overlaps and weld spot flanges with welding primer.
- To determine the optimum electrode contact force for spot-welding, carry out spot-weld shear tests on sample metal sheets.
- In order to keep the electron flow short during MAG welding on the body, you must if possible attach the ground terminal directly to the component to be welded.

4. Welding

- During MAG welding, the weld gap must be kept as small as possible. The larger the weld gap, the lower will be the strength of the joint.
- During spot-welding, the metal flanges to be joined must be placed as close together as possible without gaps.

The larger the gap, the lower will be the strength of the joint.

Minimum gap between welding spots 25 mm.

5. Subsequent treatment of weld joints:

- When grinding a weld seam, do not grind thin the base material next to the seam.
- After joining, clean all weld seams and spots with a stainless steel wire brush.
- Remove burnt paint with a stainless steel wire brush.
- All weld joints sealed off with body sealing compound in original state must be primed and sealed off again thoroughly after repairing. Replace damaged or removed antinoise compounds.

B. Soldering steel parts:

1. General information

- The following procedures are used for repairs:
 - Gas brazing
 - Tinning
- The MIG soldering procedure is not used in repairs for strength reasons. MIG soldered/brazed seams used in series production are replaced in repairs by MAG weld seams.
- Areas brazed in vehicle production are joined during repairs with the same procedure.
- It is possible when straightening steel parts to correct irregularities smaller than 2 mm with filler.

If in exceptional cases the irregularities are in excess of 2 mm, these areas must be tinned.

Only visible areas of the outer skin and on the support carrier must be tinned.

All areas which have covers on the vehicle are not to be tinned.

**NOTE: Only applicable within the European Union!
European used-car regulations prohibit the use of tin containing lead in motor vehicles introduced after 01.07.2003!**

2. Work materials

- Gas brazing:
 - Tube pack and torch (gas torch)
 - Brazing solder
 - Gas bottles (oxygen and acetylene)
 - Welding goggles
- Tinning:
 - Tube pack and torch (torch for tinning)
 - Tinning paste
 - Tin

- Gas bottle (acetylene)
- Protective goggles

3. Preparations for brazing/tinning

- Heat brazed joints to be opened with an autogenous flame. Lift off remaining metal and remove remaining brazing solder with a wire brush.
- Remove the paint and zinc coating in an area of approx. 30 mm around the seam to be soldered.
- Remove the paint and zinc coating in the tin-plating area and approx. 30 mm beyond.

4. Brazing/tinning

- Execute brazed seam without overheating the solder and with low heat dissipation. If necessary, use heat protecting paste.

5. Subsequent treatment of brazed joints:

- Remove burnt residual zinc completely. Straighten, grind and tin visible connection points.
- Remove burnt paint with a stainless steel wire brush.

41 00 ... WELDING IN REINFORCEMENT PLATE (STEEL PLATE)

In the case of a partial replacement piece, a body component is cut at a point described in the repair instructions.

A reinforcement plate is welded in to ensure sufficient strength.

Follow notes for welding steel parts, see [41 00 ... Welding and soldering steel parts](#).

NOTE: The following illustrations serve as general illustrations of reinforcement plate repair work. They are applicable to all cutting repairs.

Mark component in accordance with distance A and cut.

Fig. 11: Welding In Reinforcement Plate - Mark Component In Accordance With Distance And Cut
 Courtesy of BMW OF NORTH AMERICA, INC.

Cut new part (1) in accordance with cut and if necessary adjust to fit with straightening attachment or universal mount.

Installation:

Adhere to a gap at severance cut of approx. one to max. two material thicknesses in order to ensure welding with the reinforcement plate and to facilitate a more tolerant fit.

Fig. 12: Welding In Reinforcement Plate - Cut Part
Courtesy of BMW OF NORTH AMERICA, INC.

Clean inner and outer sides of connecting areas (1) on new part and (2) on body.

Coat inner sides with welding primer.

Fig. 13: Welding In Reinforcement Plate - Areas Part And Body
Courtesy of BMW OF NORTH AMERICA, INC.

Drill holes (1) and (2) at distance of 25 mm to each other.

Hole diameter approx. 8 mm.

Fig. 14: Welding In Reinforcement Plate - Drill Holes
 Courtesy of BMW OF NORTH AMERICA, INC.

Make reinforcement plate (1) from trim of new part.

If necessary, make further reinforcement plates.

Length of reinforcement plates is min. 40 mm.

Coat reinforcement plates (1) and (2) on both sides with welding primer.

Fig. 15: Welding In Reinforcement Plate
 Courtesy of BMW OF NORTH AMERICA, INC.

Push reinforcement plate (1) into component on body up to half way and plug-weld (3).

Fig. 16: Reinforcement Plate And Welding Primer
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, adjust new part (1) to fit with straightening attachment or universal mount and plug-weld (2).
 MAG weld joint (3).

Grind and clean weld seam and plug weld spots.

Only visible areas of the outer skin and worn areas on the support carrier must be tinned.

All areas which have covers on the vehicle are not to be tinned.

NOTE: Only applicable within the European Union!

European used-car regulations prohibit the use of tin containing lead in motor vehicles introduced after 01.07.2003!

Fig. 17: MAG Weld Joint And Plug-weld
Courtesy of BMW OF NORTH AMERICA, INC.

41 00 ... WORKSHOP EQUIPMENT

Minimum workshop equipment requirements in order to ensure the correct and expert performance of body repairs:

The tools listed below **must be used** .

TOOLS MATERIALS SPECIFICATION

Tool ⁽¹⁾	Steel		Aluminium	
	Structure	Outer skin	Structure	Outer skin
Bodywork tool assortment	x	x		
Aluminium bodywork tool assortment			x	x
Bodywork saw	x	x		
Single-handed grinder	x	x	x	x
Welding spot remover	x	x		
MAG welding apparatus	x	x		
MIG welding apparatus			(E52 only)	
Spot welding apparatus	x	x

Straightening system	x		x	
Stud welding apparatus			x	
Flame coating set			x	
Universal riveting tool			x	

(1) See Aftersales Assistance Portal (ASAP) - Service/Technical - Workshop equipment (Start BMW) - Shop Workshop equipment or under www.bmwgroup-wep.com

IMPORTANT: In vehicles from model year 2001, higher-tensile and high-tensile steels are used in certain areas.

It is essential to check whether the spot-welding apparatus used conforms to the technical requirements of the currently recommended welding sets. Should you have any questions, please contact the country - specific Hotline.

The use of technically obsolete equipment may have serious consequences for the structure of the vehicle (e.g. in the event of a crash). In the end, this can result in safety and product liability risks which cannot be calculated.

Use and restrictions:

Definition of Recommendation:

All currently recommended spot welding sets comply with the requirements relating to reliable welding of today's and future BMW Group vehicles. A spot welding unit will lose its recommendation as soon as tests with materials and material combinations designated for future use in BMW Group vehicles return negative results. All previous application before the withdrawal of the recommendation shall remain unaffected.

DEVICE DESIGNATION MANUFACTURER CHART

	Device designation	Manufacturer
Group 1 Devices currently no longer recommended	CR500	Car-O-Liner
	Spot9000	Tecna
	ATL 400V	Wielander & Schill
Group 2 Devices currently recommended (March 2007)	MIDIspot QSVM9000	Celette
	MIDIspot QSVM9000	Elmatech
	CR600	Car-O-Liner
	Multispot MI-100 Control	Elektron

Application options and restrictions of above devices.

VEHICLE GROUP REFERENCE

Vehicle	Group 1	Group 2
E93	x Except A-pillar, B-pillar, sill	x
E70	x Except B-pillar	x
E64	x Except A-pillar, B-pillar, sill	x

NOTE: (March 2007)

All models not listed can be repaired using the Group 1 and Group 2 devices.

99 00 ... GENERAL INSTRUCTIONS ON PAINTING

General instructions and classification of paint stages are described on the KSD-CD (notes-general information on flat rate unit data, passenger car explanation for FR specifications for painting).

The marked area serves as the starting point for painting. This area may differ from the illustration for technical painting reasons.

Touching-up areas are taken into account.

11 SUPPORT MEMBERS

41 11 005 REPLACING LEFT CROSS-MEMBER MOUNTING

Read contents of Body, General, see **41 0 Contents of Body, General**.

Place vehicle on straightening bench.

Following new body parts are required:

- o (1) Mounting, cross-member

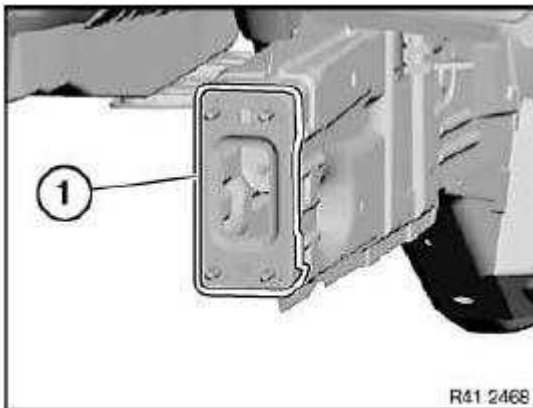

R41 2467

Fig. 18: Mounting, Cross-Member
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

R41 2468

Fig. 19: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

41 11 028 REPLACING FRONT LEFT ENGINE CARRIER (PARTIAL REPLACEMENT BETWEEN FRONT AXLE TAKE-UPS)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Place vehicle on straightening bench.

Following new body parts are required:

- (1) Engine carrier, front
- (2) Mounting, cross-member

Fig. 20: Engine Carrier, Front And Mounting, Cross-Member
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with specified measurements and cut.

NOTE: Reuse metal section (3) if it is undamaged.

Measurement a=60 mm from center of 12 mm dia. bore

Measurement b=215 mm

Open weld joints in area (2).

Remove metal section (3).

Fig. 21: Mark Severance Cut Measurement
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Weld in reinforcement plate, see **41 00 ... Welding in reinforcement plate (steel plate)** at severance cut (1).

Plug weld, see **41 00 ... Welding and soldering steel parts** in area (2) additionally.

Fig. 22: Severance Cut And Plug Weld In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Fig. 23: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with measurement and cut.

Measurement a=190 mm

NOTE: Right side only:

Measurement a=180 mm

Installation:

Weld in reinforcement plate, see **41 00 ... Welding in reinforcement plate (steel plate)** at severance cut (1).

Fig. 24: Mark Severance Cut Measurement
Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Mark severance cut (1) in accordance with vehicle and cut.

Installation:

Adjust all new parts to fit with straightening attachment or universal mount.

Fig. 25: Mark Severance Cut
Courtesy of BMW OF NORTH AMERICA, INC.

Weld new component in area (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

Fig. 26: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

41 11 048 REPLACING FRONT LEFT ENGINE CARRIER

Read contents of Body, General, see **41 0 Contents of Body, General**.

Use only approved spot-welding apparatus for repairs, see **41 00 ... Workshop equipment**

Remove or cover those vehicle components in the repair area which are susceptible to heat or dust.

Place vehicle on straightening bench.

Following new body parts are required:

- (1) Engine carrier, complete
- (2) Mounting, cross-member
- (3) Connection, outer
- (4) Reinforcement, bulkhead
- (5) Support carrier, bulkhead
- (6) Partition wall, assembly compartment
- (7) Reinforcement, partition wall (right side only - not shown)

Fig. 27: Engine Carrier, Complete And Partition Wall, Assembly Compartment
 Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 28: Weld Joints In Areas
 Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 29: Weld Joints In Areas

Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 30: Weld Joints In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 31: Weld Joints In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 32: Weld Joints In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with measurements a and b and cut bulkhead support carrier.

Measurement a=95 mm

Measurement b=120 mm

Open weld joints in area (2).

Fig. 33: Mark Severance Cut Measurement
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Fig. 34: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Right side only:

Open weld joint in area (1).

Fig. 35: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 36: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

Fig. 37: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Weld new component in area (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

Fig. 38: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

**41 11 301 REPLACING COVER FOR LONGITUDINAL MEMBER WITH LEFT DOOR PILLAR
(PARTIAL REPLACEMENT B - PILLAR)**

Read contents of Body, General, see **41 0 Contents of Body, General.**

Place vehicle on straightening bench.

Following new body parts are required:

- (1) B-pillar with entrance
- (2) Shaped part, B-pillar, inner

Fig. 39: B-Pillar With Entrance And Shaped Part, B-Pillar, Inner

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 40: Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

IMPORTANT: Cut outer plate only for following severance cuts.

Measurement a = approx. 220 mm behind hole dia. 20 mm.

Measurement b = approx. 60 mm behind cut a.

Measurement c = approx. 200 mm from middle of lower lock striker screw point.

Measurement d = approx. 450 mm above upper door hinge mounting.

Measurement e = approx. 80 mm above cut d.

Open weld joints in areas (1).

Installation:

Weld in reinforcing panels, see **41 00 ... Welding in reinforcement plate (steel plate)** at all severance cuts.

Fig. 41: Metal Sections And Weld Joints In Areas Dimension
Courtesy of BMW OF NORTH AMERICA, INC.

Remove metal sections (1).

Open weld joints in areas (2) and (3).

Longitudinal member cover is bonded to inner frame in area (4).

**IMPORTANT: Cut two metal plates in areas (2).
Cut outer metal plate only in areas (3).**

Installation:

Cut-out metal sections (1) are required again for sealing.

Mark severance cut in accordance with specified measurement and cut.

IMPORTANT: Cut outer metal plate only for following severance cut.

Measurement a = 490 mm above upper door hinge mounting.

Installation:

Weld in reinforcement plate at severance cut, see **41 00 ... Welding in reinforcement plate (steel plate)**.

Fig. 42: Reinforcement Plate At Severance Cut Dimension
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut in accordance with specified measurement and cut.

Measurement a = 250 mm behind hole dia. 20 mm.

Installation:

Weld in reinforcement plate at severance cut, see **41 00 ... Welding in reinforcement plate (steel plate)**.

Fig. 43: Reinforcement Plate At Severance Cut Dimension (Behind Hole)
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: View from inside

Open weld joints in areas (1).

Open adhesive bond in area (2).

Fig. 44: Weld Joints And Adhesive Bond In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: View from below

Open weld joints in areas (1).

Fig. 45: Weld Joints In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

R41 2535

Fig. 46: Sheet Panel On Weld Joints Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Mark severance cuts (1) on new part in accordance with previous severance cuts and cut.

IMPORTANT: Cut outer plate only for severance cuts (2).

Measurement a = approx. 220 mm behind hole dia. 20 mm.

Measurement b = approx. 60 mm behind cut a.

Measurement c = approx. 450 mm above upper door hinge mounting.

Measurement d = approx. 80 mm above cut d.

Open weld joints on sheet panel (3) and remove component.

R41 2536

Fig. 47: Mark Severance Cuts
Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Mark severance cuts (1) on new part in accordance with severance cuts on vehicle and cut.

Fig. 48: Mark Severance Cuts And Adhesive In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

Apply window glass adhesive, see **41 00 ... Installing a cavity bulkhead (expanded)** to cavity acoustic baffles (1).

Apply adhesive, see **41 00 ... Bonding steel parts** in areas (2).

Installation information:

Adjust new part to fit with straightening attachment or universal mount.

41 11 620 REPLACING REAR AXLE TAKE-UP CROSS-MEMBER AT REAR (LUGGAGE COMPARTMENT FLOOR COMPLETELY REMOVED)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Place vehicle on straightening bench.

Following new body parts are required:

- (1) Cross-member, rear axle take-up, rear

R41 2593

Fig. 49: Cross-Member, Rear Axle Take-Up, Rear
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

R41 2594

Fig. 50: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

R41 2595

Courtesy of BMW OF NORTH AMERICA, INC.

12 LUGGAGE COMPARTMENT FLOOR

41 12 535 FOR DETAILS OF STRIPPING-DOWN AND RIGGING WORK. PLACE VEHICLE ON STRAIGHTENING BENCH.

Read contents of Body, General, see 41 0 Contents of Body, General.

compartment floor (tail panel removed)

Following new body parts are required:

- (1) Luggage compartment floor
- (2) Luggage compartment floor, right
- (3) Rear axle carrier, upper section, right
- (4) Rear axle carrier, lower section, right
- (5) Cross-member, rear axle take-up, rear
- (6) Rear axle carrier, upper section, left
- (7) Rear axle carrier, lower section, left
- (8) Luggage compartment floor, left

Fig. 52: Luggage Compartment Floor And Rear Axle Carrier, Section
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Installation:

Adjust new component (2) to fit to body in accordance with paint impressions.

Fig. 53: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Installation:

Weld in area (2) additionally.

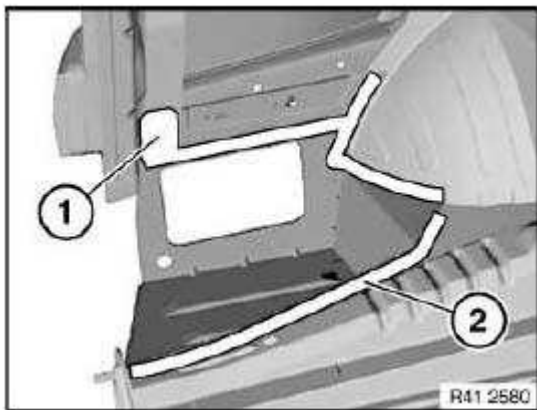

Fig. 54: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Installation:

Weld new component in area (2) additionally.

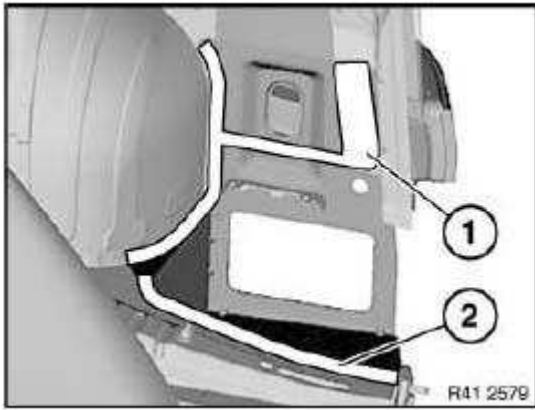

Fig. 55: Weld Joints In Area
 Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Installation:

Weld new component in areas (2) additionally.

Fig. 56: Weld Joints In Area
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut in accordance with measurement a and cut rear axle carrier upper section (1) on both sides of vehicle.

Measurement a=220 mm from edge of square hole.

Installation:

Weld in reinforcement plate at severance cut, see **41 00 ... Welding in reinforcement plate (steel plate)**.

Fig. 57: Cut Rear Axle Carrier Upper Section Measurement
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1) on both sides of vehicle.

Installation:

Weld new component in areas (2) additionally.

Fig. 58: Weld Joints And New Component In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut in accordance with measurement a and cut rear axle carrier lower section (1) on both sides of vehicle.

Measurement a=140 mm from center point of bore with dia.

Fig. 59: Cut Rear Axle Carrier Lower Section Measurement
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Adjust new parts to fit with straightening attachment or universal mount.

Before welding in, also adjust tail panel, rear lid and rear lights to fit.

Weld reinforcement (1) in area (2) from inside additionally.

Weld in reinforcement plate, see **41 00 ... Welding in reinforcement plate (steel plate)** in area (3).

Fig. 60: Weld Reinforcement In Area
 Courtesy of BMW OF NORTH AMERICA, INC.

14 WHEEL WELLS

41 14 015 REPLACING ENGINE CARRIER WITH WHEEL ARCH, LEFT

Read contents of Body, General, see **41 0 Contents of Body, General**.

Use only approved spot-welding apparatus, see **41 00 ... Workshop equipment** for repairs.

Remove or cover those vehicle components in the repair area which are susceptible to heat or dust.

Place vehicle on straightening bench.

Following new body parts are required:

- (1) Wheel arch, front left
- (2) Reinforcement, bulkhead
- (3) Partition wall, assembly compartment
- (4) Support carrier, bulkhead
- (5) Support, engine carrier, rear
- (6) Reinforcement, partition wall, right (not shown)

Fig. 61: Wheel Arch, Front Left And Partition Wall, Assembly Compartment
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

NOTE: **Cut outer metal sheet only.**

Fig. 62: Weld Joints In Area

Open weld joints in areas (1).

Fig. 75: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Open weld joints in area (1).

Remove plate (2).

Installation:

Adjust new parts to fit with straightening attachment or universal mount.

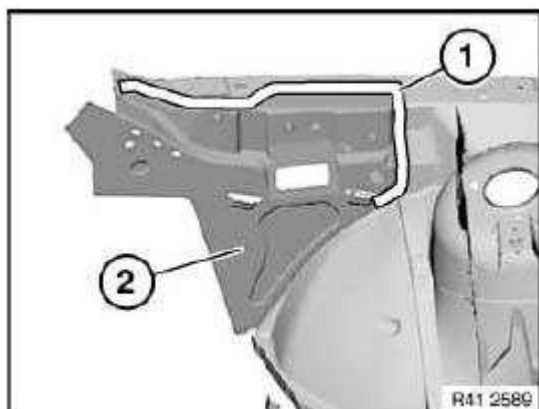

Fig. 76: Weld Joints In Area And Plate

Courtesy of BMW OF NORTH AMERICA, INC.

Weld new component in area (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

Fig. 77: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

41 14 502 REPLACING REAR LEFT OUTER WHEEL ARCH SECTION (REAR LEFT SIDE PANEL REMOVED)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Following new body parts are required:

- (1) C-pillar reinforcement
- (2) Inner side frame
- (3) Rear outer entrance shaped part
- (4) Rear entrance shaped part

Fig. 78: C-Pillar Reinforcement, Inner Side Frame And Rear Outer Entrance Shaped Part

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 79: Mark Severance Cut And Weld Joints In Areas Dimension
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with measurement and cut.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 160 mm from M8 threaded hole

Open weld joints in area (2).

Remove inner and outer cavity acoustic baffles (3).

Installation information:

- Apply window glass adhesive to cavity acoustic baffles in area (3), see **41 00 ... Installing a cavity bulkhead (expanded)**

Weld in reinforcing panels at all severance cuts., see **41 00 ... Welding in reinforcement plate (steel plate)**.

Open weld joints in areas (1).

Fig. 80: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Cut wheel arch along line (1).

Installation:

Adjust new part in conjunction with side panel to fit.

Fig. 81: Cut Wheel Arch Along Line
Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Mark new part in accordance with severance cut on vehicle + 20 mm extra material and cut (1).

Fig. 82: Extra Material And Cut
Courtesy of BMW OF NORTH AMERICA, INC.

41 14 511 REPLACING COMPLETE REAR LEFT WHEEL ARCH (REAR LEFT SIDE PANEL REMOVED)

Read contents of Body, General, see **41 0 Contents of Body, General.**

Place vehicle on straightening bench.

Following new body parts are required:

- (1) C-pillar reinforcement
- (2) Inner side frame
- (3) Rear wheel arch
- (4) Rear outer entrance shaped part (not shown)
- (5) Rear entrance shaped part (not shown)
- (6) D-pillar shaped part (not shown)

Fig. 83: C-Pillar Reinforcement, Inner Side Frame And Rear Wheel Arch
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 84: Mark Severance Cut And Weld Joints In Areas Dimension
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with measurement and cut.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 160 mm from M8 threaded hole

Open weld joints in area (2).

Remove inner and outer cavity acoustic baffles (3).

Installation information:

- Apply window glass adhesive to cavity acoustic baffles in area (3), see **41 00 ... Installing a cavity bulkhead (expanded)**.

Weld in reinforcement plate at severance cut, see **41 00 ... Welding in reinforcement plate (steel plate)**.

Open weld joints in areas (1).

Fig. 85: Weld Joints In Area
 Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 86: Cavity Acoustic Baffles And Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 210 mm from roof frame

Measurement b = approx. 160 mm from M8 threaded hole

Measurement c = approx. 330 mm

Open weld joints in areas (1).

Remove cavity acoustic baffles (2).

Installation information:

- Apply window glass adhesive to cavity acoustic baffles in area (3), see **41 00 ... Installing a cavity bulkhead (expanded)**.

Weld in reinforcing panels at all severance cuts., see **41 00 ... Welding in reinforcement plate (steel plate)**.

Adjust new part in conjunction with side panel to fit.

Open weld joints in area (1).

Installation:

Adjust new part to fit with straightening attachment or universal mount.

Fig. 87: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

21 SIDE FRAME AND DOOR PILLARS

41 21 510 REPLACING FRONT LEFT DOOR PILLAR (FRONT SIDE PANEL REMOVED)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Spot-weld bonding is used on the E83. Observe specific procedure, see **41 00 ... Opening adhesive bonds**.

Place vehicle on straightening bench.

Following new body parts are required:

- (1) A-pillar, outer
- (2) Connecting plate, side frame

Fig. 88: A-Pillar, Outer And Connecting Plate, Side Frame
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 89: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 90: Weld Joints In Area
 Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 91: Metal Section And Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

IMPORTANT: Cut outer plate only for following severance cuts.

Measurement a = approx. 150 mm from roof edge.

Measurement b = approx. 80 mm below severance cut a.

Measurement c = approx. 560 mm before hole dia. 20 mm.

Measurement d = approx. 80 mm before severance cut c.

Open weld joints in areas (1).

Installation:

Metal sections (2) are needed again to seal cowl.

IMPORTANT: For following severance cut, do not damage sunroof water drain hose.

Mark severance cut (1) in accordance with measurement and cut.

Measurement a = approx. 190 mm from roof edge.

Fig. 92: Mark Severance Cut Dimension
Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cut (1) in accordance with measurement and cut.

Measurement a = approx. 600 mm before hole dia. 20 mm.

Fig. 93: Mark Severance Cut Dimension (Before Hole Dia)
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 94: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Fig. 95: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

Preparation of new part:

Mark new part in accordance with severance cuts above and cut.

Installation:

Weld in reinforcing panels at all severance cuts., see **41 00 ... Welding in reinforcement plate (steel plate)**.

Apply window glass adhesive to cavity acoustic baffles (1), see **41 00 ... Installing a cavity bulkhead (expanded)**

Adjust new part to fit with straightening attachment or universal mount.

Fig. 96: Cavity Acoustic Baffles

Courtesy of BMW OF NORTH AMERICA, INC.

31 ROOF OUTER SKIN

41 31 010 REPLACING ROOF OUTER SKIN (VERSION WITH SLIDE/TILT SUNROOF)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Following new body parts are required:

- (1) Roof outer skin, slide/tilt sunroof

Fig. 97: Roof Outer Skin, Slide/Tilt Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 98: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in areas (1).

Release adhesive areas (layout, see next operation) and remove roof outer skin, see **41 00 ... Bonding steel parts.**

Installation:

Fit new part on body. Fit windshield for positioning.

Seal weld seams with sealing compound.

Apply sealing compound in areas (1).

Fig. 99: Sealing Compound In Areas

Courtesy of BMW OF NORTH AMERICA, INC.

33 FRONT TRIM PANEL

41 33 040 REPLACING FRONT PANEL

Read contents of Body, General, see **41 0 Contents of Body, General**.

Following new body parts are required:

- (1) Front panel

R41 2462

Fig. 100: Front Panel

Courtesy of BMW OF NORTH AMERICA, INC.

Open screws (1) and (2).

Remove tension strut (3) with retaining hook counter support holder.

Fig. 101: Screws And Tension Strut
Courtesy of BMW OF NORTH AMERICA, INC.

Open screws in areas (1).

Remove bumper trim carrier (2) with deformation elements and front panel (3).

Fig. 102: Screws, Bumper Trim Carrier And Front Panel
Courtesy of BMW OF NORTH AMERICA, INC.

34 REAR TRIM PANEL

41 34 038 REPLACING OUTER SECTION OF TAIL PANEL

Read contents of Body, General, see **41 0 Contents of Body, General**.

Following new body parts are required:

- Rear trim

R41 2473

Fig. 103: Rear Trim

Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

R41 2483

Fig. 104: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

41 34 041 REPLACING COMPLETE TAIL PANEL

Read contents of Body, General, see **41 0 Contents of Body, General**.

Following new body parts are required:

- (1) Rear trim
- (2) Rear trim, inner

Fig. 105: Rear Trim And Rear Trim, Inner
Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Carry over the following work steps symmetrically to the other side of the car.

Open weld joints in areas (1).

Fig. 106: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Open weld joints in area (1).

Fig. 107: Weld Joints In Area
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

The two new components are fitted individually.

Slide in inner rear trim (2).

Bend open metal plate slightly in areas (1).

Fig. 108: Inner Rear Trim And Metal Plate Slightly In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Also weld rear trim (2) in areas (1).

Fig. 109: Weld Rear Trim In Areas
Courtesy of BMW OF NORTH AMERICA, INC.

35 SIDE PANELS

41 35 000 REMOVING AND INSTALLING/REPLACING SIDE PANEL, FRONT LEFT OR RIGHT

CAUTION: Do not damage adjoining body parts.

Installation information:

E83 gap dimensions serve as basis for adjustment tasks.

R41 2465

Courtesy of BMW OF NORTH AMERICA, INC.

Interior view of front side panel

Open screws.

41 35 101 REPLACING REAR LEFT SIDE PANEL (PARTIAL REPLACEMENT, LONGITUDINAL MEMBER COVER BEFORE B-PILLAR)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Use only approved spot-welding apparatus for repairs, see **41 00 ... Workshop equipment**

Following new body parts are required:

- (1) Side panel, rear
- (2) D-pillar shaped part

R41 2488

Fig. 111: Side Panel, Rear And D-Pillar Shaped Part
 Courtesy of BMW OF NORTH AMERICA, INC.

R41 2489

Fig. 112: Mark Severance Cut And Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

Mark severance cut (1) in accordance with new part on vehicle.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 120 mm from roof frame

Measurement b = approx. 140 mm

Open weld joints in areas (2).

Installation information:

- Apply window glass adhesive to cavity acoustic baffles in area (3), see **41 00 ... Installing a cavity bulkhead (expanded)**.
- Weld in reinforcing panels at all severance cuts., see **41 00 ... Welding in reinforcement plate (steel plate)**.

Open weld joints in areas (1).

Fig. 113: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

41 35 105 REPLACING REAR LEFT SIDE PANEL (PARTIAL REPLACEMENT BEFORE LONGITUDINAL MEMBER COVER)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Use only approved spot-welding apparatus for repairs, see **41 00 ... Workshop equipment**

Following new body parts are required:

- (1) Side panel, rear
- (2) D-pillar shaped part (not shown)

R41 2475

Fig. 114: Side Panel, Rear And D-Pillar Shaped Part (Not Shown)
 Courtesy of BMW OF NORTH AMERICA, INC.

R41 2476

Fig. 115: Cavity Acoustic Baffles And Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 120 mm from roof frame

Measurement b = approx. 190 mm from middle of lower lock striker screw point.

Measurement c = approx. 290 mm

Open weld joints in areas (1).

Installation information:

- Apply window glass adhesive to cavity acoustic baffles (2).
- Weld in reinforcement plate at severance cut, see **41 00 ... Welding in reinforcement plate (steel plate)**.

Open weld joints in areas (1).

Fig. 116: Weld Joints In Area

Courtesy of BMW OF NORTH AMERICA, INC.

41 35 401 REPLACING REAR LEFT SIDE PANEL (PARTIAL REPLACEMENT, DOOR OPENING)

Read contents of Body, General, see **41 0 Contents of Body, General**.

Use only approved spot-welding apparatus for repairs, see **41 00 ... Workshop equipment**

Following new body parts are required:

- (1) Side panel, rear

Fig. 117: Side Panel, Rear And D-Pillar Shaped Part
 Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 118: Mark Severance Cut And Weld Joints In Areas Dimension
 Courtesy of BMW OF NORTH AMERICA, INC.

Mark severance cuts in accordance with specified measurements and cut.

Mark severance cut (1) in accordance with new part on vehicle.

IMPORTANT: Cut outer metal sheet only.

Measurement a = approx. 200 mm from middle of lower lock striker screw point.

Open weld joints in areas (2).

Installation information:

- Apply window glass adhesive to cavity acoustic baffle (3), see **41 00 ... Installing a cavity bulkhead (expanded)**.
- Weld in reinforcing panels at all severance cuts., see **41 00 ... Welding in reinforcement plate (steel plate)**.

51 FRONT SIDE DOORS

41 51 004 ADJUSTING FRONT LEFT OR RIGHT DOOR

NOTE: The gap dimensions serve as the basis for adjustment work.
Adjust screwed body parts from rear to front.
Make unpainted surfaces visible by also moving the hinges.
Touch these up in the appropriate color.

CAUTION: Do not damage adjoining body parts.
Minor corrections (realignment work) are permitted if the existing adjustment options are not sufficient.

Fig. 119: Gap Dimension

Courtesy of BMW OF NORTH AMERICA, INC.

Slacken screws (1) and (2) on door hinges to be adjusted at top and bottom.

Adjust door according to specified gap dimension.

Check that adjoining body parts are flush in terms of height and correct if necessary.

After adjustment, tighten hinge screws and nuts.

Tightening torque: 41 51 2AZ, see **41 51 FRONT DOORS** .

Tightening torque: 41 51 3AZ, see **41 51 FRONT DOORS** .

Fig. 120: Adjoining Body

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: **If necessary, adjust lock striker.**

Slacken screws (1), adjust lock striker and tighten screws.

NOTE: **After slackening, lock striker should be positioned approx. 90° to door frame inner edge (2) and be movable. When the door is closed, the lock striker must not touch or scrape against the door lock. Look out for scratches.**

Fig. 121: Slacken Screws

41 51 080 REMOVING AND INSTALLING FRONT LEFT OR RIGHT DOOR

IMPORTANT: Do not damage adjoining body parts.

Cars with side airbags:

Observe airbag safety regulations, see 41 00 ... Handling airbags and restraint systems.

The illustrations are schematic representations and are to be applied to the relevant vehicle type.

Open door.

WARNING: Side airbag is installed in door trim panel: Disconnect battery.

Release screw on connector frame.

Fig. 122: Locating Screw On Connector Frame

Courtesy of BMW OF NORTH AMERICA, INC.

Release screw (1) on door retainer.

Fig. 123: Door Retainer Screw

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Secure door against falling out.

Release screws between both hinge elements at top and bottom.

Pull both screws out of hinges.

Tightening torque: 41 51 1AZ, see **41 51 FRONT DOORS** .

Fig. 124: Locating Screws Between Both Hinge Elements At Top And Bottom

Courtesy of BMW OF NORTH AMERICA, INC.

Pull out door sideways and place it on a suitable surface.

Fig. 125: Pulling Out Door Sideways
Courtesy of BMW OF NORTH AMERICA, INC.

Pull plug connection from door pillar, unlock by pulling out bar and detach.

Installation:

If necessary, adjust front door, see **41 51 004 Adjusting front left or right door.**

Fig. 126: Pulling Plug Connection From Door Pillar
Courtesy of BMW OF NORTH AMERICA, INC.

52 REAR SIDE DOORS

41 52 004 ADJUSTING REAR LEFT OR RIGHT DOOR

Procedure is identical to Adjusting front left or right door, see **41 51 004 Adjusting front left or right door.**

Door to hinge, tightening torque: 41 52 2AZ, see **41 52 REAR SIDE DOORS** .

Hinge to body, tightening torque: 41 52 3AZ, see **41 52 REAR SIDE DOORS** .

41 52 080 REMOVING AND INSTALLING REAR LEFT OR RIGHT DOOR

Operation is identical to Removing and installing front left or right door, see **41 51 004 Adjusting front left or right door**.

Hinge pin, tightening torque: 41 52 1AZ, see **41 52 REAR SIDE DOORS** .

Door to hinge, tightening torque: 41 52 2AZ, see **41 52 REAR SIDE DOORS** .

Hinge to body, tightening torque: 41 52 3AZ, see **41 52 REAR SIDE DOORS** .

61 FRONT LID

41 61 000 REMOVING AND INSTALLING ENGINE HOOD

**WARNING: Support engine hood in fully opened position with suitable apparatus.
Risk of injury.**

NOTE: Carry over schematic representation to the relevant vehicle type.

Loosen screws (1).

Unfasten screws (2).

Remove hood lid.

Installation:

Install engine hood at screw locations to on hinge. This dispenses with the need for adjustment after installation.

If this is not possible, adjust engine hood, see **41 61 014 Adjusting engine bonnet/hood**.

Tightening torque: 41 61 1AZ, see **41 61 ENGINE BONNET/HOOD** .

Fig. 127: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

41 61 014 ADJUSTING ENGINE BONNET/HOOD

Read contents of Body, General, see **41 0 Contents of Body, General**.

The specified gap dimensions serve as the basis for adjustment tasks.

Make unpainted surfaces visible by also moving the hinges.

Touch these up in the appropriate colour.

NOTE: Carry over schematic representation to the relevant vehicle type.

Loosen screws (1) and (2) on left and right hinges.

Hood lid must be able to be moved.

NOTE: If the adjustment range is not sufficient, release retaining screws of engine hood hinge on body and move hinge.

Fig. 128: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Locks and retaining hook must snap correctly into place.

Adjust engine hood.

NOTE: Vertical adjustment, see 51 23 ... ADJUSTING/REPLACING BUMP STOPS of engine hood to side panel by means of stop pads.

Fig. 129: Locating Engine Hood

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Height adjustment of hood lid to front wall:
 Release screw (1) and remove cover (2).
 Height adjustment by turning at closing hooks (3).

Fig. 130: Screws, Cover And Hooks

Courtesy of BMW OF NORTH AMERICA, INC.

Tighten down all screw connections again.

Tightening torque: 41 61 1AZ, see **41 61 ENGINE BONNET/HOOD** .

IMPORTANT: Check function of retaining hook.

62 REAR LID

41 62 000 REMOVING AND INSTALLING REAR LID

Read contents of Body, General, see **41 0 Contents of Body, General**.

Necessary preliminary tasks:

- Remove trim for rear lid, see **51 49 008 REMOVING AND INSTALLING/REPLACING PANEL FOR REAR LID** .
- Disconnect all plug and socket cable connections on rear lid.

Open screws (1) on rear lid hinge to rear lid.

Remove trunk lid.

Fig. 131: Screws On Rear Lid Hinge To Rear Lid
Courtesy of BMW OF NORTH AMERICA, INC.

41 62 014 ADJUSTING REAR LID

Read contents of Body, General, see **41 0 Contents of Body, General**.

The E83 gap dimensions serve as the basis for adjustment work.

Make unpainted surfaces visible by also moving the hinges. Touch these up in the appropriate color.

Release screws (1) on rear lid hinge to rear lid so that rear lid can still be moved.

If adjustment range is not enough, also slacken screws (2).

Adjust rear lid.

Adjust rear lid lock, see **51 24 004 ADJUSTING REAR LID LOCK**.

Retighten all screws.

Fig. 132: Release And Slacken Screws
Courtesy of BMW OF NORTH AMERICA, INC.

41 62 519 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT HINGE FOR REAR LID

Read contents of Body, General, see **41 0 Contents of Body, General.**

Necessary preliminary tasks:

- Remove rear lid, see **41 62 000 Removing and installing rear lid**

Open screw connections (1) on car.

Remove hinge.

Installation:

Adjust rear lid on basis of E83 body gap dimensions.

Fig. 133: Screw Connections On Car
Courtesy of BMW OF NORTH AMERICA, INC.

63 OTHER FLAPS

41 63 000 REMOVING AND INSTALLING FLAP FOR FUEL FILLER NECK

NOTE: The illustration is a schematic representation and is to be applied to the relevant vehicle type.

Open fuel filler flap.

Lever out lock (2) and detach fuel filler flap (1) in direction of arrow.

Fig. 134: Removing Lever Out Lock And Fuel Filler Flap
 Courtesy of BMW OF NORTH AMERICA, INC.

41 63 003 REPLACING COVER BOWL

Necessary preliminary tasks:

- Remove flap for fuel filler neck, see **41 63 000 Removing and installing flap for fuel filler neck**
- Remove servodrive for tank filler flap, see **67 11 555 REMOVING AND INSTALLING/REPLACING SERVODRIVE FOR TANK FILLER FLAP** .

Turn cover (1) through approx. 45° and lever out in direction of arrow.

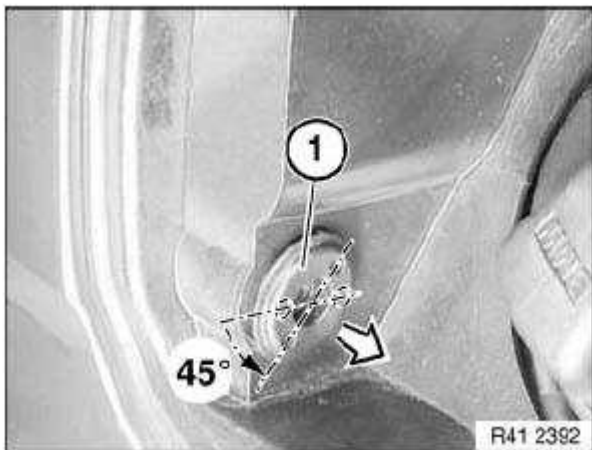

Fig. 135: Turning Cover
 Courtesy of BMW OF NORTH AMERICA, INC.

Press retaining strap (1) inwards and remove.

Remove cover (2).

Remove rubber pad (3).

Insert a suitable tool through bores (3) and release catches.

Installation:

Make sure seal (4) is correctly seated.

Fig. 136: Retaining Strap, Cover, Rubber Pad And Seal
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Catches (1) on ejector (2) must not be damaged.

Check protective cap (3) for correct seating.

Fig. 137: Catches, Ejector And Protective Cap
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Locks (1) on left/right of cover (2) must not be damaged.

Fig. 138: Locks And Left/Right Of Cover
Courtesy of BMW OF NORTH AMERICA, INC.

Close flap (1).

Twist cover bowl (2) in direction of arrow out of side panel and remove.

Fig. 139: Twisting Cover Bowl
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Following parts on cover bowl (6) must not be damaged or missing:

1. Rubber pad
2. Catches, top/bottom

3. Spring
4. Catch
5. Guide

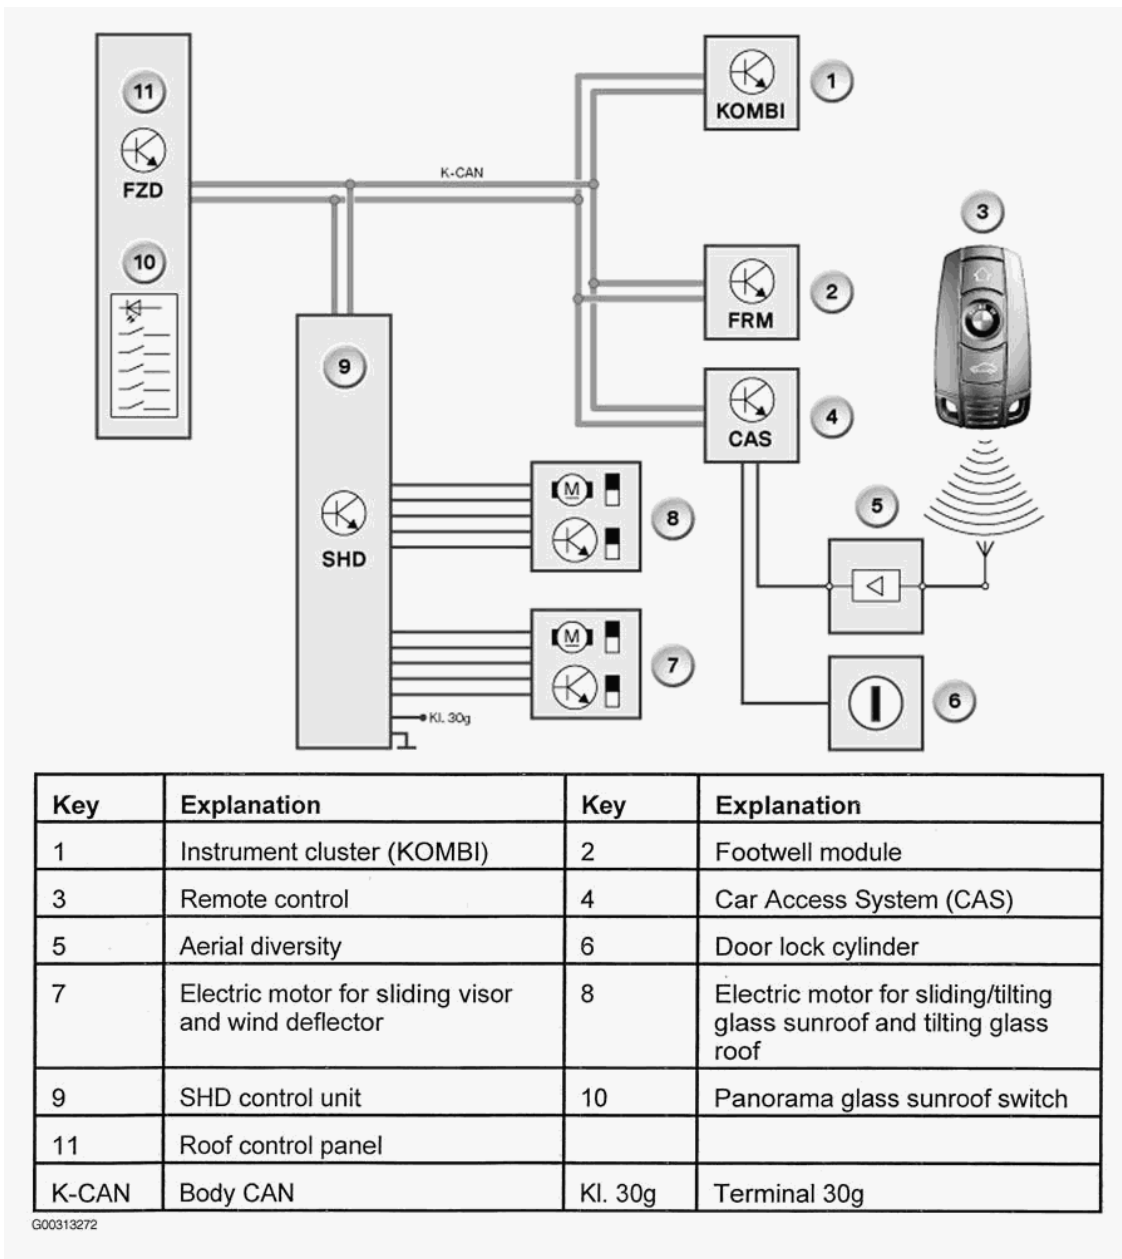

Fig. 7: Panorama Glass Sunroof Circuit Flow Diagram (E91)
 Courtesy of BMW OF NORTH AMERICA, INC.

The Panorama glass sunroof is available as special equipment (option 402).

BRIEF DESCRIPTION OF COMPONENTS

The following components supply the input signals for the Panorama glass sunroof:

Panorama Glass Sunroof Switch

The switch is located in the control unit in the roof console.

The switch can be moved in 3 directions (pushed forwards, pushed backwards, pushed upwards).

Installation Location

E53, E61, E83: The switch is integrated in the control panel in the roof console.

E91: The switch is integrated into the roof control panel (FZD).

How It Works

The switch for the Panorama glass sunroof does not engage. The switch has three operating directions:

- Open
- Close
- Tilt

NOTE: The "open" or "close" process for the sliding/tilting glass sunroof is interrupted when the comfort position is reached.

When the comfort position is reached as the sliding/tilting glass sunroof is opened or closed (sliding/tilting glass sunroof approx. 3/4 open), the "open" or "close" process is interrupted. The switch for the Panorama glass sunroof must be pushed again to continue the process.

The switch for the Panorama glass sunroof has a locating light (terminal 58g).

E53, E83 - The SHD control unit receives the information terminal 58g from the light switch cluster (LSZ) via the body bus. The control unit activates the LEDs (Light-Emitting Diodes) in the Panorama glass sunroof switch.

E61 - The SHD control unit receives the information terminal 58g from the light module (LM) via the Body CAN.

E91 - The SHD control unit receives the information terminal 58g from the footwell module (FRM) via the Body CAN.

Hall Sensors In Panorama Glass Sunroof Drive

There are 2 Hall sensors integrated in each of the two electric motors for the Panorama glass sunroof. The Hall sensors detect the motor speed. The signals are forwarded to the SHD control unit. These signals enable the control unit to recognize the position of the two glass sunroofs and of the 2-piece sliding visor. Moreover, the closing speed of each electric motor is used to calculate the closing force for the two glass sunroofs and for the sliding visor.

SHD Control Unit (Control Unit For Panorama Glass Sunroof)

NOTE: The control units involved in the functions of the Panorama glass sunroof are as follows:

The SHD control unit controls all the electrical functions of the Panorama glass sunroof.

Installation Location

E53, E83 - The SHD control unit is located next to the electric motor for the two glass sunroofs. The control unit is secured at the bottom to the Panorama glass sunroof frame.

Fig. 8: Identifying SHD Control Module (E53 & E83)

10	A	Hall sensor in the sliding visor motor
A = Output E = Input For current specifications regarding pin assignment, please refer to BMW diagnosis system.		

GM: General Module 3 (E53) Or General Module 5 (E83)

The general module controls the convenience opening or closing function of the Panorama glass sunroof. The general module forwards the request (from the remote control, for example) to the SHD control unit via the body bus.

CAS: Car Access System (E61, E91)

The CAS controls the convenience opening or closing function of the Panorama glass sunroof. The CAS forwards the request (from the remote control, for example) to the SHD control unit via the Body CAN.

CA: Comfort Access

Option 322 "Comfort Access" allows convenience closing of the Panorama glass sunroof without actively using the ID transmitter.

For further information, please refer to SI Technology (SBT) 66 04 04 093.

LSZ: Light Switch Cluster (E53, E83)

The light switch cluster sends the SHD control unit the request to switch on the locating light via the body bus (terminal 58g).

LM: Light Module (E61)

The light module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

FRM: Footwell Module (E91)

The footwell module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

FZD: Roof Control Panel (E91)

The roof control panel picks up the signals from the switch for the Panorama glass sunroof. In addition, the FZD control unit also converts the signal into a CAN message. The CAN message is forwarded to the SHD control unit via the K-CAN.

KOMBI: Instrument Cluster

The instrument cluster sends the road speed signal to the SHD control unit:

via the K-bus (body bus) on the **E53, E83**

via the K-CAN (Body CAN) on the **E61, E91**

The signal is needed to extend and retract the wind deflector and to adjust the closing force limitation.

Panorama Glass Sunroof Drive

NOTE: The following components are actuated for the purposes of the functions of the Panorama glass sunroof:

The drive consists of 2 DC motors with reduction gearing. One motor operates the two glass sunroofs, the other

motor the sliding visor and the wind deflector.

Installation Location

The electric motors for the Panorama glass sunroof are installed from below on the Panorama glass sunroof frame. See **Fig. 8** .

Construction

The Panorama glass sunroof drive and the sliding visor and wind deflector drive consist of 2 technically identical DC motors with reduction gearing.

How It Works

Both electric motors are actuated by the SHD control unit. Two Hall sensors are integrated in the electric motor for each of the two glass sunroofs in the sliding visor motor. This allows the control unit to recognise the position of the glass sunroofs and of the sliding visor. The closing speed is used by the SHD control unit to calculate the closing force needed for the glass sunroofs and the sliding visor.

Wind Deflector

The wind deflector is extended to reduce noises inside the vehicle when the sliding/tilting glass sunroof is open. The wind deflector automatically extends depending on the road speed.

How It Works

The wind deflector is extended, depending on the road speed.

Signal path:

E53, E83: Instrument cluster -> Body bus -> SHD control unit

E61, E91: Instrument cluster -> Body CAN -> SHD control unit

The wind deflector has 2 positions:

- Wind Deflector Completely Extended
- Intermediate Position

When the sliding visor is fully open, the wind deflector extends fully with a net if the sliding/tilting glass sunroof is more than approx. 1/3 open. For this to happen, the sliding visor is disengaged from the sliding visor motor. The wind deflector is extended by the sliding visor motor. When a road speed of approx. 140 km/h is reached, the wind deflector is retracted to the intermediate position. When the speed drops below approx. 100 km/h again, the wind deflector is fully extended again. To prevent the wind deflector from extending and retracting in a haphazard manner, the wind deflector is actuated with a time lag.

Wind deflector completely extended

- 1) Wind deflector
- 2) Net

Wind deflector in intermediate position

- 1) Wind deflector

G00313276

Fig. 11: Identifying Wind Deflector Positions
 Courtesy of BMW OF NORTH AMERICA, INC.

2-Piece Sliding Visor

E53, E61, E83: When driving with the Panorama glass sunroof tilted ("vent" position), a suction effect develops on the 2-piece sliding visor. This suction effect can lead to noise disturbance.

To minimize the suction effect, the rear piece of the 2-piece sliding visor is opened approximately 3 cm.

E91: The 2-piece sliding visor moves back approx.5 cm and forms an opening at the front.

SYSTEM FUNCTIONS

The Panorama glass sunroof comprises the following functions:

- Opening And Closing
- Convenience Opening And Closing
- Emergency Closing
- Anti-Trap Function (Limits Closing Force)
- Safety Functions

Opening And Closing

The functions for opening and closing are as follows:

- Manual opening or closing

Push the switch for the Panorama glass sunroof backwards to the first resistance point to open it, or forwards to close it.

The glass sliding/tilting sunroof (front glass sunroof) keeps moving as long as the switch remains pushed.

- Automatic opening or closing

- Automatic opening:

Press the switch for the Panorama glass sunroof beyond the pressure point. The Panorama glass sunroof is partially opened automatically. That means: Depending on the initial position of the Panorama glass sunroof, the sliding visor is first opened fully. Then, if the switch is again pressed beyond the pressure point, the glass sliding/tilting sunroof is opened. When it is opened, the sliding/tilting glass sunroof automatically moves to the comfort position (sliding/tilting glass sunroof approx. 3/4 open). The switch must be pushed again to completely open the glass sliding/tilting sunroof.

- Automatic closing:

The closing procedure is a reverse of the above. When the comfort position is reached during closing, the closing operation is interrupted and must be restarted.

- Automatic opening or closing with a double click

Press the button for the Panorama glass sunroof beyond the pressure point to "Open" or "Close" twice within the space of 2 seconds. The Panorama glass sunroof completely opens or closes automatically. When this happens, the sliding visor and the sliding/tilting glass sunroof open or close together. However, the sliding visor always moves out-of-line with the sliding/tilting glass sunroof. This ensures that the sliding visor is always slightly more open than the sliding/tilting glass sunroof as the sliding/tilting glass sunroof is opened or closed.

- Tilt

- Push the switch for the Panorama glass sunroof upwards until it reaches its mechanical stop. The front glass sliding/tilting sunroof and the rear tilting glass sunroof are automatically lifted from every other position as long as the switch remains pushed.

- Press the switch for the Panorama glass sunroof up twice within the space of 2 seconds. The Panorama glass sunroof moves to the "Vent" position, regardless of the starting position. ("Vent" position means: both glass sunroofs are fully tilted, the rear section of the 2-piece sliding visor is opened approx.3 cm.)

NOTE: **Automatic closing is not possible if the anti-trap function fails.**
Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.
Any fault data is then stored in the SHD control unit.

Convenience Opening And Closing

The controls that can be used for this purpose are as follows:

- Button on remote control (radio-control key)

Press the button on the remote control to "unlock" or "lock" and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Door lock on driver's door

Use the mechanical key to turn the lock in the driver's door to the position for unlocking or locking, and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Driver-side outside door handle and passenger-side outside door handle

If the vehicle is equipped with Comfort Access (CA), **convenience closing** can be started using the outside door handle electronics in the bow handle.

The convenience opening/convenience closing function is stopped if the command is cancelled.

Emergency Closing

Emergency closing is a function for deliberate closure of the Panorama glass sunroof without anti-trap function (closing-force limitation). Emergency closing may be necessary if someone attempts to reach into the interior of the car or if mechanical difficulty is experienced in closing the Panorama glass sunroof.

Emergency closing can be activated when the car is stopped or travelling at a speed up to 16 km/h.

To activate emergency closing:

Push the switch for the Panorama glass sunroof in the "close" direction until it reaches its mechanical stop and hold it there. The Panorama glass sunroof is closed with maximum force and maximum speed without anti-trap function.

If the Panorama glass sunroof is blocked, the electric motor continues to run until the overheating protection is

activated.

Anti-Trap Function (Closing-Force Limitation)

WARNING: Note Initialization

The Panorama glass sunroof has to be initialized in order for the anti-trap function to work correctly. The Panorama glass sunroof has to be initialized by service staff.

The anti-trap function is active over the entire range of movement in the closing direction.

The anti-trap function works as follows:

- The sliding/tilting glass sunroof and/or the sliding visor is opened approx.20 cm.
- When closing from the "tilt" position, the sunroof will return to the "tilt" position.

Anti-trap function does not in principle prevent trapping; instead, it limits the maximum permissible force applied to the trapped object (by limiting the closing force).

To prevent impermissibly high closing forces, there are 2 Hall sensors integrated in each of the electric motors. The speed of closure can be measured on the basis of the signals from these two Hall sensors. The closing force is calculated from the speed of closure.

The mechanical forces involved change with ambient temperature and as a result of ageing. For this reason, the closing forces required are adapted during the closing process.

Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.

Safety Functions

- **Maximum Motor ON Time**

If a motor runs in a single direction for longer than 15 seconds, the SHD control unit will deactivate the drive.

- **Overheating Protection**

The heating up of the electric motors is computed in the SHD control unit. The outside temperature is available as a temperature signal (via the body bus or CAN). Moreover, there is a temperature sensor on the board of the SHD control unit. After a certain temperature threshold is reached the overheating protection is activated. The drive is switched off.

- **Emergency Operation**

In emergency mode, the Panorama glass sunroof can only be moved in small steps.

Emergency mode is possible in the following conditions:

- Encoding of the SHD control unit incorrect
- Implausible signal from a Hall sensor
- Initialization incomplete

NOTE: **Mechanical emergency mode is possible**
In case of an electrical defect, emergency mode of the Panorama glass
sunroof is available.
There is no emergency mode for the sliding visor.

Notes For Service Staff

Service staff should note the following points:

- General information: Refer to **E53, E61, E83, E91 - GENERAL INFORMATION FOR SERVICE STAFF ON THE PANORAMA GLASS SUNROOF** .
- Diagnosis:
- Encoding/programming: Refer to **E53, E61, E83, E91 - ENCODING/PROGRAMMING THE PANORAMA GLASS SUNROOF** .
- Car and Key Memory:

E53, E61, E83, E91 - General Information For Service Staff On The Panorama Glass Sunroof

Initialising The Panorama Glass Sunroof The Panorama glass sunroof must be initialised after the following service operations:

- Replacement of SHD control unit
- Repair of the Panorama glass sunroof mechanics (e.g. if the Panorama glass sunroof has been mechanically moved using emergency mode or if a Panorama glass sunroof electric motor has been replaced)
- Other repairs to the Panorama glass sunroof (e.g. if the glass sunroof or sliding visor has been replaced)

Initialisation will calibrate the anti-trap function to the Panorama glass sunroof.

IMPORTANT: Anti-Trap Function Not Active The anti-trap function is not active during initialisation.

Initialisation is divided into the steps "normalisation" and "characteristic curve teach-in":

- During normalisation, the end stop for the Panorama glass sunroof and sliding visor in the "tilt" direction is learnt. The SHD control unit uses this information to calculate the end stops for opening and closing.
- When it is taught the characteristic map, the processor registers the mechanical forces required to close the Panorama glass sunroof.

Comply With The Following Procedure For Initialisation:

- Terminal 15 ON
- Push the switch for the Panorama glass sunroof upwards in the "tilt" direction and hold it there.

NOTE: Hold the switch for the Panorama glass sunroof depressed during the initialisation. If the switch for the Panorama glass sunroof is released during initialisation, the procedure must be repeated.

- The process will start automatically after approx. 15 seconds. All positions for the Panorama glass sunroof are selected.
- The Panorama glass sunroof will be closed when initialisation is complete.
- Once the Panorama glass sunroof is again closed, the switch for the Panorama glass sunroof can be released. After a delay of approx. 5 seconds, which is needed to store data, the switch can again be used to operate the Panorama glass sunroof.

E53, E61, E83, E91 - Encoding/Programming The Panorama Glass Sunroof

The following step should be performed if the SHD control unit has been replaced:

- Encode the electronic control unit

IMPORTANT: Perform encoding after replacing the control unit. If encoding is not performed, there is risk of malfunction (e.g.. anti-trap circuit) or of the battery becoming permanently discharged.

ACCESSORIES AND EQUIPMENT

Slide/Tilt Roof and Convertible Top - SI Techniques - X3

PANORAMA GLASS SUNROOF

INTRODUCTION

The fully automatic Panorama glass sunroof consists of 2 glass sunroofs and a 2 -piece sliding visor. The front glass sunroof works like a sliding/tilting sunroof, the rear glass sunroof is a tilting glass sunroof. The Panorama glass sunroof is actuated in the usual way by its own control unit.

- > E53, E83
- > E61
- > E91

The Panorama glass sunroof is available as special equipment (option 402).

BRIEF DESCRIPTION OF COMPONENTS

The following components supply the input signals for the Panorama glass sunroof:

- **Panorama glass sunroof switch**

The switch is located in the control unit in the roof console.

The switch can be moved in 3 directions (pushed forwards, pushed backwards, pushed upwards).

- **Hall sensors in Panorama glass sunroof drive**

There are 2 Hall sensors integrated in each of the two electric motors for the Panorama glass sunroof. The Hall sensors detect the motor speed. The signals are forwarded to the SHD control unit. These signals enable the control unit to recognize the position of the two glass sunroofs and of the 2 -piece sliding visor. Moreover, the closing speed of each electric motor is used to calculate the closing force for the two glass sunroofs and for the sliding visor.

The control units involved in the functions of the Panorama glass sunroof are as follows:

- **SHD control unit (control unit for Panorama glass sunroof)**

The SHD control unit controls all the electrical functions of the Panorama glass sunroof.

- **GM: General module 3 (E53) or general module 5 (E83)**

The general module controls the convenience opening or closing function of the Panorama glass sunroof. The general module forwards the request (from the remote control, for example) to the SHD control unit via the body bus.

- **CAS: Car Access System (E61, E91)**

The CAS controls the convenience opening or closing function of the Panorama glass sunroof. The CAS forwards the request (from the remote control, for example) to the SHD control unit via the Body CAN.

- **CA: Comfort Access**

Option 322 "Comfort Access" allows convenience closing of the Panorama glass sunroof without actively using the ID transmitter.

- **LSZ: Light switch cluster (E53, E83)**

The light switch cluster sends the SHD control unit the request to switch on the locating light via the body bus (terminal 58g).

- **LM: Light module (E61)**

The light module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

- **FRM: Footwell module (E91)**

The footwell module sends the SHD control unit the request to switch on the locating light via the Body CAN (terminal 58g).

- **FZD: Roof control panel (E91)**

The roof control panel picks up the signals from the switch for the Panorama glass sunroof. In addition, the FZD control unit also converts the signal into a CAN message. The CAN message is forwarded to the SHD control unit via the K-CAN.

- **KOMBI: Instrument cluster**

The instrument cluster sends the road speed signal to the SHD control unit.

- > via the K-bus (body bus) on the **E53, E83**
- > via the K-CAN (Body CAN) on the **E61, E91**

The signal is needed to extend and retract the wind deflector and to adjust the closing force limitation.

The following components are actuated for the purposes of the functions of the Panorama glass sunroof:

- **Panorama glass sunroof drive**

The drive consists of 2 DC motors with reduction gearing. One motor operates the two glass sunroofs, the other motor the sliding visor and the wind deflector.

- **Wind deflector**

The wind deflector is extended to reduce noises inside the vehicle when the sliding/tilting glass sunroof is open. The wind deflector automatically extends depending on the road speed.

- **2-piece sliding visor**

When driving with the Panorama glass sunroof tilted ("vent" position), a suction effect develops on the 2-piece sliding visor. This suction effect can lead to noise disturbance.

- E53, E61, E83:

To minimize the suction effect, the rear piece of the 2-piece sliding visor is opened approximately 3 cm.

- E91 : The 2-piece sliding visor moves back approx. 5 cm and forms an opening at the front.

SYSTEM FUNCTIONS

The Panorama glass sunroof comprises the following functions:

- Opening and closing
- Convenience opening and closing

- Emergency closing
- Anti-trap function (limits closing force)
- Safety functions

Opening and closing

The functions for opening and closing are as follows:

- Manual opening or closing

Push the switch for the Panorama glass sunroof backwards to the first resistance point to open it, or forwards to close it.

The glass sliding/tilting sunroof (front glass sunroof) keeps moving as long as the switch remains pushed.

- Automatic opening or closing

- Automatic opening:

Press the switch for the Panorama glass sunroof beyond the pressure point. The Panorama glass sunroof is partially opened automatically. That means: Depending on the initial position of the Panorama glass sunroof, the sliding visor is first opened fully. Then, if the switch is again pressed beyond the pressure point, the glass sliding/tilting sunroof is opened. When it is opened, the sliding/tilting glass sunroof automatically moves to the comfort position (sliding/tilting glass sunroof approx. 3/4 open). The switch must be pushed again to completely open the glass sliding/tilting sunroof.

- Automatic closing:

The closing procedure is a reverse of the above. When the comfort position is reached during closing, the closing operation is interrupted and must be restarted.

- Automatic opening or closing with a double click

Press the button for the Panorama glass sunroof beyond the pressure point to "Open" or "Close" twice within the space of 2 seconds. The Panorama glass sunroof completely opens or closes automatically. When this happens, the sliding visor and the sliding/tilting glass sunroof open or close together. However, the sliding visor always moves out-of-line with the sliding/tilting glass sunroof. This ensures that the sliding visor is always slightly more open than the sliding/tilting glass sunroof as the sliding/tilting glass sunroof is opened or closed.

- Tilt

- Push the switch for the Panorama glass sunroof upwards until it reaches its mechanical stop. The front glass sliding/tilting sunroof and the rear tilting glass sunroof are automatically lifted from every other position as long as the switch remains pushed.
- Press the switch for the Panorama glass sunroof up twice within the space of 2 seconds. The Panorama glass sunroof moves to the "Vent" position, regardless of the starting position. ("Vent"

position means: both glass sunroofs are fully tilted, the rear section of the 2-piece sliding visor is opened approx. 3 cm.)

NOTE: Automatic closing is not possible if the anti-trap function fails.

Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.

Any fault data is then stored in the SHD control unit.

Convenience opening and closing

The controls that can be used for this purpose are as follows:

- Button on remote control (radio-control key)

Press the button on the remote control to "unlock" or "lock" and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Door lock on driver's door

Use the mechanical key to turn the lock in the driver's door to the position for unlocking or locking, and hold it in this position until the Panorama glass sunroof reaches the desired position.

- Driver-side outside door handle and passenger-side outside door handle

If the vehicle is equipped with Comfort Access (CA), **convenience closing** can be started using the outside door handle electronics in the bow handle.

The convenience opening/convenience closing function is stopped if the command is cancelled.

Emergency closing

Emergency closing is a function for deliberate closure of the Panorama glass sunroof without anti-trap function (closing-force limitation). Emergency closing may be necessary if someone attempts to reach into the interior of the car or if mechanical difficulty is experienced in closing the Panorama glass sunroof.

Emergency closing can be activated when the car is stopped or travelling at a speed up to 16 km/h.

To activate emergency closing:

Push the switch for the Panorama glass sunroof in the "close" direction until it reaches its mechanical stop and hold it there. The Panorama glass sunroof is closed with maximum force and maximum speed without anti-trap function.

If the Panorama glass sunroof is blocked, the electric motor continues to run until the overheating protection is activated.

Anti-trap function (closing-force limitation)

WARNING: Note initialization

The Panorama glass sunroof has to be initialized in order for the anti-trap function to work correctly. The Panorama glass sunroof has to be initialized by service staff.

The anti-trap function is active over the entire range of movement in the closing direction.

The anti-trap function works as follows:

- The sliding/tilting glass sunroof and/or the sliding visor is opened approx. 20 cm.
- When closing from the "tilt" position, the sunroof will return to the "tilt" position.

Anti-trap function does not in principle prevent trapping; instead, it limits the maximum permissible force applied to the trapped object (by limiting the closing force).

To prevent impermissibly high closing forces, there are 2 Hall sensors integrated in each of the electric motors. The speed of closure can be measured on the basis of the signals from these two Hall sensors. The closing force is calculated from the speed of closure.

The mechanical forces involved change with ambient temperature and as a result of ageing. For this reason, the closing forces required are adapted during the closing process.

Automatic closing is not possible if the anti-trap function fails (on account of defective Hall sensor, for example). Closing is then only possible with the mechanical emergency mode.

Safety functions

- **Maximum motor ON time**

If a motor runs in a single direction for longer than 15 seconds, the SHD control unit will deactivate the drive.

- **Overheating protection**

The heating up of the electric motors is computed in the SHD control unit. The outside temperature is available as a temperature signal (via the body bus or CAN). Moreover, there is a temperature sensor on the board of the SHD control unit. After a certain temperature threshold is reached the overheating protection is activated. The drive is switched off.

- **Emergency operation**

In emergency mode, the Panorama glass sunroof can only be moved in small steps. Emergency mode is possible in the following conditions:

- Encoding of the SHD control unit incorrect
- Implausible signal from a Hall sensor
- Initialisation incomplete

NOTE: Mechanical emergency mode is possible

In case of an electrical defect, emergency mode of the Panorama glass sunroof is available.

There is no emergency mode for the sliding visor.

ACCESSORIES AND EQUIPMENT

Slide/Tilt Roof and Convertible Top - Tightening Torques - X3

ACCESSORIES AND BODY, CAB

Sliding/Tilt Sunroof - Repair Instructions - X3

10 SUNROOF

54 0 ... REPAIR INSTRUCTIONS FOR BONDED SEALS

1. General information on handling rubber seal profiles:

- If seals reveal partly detached protective film on delivery, they must not be bonded.
- Store seals at 15°C to 25°C.
- If, during the handling, the protective film has come off before bonding, it can still be bonded.
- Bonding at room and object temperature >20°C. Temperatures between 40 and 50°C significantly increase initial adhesion.
- Seals, which are subjected to temperatures above 80°C after gluing, will be very difficult to remove.

2. Damage pattern and repair

2.1 Partially detached bond (rubber-adhesive tape or adhesive tape-paint)

- Up to 120 mm for retouching without auxiliary resources
- Up to 200 mm repaired with pressing-on tools on straight surfaces
- a. Cleaning damaged areas:
 - Degrease bonded area with adhesive cleaner and remove other residues.

NOTE: Use necessary cotton-or fluff-free paper towel once only.
When using solvent:
expose repair area to air for at least 2 minutes.

b. Applying adhesive:

- With a fine nozzle, apply a wafer-thin bead to adhesive tape.

NOTE: Use contact adhesive (e.g. Terokal 2444)

CAUTION: Avoid contact to skin!
Do not apply adhesive to visible painted surfaces.

c. Pressing on rubber seal:

- Press down seal using contact pressure (forced pressure not necessary) for at least 1 minute.

CAUTION: Load can only be applied to the bond after a period of 2 minutes. This waiting time is absolutely essential.

2.2 Larger defects (mechanical damage and larger separations of seal)

- A complete replacement of the rubber seal is necessary, see **54 13 050 Replacing seal for slide/tilt sunroof lid at rear.**
- a. Peeling off damaged rubber seal:
 - Pull off rubber seal slowly at an angle up to 20° under uniformly strong tension.

NOTE: **Make sure the connection between adhesive tape and seal is retained.**
If the connection between adhesive tape and seal is detached: Carefully and slowly detach adhesive tape at an angle of 20° from roof opening or lid.
If, in the case of older seals, you are peeling off using a hot air blower: Do not damage paintwork.
Do not detach rubber-adhesive tape connection if at all possible.

- b. Cleaning bonded area:
 - Degrease bonded area with adhesive cleaner and remove other residues.

NOTE: **Use necessary cotton-or fluff-free paper towel once only.**
When using solvent: expose repair area to air for at least 2 minutes.

- c. Detaching protective film from bonded area:
 - Detach protective film from rubber seal in sections.

CAUTION: Once the protective film has been removed, do not under any circumstances touch the exposed bonded area.

- d. Applying rubber seal:
 - Apply rubber seal on roof opening edge beginning at rear center. Use upper lip as application edge. Press on seal continuously by hand. Carefully unwrap seal at radii without tension and press down (critical area).

NOTE: **If positioned incorrectly, the seal can still be pulled off, repositioned and pressed on again.**

- e. Establishing seal joint:
 - Mark contact point at joint by pressing down loose end on seal of already bonded end. Then cut and press down loose end at same height.
- f. Pressing on seal:
 - Press on seal using a roller
 - Adhesive tape width up to 5 mm Application pressure approx. 5 N

- Adhesive tape width up to 10 mm Application pressure approx. 10 N

Sliding sunroof seal only:

- Press against seal strongly with a roller. Application pressure approx. 70 N.

E36 sliding sunroof seal only:

- Application pressure approx. 30 N.
- Tear off tear-off lip at rear and side in area of narrower flange.

NOTE: Firm thumb pressure has approx. 35 N/cm 2

Checking rubber seal

- Check the bonded seals for correct positioning and perfect adhesion. The bonding can be checked by pressing back the sealing lip.
- The force required to peel off the seal immediately after gluing must be greater than 10 N/cm.

54 10 ... REMOVING AND INSTALLING/REPLACING DRIVE CABLE PLATE

Necessary preliminary tasks:

- Remove mechanism for glass cover at front, see **54 10 020 Removing and installing mechanism for front glass lid.**

Overview of glass lid mechanism:

R54 1017

- | | | | |
|---|----------------------------------|----|--|
| 1 | Floating roofline mechanism | 7 | Spring retainer |
| 2 | Mechanism, front glass lid | 8 | Drive cable, rear glass lid (connecting link) |
| 3 | Drive wedge | 9 | Drive cable plate |
| 4 | Drive plate | 10 | Drive cable, front glass lid (connecting link) |
| 5 | Mechanism, rear glass lid | 11 | Control carriage, wind deflector |
| 6 | Control carriage, rear glass lid | 12 | Slide element |

Fig. 1: Identifying Glass Lid Mechanism Components
 Courtesy of BMW OF NORTH AMERICA, INC.

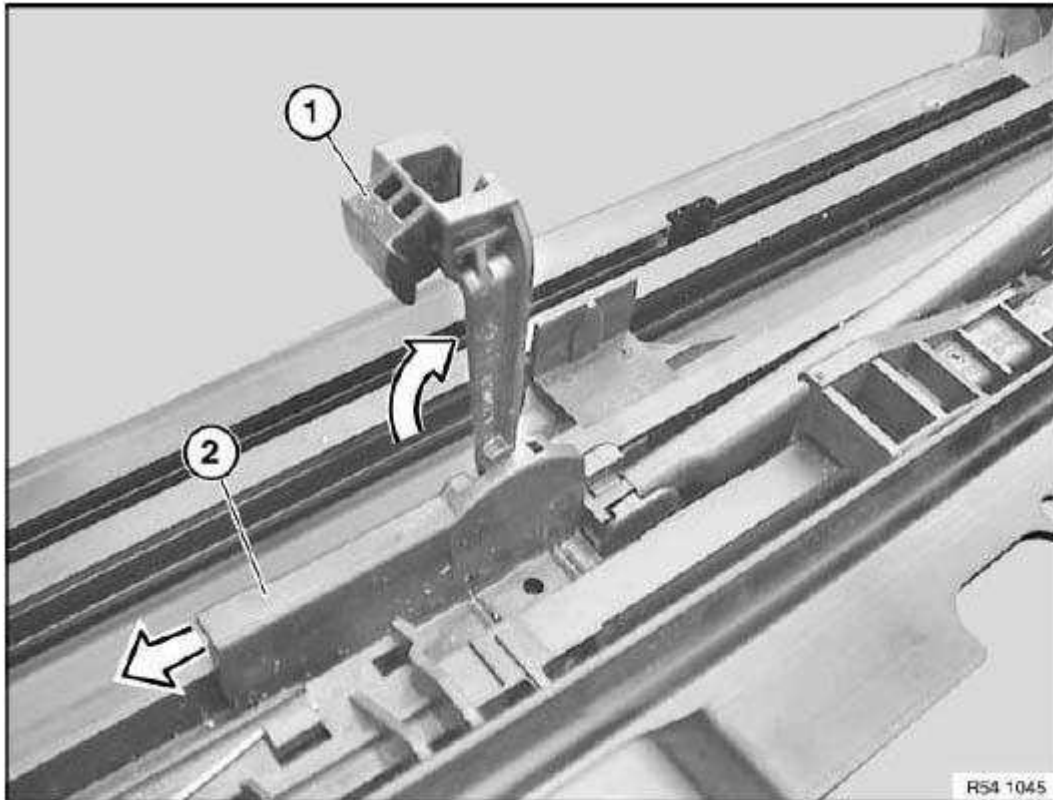

Fig. 2: Removing Drive Wedge

Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, remove drive wedge (1).

If necessary, slide drive cable plate (2) towards rear and remove from guide rail.

Fig. 3: Sliding Drive Cable Plate And Drive Wedge
Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Risk of damage when installing drive cable plate

The rear drive cable plate (2) must be engaged before the front drive cable plate (1) is installed.

Incorrect setting can be identified from spring position and lever position (marked area).

Check engagement of rear drive cable plate (2) in guide rail.

Slide in drive cable plate (1).

54 10 ... ELIMINATING FLOATING ROOFLINER CLICKING NOISES

Special tools required:

- **54 1 100**

IMPORTANT: The following measures describe how to eliminate clearly audible clicking noises when closing the floating roofliner. Only vehicles from the production period 10.12.05 to 10.02.06 may be affected.

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof lid.
- Close floating roofliner fully.

The following special tool is required: Pressing fixture 54 1 100 for panorama glass roof guide rail, comprising:

- Special tool 54 1 101 Pressing fixture
- Special tools 54 1 102 Flexible shaft

Fig. 4: Pressing Fixture 54 1 100 For Panorama Glass Roof Guide Rail
 Courtesy of BMW OF NORTH AMERICA, INC.

Approximate position of end fittings between floating roofliner and roof outer skin.

Fig. 5: Approximate Position Of End Fittings Between Floating Roofliner And Roof Outer Skin
 Courtesy of BMW OF NORTH AMERICA, INC.

Place pressing fixture in guide rail and snap into guide rail opening by gently sliding forwards and back.

IMPORTANT: Do not engage in rear position (measure ineffective).

Fig. 6: Place Pressing Fixture In Guide Rail And Snap Into Guide Rail
Courtesy of BMW OF NORTH AMERICA, INC.

Screw pressing fixture by means of reversible ratchet down to stop. End stop is thereby pressed into the guide rail.

IMPORTANT: A helper must press into the pressing fixture during the entire screwing process vertically onto the guide rail so that the pressing fixture does not jam.

Fig. 7: Screw Pressing Fixture By Means Of Reversible Ratchet Down To Stop
Courtesy of BMW OF NORTH AMERICA, INC.

Repeat the entire procedure on the other side.

54 10 020 REMOVING AND INSTALLING MECHANISM FOR FRONT GLASS LID

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove glass slide/tilt sunroof lid at front, see **54 10 170 Removing and installing front glass slide/tilt sunroof cover.**
- Remove glass slide/tilt sunroof lid at rear **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**
- Remove front drip molding, see **54 13 100 Removing and installing/replacing drip molding.**
- Remove drive for slide/tilt sunroof actuation, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .**

Overview of glass lid mechanism:

R54 1017

- | | | | |
|---|----------------------------------|----|--|
| 1 | Floating roof liner mechanism | 7 | Spring retainer |
| 2 | Mechanism, front glass lid | 8 | Drive cable, rear glass lid (connecting link) |
| 3 | Drive wedge | 9 | Drive cable plate |
| 4 | Drive plate | 10 | Drive cable, front glass lid (connecting link) |
| 5 | Mechanism, rear glass lid | 11 | Control carriage, wind deflector |
| 6 | Control carriage, rear glass lid | 12 | Slide element |

Fig. 8: Identifying Glass Lid Mechanism Components

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Always replace mechanism for glass slide/tilt sunroof in pairs.
If necessary, lightly grease guide channel.

Fig. 9: Tabs Of Cover Strip

Courtesy of BMW OF NORTH AMERICA, INC.

Removing upper connecting link (return linkage):

Bend open tabs (1) of cover strip (2).

Remove cover strip (2).

Installation:

Cover strip determines alignment of mechanism.

Fig. 10: Sliding Drive Cable Plate
Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, slide drive cable plate (1) fully forwards with a screwdriver (stop).

Fig. 11: Prying Out Locking Lever Of Detent Element
Courtesy of BMW OF NORTH AMERICA, INC.

Pry out locking lever (1) of detent element at front from guide rail (unlock).

Fig. 12: Drive Cable Plate

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Do not move drive cable plate (2) before locking lever (1) is engaged (risk of damage).

Fig. 13: Pulling Upper Connecting Link Towards Rear Out Of Drive Wedge
Courtesy of BMW OF NORTH AMERICA, INC.

Pull upper connecting link (1) towards rear out of drive wedge (2).

Fig. 14: Pulling Upper Connecting Link
Courtesy of BMW OF NORTH AMERICA, INC.

Feed upper connecting link (1) out of guide rail.

NOTE: If necessary, move mechanism (drive cable plate) approx. 2 cm towards rear.
Upper detent element can be fed out and in more easily.

Fig. 15: Removing Upper Connecting Link

Courtesy of BMW OF NORTH AMERICA, INC.

Remove upper connecting link (1) in direction of arrow from lower connecting link.

Fig. 16: Sliding Drip Molding Carrier With Lower Connecting Link
Courtesy of BMW OF NORTH AMERICA, INC.

Removing drip molding carrier and lower connecting link:

Slide drip molding carrier (2) with lower connecting link (1) towards rear and remove from guide rail.

Fig. 17: Pushing Slide Element

Courtesy of BMW OF NORTH AMERICA, INC.

If necessary, push slide element (1) towards rear and remove from guide rail.

Fig. 18: Inserting Screwdriver Into Upper Connecting Link
 Courtesy of BMW OF NORTH AMERICA, INC.

Adjusting mechanism before installing glass lid:

Insert screwdriver into upper connecting link (3).

Slide drive plate (2) towards rear until drive wedge (1) runs against screwdriver.

NOTE: Check that mechanical components on left and right sides have same status.

NOTE: Check smooth and noise-free running of kinematics.
 Check function.

54 10 030 REMOVING AND INSTALLING MECHANISM FOR REAR GLASS LID

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove glass slide/tilt sunroof lid at rear **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**
- Remove rear drip molding, see **54 13 105 Removing and installing/replacing rear drip molding.**
- Remove drive units with gearing, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR**

ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .

Overview of glass lid mechanism:

- | | | | |
|---|----------------------------------|----|--|
| 1 | Floating roofiner mechanism | 7 | Spring retainer |
| 2 | Mechanism, front glass lid | 8 | Drive cable, rear glass lid (connecting link) |
| 3 | Drive wedge | 9 | Drive cable plate |
| 4 | Drive plate | 10 | Drive cable, front glass lid (connecting link) |
| 5 | Mechanism, rear glass lid | 11 | Control carriage, wind deflector |
| 6 | Control carriage, rear glass lid | 12 | Slide element |

Fig. 19: Identifying Glass Lid Mechanism Components

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: Always replace mechanism for glass slide/tilt sunroof in pairs.
If necessary, lightly grease guide channel.

NOTE: Drip molding carrier cannot be removed without incurring damage.
Break out tabs with a screwdriver and lever out carrier.

Installation:

Replace drip molding carrier and hook into place.

Fig. 20: [Tabs]
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 21: Sliding Front Connecting Link
Courtesy of BMW OF NORTH AMERICA, INC.

Slide front connecting link (1) towards rear past drive cable plate (2).

If front glass lid is installed, move mechanism with lid.

Fig. 22: Sliding Rear Connecting Line With Drive Cable Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Lever out retaining bracket (1) from drive cable plate (2).

Fig. 23: Sliding Rear Connecting Line With Drive Cable Plate
Courtesy of BMW OF NORTH AMERICA, INC.

Slide rear connecting line (2) with drive cable plate (1) towards rear until spring retainer (3) is exposed.

NOTE: Spring retainer (3) cannot be removed without incurring damage.

Lever out spring retainer (3) with screwdriver.

Installation:

Replace faulty spring retainer.

Continue sliding rear connecting link (2) with drive cable plate (1) towards rear out of guide channel and remove in succession.

Fig. 24: Drive Cable Plate And Locking Lever
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Slide drive cable plate (1) up against drive cable.

Install locking lever (2) and lock retaining bracket.

Fig. 25: Spring Retainer

Courtesy of BMW OF NORTH AMERICA, INC.

Removing control carriage for wind deflector:

NOTE: Spring retainer (2) cannot be removed without incurring damage.

Lever out spring retainer (2) with screwdriver.

Installation:

Replace faulty spring retainer.

Pull control carriage (1) for wind deflector towards rear out of rail and remove.

NOTE: Check smooth and noise-free running of kinematics.
Check function.

54 10 050 REMOVING AND INSTALLING/REPLACING MECHANISM FOR FLOATING ROOFLINER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove slider set for floating roofliner, see **54 10 070 Removing and installing/replacing slider set for floating roofliner.**
- Remove rear cross-member, see **54 13 150 Removing and installing rear cross - member.**

Unclip end stops (1) on left and right from guide channel.

Fig. 26: Unclipping End Stops

Courtesy of BMW OF NORTH AMERICA, INC.

Unclip floating roofliner cover plate (1) from slider for front sun shield.

Remove floating roofliner cover plate (1) upwards from locking lever (2).

Fig. 27: Floating Roofliner Cover Plate

Courtesy of BMW OF NORTH AMERICA, INC.

Pull mechanism for floating roofliner towards rear out of guide channel:

1. Sliders for floating roofliner
2. Locking lever for floating roofliner

3. Rear drive cable plate with drive cable

Fig. 28: Locking Lever For Floating Roofliner
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Ensure correct installation sequence:

1. Sliders for floating roofliner
2. Locking lever for floating roofliner
3. Rear drive cable plate with drive cable

Fig. 29: Sliders For Floating Roofliner
Courtesy of BMW OF NORTH AMERICA, INC.

Slide in locking lever for floating roofliner (3) and slide up to recess in guide frame.

Open locking lever (1) with screwdriver.

Slide rear drive cable plate (2) into locking lever.

NOTE: Correct insertion can be checked by pulling back the drive cable plate (2): Drive cable plate (2) and locking lever for floating roofliner (3) must execute a joint movement. In addition, the correct spacing of locking lever (3) and drive cable plate (2) is determined by the floating roofliner cover plate.

Fig. 30: Sliding In Locking Lever For Floating Roofliner
Courtesy of BMW OF NORTH AMERICA, INC.

54 10 070 REMOVING AND INSTALLING/REPLACING SLIDER SET FOR FLOATING ROOFLINER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove rear floating roofliner, see **54 13 070 Removing and installing/replacing both floating roofliners for glass slide/tilt sunroof.**
- Remove fan grille, see **54 13 070 Removing and installing/replacing both floating roofliners for glass slide/tilt sunroof.**
- Remove drive unit with gearing, see **67 61 517 REPLACING DRIVE WITH GEAR (REAR) FOR ACTUATING SLIDE/TILT SUNROOF .**

Unclip end stops (1) on left and right from guide channel.

Installation:

Engage end stops at front and clip into place by applying pressure.

Fig. 31: Unclipping End Stops

Courtesy of BMW OF NORTH AMERICA, INC.

Carefully unclip slide block (1) on left and right (risk of damage).

Pull driver for rear floating roofliner (2) and slider set (3) towards rear out of guide.

Fig. 32: Pulling Driver For Rear Floating Roofliner

Courtesy of BMW OF NORTH AMERICA, INC.

Disengage rocker arm (1) from driver for rear floating roofliner (2).

Fig. 33: Disengaging Rocker Arm From Driver For Rear Floating Roofliner
Courtesy of BMW OF NORTH AMERICA, INC.

Remove rocker arm (1) from rail and replace if necessary.

Fig. 34: Removing Rocker Arm From Rail
Courtesy of BMW OF NORTH AMERICA, INC.

54 10 160 REPLACING LEFT OR RIGHT GAITER FOR GLASS SLIDE/TILT SUNROOF

Necessary preliminary tasks:

- Close glass slide/tilt sunroof

Detach gaiter (1) from guide.

Installation:

Gaiter cannot be removed without incurring damage.

Replace gaiter.

Check that aluminium section inlay is firmly seated on guide.

Fig. 35: Detaching Gaiter From Guide
Courtesy of BMW OF NORTH AMERICA, INC.

54 10 170 REMOVING AND INSTALLING FRONT GLASS SLIDE/TILT SUNROOF COVER

Necessary preliminary tasks:

- Remove gaiter, see **54 10 160 Replacing left or right gaiter for glass slide/tilt sunroof.**

NOTE: **The following steps can be carried out inside the vehicle with the glass roof panel fully closed.**
 Open floating roofliner fully.
 Make sure that grease at the ends of the rail do not come into contact with the roofliner.
 Not necessary for replacement:
 Before removing the Torx screws, make a mark around the washers in order to ensure correct alignment during installation.

Remove and dispose of the Torx screws (1) securing the glass panel to the mechanism.

Installation:

Insert new Torx screws with Loctite and align washers to markings.

Tightening torque: 54 12 2AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

Fig. 36: Torx Screws

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: A second person is required to help in removing and installing the glass slide/tilt sunroof lid!

Lift out glass slide/tilt sunroof cover (1).

Installation:

Tape off installation area on left and right at roof aperture with fabric adhesive tape.

Install glass slide/tilt sunroof cover carefully (twist in) as seal can be damaged during installation.

Check glass slide/tilt sunroof cover for correct alignment and adjust if necessary, see **54 13 003 Adjusting glass slide/tilt sunroof lid.**

Fig. 37: Lifting Out Glass Slide/Tilt Sunroof Cover

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: The following steps can be carried out inside the vehicle with the glass roof panel fully closed.
Open floating roofliner fully.
Make sure that grease at the ends of the rail do not come into contact with the roofliner.
Not necessary for replacement:
Before removing the Torx screws, make a mark around the washers in order to ensure correct alignment during installation.

Remove and dispose of the Torx screws (1) securing the glass panel to the mechanism.

Installation:

Insert new Torx screws with Loctite and align washers to markings.

Tightening torque: 54 12 2AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

Fig. 38: Torx Screws

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: A second person is required to help in removing and installing the glass slide/tilt sunroof lid!

Lift out glass slide/tilt sunroof cover (1).

Installation:

Tape off complete edge area at roof aperture with fabric adhesive tape (risk of damage).

Install glass slide/tilt sunroof cover carefully (twist in) as seal can be damaged during installation.

Check glass slide/tilt sunroof cover for correct alignment and adjust if necessary, see **54 13 003 Adjusting glass slide/tilt sunroof lid.**

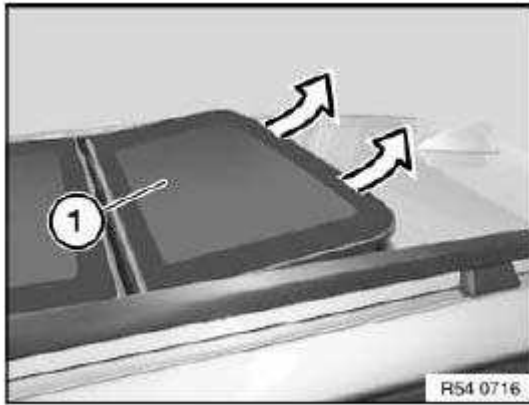

Fig. 39: Lifting Out Glass Slide/Tilt Sunroof Cover
Courtesy of BMW OF NORTH AMERICA, INC.

54 13 130 REMOVING AND INSTALLING FRONT CROSS - MEMBER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove control unit for glass slide/tilt sunroof, see **61 35 714 REMOVING AND INSTALLING/REPLACING CONTROL UNIT FOR SLIDE/TILT SUNROOF .**
- Remove drive, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .**

Release screws in marked area.

Feed cross-member (2) out of wiring harness (1) during removal.

If necessary, release fabric adhesive tape and replace.

Installation:

Pitch cables must be correctly located in guide

Fig. 40: Cross-Member And Wiring Harness
 Courtesy of BMW OF NORTH AMERICA, INC.

54 13 150 REMOVING AND INSTALLING REAR CROSS - MEMBER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove control unit for glass slide/tilt sunroof, see **61 35 714 REMOVING AND INSTALLING/REPLACING CONTROL UNIT FOR SLIDE/TILT SUNROOF .**
- Remove drive, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .**

Release screws in marked area.

Feed cross-member (2) out of wiring harness (1) during removal.

Installation:

Pitch cables must be correctly laid diagonally in guide.

Fig. 41: Cross-Member And Wiring Harness

13 ELECTRICAL SUN ROOF COMPONENTS

54 0 ... NOTES ON PANORAMA GLASS ROOF (INITIALIZATION/NORMALIZATION/LEARNING OF CHARACTERISTIC CURVE)

NOTE: Initialization comprises:

- Normalization
- Learning characteristic curve

The mechanical end positions are recorded and stored during normalization. The characteristic curve is learnt immediately after normalization. When the characteristic curve is learnt, the mechanical closing forces of the panorama glass roof are recorded and stored for correct operation of the anti-trapping mechanism.

NOTE: Then carry out an initialization :

- if the panorama glass roof has been mechanically moved by means of the emergency actuator
- in the event of malfunctions, e.g. no one-touch function, no opening or no comfort function possible
- after disengagement of the drive unit
- after work is carried out on the mechanism of the panorama glass roof
- after the control unit has been replaced

WARNING: There is no anti-trapping protection during initialization.

NOTE: Starting situation in accordance with following description:

- Panorama glass sunroof closed
- Floating roofliner completely open

Normalization:

- Press and hold the switch in the "Lift" direction
- In the event of delayed starting or sudden stopping of the panorama glass roof, continue pressing the switch in the "Lift" direction

Fig. 42: Pressing Switch
 Courtesy of BMW OF NORTH AMERICA, INC.

- After reaching the lift end position (A), keep the switch pressed for approx. 15 seconds further
- Normalization is completed when the panorama glass roof in lift end position (A) presses again briefly in the direction of position (B).

Fig. 43: Panorama Glass Roof In Lift End Position
 Courtesy of BMW OF NORTH AMERICA, INC.

Learning characteristic curve:

E53/E61/E83 only:

The curve is learnt manually in the following steps:

- After normalization, keep switch pressed in "Lift" direction.
- The panorama glass roof stops for 5 seconds in the final raise position after normalization.
- Floating roofliner closes completely.
- Floating roofliner opens completely.
- The panorama glass roof then moves into the "Closed" position (learning of the "Closing from raising" curve)
- The panorama glass roof then moves into the "Open" end position and immediately back into the

"Closed" position (learning of the "Closing" curve).

- Floating roofliner closes completely.
- Release switch.

Fig. 44: Pressing Switch

Courtesy of BMW OF NORTH AMERICA, INC.

E63 only:

The curve is learnt manually in the following steps:

- After normalization, keep switch pressed in "Lift" direction.
- The panorama glass roof stops for 5 seconds in the final raise position after normalization.
- Floating roofliner closes completely.
- Floating roofliner opens completely.
- The panorama glass roof then moves into the "Closed" position (learning of the "Closing from raising" curve)
- Floating roofliner closes completely.
- Release switch.

Fig. 45: Pressing Switch

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE:

- The entire operation lasts approx. 75 seconds
- Learning of the curve is terminated when the switch is released
- If the switch is released in the meantime, the entire procedure must be repeated
- On completion of successful initialization, the corresponding messages in the check control and the control display go out
- Carry out function check (tip function, anti-trapping protection and, if necessary, comfort function)

54 13 003 ADJUSTING GLASS SLIDE/TILT SUNROOF LID

Special tools required:

See **MAINTENANCE AND GENERAL INFORMATION - SPECIAL TOOLS** .

- 00 9 315
- 00 9 340

Necessary preliminary tasks:

- Remove gaiter, see **54 10 160 Replacing left or right gaiter for glass slide/tilt sunroof.**
- Close glass slide/tilt sunroof completely

If the glass slide/tilt sunroof is outside the adjustment tolerances, adjust as follows:

Adjusting glass slide/tilt sunroof unit:

Carry out the following step on one side first and then the other (first left, then right or vice versa):

- Insert Torx screws (1) on left/right so that glass roof panel can still just be adjusted
- Move glass slide/tilt sunroof lid as required
- Make sure all screws are tightened down.
- Tightening torque: 54 12 2AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .
- Repeat procedure on other side.

Fig. 46: Torx Screws
Courtesy of BMW OF NORTH AMERICA, INC.

Distance setting:

Distance A between body and glass lid (without seal):

$$A = 5.8 \pm 0.3 \text{ mm all round}$$

Check same gap of glass lid and body with special tool 00 9 340.

Slide special tool 00 9 340 or similar between seal and insert. It must be possible to slide the card against the same level of resistance.

Slide glass lid towards front or rear until ideal position is reached.

Fig. 47: Special Tool (00 9 341)
Courtesy of BMW OF NORTH AMERICA, INC.

Height adjustment:

NOTE: Front glass lid must be adjusted first.

Check height of glass lid (1) in relation to body (2) with special tool 00 9 315.

Press glass lid (1) at front and rear towards top or bottom until ideal position is reached.

Height:

- Front edge of glass lid at front 0 to 1 mm under roof edge
- Rear edge of glass lid at front 0 to 0.5 mm over glass lid at rear
- Rear edge of glass lid at rear 0 to 1 mm over roof edge

Check function and adjustment.

Fig. 48: Special Tool (00 9 315)

Courtesy of BMW OF NORTH AMERICA, INC.

54 13 050 REPLACING SEAL FOR SLIDE/TILT SUNROOF LID AT REAR

Necessary preliminary tasks:

- Open glass slide/tilt sunroof

NOTE: Follow repair instructions for bonded seals on glass slide/tilt sunroof.

Detach seal (1) from slide/tilt sunroof lid.

Installation:

Clean bonding surface with adhesive remover (sourcing reference: BMW Parts Service).

Press seal without stretching (squashing).

IMPORTANT: Do not touch bonding surface.

Surface temperature greater than 20°C

Incorrect bonding of the seal will result in leakage.

Fig. 49: Detaching Seal From Slide/Tilt Sunroof Lid
Courtesy of BMW OF NORTH AMERICA, INC.

54 13 055 REPLACING SEAL FOR SLIDE/TILT SUNROOF FRAME

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof lid at rear, see **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**
- Lower (open) glass slide/tilt sunroof lid at front

NOTE: Follow repair instructions for bonded seals on glass slide/tilt sunroof, see **54 0 ... Notes on panorama glass roof (initialization/normalization/learning of characteristic curve).**

Pull off seal of sunroof cut-out at contact edge starting from body. (Peel off)

Installation:

Clean bonding surface with adhesive remover (sourcing reference: BMW Parts Service).

Press seal without stretching (squashing).

Stick on seal in sections.

Establish seal joint.

IMPORTANT: Do not touch bonding surface.
Surface temperature greater than 20°C
Incorrect bonding of the seal will result in leakage.

Fig. 50: Pulling Off Seal Of Sunroof Cut-Out
Courtesy of BMW OF NORTH AMERICA, INC.

54 13 060 REMOVING AND INSTALLING/REPLACING FRONT FLOATING ROOFLINER FOR GLASS SLIDE/TILT SUNROOF

This operation is described in section on:

- Removing both floating roofliners for glass slide/tilt sunroof, see **54 13 070 Removing and installing/replacing both floating roofliners for glass slide/tilt sunroof.**

54 13 065 REMOVING AND INSTALLING/REPLACING REAR FLOATING ROOFLINER FOR GLASS SLIDE/TILT SUNROOF

This operation is described in section on:

- Removing both floating roofliners for glass slide/tilt sunroof, see **54 13 070 Removing and installing/replacing both floating roofliners for glass slide/tilt sunroof.**

54 13 070 REMOVING AND INSTALLING/REPLACING BOTH FLOATING ROOFLINERS FOR GLASS SLIDE/TILT SUNROOF

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof lid at rear, see **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**

NOTE: Front and rear floating roofliners can be removed separately from each other. Make sure that grease on the rails does not come into contact with the floating roofliner.

Release screw (1).

Release clips (2) with rotary block.

Remove fan plate (3).

Installation:

Do not tighten down screw (1), fan plate (3) should be able to move in Y-direction.

Fig. 51: Screw And Clips

Courtesy of BMW OF NORTH AMERICA, INC.

Front floating roofliner:

Open floating headliner approx. halfway.

Front rain channel must be situated between first and second screws.

Release screws (1).

Tightening torque: 54 12 10AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

Remove star shims.

Fig. 52: Screws

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace microencapsulated screws and insert with Loctite.

Make sure star shims are correctly positioned.

Pull out floating roofliner (2) in direction of arrow.

If necessary, press wind deflector downwards.

Installation:

Carefully raise floating roofliner mechanism.

Rear floating roofliner:

Close roofliner completely but not in fan position.

Release screws (1).

Remove tensioning springs (left side only) and washers.

Fig. 53: Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Slide floating roofliner (4) in direction of arrow (1) between outer body skin and roofliner.

Slide floating roofliner (4) up to end of control rail (3).

Raise floating roofliner (4) and remove over control rail (3) in direction of arrow (2).

Fig. 54: Sliding Floating Roofliner
 Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 55: Tension Spring And Floating Roofliner
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Tensioning springs (1) must rest correctly in recess of floating roofliner (2).

Adjust gap A = 3 ± 0.2 mm from control rail (3) to floating roofliner (2).

Make sure washer (4) is correctly positioned with turning lock.

Replace microencapsulated screws (5) and insert with Loctite.

Tightening torque: 54 12 11AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

Performing function check:

- Floating roofliner must be able to move in control rail in X-direction.
- Floating roofliner is positioned on right and can be pressed towards left under spring tension.
- Floating roofliner springs back towards right into initial position.

54 13 080 REMOVING AND INSTALLING COMPLETE GLASS SLIDE/TILT SUNROOF

Special tools required:

- **54 1 110 CENTERING PINS**

Necessary preliminary tasks:

- Remove roofliner, see **51 44 013 REMOVING AND INSTALLING ROOFLINER (ON VERSION WITH PANORAMA SUNROOF)** .
- Open rear lid

E53 only:

- Partially remove rear-compartment head airbag.

IMPORTANT: Two persons are required to help in removing the glass slide/tilt sunroof.

E61/E83 only:

Remove holder for handles on left and right:

- Release screws.
- Remove holder.

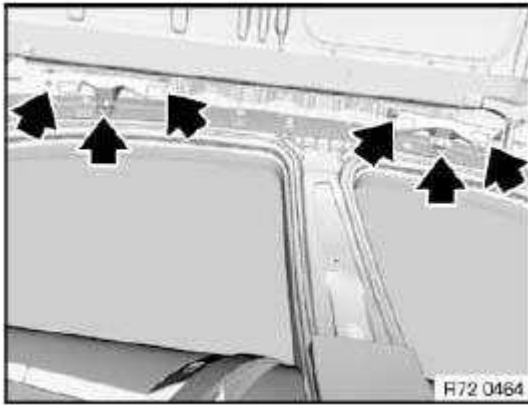

Fig. 56: Locating Screws And Holder
Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 57: Water Drain Hoses And Plug
Courtesy of BMW OF NORTH AMERICA, INC.

- Unlock and disconnect plug (1)
- Detach water drain hoses (2)

NOTE: Check hoses for damage and moisten with water before fitting

- Release screws in marked area (when installing: fit washers on front side)

Tightening torque: 54 12 6AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

- Helper must hold glass sunroof to prevent it falling out.
- Release screws (3) on and carefully lower slide/tilt sunroof (4).

IMPORTANT: Do not damage any surrounding parts when removing slide/tilt sunroof (4).

- Remove slide/tilt sunroof (4) completely (through rear lid at rear).

Installation:

If necessary, remove fabric adhesive tape.

To stop grating noises, secure all screws (1) prior to installation with plastic washers (2).

If the standard screws can no longer grip, use "repair screws" (have larger threads).

Fig. 58: Plastic Washers

Courtesy of BMW OF NORTH AMERICA, INC.

Fig. 59: Special Tool (54 1 110)
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

To align panorama sunroof to body-cutout, insert screws and tighten loosely.

Panorama sunroof must still be able to move in the body-cutout.

On account of leaks, panorama sunroof must be exactly aligned to body-cutout.

Insert special tool 54 1 110 into centering bores up to stop in panorama sunroof and body.

Tighten down screws.

Tightening torque: 54 12 6AZ, see **54 12 MECHANICAL SUN ROOF COMPONENTS** .

E53 only:

Side centering bore omitted on body side.

Align panorama sunroof over front centering bore in longitudinal direction and align at sides over glass cover distance to body. (See next work step).

IMPORTANT: Do not crush any cables when fitting the glass slide/tilt sunroof.
Initialize glass slide/tilt sunroof, see 54 0 ... Notes on panorama glass roof (initialization/normalization/learning of characteristic curve)

54 13 090 REMOVING AND INSTALLING/REPLACING WIND DEFLECTOR

Necessary preliminary tasks:

- Open slide/tilt sunroof

NOTE: Shown removed here for purposes of clarity.

Pull plastic strip (1) on net of wind deflector out of retainers (2).

IMPORTANT: Do not pull on the net so as to avoid tearing the net.

Installation:

If necessary, reinstall retainers in frame.

Fig. 60: Pulling Plastic Strip

Courtesy of BMW OF NORTH AMERICA, INC.

IMPORTANT: Tape off paintwork in working area.
Avoid bending wind deflector (1).

NOTE: Pictures show removal on the left side, proceed in the same way for the right side.
Slide control carriage (4) for wind deflector with plastic wedge towards front.

Carefully lift wind deflector (1) in direction of arrow with guide (2) out of rail (3).

Fig. 61: Sliding Control Carriage And Wind Deflector
 Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Make sure clamping elements are correctly seated.

Tilt wind deflector (1) into vertical position and remove.

Installation:

Make sure wind deflector (1) is correctly seated in pivot point (2).

Fig. 62: Wind Deflector And Pivot Point
 Courtesy of BMW OF NORTH AMERICA, INC.

54 13 095 REPLACING/CLEANING NET FOR WIND DEFLECTOR

Necessary preliminary tasks:

- Open slide/tilt sunroof

Cleaning:

The wind deflector net can be cleaned while installed as follows:

- Accelerate vehicle with glass slide/tilt sunroof open to over 5 km/h
- Stop vehicle and turn ignition key to position 2.

NOTE: This prevents the wind deflector from retracting, and thereby leaving it fully open.

Net is now accessible and easy to clean.

Replacement:

Pull plastic strip (1) out of retainers (2) on panorama glass sunroof and wind deflector.

Installation:

If necessary, reinstall retainers.

Clip new net into place.

Fig. 63: Pulling Plastic Strip

Courtesy of BMW OF NORTH AMERICA, INC.

54 13 100 REMOVING AND INSTALLING/REPLACING DRIP MOLDING

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove glass slide/tilt sunroof lid at rear **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**
- Remove glass slide/tilt sunroof lid at front, see **54 10 170 Removing and installing front glass slide/tilt sunroof cover.**

IMPORTANT: Risk of damage to drip molding carrier.

Carefully unclip drip molding (1) upwards out of carrier (2).

Fig. 64: Unclipping Drip Molding
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Attach spring (3) to drip molding pivot point.

Make sure spring is correctly positioned in drip molding.

Fig. 65: Locating Spring
Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Observe installation sequence:

1. Suspend spring in drip molding carrier
2. Press drip molding onto glass slide/tilt sunroof

3. Clip pivot point (bearing) of drip molding into carrier

Check drip molding for spring tension.

Fig. 66: Pressing Drip Molding Onto Glass Slide/Tilt Sunroof
Courtesy of BMW OF NORTH AMERICA, INC.

54 13 105 REMOVING AND INSTALLING/REPLACING REAR DRIP MOLDING

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove glass slide/tilt sunroof lid at rear **54 10 175 Removing and installing rear glass slide/tilt sunroof cover.**

Unlock tab (2) and remove drip molding (1) towards top.

NOTE: 2 springs are loosely connected to guide for drip molding.

Installation:

Make sure springs are reinstalled on drip molding carriers.

Fig. 67: Drip Molding

Courtesy of BMW OF NORTH AMERICA, INC.

Removing drip molding carrier:

NOTE: Drip molding carrier cannot be removed without incurring damage.

Break out tabs with a screwdriver and lever out carrier.

Installation:

Replace drip molding carrier and hook into place.

Fig. 68: [Tabs]

Courtesy of BMW OF NORTH AMERICA, INC.

54 13 130 REMOVING AND INSTALLING FRONT CROSS - MEMBER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove control unit for glass slide/tilt sunroof, see **61 35 714 REMOVING AND**

INSTALLING/REPLACING CONTROL UNIT FOR SLIDE/TILT SUNROOF .

- Remove drive, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .**

Release screws in marked area.

Feed cross-member (2) out of wiring harness (1) during removal.

If necessary, release fabric adhesive tape and replace.

Installation:

Pitch cables must be correctly located in guide

Fig. 69: Cross-Member And Wiring Harness

Courtesy of BMW OF NORTH AMERICA, INC.

54 13 150 REMOVING AND INSTALLING REAR CROSS - MEMBER

Necessary preliminary tasks:

- Remove glass slide/tilt sunroof **54 13 080 Removing and installing complete glass slide/tilt sunroof.**
- Remove control unit, see **61 35 714 REMOVING AND INSTALLING/REPLACING CONTROL UNIT FOR SLIDE/TILT SUNROOF .**
- Remove drive, see **67 61 515 REPLACING DRIVE WITH GEAR (FRONT) FOR ACTUATING SLIDE/TILT SUNROOF (PANORAMA GLASS SUNROOF) .**

Release screws in marked area.

Feed cross-member (2) out of wiring harness (1) during removal.

Installation:

Pitch cables must be correctly laid diagonally in guide.

Fig. 70: Cross-Member And Wiring Harness
Courtesy of BMW OF NORTH AMERICA, INC.

ACCESSORIES & EQUIPMENT

Sunroof and Convertible Top - Operating Fluids

1.0 CONVERTIBLE TOP MATERIAL

Cleaning Kit consists of three fluids for periodic maintenance of the top's outer surface:

- Car Shampoo

For cleaning the entire convertible top. Add 2 to 3 capfuls of shampoo to 2.5 gallons of water. Rinse with clean water.

- Glass Cleaner

Cleans the plastic rear window as well as the vehicle's glass windows. Spray on, wipe off with dry cloth.

- Impregnating Spray

After cleaning the top, apply this spray over a large area about 12 inches from the surface to seal the top against possible leaks.

Convertible Top Cleaning Kit

BRAKES

Brakes - Operating Fluids

1.0 GENERAL INFORMATION

Brake fluid, (glycol-based) as used in BMW brake systems, must conform with the following requirements:

- High boiling point
- Good low temperature resistance
- Low compressibility
- Corrosion inhibition for all metal parts inside of brake system
- Compatibility with all rubber parts used in brake system

These requirements are fulfilled by reputable brand name DOT 4 brake fluids.

Silicone-based brake fluid has better compressibility, but because it cannot absorb moisture, is subject to vapor lock at temperatures above 212°F/ 100°C. At lower temperatures, it may even ice-up. **Silicone-based brake fluid is not approved by BMW.**

Glycol-based brake fluid absorbs moisture from the atmosphere (hygroscopicity) through the brake fluid reservoir, brake hoses, etc. This absorption of water lowers the original boiling point of brake fluid and active safety of the entire system. If there is extended use of the brakes while driving downhill at high speeds, the thermal loads could cause vapor bubbles in the brake fluid. This situation could lead to reduced braking effectiveness.

The original boiling point of factory-approved brake fluids is approximately 500°F/260°C. Due to the hygroscopic behavior of brake fluid, 2% of water within one year is permissible. The boiling point of brake fluid will drop by 100°C with 3% water absorption. It is essential to conform with brake fluid changing intervals in order to guarantee the safety and maximum effectiveness of a brake system.

It would not be sufficient simply to replace the brake fluid in the reservoir. Experience has shown that vapor bubbles will occur first on areas of the brake caliper. This area is subjected to high thermal loads and also exposed to heat transmission.

When replacing the brake fluid, the brake fluid used as the working fluid in the hydraulic clutch should also be replaced. This is done by draining the clutch operation system or bleeding with the help of the clutch slave cylinder.

The brake fluid should be replaced by filling the brake fluid reservoir. Make sure that each bleeder valve of all wheel cylinders or brake calipers is kept open until the escaping brake fluid is clear and without air bubbles. Never use brake fluid that has been drained from the system.

Storage of brake fluids also deserves your special attention. The aging process begins with the initial contact between the brake fluid and the atmosphere. This means immediately after a new container is opened.

To keep the boiling point of stored brake fluids as high as possible, we recommend conforming with the following points:

- Close all containers tightly.
- Select small size containers, which can be used up quickly.
- Avoid pouring contents of one container into a different container.

2.0 HANDLING BRAKE FLUIDS

Brake fluids could be mixed up accidentally with mineral oil products so it is important to leave them in their original containers and not pour them into a different container.

CAUTION: If brake fluid accidentally comes into contact with your skin, wash it off with soap and water immediately. Eyes should be thoroughly flushed with cold water if contacted by brake fluid. Vomiting should be induced if brake fluid is internally consumed and a physician should be consulted.

If brake fluid is spilled or drips on a painted surface, wash it off with water immediately to prevent damage to the paint finish. Never rub it off. Brake fluids should not have contact with grease or oil. Wash hands to remove grease and oil before working with brake fluids. Also make sure that grease cannot enter the brake system.

Drained brake fluid must never be discarded in the garbage, oil disposal tanks or water drains.

Read instructions on container label prior to use.

3.0 BMW TESTED AND APPROVED BRAKE FLUIDS

BMW Tested and Approved DOT 4 ESL Brake Fluid is available as follows:

BMW PARTS SPECIFICATION

12 fl. oz. bottle	BMW Part No. 81 22 0 142 156
1 gallon container	BMW Part No. 81 22 0 142 155

4.0 BRAKE FLUID CHANGE INTERVALS

All Models Brake fluid change interval every 2 years.

5.0 OTHER OPERATING FLUIDS

ANTI-SQUEAK/CORROSION PASTE

Bostik NEVER-SEEZ® to prevent disc brake squeaking. It is applied on cleaned recesses, pressure surfaces of piston crowns, brake pad backplates and possibly transfer plates-but not on friction liners.

To prevent corrosion between the ABS impulse sensor and the hole in the wheel suspension component, apply a

thin coat of Bostik NEVER-SEEZ® to cleaned sensor and hole before assembly.

BMW PARTS SPECIFICATION

Bostik NEVER-SEEZ®

DYNAMIC STABILITY CONTROL 8PLUS

E60, E61, E63, E64, E83, E90, E91, E92

T3403001

Fig. 1: Dynamic Stability Control 8Plus
Courtesy of BMW OF NORTH AMERICA, INC.

**NOTE: Vehicles with DSC 8Plus:
This SBT describes DSC 8Plus, which is installed on the following model series:**

- > E60, E61, E63, E64 (rear and all-wheel drive)
- > E83
- > E90, E91, E92 (all-wheel drive only)

INTRODUCTION

The **xDrive** all-wheel drive system was introduced on the BMW 5-Series in 03/2005. From this time on, these vehicles are equipped as standard with Dynamic Stability Control (DSC) 8Plus.

DSC 8Plus is an advanced development of DSC 8.

The DSC unit (comprising DSC control unit and hydraulic unit) is even more powerful.

The newly developed switchover valves allow a more precise regulation, especially at low brake pressure. DSC 8Plus is supplied by Bosch.

- > E60, E61 from 03/2005 up to 09/2005 (all-wheel drive)
- > E60, E61, E63, E64 from 09/2005 (rear and all-wheel drive)
- > E83 from 09/2006
- > E90, E91 from 09/2005 and E92 from 06/2006 (all-wheel drive)
- > Hydraulic circuit diagram with electrically actuated valves

The principal new features of DSC 8Plus are:

- Additional functions:
 - Brake Standby through precautionary pre-tensioning of the brakes in an emergency
 - Brake disc drying on wet roads
 - Detection of fading and increase in brake pressure during fading
 - Start-off assistant
 - Soft stop when braking to standstill

**NOTE: New soft stop function not available on BMW 3-Series all-wheel drive or E83.
For technical reasons, the soft stop function has not been incorporated on
BMW 3-Series all-wheel drive or on E83 vehicles.**

- 2 additional brake pressure sensors, only in combination with Active Cruise Control (ACC)

New from 09/2005:

- > E60, E61, E63, E64

Introduction of DSC 8Plus on the BMW 5-Series and 6-Series **with rear-wheel drive.**

From this point time on, the body gateway module (KGM) is the gateway to the PT-CAN.

- > E90, E91

Introduction of DSC 8Plus on the BMW 3-Series **with all-wheel drive.**

In these vehicles, the junction box electronics (JBE) is the gateway to the PT-CAN.

- > E92

Introduction of DSC 8Plus on BMW 3-Series Coup **with all-wheel drive.**

New from 09/2006:

- > E83

Introduction of DSC 8Plus on E83.

DSC is a control system that maintains dynamic stability within physical limits when the car is being driven close to the limits of performance and handling.

It also improves traction.

DSC needs the following input signals in order to discharge its control functions:

- Rate of yaw (measure of movement of the car about its vertical axis)
- Lateral acceleration
- Wheel speeds (measure of the car's roadspeed)
- Steering angle
- Brake pressure

The measured values available are used to calculate how the car is moving at any given instant. The actual condition is compared with nominal values (values in stable driving conditions) that are calculated in the DSC control unit. If the actual condition differs from the nominal values, DSC is activated and initiates brake actions and/or engine control functions.

The advantages:

The intervention of DSC in the engine control and brakes provides outstanding driving stability and traction in all driving situations.

DSC combats negative, dynamic driving forces. This means DSC brings about maximum active safety within

the physical limits. DSC thus enhances driving comfort by allowing more relaxed driving.

BRIEF DESCRIPTION OF COMPONENTS

The following components are described for the Dynamic Stability Control (DSC):

○ **DSC unit**

The DSC unit consists of the components DSC control unit and hydraulic unit.

The DSC control unit regulates the pressure in the brake system via the hydraulic unit (comprises valve block and pump motor).

○ **Brake light switch**

The brake light switch tells the DSC when the brake pedal has been pressed.

○ **4 wheel-speed sensors**

The active wheel-speed sensors register the speed of an individual wheel at their circumference. Moreover, the wheel-speed sensors also recognize the direction of rotation (forwards or backwards).

When a wheel is stationary, the wheel-speed sensor emits a pulse every 0.75 seconds.

○ **DSC sensor**

The DSC sensor measures:

- Vehicle rotation around the vertical axis (yaw rate)
- Lateral acceleration of vehicle
- Longitudinal acceleration of vehicle
- > E60, E61, E63, E64

The DSC sensor is linked to the DSC control unit by the F-CAN (chassis CAN).

The DSC sensor is secured to the floor assembly under the front-passenger seat.

- > E83

The DSC sensor is connected to the DSC control unit via the PT-CAN (powertrain CAN).

The DSC sensor is secured to the retainer plate for the parking brake lever.

- > E90, E91, E92

The DSC sensor is linked to the DSC control unit by the F-CAN (chassis CAN).

The DSC sensor is located on the seat cross member under the driver's seat.

○ **Steering-angle sensor**

The steering-angle sensor registers the movements of the steering wheel.

- > E60, E61, E63, E64

The steering-angle sensor is part of the steering column switch cluster (SZL).

The steering column switch cluster is connected to the F-CAN (chassis CAN) and to the PT-CAN (powertrain CAN).

- > E90, E91, E92

The steering-angle sensor is part of the steering column switch cluster (SZL).

The steering column switch cluster is connected to the F-CAN (chassis CAN).

- > E83

The steering-angle sensor is fitted to the steering spindle. The steering angle sensor is connected to the PT-CAN (powertrain CAN).

○ **Internal brake pressure sensor**

The DSC unit incorporates a brake-pressure sensor. This brake pressure sensor registers the braking pressure applied by the brake pedal and the brake booster.

○ **2 brake pad wear sensors**

The brake pad wear sensors (front left and rear right in the inner brake pads) provide additional information about the thickness of the brake pads. This additional information (2 reference points) is compared to the value calculated by the DSC.

A critical brake lining thickness will be indicated in the instrument cluster by the "Next Service" indicator (Condition Based Service, CBS) and by the general brake warning lamp lighting up red.

○ **DTC button**

The DTC button has the letters "DTC". The DTC button can be used to select 3 switch states:

- DTC button not pressed after terminal change: DSC in operation (default)
- DTC button briefly pressed: DTC in operation (DTC indicator light lights up in instrument cluster)
- DTC button pressed and held: DSC and ASC deactivated, ABS and ABD-X on all wheel drive vehicles remain active (indicator lamp in instrument cluster lights up permanently)

- > E60, E61, E63, E64

The DTC button is in the center console switch cluster (SZM) The signal is transmitted on the K-CAN **and** via a separate wire. The signal on the separate wire is decisive.

- > E83

The DTC button is in the center console switch cluster (SZM) The signal is transmitted via a separate wire.

- > E90, E91, E92

The DTC button is connected to the junction box electronics (JBE). The JBE transmits a bus signal.

- **Brake-fluid-level switch**

Insufficient brake fluid is detected and a signal sent to the DSC control unit.

If there is insufficient brake fluid, this will be indicated in the instrument cluster by the general brake warning lamp lighting up red.

The DSC control unit also communicates with the following control units:

- **DME or DDE: Digital engine electronics or digital diesel electronics**

The DME or DDE, as applicable, controls engine adaptation (for example, reduction in engine output to prevent spin at the driven wheels). The DME or DDE also receives the converted wheel speed signal from the rear right wheel. This signal is used to check the plausibility of engine misfires (DME). The signal on the PT-CAN is redundant.

- **RLS: Rain-light sensor**

The signal from the rain-light sensor is used to brake the brake discs dry on a wet road surface. In addition, it is important for a wiper stage to be switched on.

- > E60, E61, E63, E64

The rain-light sensor supplies the signal on the CAN bus.

- > E83

The rain-light sensor supplies the signal on the K-bus.

- > E90, E91, E92

The rain-light sensor is connected to the roof control panel (FZD) via the LIN bus.

- **CAS and M-ASK/CCC: Car Access System and multi-audio system controller/Car Communication Computer**

The CAS control unit and M-ASK/CCC receive the converted wheel speed signal from the rear left wheel.

Both these control units use this signal to ascertain whether the car is moving or at a standstill.

- **SGM: Safety and gateway module**

- > E60, E61, E63, E64 up to 09/2005

The SGM is the data interface (= gateway) between:

- PT-CAN
- K-CAN
- **Byteflight**
- Diagnosis wire to diagnosis socket

- **KGM: Body gateway module**

- > E60, E61, E63, E64 from 09/2005

The vehicle electrical system was changed from 09/2005. As a result of the change, several control units were discontinued and some control unit functions were integrated into new control units.

The new body gateway module supersedes the safety and gateway module (SGM) previously fitted.

The KGM is the data interface (= gateway) between:

- PT-CAN
- K-CAN
- Diagnosis wire to diagnosis socket

- **JBE: Junction box electronics**

- > E90, E91 from 09/2005 and
- > E92 from 06/2006

The JBE is the data interface (= gateway) between:

- PT-CAN
- K-CAN
- Diagnosis wire to diagnosis socket

Signals from the chassis CAN (F-CAN) are simply looped through.

- **ACC: Active Cruise Control**

DSC receives requests from Active Cruise Control (ACC) via the PT-CAN. In response, DSC reduces speed by applying the brakes at all four wheels.

- > E60, E61, E63, E64
- > E90, E91 from 09/2005 and E92 from 06/2006

The request for brake application is given by the LDM control unit (LDM: longitudinal dynamics management).

○ **LM: Light module**

- > E60, E61, E63, E64

As required by law, the brake lights are activated in the event of automatic braking when the Electronically Controlled Deceleration function (ECD) is triggered by the ACC.

To do this, a signal must be sent from the DSC to the light module (LM) via the K-CAN.

○ **FRM: Footwell module**

- > E90, E91, E92

As required by law, the brake lights are activated in the event of automatic braking when the Electronically Controlled Deceleration function (ECD) is triggered by the ACC.

To do this, a signal must be sent from the DSC to the footwell module via the PT-CAN.

○ **KOMBI: Instrument cluster**

The DSC control unit actuates the indicator and warning lights for the individual DSC functions via the instrument cluster (signal via CAN bus).

- > E83

The instrument cluster is the data interface (= gateway) between:

- PT-CAN
- K-bus

○ **EGS: Electronic gearbox control (vehicles with automatic transmission)**

The transmission control (EGS) receives the wheel-speed signals via the PT-CAN.

The gearbox controller responds by adapting the gearshift characteristics for cornering and ascents. In addition, the gearshift characteristics are adapted to winter conditions (high wheel slip).

Moreover, gearshifts are suppressed during DSC control.

○ **CID and CON: Central Information Display and controller**

The detailed texts for the Check-Control messages are shown in the Central Information Display (CID).

CID and controller are also used to initialize the Run Flat Indicator (RPA).

With xDrive an additional function can be activated to reduce speed when driving downhill: Hill descent control (HDC)

- **TCU or ULF: Telephone control unit with GPS antenna**

If the car is **not fitted with a navigation system**, the telephone control unit receives the converted wheel speed signals from the front left and right wheels.

The telephone control unit uses these signals to pinpoint the car's position by dead reckoning.

- **GM: General module**

- > E83

The general module supplies input signals with respect to terminal control.

SYSTEM FUNCTIONS

The dynamic stability control system (DSC) controls longitudinal and transverse dynamics by means of engine and brake system intervention.

DSC 8Plus includes the following **new** functions.

- Brake Standby through pre-tensioning of the brakes in an emergency
- Brake disc drying on wet roads
- Fading compensation
- Soft stop when braking to standstill (not on BMW 3-Series all-wheel drive or E83)
- Start-off assistant

DSC 8Plus includes the following **familiar** functions.

- ABS: Anti-lock braking system
- EBV: Electronic brake force distribution
- CBC: Cornering brake control
- DTC: Dynamic traction control
- ASC: Automatic stability control
- MSR: Engine drag torque control
- DBC: Dynamic brake control
- Trailer stabilization control
- HDC: Hill descent control
- ECD: Electronically controlled deceleration (only in conjunction with ACC)

- All-wheel control
- RPA: Run Flat Indicator
- CBS: Condition Based Service

New functions for DSC:

Brake Standby through pre-tensioning of the brakes in an emergency

Pre-tensioning the brakes shortens the brakes' response time.

If the accelerator pedal is rapidly released (accelerator pedal angle), the brakes are immediately pretensioned.

DSC generates a low brake pressure without a measurable deceleration taking place.

The clearance between the brake pads and brake discs is eliminated. If the brakes are not applied within half a second, the brake pressure that was generated early is reduced again. The pre-tensioning of the brakes depends on active at speeds greater than 70 km/h.

Brake disc drying on wet roads

Braking dry removes moisture that gathers on the brake discs during journeys on wet roads or in rain.

The brake pads are lightly applied. This function also shortens the brakes' response time.

Depending on the signal from the rain sensor and the position of the wiper switch, DSC cyclically generates a low brake pressure. This creates no measurable deceleration on the vehicle. The brake pads are cyclically applied. This means that the brake disc are regularly wiped down. How often and how long the brake pads are applied depends on:

- The intensity of the rain, e.g. the speed of the windscreen wiper
- Road speed greater than 70 km/h

Fading compensation

Fading means: braking effect deteriorates as a result of high brake-disc temperatures.

If fading is detected, DSC reacts by increasing the brake pressure above that specified by the driver.

At very high brake-disc temperatures, fading compensation is indicated by the following:

- General brake warning lamp lighting up yellow
- Check-Control symbol in LCD display in instrument cluster lighting up yellow

(not E83)

DSC detects fading as follows: DSC compares the current vehicle deceleration with a nominal value based on

the current brake pressure.

DSC increases brake pressure until the nominal deceleration is achieved or until all wheels are subject to ABS control. The process is ended when the brake pedal is no longer depressed or when the speed drops below a certain threshold.

Soft stop when braking to standstill (not on BMW 3-Series all-wheel drive or E83)

Soft stop prevents the vehicle from jolting to a stop (e.g. with an inexperienced driver).

When the vehicle is braked to a standstill, there is no uncomfortable jerk (causing the occupants to "lurch" forward). DSC calculates the moment that standstill can be expected from the current road speed and deceleration.

Just before standstill is achieved, the brake pressure on the rear axle is reduced so that the vehicle stops with practically no jerking.

Soft stop is only active for light braking, so that the shortest possible stopping distance can still be achieved in emergency braking situations.

Start-off assistant

When pulling away on a slope, it is necessary to move your foot from the brake pedal to the accelerator pedal. The start-off assistant prevents the vehicle from rolling downhill in the following situations:

- uphill in forward gear
- uphill in reverse gear

It does this by maintaining the brake pressure needed to hold the vehicle. The gradient is recorded by the longitudinal-acceleration sensor in the DSC control unit.

The braking torque and engine torque needed is calculated from the gradient. When pulling away is detected, brake pressure is reduced as soon as the available engine torque is sufficient to move the vehicle in the direction required. The start-off assistant is deactivated when the parking brake is applied. If no move is made to pull away within 2 seconds of the brake pedal being released, the start-off assistant will be deactivated.

Familiar functions for DSC:

DSC: Dynamic Stability Control

Dynamic Stability Control (DSC) detects the current status of the vehicle by evaluating the sensor signals.

This status is compared with the nominal values derived from a computational model.

In this way, the system recognizes incipient instabilities.

The vehicle is stabilized as soon as a deviation overshoots the control threshold stored in the DSC control unit.

Stabilization (within the limits imposed by the laws of physics) is achieved by reducing engine power and by braking individual wheels.

DSC actions are superimposed on the ABS and ASC functions.

The DSC function can be deactivated by means of the DTC button.

ABS: Anti-lock braking system

The anti-lock braking system (ABS) stops the wheels locking during braking.

Advantage: Shorter stopping distances, the car retains its directional stability and remains steerable.

Brake pressure is regulated at all wheels to ensure that each wheel runs in the best possible slip range.

When this happens, slip is controlled so that the maximum possible braking and lateral stability forces can be transmitted.

ABS alone is available for braking if a sensor for DSC fails or if a bus fault occurs (PT-CAN and chassis CAN).

ABS is the surviving safety function in circumstances in which DSC control is no longer possible.

EBV: Electronic brake force distribution

Electronic brake force distribution (EBV) is a component of the ABS. EBV regulates the brake force distribution between the front and rear axles, depending on vehicle load.

Advantage: Regardless of the load state of the vehicle, the best possible braking distance is achieved while driving stability is maintained. The brake pads wear more evenly.

If the ABS fails, the EBV function is sustained for as long as possible.

The signals from at least two wheel-speed sensors are needed for the EBV function.

CBC: Cornering brake control

Cornering brake control (CBC) is an extension of ABS. CBC increases driving stability when the brakes are applied as the car corners ("cornering logic").

Advantage: Optimum driving stability if brakes are partially applied when cornering.

The shift in wheel loads as the car corners (the onset of this phenomenon requires no more than light application of the brakes) can result in a reduction in handling stability. If required, CBC generates a stabilizing load moment when the brakes are applied lightly outside the ABS intervention range.

DTC: Dynamic traction control

DTC is a version of DSC that has been optimized for forward momentum in certain road conditions.

Dynamic traction control (DTC) offers better traction as a trade-off against a reduction in stability in some circumstances. Consequently, its use should be reserved for exceptional conditions. It is advisable to briefly activate DTC in the following exceptional circumstances:

- To rock the vehicle free or pull away in deep snow or on a loose surface.
- When driving on snowy uphill stretches, in slush and on roads that have not been cleared
- When driving with snow chains.

The DTC function approximates to that of DSC with a slightly modified control strategy.

DTC can be activated by deactivating DSC (DTC button). DTC intervenes in the braking actions to imitate the function of a conventional differential lock. This effect of this is to increase the input torque on those wheels that are on a higher-friction surface.

Advantage: Higher traction is available with DTC.

Vehicle stabilization intervention (e.g. reduced power output) is made slightly later than with DSC. In certain situation, the driver has to intervene more intensively himself to stabilize the vehicle.

ASC: Automatic stability control

Automatic stability control (ASC) prevents the wheels spinning during acceleration by intervention in brake and engine operations.

Advantage: More traction and better driving stability.

If the wheels on the driven axle have a different level of grip, the wheel that tends to spin is braked. If necessary, the engine's power output is also reduced.

MSR: Engine drag torque control

The engine drag torque control (MSR) counteracts the tendency of the wheels to lock on smooth surfaces. The engine's drag torque generated by downshifts or abrupt load changes can lock the driven wheels (especially on surfaces with a low coefficient of friction).

The wheel-speed sensors tell MSR as soon as the wheels are about to lock. MSR then briefly reduces the engine's drag torque by opening the throttle slightly.

Advantage: The drive wheels retain their lateral stability in overrun mode.

DBC: Dynamic brake control

Dynamic brake control (DBC) assists in emergency braking situations by automatically increasing the brake pressure.

Advantage: Shortest possible braking distances in emergency braking situations by achieving ABS regulation on all four wheels.

The brake pedal is frequently not depressed strongly enough in emergency braking situations. ABS regulation is then not activated.

In the following situations, the return pump increases the brake pressure until ABS regulation is activated:

- When the brake pedal is rapidly depressed with insufficient pedal force
- When the brake pedal is depressed slowly and the demand for deceleration is subsequently high, after one wheel reaches the ABS control threshold.

Which wheel locks first depends on load and coefficient of friction of the road surface.

Example of a typical situation:

The traffic slows, making light braking necessary at first, but then demands as short a stopping distance as possible.

Trailer stabilization control

Trailer stabilizing control detects when a trailer is rocking about its vertical axis. The system functions at a speed of about 65 km/h when the trailer socket is in use.

With the aid of the DSC sensors, Dynamic Stability Control (DSC) monitors the vehicle's yaw behavior.

If the trailer's rocking motion exceeds the limit, the engine output is reduced. In addition, DSC brakes all four wheels automatically.

If DSC is deactivated or faulty, then the trailer stabilizing control does not work either.

HDC: Hill Descent Control

Hill descent control (HDC) is an automatic cruise control system on **all-wheel-drive vehicles** for driving downhill.

HDC automatically reduces the vehicle's speed. The brakes are applied on all four wheels to reduce road speed to just above walking pace. This allows stable downhill driving on steep and slippery surfaces.

HDC holds this speed constant (all DSC functions remain active).

The vehicle's road speed can be continuously varied within the specified values by depressing the accelerator pedal and brake pedal or the cruise-control system steering-column stalk.

- > E60, E61

HDC can be switched on and off at the Central Information Display (CID): "Settings" menu and "Vehicle settings" submenu.

At the factory, HDC is assigned to the lower freely programmable button on the multi-function steering wheel.

- > E83 and E90, E91, E92

HDC can be activated and deactivated via a separate button in the SZM (center console switch cluster).

ELECTRONICALLY CONTROLLED DECELERATION

The electronically controlled deceleration (ECD) reacts to a demand from Active Cruise Control (ACC).

When the ACC system requires deceleration, DSC responds by applying the disc brakes on all four wheels (maximum rate of retardation 2.5 m/s^2).

When the car is on a decent with the speed preset by the driver, ECD automatically applies the brakes in order to keep the car's speed constant at the preset value.

When the brakes are applied automatically in this way, the brake lights are activated in accordance with the requirements of road-safety legislation.

The light module does not activate the brake lights unless the vehicle's rate of deceleration is greater than 1 m/s^2 . This prevents the brake lights from flickering on and off.

All-wheel control

Dynamic Stability Control (DSC) specifies the nominal value for xDrive all-wheel control. The DSC control unit calculates the locking moment for the multi-plate clutch in the transfer box.

The nominal value depends on the vehicle's tendency to oversteer or understeer and wheelslip. The nominal value is sent via the PT-CAN to the VTG control unit.

The VTG control unit reports the actual set locking moment back to the DSC control unit.

The DSC control unit calculates the locking torque for the multi-plate clutch as follows:

- Pre-activation = driver's command
- Driving dynamic control
- Detection of different tyre rolling circumferences

RPA: Run Flat Indicator

The Run Flat Indicator (RPA) is not a dynamic driving control function.

RPA is integrated into the DSC control unit as 4 wheel-speed signals are needed for this function.

By comparing the speed signals for all four wheels, the system detects differences in rolling circumference at the individual wheels. This enables a gradual drop in pressure to be detected.

CBS: Condition Based Service

CBS is not a driving dynamic function.

Condition Based Service, as the name suggests, is a means of ensuring that the car is serviced as and when necessary. CBS comprises various maintenance operations, e.g. engine oil, spark plugs and brake pads.

The remaining distance for the front and back brake pads are calculated separately in the DSC control unit.

When making the calculation, the condition of the brake pad wear sensors is taken into account (reference point at 6 mm and 4 mm).

OPERATION

- > E60, E61, E63, E64 and E83

The DTC button is located in the center console switch cluster (SZM).

- > E90, E91, E92

The DTC button is located between the central air vents in the instrument panel.

The DTC button has 2 functions that can be set by pressing the button for different lengths of time.

DTC BUTTON FUNCTIONS REFERENCE

Press button	Function	Remarks
short < 3 seconds	DTC function activated.	DTC indicator light on. DSC indicator and warning light on.
long > 3 seconds	DSC is completely deactivated	DSC indicator and warning light on. This mode is intended for service work (e.g. brake dynamometer).

NOTE:

Reactivating DSC

Briefly pressing the button again reactivates the DSC function. The DSC indicator and warning light goes out (unless a fault has developed in the system).

If the DTC button is pressed for longer than 10 seconds (e.g. by a handbag on the center console), DSC will recognize an operating error. The DSC function remains active and cannot be deactivated until the ignition has been switched off and on again.

2AZ Brake caliper to steering knuckle (screws lightly oiled, contact surfaces between brake caliper and steering knuckle cleaned and grease-free)	E34 / E36 / E32 / E31 / E38 / E39 / E46 / E52 / E53 / E65, E30 / 325iX, E66 / E67 / E83 / E85 / E86 / E60 / E61 / E63 / E64			110 Nm
2AZ with aluminum brake caliper	E31			115 Nm
	E12 / E21 / E23 / E24 to 5.82			95 Nm
	E28 / E30 / E24 / from 5.82			123 Nm
3AZ Guide bolt	E39 / E38 / E46 / E52 / E53 / E85 / E86 / E83 / E65 / E66 / E67 / E60 / E61 / E63 / E64	wrench size 7 mm		30-5 Nm
4AZ Bolts to guide pin (always replace)	E30			35 Nm
5AZ Protective plate to steering knuckle	E85 / E86 / E83	M6		9 Nm
	E67 / E60 / E61 / E63 / E64 / E65 / E66	M6		12 Nm

21 REAR BRAKES

34 21 REAR BRAKE

REAR BRAKE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Brake drum/disc to wheel hub	E39 / E38 / E46 / E52 / E53 / E83 / E85 / E86 / E65 / E66 / E67 / E60 / E61 / E63 / E64			16 Nm
2AZ Wheel brake cylinder to brake anchor plate	E36			10 Nm
3AZ Brake carrier on semi-trailing arm/wheel carrier	E65 / E66 / E67 / E60 / E61 / E63 / E64			110 Nm
	E46 / E85 / E86 / E86			65 Nm
	E83	M10	Replace micro-encapsulated screws	65 Nm
5AZ Guide bolt	E39 / E38 / E46 / E52 / E53 / E83 / E85 / E86 / E65 / E66 / E67 / E60 / E61 / E63 / E64	wrench size 7 mm		30 - 5 Nm
6AZ Protective plate to wheel carrier	E85 / E86 / E83	M6		9 Nm
	E85 / E86 / E83	M8		15 Nm
	E60 / E61 / E63 / E64 / E65 / E66 / E67	M6		12 Nm

31 MASTER BRAKE CYLINDER

34 31 BRAKE MASTER CYLINDER

BRAKE MASTER CYLINDER - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Brake master cylinder to brake booster (vacuum)	E30			24 Nm
	E32		Replace self-locking nut.	21 Nm
	E28 / E34 / E36 / E46 / E38 / E39 / E52 / E53 / E85 / E86 / E83		Replace self-locking nut.	26 Nm
	E65 / E66 / E60 / E61 / E63 / E64		Replace self-locking nut. Retighten after 30 minutes.	26 Nm
2AZ Brake master			Replace hexagon socket head	

cylinder to brake booster hydraulic	E31 / E32 / E34 / E24		screw with a hexagon screw, refer to	28 Nm
3AZ Expansion tank to brake master cylinder	E36 / E46 / E85 / E86			3,5 Nm
	E83 / E60 / E61 / E63 / E64			8 ±2 Nm

32 BRAKE LINES

34 32 BRAKE LINES

BRAKE LINES - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Brake hose couplings	E36 / E38 / E39	M10 x 1		18 Nm
	E53 / E60 / E61 / E63 / E64 / E65 / E66 / E67 / E83 / E85 / E86	M10 x 1		14 Nm
	E36 / E38 / E39	M12 x 1		18 Nm
	E53 / E60 / E61 / E63 / E64 / E65 / E66 / E67 / E85 / E86	M12 x 1		14 Nm
2AZ Brake hose to brake caliper, front and rear	E85 / E83 / E86			19 Nm
3AZ Bracket to trailing arm	E85 / E86 / E83	M6		9 Nm
	E85 / E86	M5		5 Nm
4AZ Brake hose to brake caliper, front	E53 / E60 / E61 / E63 / E64 / E65 / E66 / E67	M10 x 1		24 ±2 Nm
5AZ Brake hose to brake caliper, rear	E53	Banjo bolt M10 x 1		40 Nm
	E60 / E61 / E63 / E64 / E65 / E66 / E67	M10 x 1		24 ±2 Nm
6AZ Brake lines to master brake cylinder / hydraulic unit	E83			17 Nm

33 BRAKE BOOSTER

34 33 BRAKE BOOSTER

BRAKE BOOSTER - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
10AZ Hydraulic pipe to pressure reservoir on power flow regulator	E31 / E32			47 Nm
11AZ Hydraulic pipe to pressure reservoir	E31 / E32			40 Nm

12AZ Brake booster to pedal assembly console	E85 / E86	M8	Retighten 1x after 30 minutes on brake booster	22 Nm
	E36 / E46			25 Nm
	E38 / E39 / E52 / E53			31 Nm
	E65 / E66 / E67 / E60 / E61 / E63 / E64 / E83		Retighten 1x after 30 minutes on brake booster	26 Nm

41 PARKING BRAKE

34 41 PARKING BRAKE

PARKING BRAKE - TIGHTENING TORQUES

	Type	Thread	Tightening specification	Measure
1AZ Handbrake lever to body	E52 / E53 / E60 / E61 / E63 / E64			21 Nm
2AZ Housing cover to parking brake	E65 / E66 / E67			2 Nm
3AZ Actuating unit and control unit of parking brake	E65 / E66 / E67			4 Nm
4AZ Mounting pan to tunnel	E85 / E86	M6		8 Nm
5AZ Spring clip to wheel carrier	E60 / E61 / E63 / E64	M6		8 Nm
6AZ Support Duo-Servo to wheel carrier, rear	E60 / E61 / E63 / E64	M10		60 Nm

51 MECHANICAL-HYDRAULIC COMPONENTS

34 51 SLIP CONTROL SYSTEM (ABS, ASC+T, DSC)

SLIP CONTROL SYSTEM - TIGHTENING TORQUES (ABS, ASC+T, DSC)

	Type	Thread	Tightening specification	Measure
1 AZ Control unit on hydraulic unit	E46 (MK20)			2,6 Nm
	E46 / E85 / E86 / (MK60)			5+1 Nm
	E38 / E39 / E52 / E53 / E46 AWD / E65 / E66 / E67			2,9 Nm
	E60 / E61 / E63 / E64 / E83			3±0,3 Nm
2AZ Pressure sensor "V" and "H" to master brake cylinder	E46 / E85			25 + 5 Nm
Pressure sensor to hydraulic unit	E38 / E39			20 Nm
	E52 / E53 / E46 AWD / E65 / E66		Only with special tool 34 1 290	19 Nm
	E46 / E65 / E66 / E67 / E60 /			

3AZ Rotation rate sensor / DSC sensor to holder	E61 / E63 / E64 / E83 / E85 / E86			8 Nm
4AZ Bracket, rotation rate sensor to body	E46 / E85 / E86			8 Nm
5AZ Banjo bolt for pre-boost pump intake line to pre-boost pump	E46			20 Nm
6AZ Pulse generator to swivel bearing/wheel carrier	E52 / E53 / E46 / E85 / E60 / E61 / E63 / E64 / E67			8 Nm
	E39 / E38 / E65 / E66			9 Nm
7AZ Rotation rate sensor to body	E38 / E39			8,6 Nm
8AZ Rotation rate sensor to body	E52 / E53			8 Nm
9AZ Bracket to hydraulic unit	E52 / E53 / E46 / E85 / E86 / E83 / E60 / E61 / E63 / E64			8 Nm
10AZ Bracket, hydraulic unit to body	E52 / E53 / E46 / E85 / E86 / E83 / E60 / E61 / E63 / E64			8 Nm
11 AZ All screws to precharging pump and holder	E52 / E53 / E46 (M3) / E65 / E66	M6		8 Nm
12AZ Pressure sensor, front and rear for ACC, to brake line	E60 / E61 / E63 / E64			25 + 5 Nm

BRAKES

Disc - Repair Instructions - X3

00 BRAKE TESTING AND BLEEDING

34 00 ... GENERAL INFORMATION

The brake system is one of the most important safety systems on any motor vehicle. It is therefore essential to act with utmost care when working on the brake system and to follow the instructions below.

General:

- Ensure cleanliness and only use rags which do not lose lint.
- Wash away or vacuum up brake dust, do not clear it away using compressed air. This dust is a health hazard.
- Do not under any circumstances allow any oil or grease to get into the brake system. This would result in a complete malfunction of the brake system.
- When cleaning brake components with brake cleaner, do not allow brake cleaner to get into in the brake system.
- Even the most minute traces of brake cleaner must be avoided.

Brake fluid:

- Replace brake fluid at least every two years.
- Never reuse drained brake fluid.
- Always use BMW-approved brake fluid.
- Dispose of brake fluid in approved appliances only.
- Do not allow brake fluid to drain into drain pipes, into the outside environment or into unsuitable facilities. This would create the risk of groundwater contamination since brake fluid is classed as a fluid that is hazardous to water.
- Do not allow brake fluid to come into contact with paintwork as this will destroy the paint.
- Brake fluid must not be allowed to remain on bare skin too long in order to avoid skin problems. Wash skin coated with brake fluid with water and soap.
- If brake fluid makes contact with eyes, immediately flush with large quantity of clean water and visit eye doctor.

Wheel brakes:

- Brake pads:

Brake pads must be replaced when the warning threshold of the brake pad wear indicator is reached, see **34 11 ... Overview of front brakes.**

Brake pads must always be replaced on both sides of any axle.

The friction surfaces of the brake pads must not come into contact with oil or grease. The brake pads must be replaced if they are fouled by such substances.

In the case of rotation-dependent brake pads, make sure the arrow marking points in the direction of rotation of the brake disk for when the vehicle is moving forward. Brake pads with left/right markings must be fitted on the relevant side of the vehicle.

One-sided angled areas on the brake pads must be located on the disk contact side of the brake caliper for when the vehicle is moving forward.

- Brake discs:

Brake disks must not be scored or cracked. Furthermore, minimum brake disk thickness, disk runout, parallelism and surface roughness of the friction surfaces must not exceed or drop below the permitted values, see **34 11 ... Overview of front brakes**.

Always strip preservative off new parts before installation. With the rear brake discs, also strip preservative off brake drum on parking brake.

- Always strip preservative off new parts before installation.
- Brake calipers:

Only approved pastes on the basis of glycol must be used for repairs on brake calipers.

All moving parts on the brake caliper must move freely: note grease specifications.

Use only BMW-approved lubricants to grease caliper guides.

Brake lines, brake hoses:

- Brake lines and brake hoses must be correctly routed and must not abut with body or components in a way which would cause chafing.
- To prevent damage, release and tighten brake line couplings with a special brake line wrench only.
- The system must be bled each time any brake lines have been detached.
- All connection points must be checked for leaks.
- Only tighten down brake hoses on the front axle when wheels are in straight-ahead position.
- Close off open connections of brake lines and individual components to prevent dirt from getting into the brake system.
- When tightening down brake line couplings, observe tightening torque: 34 32 1AZ, see **34 32 BRAKE LINES** .

Wheel-slip control system:

The wheel-slip control system is essentially maintenance-free; however the following must be observed:

- When carrying out welding work with electric welding equipment, be sure to disconnect the plug from the electronic control unit (ignition turned off).
- During painting work, the control unit may be subjected for brief periods to loads of max. 95°C and for long periods (approx. 2 hours) to loads of max. 85°C.
- Terminals must be completely tight on end poles of battery.
- Brake lines on hydraulic unit must not be swapped over: if applicable, mark them prior to disassembly.

On completion of repair work, carry out swap-over test with the DIS diagnosis system.

34 00 ... GENERAL INFORMATION ON BRAKING IN NEW BRAKE DISCS / BRAKE PADS

IMPORTANT: After completing work:

- **Carry out function check on brake analyzer (test stand) to ensure that the brakes complies with legal requirements.**
- **Carry out test braking while driving at low speed; the effectiveness of the brakes may be reduced during the initial braking operations.**
- **Exaggerated drastic and continuous braking operations for faster braking in are not permitted.**
- **Advise the customer not to perform any wilful drastic braking in the first 200 km after brake replacement.**
- **Attach mirror tag to interior rearview mirror.**

34 00 ... TESTING AWD VEHICLES ON DYNAMIC BRAKE AND POWER ANALYZERS (E30, E34, E46, E53, E83, E60, E61, E90, E91, E92)

NOTE: Running AWD vehicles on dynamic brake analyzers is governed by different instructions, depending on the vehicle model.

IMPORTANT: Power measurements on single-axle roller dynamometers are generally not permitted as total failure of the transfer case cannot be ruled out during such measurements.

In order to test AWD vehicles on dynamic brake analyzers, it is essential to follow various measures in accordance with the special instructions in Appendices 1 to 5 for the vehicles in question:

1. E30 AWD
2. E34 AWD
3. E46 AWD
4. E53 X5
5. E83 X3
6. E60 / E61 AWD
7. E90 / E91/ E92 AWD

34 00 009 CHECKING BRAKES ON TEST STAND

- NOTE:**
1. Check tires for damage
 2. Check tire treads
 3. Check tire pressure

Follow Brake testing instructions for E83 (X3).

You must follow without fail the guidelines contained in the operating instructions of the relevant test stand manufacturer.

IMPORTANT: Only brake test stands (analyzers) with test speeds of 2.5 - 6 km/h may be used.

Before driving onto the brake test stand (dynamic brake analyzer), switch off the Hill Descent Control (HDC) and keep it switched off while testing the brakes.

The HDC indicator lamp must not light up!

NOTE: It is possible for the HDC indicator lamp to go out or not to light up even when HDC mode is activated if HDC is temporarily unavailable on account of high operating temperature.

Fig. 1: Brake Test Stands

Courtesy of BMW OF NORTH AMERICA, INC.

- IMPORTANT:**
- Vehicles with manual transmission and XDrive:
Do not select a gear and do not accelerate.
 - Vehicles with automatic transmission and XDrive:

Carry out brake testing with selector lever in N position (Neutral) only.

Do not accelerate when the rollers start up.

Failure to comply with this instruction may result in damage to the test stand or to the vehicle.

34 00 010 CHECKING THICKNESS OF BRAKE PAD

Special tools required:

- 34 1 260 BRAKE LINING MEASURING GAUGE

NOTE: The thickness of the outer brake pads can be determined without removing the wheels.

If necessary, move car until opening for brake pad wear indicator (brake pad) can be seen through rim styling.

Insert special tool 34 1 260 through rim into opening for brake pad wear indicator.

Press special tool onto brake pad. Slide ring (1) in direction of arrow up to stop and read off measured value.

Fig. 2: Special Tool (34 1 260)

Courtesy of BMW OF NORTH AMERICA, INC.

NOTE: A. Brake disk
B. Brake pad with backplate

Safe limit for lining wear, front brake, see 34 11 FRONT BRAKE E83 .

Safe limit for lining wear, rear brake, see 34 21 REAR BRAKE DISCS E83 .

34 00 025 REPLACING FLUID IN ABS/ASC+T BRAKE SYSTEM

NOTE: Read and comply with General Information, see 34 00 ... General Information.

IMPORTANT: When carrying out repairs to the brake system, follow the procedure set out in Bleeding brake system with DSC, see 34 00 050 Bleeding brake system with DSC.

Connect brake fluid changer to expansion tank and switch on.

NOTE: Check relevant Operating Instructions for each device.

Charging pressure should not exceed 2 bar.

Fig. 3: Connecting Brake Fluid Changer To Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

Flushing brake system completely

Connect bleeder hose with collecting tray to bleeder valve on rear right brake caliper.

Open bleeder valve and purge until clear, bubble-free brake fluid emerges.

Close bleed valve.

Follow same procedure on rear left, front right and front left wheel brake.

Fig. 4: Brake Flushing System

Courtesy of BMW OF NORTH AMERICA, INC.

The clutch slave cylinder must also be scavenged in vehicles with manual transmissions.

Switch off brake fluid changer and remove from expansion tank.

Check brake fluid level.

Close expansion tank.

NOTE: Pay attention to rubber seal (1) in sealing cap.

Fig. 5: Locating Rubber Seal In Sealing Cap

Courtesy of BMW OF NORTH AMERICA, INC.

34 00 050 BLEEDING BRAKE SYSTEM WITH DSC

NOTE: Read and comply with General Information, see 34 00 ... General Information.

When replacing or repairing, observe the filling and bleeding instructions for the following parts:

1. Tandem brake master cylinder
2. Hydraulic unit DSC3
3. and components/connecting lines which are fitted between these assemblies.

After work has been completed on the precharging pump, only the front-axle brake circuit has to be bled. Activate precharging pump once with Diagnosis and Information System (DIS).

(Bleeder unit connected with max. 2 bar filling pressure).

After completing work: Carry out final check with DIS under menu item "Service functions".

Contrary to the instructions in the DIS, the bleeding routine must be restarted on each wheel.

A second person is needed to help carry out this work.

Connect DIS.

Call up service function "Bleeding ABS/DSC3 Hydraulics".

Connect bleeder unit to expansion tank and switch on.

NOTE: Check relevant Operating Instructions for each device.

Charging pressure should not exceed 2 bar.

Fig. 6: Connecting Brake Fluid Changer To Expansion Tank
Courtesy of BMW OF NORTH AMERICA, INC.

Flushing brake system completely

Connect bleeder hose with collecting tray to bleeder valve on rear right brake caliper.

Open bleeder valve and purge until clear, bubble-free brake fluid emerges.

Close bleed valve.

Follow same procedure on rear left, front right and front left wheel brake.

Fig. 7: Brake Flushing System

Courtesy of BMW OF NORTH AMERICA, INC.

Bleeding rear-axle brake circuit

Connect bleeder hose with collecting tray to bleeder valve on rear right brake caliper.

Close bleeder valve.

Run bleeding routine with DIS with bleeder valve open.

After completing routine, press brake pedal 5 times to floor; clear and bubble-free brake fluid must flow out.

Close bleed valve.

Repeat procedure at rear left.

Fig. 8: Brake Flushing System
Courtesy of BMW OF NORTH AMERICA, INC.

Bleeding front-axle brake circuit

Connect bleeder hose with collecting tray to bleeder valve on front right brake caliper.

Close bleeder valve.

Run bleeding routine with DIS with bleeder valve open.

After completing routine, press brake pedal 5 times to floor, clear and bubble-free brake fluid must flow out.

Close bleed valve.

Repeat procedure at front left.

Fig. 9: Bleeding Front-Axle Brake Circuit
Courtesy of BMW OF NORTH AMERICA, INC.

Switch off bleeder unit and remove from expansion tank.

Check brake fluid level.

Close expansion tank.

NOTE: Pay attention to rubber seal (1) in sealing cap.

Fig. 10: Locating Rubber Seal In Sealing Cap

Courtesy of BMW OF NORTH AMERICA, INC.

10 HAND BRAKE

34 10 014 ADJUSTING HANDBRAKE

Special tools required:

- **32 1 030 LEVER**

Perform inspection in the following manner:

When 1st ratchet is engaged, no braking force should be exerted.

The difference in wheel circumferential forces between the left and right wheels may deviate by max. 30 % from the greater value (measured on brake analyzer).

In event of larger deviations of wheel circumferential force: carry out readjustment.

It must be possible to brake with locked wheels with the handbrake.

The handbrake must be readjusted whenever the actuation stroke is greater than 10 teeth.

NOTE: The handbrake can only be adjusted correctly when the parking brake Bowden cables and all moving handbrake parts are free to move and fully operational.

Basic handbrake adjustment is necessary:

- Replacing parking brake shoes.
- Replacing brake disks.
- Excessive actuation stroke (10 teeth).
- Replacing handbrake Bowden cables.

1. **Setting instruction for brake shoes (basic setting)**

Lock adjuster unit (ASZE).

Using special tool 32 1 030 , press stop (1) of adjusting spring back to such an extent that retaining hook (2) engages in stop (1).

Fig. 11: Special Tool (32 1 030) With Retaining Hook
Courtesy of BMW OF NORTH AMERICA, INC.

Completely unscrew one wheel stud on each rear wheel.

Installation:

Tightening torque: 36 10 1AZ, see **36 10 WHEELS** .

Turn wheel until adjustment screw is visible in tapped hole.

Fig. 12: Locating Wheel Stud On Each Rear Wheel
Courtesy of BMW OF NORTH AMERICA, INC.

Turn adjusting screw with a screwdriver until the wheel is no longer able to turn.

Then unfasten the adjusting screw 6 notches.

Fig. 13: Turning Wheel Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Unlock adjuster unit (ASZE).

Lever restraint hook (2) outwards with a suitable screwdriver (1).

Restraint hook (2) must disengage from stop of adjusting spring.

Fig. 14: Restraint Hook With Screwdriver
 Courtesy of BMW OF NORTH AMERICA, INC.

**IMPORTANT: Follow instructions for Brake testing on test stand, see 34 00 009
Checking brakes on test stand.**

2. Setting instruction for parking brake Bowden cables

The handbrake lever must be applied 5 times to approx. 400N actuating force.

1. On brake analyzer

0th tooth (handbrake released): Vehicles with manual transmission: Shift lever in neutral position.

Vehicles with automatic transmission: Selector lever in Nth position.

- Without locking differential $< \text{ or } = 150 \text{ N}$.
- With locking differential $< \text{ or } = 200 \text{ N}$ (possibly odd display).

1st tooth: No increase in braking force with regard to 0th tooth. Indicator lamp can be lit.

2nd tooth: An increase in braking force must take place, indicator lamp must be lit.

3rd tooth: Increase in braking force.

5st tooth: The brake force display must have reached $< \text{ or } = 500 \text{ N}$.

3. Braking in the duo-servo parking brake

The following braking-in procedures are applicable in case of insufficient braking effect or after replacing brake disks and/or brake shoes.

1. On brake analyzer

Apply handbrake lever until wheel circumferential force on first wheel is 800 N.

Lock lever in next lower tooth.

Release handbrake lever after approx. 2 minutes.

2. **When driving on road**

(If possible inside the company grounds or on an unused road)

At approx. 40 km/h, apply handbrake lever until braking action can be felt.

Pull up handbrake lever into next notch and drive on for approx. 400 m.

A basic requirement is that handbrake is adjusted uniformly.

NOTE: Repeat braking-in procedure if necessary; allow brake to cool down sufficiently.

11 FRONT BRAKES

34 11 ... OVERVIEW OF FRONT BRAKES

- 1 Brake disk
- 2 Brake pad
- 3 Brake caliper

- 4 Brake guard plate
- 5 Checking thickness of brake lining

Fig. 15: Front Brakes Components

Courtesy of BMW OF NORTH AMERICA, INC.

34 11 000 REMOVING AND INSTALLING/REPLACING BRAKE LININGS OF BOTH FRONT DISC BRAKES

Necessary preliminary tasks:

- Remove wheels, see 36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL .

NOTE: **After completing work:**

- Fully depress brake pedal several times so that brake linings contact brake discs.
- When installing new brake linings at front and rear axles, brake fluid level must be brought up to "MAX" marking.
- Read and comply with notes on braking in new brake discs / brake pads, see 34 00 ... General information on braking in new brake discs / brake

pads.

Lift out retaining spring (1).

Left:

Disconnect plug connection for brake lining wear sensor.

If necessary, replace brake lining wear sensor, see [34 35 001 Replacing a brake lining sensor.](#)

Fig. 16: Retaining Spring

Courtesy of BMW OF NORTH AMERICA, INC.

Remove plastic plugs (2).

Fig. 17: Plastic Plugs

Courtesy of BMW OF NORTH AMERICA, INC.

Unfasten guide screws (1) and lift out brake caliper towards rear of vehicle. Do not allow brake caliper to hang from brake hose, risk of damage to brake hose.

Installation:

Only clean guide screws; do not grease.

Check threads.

Replace all guide screws which are not in perfect condition.

Installation:

Tightening torque: 34 11 3AZ, see **34 11 FRONT BRAKE** .

Fig. 18: Brake Caliper And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Turn piston fully back with special tool 34 1 050.

IMPORTANT: When turning back the piston, watch the brake-fluid level in the expansion tank, as overflowing brake fluid will destroy the paintwork.

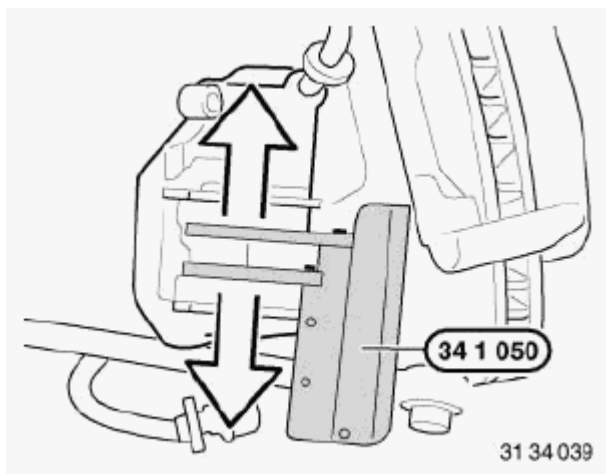

Fig. 19: Retracting Piston With Special Tool (34 1 050)

Courtesy of BMW OF NORTH AMERICA, INC.

Remove outer brake lining.

Inner brake lining is located with its spring in the piston.

IMPORTANT: Mark any worn brake linings.

In the event of one-sided brake lining wear, do not change brake linings round.

New brake linings may only be installed if the brake disc thickness is greater than or equal to the minimum brake disc thickness (MIN TH), see **34 11 FRONT BRAKE E83** .

Observe minimum thickness of brake linings, see **34 11 FRONT BRAKE E83** , Clean brake linings.

Do not grease backs of brake linings sleeve.

Fig. 20: Removing Outer Brake Lining

Courtesy of BMW OF NORTH AMERICA, INC.

Check dust sleeve (1) for damage and replace if necessary.

Clean contact face (2) of brake piston and apply a thin coating of anti-squeak compound.

IMPORTANT: Dust sleeve must not come into contact with anti-squeak compound as this may cause the dust sleeve to swell.

Fig. 21: Contact Face And Dust Sleeve
Courtesy of BMW OF NORTH AMERICA, INC.

Clean contact faces (1...2) of brake lining hammer heads/brake caliper housing and coat with anti-squeak compound.

Fig. 22: Contact Face Of Brake Piston
Courtesy of BMW OF NORTH AMERICA, INC.

Clean contact face (3) of brake caliper and apply a thin coating of anti-squeak compound.

Fig. 23: Brake Caliper And Screw
Courtesy of BMW OF NORTH AMERICA, INC.

Clean contact face of brake caliper mounting bracket and apply a thin coating of anti-squeak compound.

Fig. 24: Locating Brake Caliper Mounting Bracket
Courtesy of BMW OF NORTH AMERICA, INC.

34 11 220 REMOVING AND INSTALLING/REPLACING BOTH FRONT BRAKE DISCS

Necessary preliminary tasks:

- Remove wheels, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .
- If necessary, remove and clean brake pads, see **34 11 000 Removing and installing/replacing brake linings of both front disc brakes.**

IMPORTANT: The brake discs must be replaced if their thickness is below the minimum thickness (MIN TH).

Brake discs may only be replaced in pairs (for each axle).

If the brake discs are replaced, you must also fit new brake pads.

The brake discs of M models are tied to the direction of travel:

The uneven part number denotes the left brake disc, the even part number the right brake disc!

Read and comply with notes on braking in new brake discs / brake pads, see 34 00 ... General information on braking in new brake discs / brake pads.

Unfasten screws (1), remove brake caliper and fasten up.

NOTE: Brake hose remains connected.

Installation:

Tightening torque: 34 11 2AZ, see 34 11 FRONT BRAKE .

Fig. 25: Brake Caliper And Screw

Courtesy of BMW OF NORTH AMERICA, INC.

Unscrew bolts and take off brake disc.

IMPORTANT: To release brake disc: Do not under any circumstances strike friction ring with a hammer or similar! If necessary, carefully tap on base of brake disc chamber with a rubber mallet.

Fig. 26: Releasing Brake Disc

Courtesy of BMW OF NORTH AMERICA, INC.

Installation:

Replace brake disc retaining screw.

Thoroughly clean contact surface of wheel hub and remove traces of corrosion if necessary.

Unevenness on contact surface may result in distortion of brake disc!

Tightening torque: 34 11 1AZ, see **34 11 FRONT BRAKE** .

IMPORTANT: Internally ventilated brake discs are balanced.

Never remove or reposition balance clips.

Fig. 27: Locating Brake Discs Contact Surface

Courtesy of BMW OF NORTH AMERICA, INC.

34 11 250 REMOVING AND INSTALLING/REPLACING A BRAKE CARRIER/BRAKE GUARD PLATE AT FRONT

Necessary preliminary tasks:

- Remove front swivel bearing, see **31 21 090 REPLACING (REMOVING AND INSTALLING) LEFT OR RIGHT SWIVEL BEARING** .

Release screws (1) and remove brake guard plate (2).

Installation:

Tightening torque: 34 11 5AZ, see **34 11 FRONT BRAKE** .

34 11 519 REMOVING AND INSTALLING/REPLACING LEFT OR RIGHT FRONT BRAKE CALIPER

Necessary preliminary tasks:

Remove wheels, see **36 10 300 REMOVING OR INSTALLING FRONT OR REAR WHEEL** .

After completing tasks, bleed brake system, see **34 00 050 Bleeding brake system with DSC**.

Apply pedal prop and depress brake pedal slightly. This prevents brake fluid from emerging from the expansion tank and air from entering the brake system after the brake lines have been detached.

Disconnect brake pipe from connection with brake hose.
